- WAC 296-823-16010 Test the blood of the source person. You must arrange to test the source individual's blood for HBV and HIV as soon as feasible after getting their consent.
- (1) If you do not get consent, you must establish that legally required consent can not be obtained.
- (2) When the law does not require the source individual's consent, their blood, if available, must be tested and the results documented.
- (3) Exemption: When the source individual is already known to be infected with HBV or HIV, you do not need to test their status.

Note:

- 1. If a source individual refuses testing, a worker may request that a local or state health officer order bloodborne pathogen testing. Authority for health officer orders is given in RCW 70.24.340.
- 2. Source testing: According to the Centers for Disease Control and Prevention (CDC), hepatitis C virus (HCV) infection is the most common chronic bloodborne infection in the United States. The CDC recommends testing of the source person for the presence of anti-HCV antibody. (Updated *U.S. Public Health Service Guidelines for the Management of Occupational Exposures to HBV, HCV, and HIV and Recommendations for Postexposure Prophylaxis*, MMWR, June 29, 2000/50(RR11); 1-42.)
