WAC 296-826-30055 Installation.

You must meet the requirements	in this section:
Installation	WAC 296-826-30055
Reinstallation	WAC 296-826-30060

- (1) You must support tanks on noncombustible foundations designed for the type of tank.
- (2) You must provide protection against flotation or other water damage, where high floodwater might occur.
- (3) You must prevent the effects of freezing and consequent frost heaving, in tanks used for product storage at less than 32°F, by providing either support or heat supply.
- (4) You must prevent accidental discharge of liquids from spreading into uncontrolled areas by providing, to the area surrounding a refrigerated tank or group of tanks, one of the following:
- (a) A drainage system provided with at least a one percent slope that terminates in an impounding basin with a capacity as large as the largest tank served; or
- (b) A diked enclosure with a capacity as large as the largest tank served.
- (5) You must meet, when using a diked enclosure or an impounding basin in a drainage system, the following requirements:
- (a) Make the wall of earth, steel, or concrete. If made of earth, meet both of the following:
 - (i) The top is flat and at least two feet wide; and
- (ii) There is a stable slope consistent with the angle of the earth used.
 - (b) Design the wall to be both:
 - (i) Liquid tight; and
- (ii) Able to withstand the hydrostatic pressure and the temperature.
- (6) You must provide for drainage of rain water, that does not permit the release of ammonia, from diked or impounding areas.

- 1. It is recommended that the ground in an impounding basin or within a diked enclosure be graded so that small spills or the early part of a large spill will accumulate at one side or corner contacting both:
 a. A relatively small area of ground; and

- b. Exposing a relatively small surface area for heat gain.
 2. Shallow channels in the ground surface or low curbs of earth can help guide the liquid to these low areas without contacting a large ground
