WAC 296-307-28040 What requirements apply to guarding clutches, cutoff couplings, and clutch pulleys? (1) Unless guarded by location, clutches, cutoff couplings, or clutch pulleys with projecting parts must be enclosed by a stationary guard constructed according to WAC 296-307-28046. You may use a "U" type guard.

(2) In enginerooms, a guardrail, preferably with toeboard, may be used instead of the guard if the room is only occupied by engineroom attendants.

(3) A bearing support next to a friction clutch or cutoff coupling must have self-lubricating bearings that require infrequent maintenance.

WAC 296-307-28042 What requirements apply to guarding belt shifters, clutches, shippers, poles, perches, and fasteners? "Belt pole" (sometimes called a "belt shipper" or "shipper pole") means a device used in shifting belts on and off fixed pulleys on line or countershaft where there are no loose pulleys.

(1) Tight and loose pulleys must have a permanent belt shifter with a mechanical means to prevent the belt from creeping from loose to tight pulley.

(2) Belt shifter and clutch handles must be rounded. They must be as far as possible from danger of accidental contact, but within easy reach of the operator. Where belt shifters are not directly over a machine or bench, the handles must be cut off 6 feet 6 inches above floor level.

(3) All belt and clutch shifters of the same type in each shop should move in the same direction to stop machines, i.e., either all right or all left.

Exception: This requirement does not apply to a friction clutch on a countershaft carrying two clutch pulleys with open and crossed belts. In this case the shifter handle has three positions and the machine is at a standstill when the clutch handle is in the neutral or center position.

(4) When belt poles must be used as a substitute for mechanical shifters, they must be big enough for employees to grasp them securely. Poles must be smooth and preferably of straight grain hardwood, such as ash or hickory. The edges of rectangular poles should be rounded. Poles should extend from the top of the pulley to within approximately 40 inches of the floor or working platform.

(5) Where loose pulleys or idlers are not practical, belt perches such as brackets, rollers, etc., must be used to keep idle belts away from the shafts. Perches should be substantial and designed for safe belt shifting.

(6) Belts that must be shifted by hand and belts within seven feet of the floor or working platform that are not guarded according to WAC 296-307-28046 must not be fastened with metal, nor with any other fastening that creates a hazard.

WAC 296-307-28044 What materials must be used for standard guards? (1) Standard guards must be made of the following materials:

(a) Expanded metal;
(b) Perforated or solid sheet metal;
(c) Wire mesh on a frame of angle iron; or
(d) Iron pipe securely fastened to the floor or the frame of the machine.

(2) Wire mesh should have wires that are securely fastened at every cross point either by welding, soldering, or galvanizing.

Exception: Diamond or square wire mesh made of No. 14 gauge wire, 3/4-inch mesh or heavier is exempt from this requirement.

[Title 296 WAC—p. 2503]
WAC 296-307-28046  How must standard guards be manufactured? (1) Guards must be free from burrs, sharp edges, and sharp corners.

(2) Expanded metal, sheet or perforated metal, and wire mesh must be securely fastened to the frame by one of the following methods:

(a) Rivets or bolts spaced not more than five inches center to center. In case of expanded metal or wire mesh, metal strips or clips must be used to form a washer for rivets or bolts.

(b) Welding to frame every four inches.

(c) Weaving through channel or angle frame, or, if No. 14 gauge 3/4-inch mesh or heavier is used, by bending entirely around rod frames.

(d) To fill openings in pipe railing with expanded metal, wire mesh, or sheet metal, make the filler material into panels with rolled edges or edges bound with "V" or "U" edging. The edging must be of at least No. 24 gauge sheet metal fastened to the panels with bolts or rivets spaced a maximum of 5 inches center to center. The bound panels must be fastened to the railing by sheet-metal clips spaced a maximum of 5 inches center to center.

(e) Diamond or square mesh made of crimped wire fastened into channels, angle iron, or round-iron frames may also be used as a filler in guards. Size of mesh must correspond to Table P-1.

(3) Where guard design requires filler material greater than 12 square feet, additional frame members must be provided to ensure that the panel area is a maximum of 12 square feet.

(4) All joints of framework must be as strong as the material of the frame.

WAC 296-307-28048  What requirements apply to disk, shield, and U-guards? (1) A disk guard must have a sheet-metal disk of at least No. 22 gauge fastened by U-bolts or rivets to the spokes of pulleys, flywheels, or gears. To prevent contact with sharp edges of the disk, the edge must be rolled or wired. In all cases, the nuts must have locknuts on the unexposed side of the wheel.

(2) A shield guard must have a frame filled in with wire mesh or expanded, perforated, or solid sheet metal.

(3) If the shield area is less than six square feet, the wire mesh or expanded metal may be fastened in a framework of 3/8-inch solid rod, 3/4-inch by 3/4-inch by 1/8-inch angle iron, or a metal construction of equivalent strength. Metal shields may have edges entirely rolled around a 3/8-inch solid iron rod.

(4) A U-guard consisting of a flat surface with edge members must cover the under surface and lower edge of a belt, multiple chain, or rope drive. It must be constructed of materials specified in Table P-1, and must meet the requirements of WAC 296-307-28054 through 296-307-28058. Edges must be smooth and, if the size of the guard requires, be reinforced by rolling, wiring, or by binding with angle or flat iron.

WAC 296-307-28050  What materials must be used for guards? The materials and dimensions specified in this section apply to all guards. The materials and dimensions specified are minimum requirements. You may choose to provide stronger guards.

Exception: Horizontal overhead belts, rope, cable, or chain guards more than 7 feet above floor, or platform must meet the requirements outlined in Table P-2.

(1) The framework of all guards must have minimum dimensions of 1-inch by 1-inch by 1/8-inch for angle iron, 3/4-inch inside diameter for metal pipe, or metal construction of equivalent strength.

Exception: Guards thirty inches tall or less with a total surface area of ten square feet or less may have a framework of 3/8-inch solid rod, 3/4-inch by 3/4-inch by 1/8-inch angle iron, or metal construction of equivalent strength. The filling material must correspond to the requirements of Table 1.

(a) All guards must be rigidly braced every 3 feet of their height to some fixed part of machinery or building structure. Where a guard is exposed to contact with moving equipment additional strength may be necessary.

(b) The framework for all guards fastened to the floor or working platform and without other support or bracing must consist of 1-1/2-inch by 1-1/2-inch by 1/8-inch angle iron, metal pipe of 1-1/2-inch inside diameter, or metal construction of equivalent strength. All rectangular guards must have at least four upright frame members that extend to the floor and are securely fastened. Cylindrical guards must have at least three supporting members that extend to the floor.

(2) Where guards are exposed to unusual wear, deterioration, or impact, heavier material and construction should be used to protect against the specific hazards involved.

WAC 296-307-28052  When may wood guards be used? Wood guards may be used where fumes would cause rapid deterioration of metal guards and outdoors where extreme cold or extreme heat make metal guards and railings undesirable.

(1) Wood must be sound, tough, and without loose knots.

(2) Guards must be made of planed lumber not less than 1-inch rough board measure, with rounded edges and corners.

(3) Wood guards must be securely fastened together with wood screws, hardwood dowel pins, bolts, or rivets.

(4) Wood guards must be equal in strength and rigidity to metal guards specified in WAC 296-307-28050 and Table P-1.

Note: Requirements for the construction of standard wood railings are in WAC 296-307-28060.

[Statutory Authority: RCW 49.17.040, 49.17.050 and 49.17.060. 96-22-048, § 296-306A-28048, filed 10/31/96, effective 12/1/96.]
WAC 296-307-28054  What materials may be used for guarding horizontal overhead belts? (1) Guards for horizontal overhead belts must run the entire length of the belt and follow the line of the pulley to the ceiling or extend to the nearest wall.

Exception: Where belts are located so that it is impractical to extend the guard to wall or ceiling, the guard must completely enclose the top and bottom runs of the belt and the face of pulleys.

(2) The guard and its supporting parts must be securely fastened to the wall or ceiling by gimlet-point lag screws or through bolts. In masonry, expansion bolts must be used. We recommend using bolts placed horizontally through floor beams or ceiling rafters.

(3) When necessary, suitable reinforcement must be provided for the ceiling rafters or overhead floor beams to sustain safely the weight and stress imposed by the guard.

(4) The interior surface of all guards must be smooth and free from projections.

Exception: Where construction demands it, protruding shallow round-head rivets may be used.

WAC 296-307-28056  What clearance must be maintained between guards and power transmission machinery? (1) Overhead belt guards must be at least one-quarter wider than the belt they protect, with a maximum clearance of 6 inches on each side. Overhead rope-drive and block and roller-chain-drive guards must be at least six inches wider than the drive on each side.

(2) Overhead silent chain-drive guards with the chain held on sprockets must have side clearance of:
   (a) On drives of 20-inch centers or less, at least 1/4-inch from the nearest moving chain part, and
   (b) On drives of over 20-inch centers, a minimum of 1/2-inch from the nearest moving chain part.

(3) Table 2 gives the sizes of materials and construction specifications for guards for belts that are 10 inches wide or more. All materials for overhead belt guards must be at least the size specified in Table 2 for belts 10 to 14 inches wide, even if the overhead belt is less than 10 inches wide. However, No. 20 gauge sheet metal may be used as a filler on guards for belts less than 10 inches wide. Expanded metal, because of the sharp edges, should not be used as a filler in horizontal belt guards.

(4) For clearance between guards and belts, ropes, or chains see Table P-2.

WAC 296-307-28058  How must overhead rope and chain-drive guards be constructed? (1) Overhead-rope and chain-drive guard construction must meet the requirements for overhead-belt guard construction of similar width.

Exception: The filler material must be solid, according to Table P-2, unless fire hazard demands the use of open construction.

(2) A side guard member of the same solid filling material should extend 2 inches above the level of the lower run of the rope or chain drive and 2 inches within the periphery of the pulleys that the guard encloses, forming a trough.

(3) The side filler members should be reinforced on the edges with 1-1/2-inch by 1/4-inch flat steel, riveted to the filling material at 8 inch centers or less. The reinforcing strip should be fastened or bolted to all guard supporting members with at least one 3/8-inch rivet or bolt at each intersection, and the ends should be secured to the ceiling with lag screws or bolts.

(4) The filling material must be fastened to the framework of the guard and the filler supports by 3/16-inch rivets spaced on 4-inch centers. Measure the width of a multiple drive from the outside of the first to the outside of the last rope or chain in the group accommodated by the pulley.

WAC 296-307-28060  What materials must be used for guardrails and toeboards? (1) A guardrail used to guard power transmission parts must be 42 inches tall, with a midrail between the top rail and the floor.

(2) Posts must be 8 feet apart or less. They must be permanent and substantial, smooth, and free from protruding nails, bolts, and splinters. If made of pipe, the post must be at least 1-1/4 inches inside diameter. If posts are made of metal shapes or bars, the section must be as strong as posts made of 1-1/2 by 1-1/2 by 3/16-inch angle iron. If posts are made of wood, the posts must be at least 2 by 4 inches. The upper rail must be 2 by 4 inches, or two 1 by 4 inch strips, one at the top and one at the side of the posts. The midrail must be at least 1 by 4 inches.

(3) The rails (metal shapes, metal bars, or wood), should be on the side of the posts that gives the best protection and support. Where panels are fitted with expanded metal or wire mesh (as noted in Table 1) the middle rails may be omitted. Where guard is exposed to contact with moving equipment, additional strength may be necessary.

(4) Toeboards must be at least 4 inches tall, of wood, metal, or metal grill of a maximum 1-inch mesh. Toeboards at flywheel pits should be placed as close to edge of the pit as possible.

#### DETAILS-SPACING, ETC.

| Width of guards | One-quarter wider than belt, rope, or chain drive |
| Spacing between filler supports | 20° center to center |
| Spacing between filler flats (belt guards) | 2" apart |
| Spacing between guard supports | 36° center to center |

#### OTHER BELT GUARD FILLING PERMITTED

| Sheet metal fastened as in chain guards | No. 20 A.W.G |
| Woven Wire, 2" mesh | No. 12 A.W.G | Solid or perforated |

#### CLEARANCE FROM OUTSIDE OF BELT, ROPE, OR CHAIN DRIVE TO GUARD

| Distance center to center of shafts Up to 15° inclusive Over 40° |
| Clearance from belt, or chain to guard 16° 120° |
| Width over 14" to 24" inclusive | Material     |
| Framework | 2" x 2" x 5/16" | Angle iron |
| Filler (belt guards) | 2" x 3/16" | Flat iron |

[Title 296 WAC—p. 2506] (2005 Ed.)
WAC 296-307-28062  How must shafting be maintained? (1) Shafting must be kept in alignment, and free from rust and excess oil or grease.

(2) Where explosives, explosive dusts, flammable vapors or flammable liquids exist, guards must take into account the hazard of static sparks from shafting.

WAC 296-307-28064  How must pulleys be maintained? (1) Pulleys must be kept in proper alignment to prevent belts from running off.

(2) Any pulley carrying a nonshifting belt should have a crowned face.

(3) Cast-iron pulleys should be tested frequently with a hammer to detect cracks in rim or spokes. The sound is different depending on whether the belt is or is not on the pulley.

(4) Split pulleys should be inspected to be sure that all bolts holding together the sections of the pulley are tight.
§ 296-306A-290, filed 10/31/96, effective 12/1/96.

[Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-29005, filed 10/31/96, effective 12/1/96.]

WAC 296-307-28066 How must other equipment be maintained? (1) You must inspect all power-transmission equipment at least every 60 days and ensure that it is kept in good working condition at all times.

(2) Bearings must be kept in alignment and properly adjusted.

(3) Hangers must be inspected to ensure that all supporting bolts and screws are tight and that supports of hanger boxes are adjusted properly.

(4) The oils must wear tightfitting clothing and should use cans with long spouts to keep their hands out of danger. Machinery must be oiled when not in motion, wherever possible.

[Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-29064, filed 10/31/96, effective 12/1/96.]

WAC 296-307-28068 How must belts be maintained? (1) Quarter-twist belts without an idler can be used on drives running in one direction only. They will run off a pulley when direction is reversed.

(2) You must inspect belts, lacings, and fasteners to be sure they are kept in good repair.

(3) You must ensure that each sweep auger has its top belt tensioned at least 2-1/2 inches above and below the exposed auger. Openings in the guard, for the free flow of material, must be no less than 2-1/2 inches from the rotating flighting.

[Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-28066, filed 10/31/96, effective 12/1/96.]

WAC 296-307-29005 What requirements apply to auger conveying equipment? "Augers" means screw conveyors and related accessories designed primarily for conveying agricultural materials on farms.

(1) Power take-off shafts must be guarded according to WAC 296-307-28046.

(2) All augers must be covered or guarded when exposed to contact.

(3) You must ensure that each sweep auger has its top half shielded by a guard. All guard openings must be no larger than 4 3/4 inches across.

(4) You must ensure that the exposed auger at the hopper and the intake is guarded or designed to prevent accidental contact with the rotating inlet area. The guard must extend at least 2 1/2 inches above and below the exposed auger. Openings in the guard, for the free flow of material, must be no larger than 4 3/4 inches across and must be strong enough to support 250 pounds at mid span.

(5) The hand raising winch must have a control that will hold the auger at any angle, and that will only respond to the control. You must ensure that the operator is able to lower the auger without disengaging the control. The maximum force required on the handle to raise or lower the auger manually must be 50 pounds.

(6) The wire rope lifting pulleys must be grooved to fit the wire rope used.

(7) In order to avoid separation, you must provide a positive restraint between the auger tube and the under-carriage lifting arm. You must provide stops that restrict the maximum raised angle and minimum lowered angle.

(8) Wire ropes (cables) must be rust resistant and selected for the design load and service intended.

(9) You must provide the auger operator with service and operation instructions that include safe operation and servicing practices.

WAC 296-307-29010 What other requirements apply to auger conveying equipment manufactured after October 25, 1976? You must ensure that auger conveying equipment manufactured after October 25, 1976, is guarded as follows:

(1) Sweep-arm material-gathering mechanisms used on the top surface of materials within silo structures are guarded. The lower or leading edge of the guard is no more than 12 inches above the material surface and no less than 6 inches in front of the leading edge of the rotating member of the gathering mechanism. The guard is parallel to and extends the fullest practical length of the material gathering mechanism.

(2) Exposed auger flighting on portable grain augers is guarded with either grating type guards or solid baffle style covers as follows:

(a) The largest dimensions or openings in grating type guards through which materials flow is 4 3/4 inches. The opening area is a maximum of 10 square inches. The opening is least 2-1/2 inches from the rotating flighting.

(b) Slotted openings in solid baffle style covers are a maximum of 1-1/2 inches wide, or less than 3-1/2 inches from the exposed flighting.

[Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-29010, filed 10/31/96, effective 12/1/96.]

WAC 296-307-300 Guarding farmstead equipment.

[Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-300, filed 10/31/96, effective 12/1/96.]

WAC 296-307-30003 What does this section cover? WAC 296-307-300 applies to the guarding and care of farmstead equipment.

"Farmstead equipment" means agricultural equipment normally used in a stationary manner. This includes, but is not limited to, materials handling equipment and accessories for such equipment whether or not the equipment is an integral part of a building.

WAC 296-307-30006 How must power takeoff shafts of farmstead equipment be guarded? (1) You must ensure that all power takeoff shafts, including rear-mounted, mid-mounted or side-mounted shafts, are guarded either by a master shield or by other protective guarding. The master shield must be strong enough to prevent damaging the shield when a 250-pound operator mounts or dismounts the tractor using the shield as a step.

(2) Power takeoff driven equipment must be guarded to prevent employee contact with rotating parts of the power drive system. Where power takeoff driven equipment requires removal of the tractor master shield, the equipment must also include protection from any portion of the tractor power takeoff shaft that protrudes from the tractor.

(3) Signs must be placed at prominent locations on power takeoff driven equipment specifying that power drive system safety shields must be kept in place.

WAC 296-307-30009 How must other power transmission components of farmstead equipment be guarded? (1) All power transmission parts must be guarded according to WAC 296-307-280.

(2) Smooth shafts and shaft ends (without any projecting bolts, keys, or set screws) may be unguarded if they:
(a) Revolve at less than 10 RPM; and
(b) Are part of feed handling equipment used on the top surface of materials in bulk storage facilities.

WAC 296-307-30012 How must functional components of farmstead equipment be guarded? The following functional components must be shielded to a degree consistent with the intended function and operator's vision of the component:
- Snapping or husking rolls;
- Straw spreaders and choppers;
- Cutterbars;
- Flail rotors;
- Rotary beaters;
- Mixing augers;
- Feed rolls;
- Rotary tillers; and
- Similar units that must be exposed for proper function.

WAC 296-307-30015 When may guards be removed on farmstead equipment? (1) Guards, shields and access doors must be in place when the equipment is in operation.

(2) Where removal of a guard or access door will expose an employee to any component that continues to rotate after the power is disengaged, you must provide in the immediate area, a safety sign warning the employee:
(a) To look and listen for evidence of rotation; and
(b) To refrain from removing the guard or access door until all components have stopped.

(3) On equipment manufactured after October 25, 1976, a readily visible or audible warning of rotation is required.

WAC 296-307-30018 What requirements apply to electrical control for maintaining and servicing farmstead equipment? (1) You must ensure that only the employee maintaining or servicing equipment has control of the electrical power source by:
(a) Providing an exclusive, positive locking means on the main switch that can be operated only by the employee performing the maintenance or service; or
(b) For material handling equipment in a bulk storage structure, by providing on the equipment an electrical or mechanical means to disconnect the power. Minimum lock-out means must meet the requirements of WAC 296-307-320.

(2) All circuit protection devices, including those that are an integral part of a motor, must have a manual reset, except where:
(a) A manual reset is infeasible because of the nature of the operation, distances involved, and the amount of time normally spent by employees in the area of the affected equipment;
(b) An electrical disconnect switch is available to the employee within fifteen feet of the equipment being maintained or serviced; and
(c) A sign, prominently posted near each hazardous component, warns the employee that unless the electrical disconnect switch is utilized, the motor could automatically reset while the employee is working on the hazardous component.

WAC 296-307-30021 What additional guarding requirements apply to farmstead equipment? (1) You must ensure that carton or bag stitching machines are properly safeguarded to prevent anyone from coming in contact with the stitching head and other pinch or nip points.

(2) The point of operation of all machines must be guarded. The guard must be designed and constructed to prevent the operator from having any part of the body in the danger zone during the operating cycle.

Note: The distance from the point-of-operation guards to the danger line depends on the size of the opening. The required distances are outlined in the table below:

<table>
<thead>
<tr>

(2005 Ed.)
Control of Hazardous Energy (Lockout-tagout)

WAC 296-307-320 Control of hazardous energy (lockout-tagout).

WAC 296-307-32001 What does this section cover?
(1) WAC 296-307-320 covers the servicing and maintenance of machines and equipment in which the unexpected start up of the machine or equipment or release of stored energy could cause injury to employees. This standard establishes minimum performance requirements for the control of such hazardous energy.

(2) Normal production operations are not covered by this standard. Servicing and/or maintenance that takes place during normal production operations is covered by this standard only if:
(a) An employee is required to remove or bypass a guard or other safety device; or
(b) An employee is required to place a body part into a point of operation or where an associated danger zone exists during a machine operating cycle.

Exception: Minor servicing activities, that take place during normal production operations, are not covered by this standard if they are routine, repetitive, and integral to the use of the equipment for production, provided that the work is performed using alternative measures that provide effective protection.

WAC 296-307-32003 When does this section not apply? (1) WAC 296-307-320 does not apply to work on cord and plug connected electric equipment when:
(a) Unexpected energization or start up of the equipment is controlled by unplugging the equipment from the energy source; and
(b) The plug is under the exclusive control of the employee performing the servicing or maintenance.

(2) WAC 296-307-320 does not apply to hot tap operations involving transmission and distribution systems for substances such as gas, steam, water, or petroleum products when they are performed on pressurized pipelines, when:
(a) Continuity of service is essential;
(b) Shutdown of the system is impractical; and
(c) Documented procedures are followed, and special equipment is used that will provide proven effective protection for employees.

(3) WAC 296-307-320 does not cover exposure to electrical hazards from work on, near, or with conductors or equipment in electric utilization installations. These hazards are covered in chapter 296-307 WAC Part T.

WAC 296-307-32005 What definitions apply to this section? "Affected employee" means an employee who uses a machine or equipment while it is serviced or maintained under lockout or tagout, or who works where such servicing or maintenance is being performed.

"Authorized employee" means a person who locks out or tags out machines or equipment in order to perform servicing or maintenance on that machine or equipment. An affected employee becomes an authorized employee when that employee's duties include performing servicing or maintenance covered under this part.

"Capable of being locked out" means an energy isolating device that has a hasp or other means for a lock to be affixed, or has a locking mechanism built into it. It also means that the device can be locked out without dismantling, rebuilding, or replacing the energy isolating device or permanently altering its energy control capability.

"Energized" means connected to an energy source or containing residual or stored energy.

"Energy isolating device" means a mechanical device that physically prevents the transmission or release of energy, including but not limited to the following:
• A manually operated electrical circuit breaker;
• A disconnect switch;
• A manually operated switch with conductors of circuit that can be disconnected from all ungrounded supply conductors and allows no pole to operate independently;
• A line valve;
• A block; and
• Any similar device used to block or isolate energy.

Push buttons, selector switches, and other control circuit devices are not energy isolating devices.

"Energy source" means any source of electrical, mechanical, hydraulic, pneumatic, chemical, thermal, or other energy, including gravity.

"Hot tap" means a procedure used in repair, maintenance, and service activities that involves welding on a piece of equipment (pipelines, vessels, or tanks) under pressure, in order to install connections or accessories. It is commonly used to replace or add sections of pipeline without the interruption of service for air, gas, water, steam, and petrochemical distribution systems.

"Lockout" means placing a lockout device on an energy isolating device, in accordance with an established proce-
dure, to ensure that the energy isolating device and the equipment being controlled cannot be operated until the lockout device is removed.

"Lockout device" means a device with a positive means such as a lock (key or combination type) to hold an energy isolating device in the safe position and prevents the energizing of a machine or equipment. Blank flanges and bolted slip blinds are included.

"Normal production operations" means using a machine or equipment for its intended production function.

"Servicing and/or maintenance" means workplace activities such as constructing, installing, setting up, adjusting, inspecting, modifying, and maintaining and/or servicing machines or equipment. These activities include lubrication, cleaning, or unjamming of machines or equipment and making adjustments or tool changes, where the employee may be exposed to the unexpected energization or start up of the equipment or release of hazardous energy.

"Setting up" means any work performed to prepare a machine or equipment to perform its normal production operation.

"Tagout" means placing a tagout device on an energy isolating device, according to an established procedure, to indicate that the energy isolating device and the equipment being controlled must not be operated until the tagout device is removed.

"Tagout device" means a prominent warning device, such as a tag and attachment, that can be securely fastened to an energy isolating device according to an established procedure, to indicate that the energy isolating device and the equipment being controlled must not be operated until the tagout device is removed.

"Tagout device" means a device with a positive means such as a lock (key or combination type) to hold an energy isolating device in the safe position and prevents the energizing of a machine or equipment. Blank flanges and bolted slip blinds are included.

You must develop, document, and use procedures to control potentially hazardous energy when employees are engaged in activities covered by this section.

Exception: You are exempt from documenting procedures for a particular machine or equipment only when all of the following elements exist:

(a) The machine or equipment has no potential for stored or residual energy or reaccumulation of stored energy after shut down that could endanger employees;
(b) The machine or equipment has a single energy source that can be readily identified and isolated;
(c) The isolation and locking out of that energy source will completely deenergize and deactivate the machine or equipment;
(d) The machine or equipment is isolated from that energy source and locked out during servicing or maintenance;
(e) A single lockout device will achieve lockout;
(f) The lockout device is under the exclusive control of the authorized employee performing the servicing or maintenance;
(g) The servicing or maintenance does not create hazards for other employees; and
(h) The worksite has experienced no accidents involving the unexpected activation or reenergization of the machine or equipment during servicing or maintenance.

(2) The procedures must clearly and specifically outline the scope, purpose, authorization, rules, and techniques for the control of hazardous energy, and the means to enforce compliance including, but not limited to, the following:

(a) A specific statement of the intended use of the procedure;

(2005 Ed.)
(b) Specific procedural steps for shutting down, isolating, blocking, and securing machines or equipment to control hazardous energy;

(c) Specific procedural steps for the placement, removal, and transfer of lockout devices or tagout devices and the responsibility for them; and

(d) Specific requirements for testing a machine or equipment to determine and verify the effectiveness of lockout devices, tagout devices, and other energy control measures.

WAC 296-307-32015 What requirements apply to lockout and tagout devices and materials? (1) You must provide locks, tags, chains, wedges, key blocks, adapter pins, self-locking fasteners, or other hardware for isolating, securing, or blocking machines or equipment from energy sources.

(2) Lockout and tagout devices must be singularly identified; must be the only device(s) used for controlling energy; must not be used for other purposes.

(3) Lockout and tagout devices must be durable and meet the following requirements:

(a) Lockout and tagout devices must be able to withstand the environment to which they are exposed for the maximum period of time that exposure is expected.

(b) Tagout devices must be constructed and printed so that exposure to weather conditions or wet and damp locations will not deteriorate the tag or make the tag’s message illegible.

(c) Tags must not deteriorate when used in corrosive environments such as areas where acid and alkali chemicals are handled and stored.

(4) Lockout and tagout devices must be the same within the facility in at least color, shape, or size. Also, tagout devices must have the same print and format.

(5) Lockout and tagout devices must be substantial and meet the following requirements:

(a) Lockout devices must be substantial enough to prevent removal without the use of excessive force or unusual techniques, such as with the use of bolt cutters or other metal cutting tools.

(b) Tagout devices and their means of attachment must be substantial enough to prevent accidental removal. Tagout device attachment means must be single-use, attachable by hand, self-locking, releasable with an unlocking strength of at least 50 pounds, and having the general design and basic characteristics of being at least equivalent to a one-piece, all-environment-tolerant nylon cable tie.

(c) Lockout and tagout devices must indicate the name of employee applying the device(s).

(6) Tagout devices must warn against hazardous conditions if the machine or equipment is energized and must include a message such as: "Do not start," "do not open," "do not close," "do not energize," "do not operate."

WAC 296-307-32017 How often must the energy control procedure be inspected? (1) You must conduct an inspection of the energy control procedure at least annually to ensure that the procedure and the requirements of this standard are followed.

(a) An authorized employee, other than the one(s) using the energy control procedure, must perform the inspection.

(b) The inspection must be conducted to correct any deviations or inadequacies identified.

(c) Where lockout is used for energy control, the inspection must include a review, between the inspector and each authorized employee, of that employee’s responsibilities under the energy control procedure.

(d) Where tagout is used for energy control, the inspection must include a review, between the inspector and each authorized and affected employee, of that employee’s responsibilities under the energy control procedure, and the elements of WAC 296-307-32021.

(2) You must certify that the inspections have been performed. The certification must identify the machine or equipment on which the energy control procedure was being used, the date of the inspection, the employees included in the inspection, and the person performing the inspection.

WAC 296-307-32019 What general requirements apply to energy control program training and communication? You must provide training to ensure that employees understand the purpose and function of the energy control program, and that employees have the knowledge and skills required for the safe application, use, and removal of the energy controls. The training must include the following:

(1) Each authorized employee must receive training in the recognition of applicable hazardous energy sources, the type and magnitude of the energy available in the workplace, and the methods and means necessary for energy isolation and control.

(2) Each affected employee must be instructed in the purpose and use of the energy control procedure.

(3) All other employees who work in an area where energy control procedures must be used, must be instructed about the procedure and the prohibition against attempting to restart or reenergize machines or equipment that are locked out or tagged out.

WAC 296-307-32021 What additional requirements apply to tagout training and communication? When tagout systems are used, employees must also be trained in the following limitations of tags:

(1) Tags are warning devices affixed to energy isolating devices, and do not provide the physical restraint on those devices that is provided by a lock.

(2) When a tag is attached to an energy isolating means, it is not to be removed without approval of the authorized
person responsible for it, and it is never to be bypassed, ignored, or otherwise defeated.

(3) Tags must be legible and understandable by all authorized, affected, and other employees working in the area.

(4) Tags and their means of attachment must be made of materials that will withstand the environmental conditions encountered in the workplace.

(5) Tags may create a false sense of security, and their meaning needs to be understood as part of the overall energy control program.

(6) Tags must be securely attached to energy isolating devices so that they cannot be accidentally detached during use.

WAC 296-307-32023 What requirements apply to employee retraining? (1) Authorized and affected employees must be retrained whenever there is a change in job assignments, machines, equipment, or processes that present a new hazard, or when there is a change in the energy control procedures.

(2) Additional retraining must also be provided whenever an inspection reveals, or whenever you believe, that the employee’s knowledge or use of the energy control procedures is inadequate.

(3) Retraining must reestablish employee proficiency and introduce new or revised control methods and procedures, as necessary.

WAC 296-307-32025 What training records must an employer keep? You must keep records that certify that employee training has been completed and is up to date. The records must contain each employee’s name and dates of training.

WAC 296-307-32027 Who may perform lockout or tagout? Lockout or tagout must be performed only by authorized employees performing the service or maintenance.

WAC 296-307-32029 Who must be notified of lockout and tagout? Affected employees must be notified of the application and removal of lockout or tagout devices. Notification must be given before controls are applied and after they are removed.

WAC 296-307-32031 What order of events must lockout or tagout procedures follow? The established lockout or tagout procedures must cover the following elements in the following sequence:

1. Before an authorized or affected employee turns off a machine or equipment, the authorized employee must have knowledge of the type and magnitude of the energy, the hazards of the energy to be controlled, and the method or means to control the energy.

2. The machine or equipment must be turned off or shut down using the procedures established for the machine or equipment. The shutdown must be done in the prescribed order to avoid increased hazards to employees.

3. All necessary energy isolating devices must be physically located and operated in such a manner as to isolate the machine or equipment from the energy source.

Application of the lockout or tagout device:

4. Lockout or tagout devices must be affixed to each energy isolating device by authorized employees.

5. Lockout devices, where used, must be affixed in a manner that will hold the energy isolating devices in a "safe" or "off" position.

6. Tagout devices, where used, must be affixed in such a manner as will clearly indicate that the operation or movement of energy isolating devices from the "safe" or "off" position is prohibited.

a. Where tagout devices are used with energy isolating devices designed with the capability of being locked, the tag attachment must be fastened at the same point at which the lock would have been attached.

b. Where a tag cannot be affixed directly to the energy isolating device, the tag must be located as close as safely possible to the device, in a position that will be immediately obvious to anyone attempting to operate the device.

Eliminating the hazards of stored energy:

7. After applying lockout or tagout devices to energy isolating devices, all potentially hazardous stored or residual energy must be relieved, disconnected, restrained, and otherwise rendered safe.

8. If there is a possibility of reaccumulation of stored energy to a hazardous level, verification of isolation must be continued until the servicing or maintenance is completed, or until the possibility of such accumulation no longer exists.

Before beginning service or maintenance:

9. Prior to starting work on machines or equipment that have been locked out or tagged out, the authorized employee must verify that the machine or equipment has been isolated and deenergized.

WAC 296-307-32033 What order of events must be followed to remove lockout or tagout devices? (1) Before removing lockout or tagout devices, the authorized employee must complete the following procedures:

a. Inspect the work area to ensure that nonessential items have been removed and to ensure that machine or equipment components are operationally intact.
(b) Check the work area to ensure that all employees have been safely positioned or removed.

(2) After lockout or tagout devices have been removed and before a machine or equipment is started, affected employees must be notified that the lockout or tagout device(s) have been removed.

(3) Each lockout or tagout device must be removed from each energy isolating device by the authorized employee who applied the device.

Exception: When the authorized employee who applied the lockout or tagout device is not available to remove it, that device may be removed under your direction, if specific procedures and training for such removal have been developed, documented, and incorporated into the energy control program.

You must ensure that the specific procedure provides equivalent safety to the removal of the device by the authorized employee who applied it. The specific procedure must include at least the following elements:

(a) Verification by the employer that the authorized employee who applied the device is not at the facility;

(b) Making all reasonable efforts to inform the authorized employee that the lockout or tagout device has been removed; and

(c) Ensuring that the authorized employee has this knowledge before resuming work at that facility.

WAC 296-307-32035 What requirements apply to testing and positioning machines and equipment? When lockout or tagout devices must be temporarily removed from the energy isolating device and the machine or equipment energized to test or position the machine or equipment, the following sequence of actions must be followed:

(1) Clear the machine or equipment of tools and materials according to WAC 296-307-32035 (1)(a).

(2) Remove employees from the machine or equipment area according to WAC 296-307-32035 (1)(b).

(3) Remove the lockout or tagout devices as specified in WAC 296-307-32035 (3).

(4) Energize and proceed with testing or positioning.

(5) Deenergize all systems and reapply energy control measures in accordance with WAC 296-307-32031 to continue the servicing and/or maintenance.

WAC 296-307-32037 What requirements apply to outside servicing contractors? (1) Whenever outside servicing contractors are to be engaged in activities covered by this standard, you and the outside employer must inform each other of your respective lockout or tagout procedures.

(2) The outside employer must ensure that employees understand and comply with the restrictions and prohibitions of your energy control program.

WAC 296-307-32039 What requirements apply to group lockout or tagout? (1) When servicing and/or maintenance is performed by a crew or other group, they must use a procedure that provides a level of protection equivalent to that provided by the implementation of a personal lockout or tagout device.

(2) Group lockout or tagout devices must be used according to the procedures required by WAC 296-307-32013 including, but not limited to, the following:

(a) An authorized employee has primary responsibility for a set number of employees working under the protection of a group lockout or tagout device (such as an operations lock); and

(b) A method for the authorized employee to determine if individual group members are exposed to release of stored energy hazards; and

(c) When more than one crew or group is involved, assignment of overall lockout or tagout control responsibility to an authorized employee designated to coordinate individual group members and ensure continuity of protection; and

(d) Each authorized employee must affix a personal lockout or tagout device to the group lockout device when beginning work, and must remove those devices when the work is complete.

Part R

Safety Color Coding; Accident Prevention Signs and Tags

WAC 296-307-330 Safety color coding; accident prevention signs and tags.

WAC 296-307-33001 What definitions apply to this section? "Accident prevention sign" ("sign") means a surface with text or pictographs, meant to warn or instruct employees who may be exposed to hazards. Safety posters and education bulletins are not included in this definition.

"Accident prevention tag" ("tag") means a card that identifies a hazardous condition, generally related to unsafe equipment.

"Major message" means the sign's or tag's text that is more specific than the signal word and that identifies the spe-
cific hazardous condition or safety instruction. Examples include: "High Voltage," "Close Clearance," "Do Not Start," or "Do Not Use" or a corresponding pictograph.

"Pictograph" means a pictorial representation that identifies a specific hazardous condition or safety instruction.

"Signal word" means the sign's or tag's text that contains the word, usually "danger" or "caution" that is intended to capture the employee's immediate attention.

"Warning" is an accident prevention tag that serves primarily to warn employees of hazardous conditions and to prevent them from entering a hazardous area or working on hazardous equipment.

"Caution" is an accident prevention tag that serves primarily to alert employees to hazardous conditions, to guide them away from the hazard, and to cause them to exercise caution that will prevent the occurrence of injury.

"Danger" is an accident prevention tag that serves primarily to prevent an employee from entering a hazardous area or working on hazardous equipment.

"Signal word" means the sign's or tag's text that contains the word, usually "danger" or "caution" that is intended to capture the employee's immediate attention.

"Warning" is an accident prevention tag that serves primarily to warn employees of hazardous conditions and to prevent them from entering a hazardous area or working on hazardous equipment.

"Caution" is an accident prevention tag that serves primarily to alert employees to hazardous conditions, to guide them away from the hazard, and to cause them to exercise caution that will prevent the occurrence of injury.

"Danger" is an accident prevention tag that serves primarily to prevent an employee from entering a hazardous area or working on hazardous equipment.

WAC 296-307-33003 What does red identify in safety color coding? Use red to identify:
(1) Fire protection equipment;
(2) Safety cans or other portable containers of flammable liquids;
(3) Emergency stop bars on hazardous machines; and
(4) Stop buttons or electrical switches used to stop machinery in an emergency;

WAC 296-307-33005 What does yellow identify in safety color coding? Use yellow to identify:
(1) Caution signs and tags; and
(2) Physical hazards.

WAC 296-307-33007 When should signs and tags use "danger" versus "caution"? (1) Danger signs and tags.
(a) Use danger signs and tags when an immediate hazard presents a threat of death or serious injury to employees.
(b) Instruct all employees that danger signs and tags indicate immediate danger and that special precautions are necessary.

WAC 296-307-33009 What are the design and color specifications for accident prevention signs? (1) All signs must have rounded or blunt corners and be free from sharp edges. The ends or heads of bolts or other fastening devices must be located so that they do not constitute a hazard.

(2) Danger, caution, directional, informational, exit, and safety instruction signs must comply with the specification of safety colors of the ANSI Z53.1-1971.

WAC 296-307-33011 What are the proper uses of accident prevention tags? (1) Use tags as a temporary means of warning employees of a hazardous condition, especially defective equipment. Tags are not a complete warning method, but should be used until the hazard can be eliminated.

For example: You may use a "do not start" tag on power equipment for a short time until the switch in the system can be locked out; you may use a "defective equipment" tag on a damaged ladder while arrangements are made for the ladder to be taken out of service and repaired.

(2) Use of accident prevention tags.
(a) Use tags as a warning to prevent accidental injury or illness to employees who are exposed to hazardous or potentially hazardous conditions, equipment or operations that are out of the ordinary, unexpected or not readily apparent.
(b) Use tags until the identified hazard is eliminated or the hazardous operation is completed. Tags are not necessary if signs, guarding, or other protection is used.
(c) Place "do not start" tags in a conspicuous location and, if possible, so that they block the starting mechanism that would cause hazardous conditions if the equipment was energized.

(3) General accident prevention tag specifications.
(a) Tags must contain a signal word and a major message. The signal word must be either "danger" or "caution."
(b) The signal word must be readable at least five feet from the hazard.
(c) The signal word and the major message must be understandable to all employees who may be exposed to the identified hazard.
(d) Inform all employees of the meaning of the tags used throughout the workplace and what special precautions are necessary.
(e) Attach tags as closely as is safely possible to the hazard. Attach the tags so as to prevent loss or unintentional removal.
(f) The tag and attachment method must be constructed of material that is not likely to deteriorate.

(4) You may use warning tags to represent a hazard level between "caution" and "danger," instead of the required "caution" tag, if they have a signal word of "warning" and an appropriate major message.

(5) Use "out of order" tags only to indicate that a piece of equipment, machinery, etc., is out of order and that it might present a hazard if used.

Part S
Fire Protection and Ignition Sources; Exit Routes

[Title 296 WAC—p. 2515]
WAC 296-307-34003 What does this section cover?
(1) WAC 296-307-340 applies to the placement, use, maintenance, and testing of portable fire extinguishers provided for employee use. WAC 296-307-34012 does not apply to extinguishers provided for employee use on the outside of workplace buildings or structures. If you do not intend for employees to use extinguishers, and your emergency action plan and fire prevention plan meet the requirements of WAC 296-307-35018, then only the requirements of WAC 296-307-34015 and 296-307-34018 apply.

(2) All standpipe and hose systems, automatic sprinkler systems, fixed extinguishing systems, dry-chemical fixed extinguishing systems, water-spray and foam, and fire detection systems, must be installed according to state and local ordinances, codes, and regulations governing such installations.

[Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-34003, filed 10/31/96, effective 12/1/96.]

WAC 296-307-34006 Who is exempt from the requirements of this section?
(1) You are exempt from all requirements of this section, if:
   (a) You have implemented a written fire safety policy that requires all employees to evacuate immediately when the fire alarm sounds; and
   (b) You have an emergency action plan and a fire prevention plan meeting the requirements of WAC 296-307-35015 and 296-307-35018; and
   (c) Extinguishers are not available for employee use in the workplace.

   Note: If you are covered by one of the following sections requiring you to provide a portable fire extinguisher, then you may not apply this exemption:
   ■ WAC 296-307-07013(12)—Transporting employees;
   ■ WAC 296-307-34009(8)—Storage of flammables; or
   ■ WAC 296-307-49503(2)—Welding.

(2) You are exempt from the distribution requirements in WAC 296-307-34012, if:
   (a) You have an emergency action plan meeting the requirements of WAC 296-307-35015 that authorizes only certain employees to use the available portable fire extinguishers; and
   (b) The plan requires all other employees to evacuate immediately when the fire alarm sounds.

WAC 296-307-34009 What general requirements apply to portable fire extinguishers?
(1) You must provide portable fire extinguishers that are readily accessible to employees without subjecting the employees to possible injury.

[Title 296 WAC—p. 2516]
WAC 296-307-34015 What are the requirements for inspection, maintenance and testing of portable fire extinguishers? (1) You are responsible for the inspection, maintenance, and testing of all portable fire extinguishers in the workplace.

(2) You must visually inspect portable extinguishers or hose at least once a month.

(3) You must ensure that portable fire extinguishers receive an annual maintenance check. You must keep records of the maintenance dates for one year after the previous entry or the life of the shell, whichever comes first. You must provide us with a copy of the record if we ask for it.

(4) You must ensure that stored-pressure dry chemical extinguishers that require a twelve-year hydrostatic test are emptied and undergo applicable maintenance procedures every six years.

Exception: Dry chemical extinguishers with nonrefillable disposable containers are exempt from this requirement.

The six years begins when recharging or hydrostatic testing is performed.

(5) You must ensure that alternate equivalent protection is provided when portable fire extinguishers are removed from service for maintenance and recharging.

WAC 296-307-34018 What requirements apply to hydrostatic testing? (1) You must ensure that a trained person performs hydrostatic testing with suitable testing equipment and facilities.

(2) You must ensure that portable extinguishers are hydrostatically tested at the intervals listed in the table below.

<table>
<thead>
<tr>
<th>Type of Extinguishers</th>
<th>Test interval (years)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Soda acid (stainless steel shell)</td>

</table>

Exception: Extinguishers must not be hydrostatically tested if the following conditions exist:

(a) When the unit has been repaired by soldering, welding, brazing, or use of patching compounds;
(b) When the cylinder or shell threads are damaged;
(c) When there is corrosion that has caused pitting, including corrosion under removable name plate assemblies;
(d) When the extinguisher has been burned in a fire; or

(e) When a calcium chloride extinguishing agent has been used in a stainless steel shell.

(3) In addition to an external visual examination, you must ensure that the cylinders and shells are examined internally before the hydrostatic testing.

(4) You must ensure that portable fire extinguishers are hydrostatically tested whenever they show new evidence of corrosion or mechanical injury.

(5) You must ensure that hydrostatic tests are performed on extinguisher hose assemblies that are equipped with a shut-off nozzle at the discharge end of the hose. The test interval must be the same as specified for the extinguisher on which the hose is installed.

(6) Carbon dioxide hose assemblies with a shut-off nozzle must be hydrostatically tested at 1,250 psi (8,620 kPa).

(7) Dry chemical and dry powder hose assemblies with a shut-off nozzle must be hydrostatically tested at 300 psi (2,070 kPa).

(8) Hose assemblies passing a hydrostatic test do not require any type of recording or stamping.

(9) You must ensure that hose assemblies for carbon dioxide extinguishers that require a hydrostatic test are tested within a protective cage device.

(10) You must ensure that carbon dioxide extinguishers and nitrogen or carbon dioxide cylinders used with wheeled extinguishers are tested every five years at 5/3 of the service pressure as stamped into the cylinder. Nitrogen cylinders that comply with 29 CFR 173.34(e)(15) may be hydrostatically tested every ten years.

(11) You must ensure that all stored pressure and Halon 1211 types of extinguishers are hydrostatically tested at the factory test pressure not to exceed two times the service pressure.

(12) You must ensure that self-generating type soda acid and foam extinguishers are tested at 350 psi (2,410 kPa).

(13) Air or gas pressure used for hydrostatic testing is prohibited.

(14) You must remove from the workplace all extinguisher shells, cylinders, or cartridges that fail a hydrostatic pressure test, or that are not fit for testing.

(15)(a) Water-jacket equipment must be used for testing compressed gas type cylinders. The equipment must have an expansion indicator that operates with an accuracy within one percent of the total expansion or 0.1 cc (.1 mL) of liquid.

(b) The following equipment must be used to test non-compressed gas type cylinders:

(i) A hydrostatic test pump, hand or power operated, capable of producing not less than one hundred fifty percent of the test pressure, which must include appropriate check valves and fittings;

(ii) A flexible connection for attachment to fittings to test through the extinguisher nozzle, test bonnet, or hose outlet, as is applicable; and

(iii) A protective cage or barrier for personal protection of the tester, designed to provide visual observation of the extinguisher under test.

(16) You must maintain records of the hydrostatic testing. Your records must include:

• The date of test;
• The test pressure used;
WAC 296-307-3421 What are the training requirements for portable fire extinguishers? (1) If you provide portable fire extinguishers for employee use, then you must also provide training to familiarize employees with the general principles of fire extinguisher use and the hazards involved in fighting fires when they first appear.

You must provide the training when the employee is first hired and at least annually thereafter.

(2) For employees who have been designated to use fire fighting equipment as part of an emergency action plan, you must provide training in the use of the appropriate equipment.

You must provide the training upon initial assignment to the designated group of employees and at least annually thereafter.

WAC 296-307-345 Employee alarm systems.

WAC 296-307-34503 What does this section cover? (1) WAC 296-307-345 applies to all emergency employee alarms required by a specific WAC chapter. This section does not apply to discharge or supervisory alarms required on various fixed extinguishing systems or to supervisory alarms on fire suppression, alarm or detection systems unless they are intended to be employee alarm systems.

(2) The maintenance, testing, and inspection requirements of this section apply to all local fire alarm signaling systems used for alerting employees regardless of the other functions of the system.

(3) All predischarge employee alarms required by this chapter must meet the requirements of WAC 296-307-34506 and 296-307-34512.

WAC 296-307-34506 What general requirements apply to employee alarm systems? (1) Your employee alarm system must provide warning for necessary emergency action called for in the emergency action plan, or safe escape of employees from the workplace.

(2) You must ensure that all employees can see or hear your employee alarm above normal noise or light levels in the workplace. You may use tactile devices to alert employees who can not see or hear the alarm.

(3) You must ensure that your employee alarm is recognizable as an evacuation signal or signal to perform actions designated under the emergency action plan.

(4) You must explain to each employee how to report emergencies. For example: They may use manual pull box alarms, public address systems, radio or telephones. You must post emergency telephone numbers near telephones, or employee notice boards when telephones serve as a means of reporting emergencies. When your communication system also serves as the employee alarm system, you must ensure that all emergency messages have priority over all nonemergency messages.

(5) You must establish procedures for sounding emergency alarms in the workplace. If you have ten or fewer employees in a workplace, direct voice communication is an acceptable procedure for sounding the alarm if all employees can hear it. In this case, you do not need a back-up system.

WAC 296-307-34509 What are the installation and restoration requirements for employee alarm systems? (1) You must ensure that all systems installed to comply with this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved. Steam whistles, air horns, strobe lights or similar lighting devices, or tactile devices meeting this standard are approved.

WAC 296-307-34512 How must employee alarm systems be maintained and tested? (1) You must ensure that all employee alarm systems are maintained in operating condition except when undergoing repairs or maintenance.

(2) You must ensure that a test of the reliability and adequacy of nonsupervised employee alarm systems is made every two months. You must use a different actuation device in each test of a multiaction device system so that no individual device is used for two consecutive tests.

(3) You must maintain or replace power supplies as often as necessary to ensure fully operational condition. You must provide back-up alarms, such as employee runners or telephones, when systems are out of service.

(4) You must ensure that supervised employee alarm circuitry is supervised and that it will provide positive notification to assigned personnel whenever a deficiency exists in the system. You must ensure that all supervised employee alarm systems are tested at least annually for reliability and adequacy.

(5) You must ensure that employee alarms are serviced, maintained, and tested by someone trained in the operation and functions necessary for reliable and safe operation of the system.

WAC 296-307-34515 Where must manually operated devices be located? You must ensure that manually operated actuation devices used with employee alarms are easy to find and accessible.

WAC 296-307-350 Exit routes.

WAC 296-307-35003 What does this section cover? WAC 296-307-350 requires you to provide exit routes for employees to leave the workplace safely during emergencies. This section does not apply to mobile workplaces, such as vehicles or vessels.

WAC 296-307-35006 What definitions apply to this section? “Exit” means the portion of an exit route that is generally separated from other areas to provide a protected path of travel out of the workplace. “Exit route” means a continuous and unobstructed path of exit travel from any point within a workplace to safety outside. An exit route generally consists of three parts: Access to an exit; the area which provides a way of travel out of the workplace; and the way from the exit to the outside. An exit route includes all vertical and horizontal areas.

WAC 296-307-35009 What are the design requirements for exit routes? You must ensure that each workplace meets each of the following requirements:

   (1) Each exit is a permanent part of the workplace.

   (2) Two exit routes, remote from one another, are available to provide alternate means for employees to safely leave the workplace during an emergency.

   (a) A single exit route is permitted where the number of employees, the size of the building, its occupancy, or the arrangement of the workplace indicate that a single exit will allow all employees to exit safely during an emergency. Other means of escape, such as fire exits or accessible windows, should be available where fewer than two exit routes are provided.

   (b) More than two exit routes are available to allow employees to safely leave the workplace during an emergency where the number of employees, the size of the building, its occupancy, or the arrangement of the workplace reasonably suggest that reliance on two exit routes could endanger employees.

   (3) An exit has only those openings necessary to permit access to, or exit from, occupied areas of the workplace. An opening into an exit is protected by a self-closing fire door that remains closed. Each fire door, its frame, and hardware are listed or approved by a nationally recognized testing laboratory.

   (4) Construction materials used to separate an exit have a 1-hour fire resistance rating if the exit connects three or fewer stories. Construction materials used to separate an exit have a 2-hour fire resistance rating if the exit connects 4 or more stories.

   (5) Free and unobstructed access to each exit route is provided to ensure safe exit during an emergency.

      (a) The exit route is free of material or equipment.

      (b) Employees are not required to travel through a room that can be locked, such as a bathroom, or toward a dead end to reach an exit.

      (c) Stairs or a ramp are used if the exit route is not substantially level.

   (6) An exit leads directly outside or to a street, walkway, refuge area, or to an open space with access to the outside.

      (a) The street, walkway, refuge area, or open space to which an exit leads is large enough to accommodate all building occupants likely to use that exit.

      (b) A refuge area is:

         (i) A space along an exit route protected from the effects of fire either by separation from other spaces within the building or by its location; or

         (ii) A floor with at least two spaces separated by smoke-resistant partitions, in a building where each floor is protected by an automatic sprinkler system. An automatic sprinkler system complies with NFPA No. 13, Automatic Sprinkler Systems.

      (c) Exit stairs that continue beyond the floor of exit discharge are interrupted by doors, partitions, or other effective means.

   (7) Where a doorway or corner of a building is located near a railroad or trolley track so that an employee is likely to walk upon the track in front of an approaching engine or cars, a standard safeguard must be installed with a warning sign.

   (8) An exit door can be readily opened from the inside without keys, tools, or special knowledge. A device, such as a panic bar, that locks only from the outside is permitted. An exit door is free of any device or alarm that, if it fails, can restrict emergency use of an exit.

      Note: An exit door may be locked or blocked from the inside in a mental, penal, or correctional institution, if supervisory personnel are continually on duty and a plan exists to remove occupants during an emergency.

   (9) The opening device on all doors of walk-in refrigerated or freezer rooms must be the type, when locked from the outside with a lock, can be opened from inside.

   (10) A side-hinged exit door is used to connect any room to an exit route. A door that connects any room to an exit route swings out if the room may be occupied by more than 50 persons or highly flammable or explosive materials may be used inside.

   (11) Each exit route supports the maximum-permitted occupant load for each floor served by the exit route. The capacity of an exit does not decrease with the direction of exit travel.

   (2005 Ed.)
WAC 296-307-35012 What are the operation and maintenance requirements for exit routes? You must ensure that each workplace meets the following requirements:

1. The workplace exit route is maintained to minimize danger to employees during an emergency.
   (a) The workplace exit route is free of explosive or highly flammable furnishings or decorations.
   (b) Accumulations of flammable or combustible waste materials are controlled.
   (c) An exit route does not require employees to travel toward materials that burn very quickly, emit poisonous fumes, or are explosive, unless those materials are effectively shielded from the exit route.

2. Each exit route is adequately lit.
   (a) Each exit is clearly visible and is marked by a distinctive sign reading "exit."
      (i) An exit door is free of signs or decorations that obscure its visibility.
      (ii) Signs are posted along the exit route indicating the direction of travel to the nearest exit.
      (iii) The line-of-sight to an exit sign is uninterrupted.
      (iv) Any doorway or passage that might be mistaken for an exit is marked "not an exit" or with an indication of its actual use.
      (v) An exit sign is illuminated to a surface value of at least 5 foot candles by a reliable light source and shows a designated color. Self-luminous or electroluminescent signs have a minimum luminance surface value of .06 footlamberts.

3. Fire retardant paints or other coatings used in the workplace are maintained.

4. Each safeguard to protect employees during an emergency is maintained in proper working order.

5. Employees do not occupy a workplace under construction until an exit route that meets these requirements is available for the portion of the workplace to be occupied.

(a) Employees do not occupy a workplace during repair or alteration unless either all exits and existing fire protection are maintained or alternate fire protection is provided that ensures an equivalent level of safety.

(b) Flammable or explosive materials used during construction or repair do not expose employees to hazards not otherwise present in the workplace or impede emergency escape from the workplace.

7. An operable employee alarm system with a distinctive signal to warn employees of fire or other emergencies is installed and maintained. No employee alarm system is required if employees can see or smell a fire or other hazard so that it would provide adequate warning to them. The employee alarm system complies with the requirements of WAC 296-307-345.

WAC 296-307-35015 What are the requirements for an emergency action plan? (1) You must develop an emergency action plan for each part of the workplace as required by WAC 296-307-030 (3)(d).

(a) The plan must be in writing, kept in the workplace, and made available to employees on request.

(b) An employer of 10 or fewer employees may communicate the plan orally to employees rather than develop a written plan.

2. An emergency action plan must include:
   (a) Procedures for emergency evacuation, including exit route assignments;
   (b) Procedures to account for all employees after evacuation;
   (c) Procedures for reporting a fire or other emergency;
   (d) Procedures to follow for emergency operation or shut down of critical equipment before evacuation;
   (e) Procedures to follow for rescue and medical duties;
   (f) Procedures for operating and maintaining an emergency alarm system; and
   (g) Names or job titles of employees to be contacted to get more information about what to do in an emergency.

3. You must designate employees to assist in the safe emergency evacuation of other employees. You must ensure that the designated employees receive training in emergency evacuation procedures.

4. You must review the emergency action plan with each employee covered by the plan:
   (a) When the plan is developed or the employee is assigned initially to the job;
   (b) When the employee's responsibilities under the plan change; and
   (c) When the plan is changed.

WAC 296-307-35018  What are the requirements for a fire prevention plan? (1) You must develop a fire prevention plan for each part of the workplace if required by WAC 296-307-34006(1).
   (a) The plan must be in writing, kept in the workplace, and made available to employees on request.
   (b) An employer of 10 or fewer employees may communicate the plan orally to employees rather than develop a written plan.
(2) A fire prevention plan must include:
   (a) A list of all major fire hazards, including proper handling and storage procedures for hazardous materials, potential ignition sources and their control, and the type of fire protection equipment necessary to control each major hazard;
   (b) Procedures to control accumulations of flammable and combustible waste materials;
   (c) Procedures for regular maintenance of safeguards installed on heat producing equipment to prevent accidental ignition of combustible materials;
   (d) Names or job titles of employees responsible for maintaining equipment to prevent or control sources of ignition or fires;
   (e) Names or job titles of employees responsible for control of fuel source hazards.
(3) You must:
   (a) Inform employees of the fire hazards to which they are exposed; and
   (b) Review with each employee those parts of the fire prevention plan necessary for self-protection upon initial assignment to a job.

Part T

Electrical.

WAC 296-307-360  What definitions apply to this part? The following definitions apply to this part:
"Acceptable" means an installation or equipment that is acceptable to the department and meets the requirements of this section. An installation or equipment is acceptable if:
(1) It is accepted, certified, listed, labeled, or otherwise determined to be safe by a nationally recognized testing laboratory; or
(2) For installations or equipment that no nationally recognized testing laboratory accepts, certifies, lists, labels, or determines to be safe, it is inspected or tested by another federal agency, or by state, municipal, or other local authority responsible for enforcing occupational safety provisions of the National Electrical Code, and complies with the provisions of the National Electrical Code, and complies with the provisions of the National Electrical Code as applied in this section; or
(3) For custom-made equipment or related installations that are designed, fabricated for, and intended for use by a particular customer, it is determined to be safe for its intended use by its manufacturer on the basis of test data that you keep and make available for our inspection.
"Certified" means equipment that:
• Has been tested and found by a nationally recognized testing laboratory to meet nationally recognized standards, or to be safe for use in a specified manner; or
• Is a kind whose production is periodically inspected by a nationally recognized testing laboratory; and
• Bears a label, tag, or other record of certification.
"Exposed" means a live part that can be accidentally touched or approached nearer than a safe distance. This term applies to parts that are not suitably guarded, isolated, or insulated.
"Fixed equipment" means equipment fastened or connected by permanent wiring methods.
"Ground" means a conducting connection, whether intentional or accidental, between an electrical circuit or equipment and earth, or to some conducting body that serves in place of the earth.
"Grounded" means connected to earth or to some conducting body that serves in place of the earth.
"Isolated" means equipment that is not readily accessible except through special means of access.
"Labeled" means equipment that has an attached label, symbol, or other identifying mark of a nationally recognized testing laboratory that:
• Makes periodic inspections of the production of such equipment; and

[Title 296 WAC—p. 2521]
• Whose labeling indicates compliance with nationally recognized standards or tests to determine safe use in a specified manner.

"Qualified person" means a person who is familiar with the construction and operation of the equipment and the hazards involved.

Note 1: Whether an employee is considered a "qualified person" depends on various circumstances in the workplace. It is possible and likely for an individual to be considered "qualified" with regard to certain equipment in the workplace, but "unqualified" as to other equipment.

Note 2: An employee undergoing on-the-job training and who, in the course of such training, has demonstrated an ability to perform duties safely at his or her level of training and who is under the direct supervision of a qualified person is considered a qualified person for the performance of those duties.

"Shock hazard" exists at an accessible part in a circuit between the part and ground, or other accessible parts if the potential is more than 42.4 volts peak and the current through a 1,500 ohm load is more than 5 milliamperes.

"Weatherproof" means constructed or protected so that exposure to the weather does not interfere with successful operation. Rainproof, raintight, or watertight equipment may be considered weatherproof where weather conditions other than wetness, such as snow, ice, dust, or temperature extremes, are not a factor.

"Weatherproof" means constructed or protected so that exposure to the weather does not interfere with successful operation. Rainproof, raintight, or watertight equipment may be considered weatherproof where weather conditions other than wetness, such as snow, ice, dust, or temperature extremes, are not a factor.

WAC 296-307-362 General electrical requirements.

WAC 296-307-36203 What electrical equipment must be approved? The conductors and equipment required or permitted by this section must be approved.

WAC 296-307-36206 How must electrical equipment safety be determined? (1) Electrical equipment must be free from hazards to employees. Safety of equipment must be determined using the following considerations:

(a) Suitability for installation and use according to the requirements of this part. Suitability of equipment for a specific purpose may be shown by listing or labeling for that purpose.

(b) Mechanical strength and durability, including, for parts designed to enclose and protect other equipment, the adequacy of the protection provided.

(c) Electrical insulation.

(d) Heating effects under conditions of use.

(e) Arcing effects.

(f) Classification by type, size, voltage, current capacity, specific use.

(g) Other factors that contribute to the practical safeguarding of employees using or likely to come in contact with the equipment.

(2) Listed or labeled equipment must be used or installed according to any instructions included in the listing or labeling.

WAC 296-307-36209 What requirements apply to guarding live parts? (1) Unless otherwise indicated, live parts of electric equipment operating at 50 volts or more must be guarded against accidental contact by an approved cabinet or other form of approved enclosure, or by any of the following:

(a) Location in a room, vault, or similar enclosure that is accessible only to qualified persons.

(b) Suitable permanent substantial partitions or screens arranged so that only qualified persons have access to the area within reach of the live parts. Any openings in such partitions or screens must be small enough and located so that employees are not likely to come into accidental contact with live parts or to bring conducting objects into contact with them.

(c) Location on a suitable balcony, gallery, or platform elevated and accessible only to qualified persons.

(d) Elevation of eight feet or more above the floor or other working surface.

(2) In locations where electric equipment would be exposed to physical damage, enclosures or guards must be arranged and be strong enough to prevent damage.

(3) Entrances to rooms and other guarded locations containing exposed live parts must be marked with conspicuous warning signs forbidding unqualified persons to enter.

(4) Electrical repairs must be made only by qualified persons that you authorize.

(5) Fuse handling equipment, insulated for the circuit voltage, must be used to remove or install fuses when the fuse terminals are energized.

(6) Employees must be prohibited from working closely enough to an electric power circuit to contact it unless the employee is protected against electric shock.

Note: The circuit must be protected by deenergizing the circuit and grounding it, by guarding it, by effective insulation, or other means.

(7) In work areas where the exact location of underground electric power lines is unknown, employees using jack-hammers, bars or other hand tools that may contact a line must have insulated protective gloves.

WAC 296-307-36212 What workspace must be provided? (1) When parts are exposed, the minimum clearance for the workspace must be at least six feet six inches high, or at least a radius of three feet wide.

(2) There must be enough clearance to permit at least a 90° opening of all doors or hinged panels.

(2005 Ed.)
WAC 296-307-36215 What general requirements apply to splices? Conductors must be spliced or joined with splicing devices suitable for the use or by brazing, welding, or soldering with a fusible metal or alloy. Soldered splices must first be spliced or joined so they are mechanically and electrically secure without solder and then soldered. (Rosin-core solder should be used instead of acid core solder when joining electrical conductors.) All splices and joints and the free ends of conductors must be covered with an insulation equivalent to that of the conductors or with an insulating device suitable for the purpose.

WAC 296-307-36218 What protection must be provided against combustible materials? Parts of electric equipment that in ordinary operation produce arcs, sparks, flames, or molten metal must be enclosed or separated and isolated from all combustible material.

WAC 296-307-36221 How must electrical equipment be marked? All electrical equipment in use must have the manufacturer's name, trademark, or other descriptive marking of the organization responsible for the product on the equipment. Other markings must be provided giving voltage, current, wattage, or other ratings as necessary. The marking must be durable enough to withstand the environment.

WAC 296-307-36224 How must disconnecting means be marked? Each disconnecting means required by this part for motors and appliances must be legibly marked to indicate its purpose, unless located and arranged so the purpose is evident. Each service, feeder, and branch circuit, at its disconnection point, must be marked with the name of the organization responsible for the product on the equipment. Other markings must be provided giving voltage, current, wattage, or other ratings as necessary. The marking must be durable enough to withstand the environment.

WAC 296-307-36227 What access and working space must be provided for electrical equipment of 600 volts, nominal, or less? Sufficient access and working space must be provided and maintained about all electric equipment to permit ready and safe operation and maintenance of such equipment.

(1) Unless otherwise indicated, the dimension of the working space in the direction of access to live parts operating at 600 volts or less and likely to require examination, adjustment, servicing, or maintenance while alive must be at least that indicated in the table below. Also, workspace must be at least 30 inches wide in front of the electric equipment. Distances must be measured from the live parts if they are exposed, or from the enclosure front or opening if the live parts are enclosed. Concrete, brick, or tile walls are considered grounded. Working space is not required behind assemblies such as dead-front switchboards or motor control centers where there are no renewable or adjustable parts such as fuses or switches on the back and where all connections are accessible from other directions.

</tr>
</tbody>
</table>

Conditions:
(a) Exposed live parts on one side and no live or grounded parts on the other side of the working space, or exposed live parts on both sides guarded by suitable wood or other insulating material. Insulated wire or insulated busbars operating at 300 volts or less are not considered live parts.
(b) Exposed live parts on one side and grounded parts on the other side.
(c) Exposed live parts on both sides of the workspace (not guarded as in (a)) with the operator between.

(2) Working space required by this part must not be used for storage. When normally enclosed live parts are exposed for inspection or servicing, the working space, if in a passageway or general open space, must be suitably guarded.

(3) At least one entrance of sufficient area must be provided to give access to the working space about electric equipment.

(4) Where there are live parts normally exposed on the front of switchboards or motor control centers, the working space in front of such equipment must be at least 3 feet.

(5) All working spaces around service equipment, switchboards, panelboards, and motor control centers installed indoors must be adequately lit.

(6) The minimum headroom of working spaces about service equipment, switchboards, panelboards, or motor control centers must be 6 feet 3 inches.

"Motor control center" means an assembly of one or more enclosed sections having a common power bus and principally containing motor control units.

WAC 296-307-36230 What access and working space must be provided for electrical equipment over 600 volts, nominal? (1) Conductors and equipment used on circuits exceeding 600 volts, nominal, must meet all requirements of WAC 296-307-36221 and the additional requirements of this section. This section does not apply to equipment on the supply side of the service conductors.

(2) Electrical installations in a vault, room, closet or area surrounded by a wall, screen, or fence, with access controlled by lock and key or other approved means, are considered accessible to qualified persons only. A wall, screen, or fence less than 8 feet high is not considered to prevent access unless
it has other features that provide a degree of isolation equivalent to an 8 foot fence. The entrances to all buildings, rooms, or enclosures containing exposed live parts or exposed conductors operating at over 600 volts, nominal, must be kept locked or under the observation of a qualified person at all times.

(a) Electrical installations with exposed live parts must be accessible to qualified persons only.

(b) Electrical installations that are open to unqualified persons must be made with metal-enclosed equipment or enclosed in a vault or in an area, with access controlled by a lock. If metal-enclosed equipment is installed so that the bottom of the enclosure is less than 8 feet above the floor, the door or cover must be kept locked. Metal-enclosed switchgear, unit substations, transformers, pull boxes, connection boxes, and other similar associated equipment must be marked with appropriate caution signs. If equipment is exposed to physical damage from vehicular traffic, guards must be provided to prevent damage. Ventilating or similar openings in metal-enclosed equipment must be designed so that foreign objects inserted through these openings will be deflected from energized parts.

(3) You must provide and maintain enough space around electric equipment to permit ready and safe operation and maintenance of equipment. Where energized parts are exposed, the minimum clear workspace must be at least 6 feet 6 inches high (measured vertically from the floor or platform), or less than 3 feet wide (measured parallel to the equipment). The depth must meet the requirements of Table T. The workspace must be adequate to permit at least a 90-degree opening of doors or hinged panels.

(a) The minimum clear working space in front of electric equipment such as switchboards, control panels, switches, circuit breakers, motor controllers, relays, and similar equipment must be at least that specified in Table T unless otherwise indicated. Distances must be measured from the live parts if they are exposed, or from the enclosure front or opening if the live parts are enclosed. However, working space is not required in back of equipment such as deadfront switchboards or control assemblies where there are no renewable or adjustable parts (such as fuses or switches) on the back and where all connections are accessible from another direction. Where rear access is required to work on deenergized parts on the back of enclosed equipment, a minimum working space of 30 inches horizontally shall be provided.

(b) Permanent ladders or stairways must be provided to give safe access to the working space around electric equipment installed on platforms, balconies, mezzanine floors, or in attic or roof rooms or spaces.

(2005 Ed.)
WAC 296-307-364 Electrical installation and maintenance.

WAC 296-307-36403 How must flexible cords and cables be installed and maintained? (1) Extension cords used with portable electric tools and appliances must be three wire and must be fitted with an approved grounding attachment plug and receptacle providing ground continuity.

Exception: This does not apply to cords used with portable tools and equipment provided by an approved system of double insulation or its equivalent.

(2) Worn or frayed electric cables are prohibited.

WAC 296-307-36406 How must attachment plugs and receptacles be installed and maintained? (1) Attachment plugs used in work areas must be constructed so that they will endure rough use and have a suitable cord grip to prevent strain on the terminal screws.

(2) Attachment plugs must be approved grounding plugs.

(3) Receptacles for attachment plugs must have approved concealed contacts with a contact for extending ground continuity. Receptacles must be designed and constructed to ensure that the plug can be pulled out without leaving any live parts exposed to accidental contact.

(4) Polarized attachment plugs, receptacles, and cord connectors must be wired to maintain continuity.

(5) Polarized attachment plugs, receptacles, and cord connectors for plugs and polarized plugs must have the terminal intended for connection to the grounded (white) conductor identified by a metal coating that is mostly white. If the terminal is not visible, its entrance hole must be marked with the word "white," or the color white.

(6) The terminal for the connection of the equipment grounding conductor must be:

(a) A green colored, not easily removed terminal screw with hexagonal head; or

(b) A green colored, hexagonal, not easily removed terminal nut; or

(c) A green colored pressure wire connector.

If the terminal for the grounding conductor is not visible, the conductor entrance hole must be marked with the word "green" or the color green.

Note: Two-wire attachment plugs, unless of the polarity type, need not have their terminals marked for identification.

(7) Where different voltages, or types of current (A.C. or D.C.) are to be supplied by portable cords, receptacles must be designed so that attachment plugs used on the circuits are not interchangeable.

(8) Attachment plugs or other connectors supplying equipment at more than 300 volts must be skirted or otherwise designed so that arcs are confined.

WAC 296-307-36409 What must employees do when equipment causes electrical shock? Employees must report all shocks received from electrical equipment, no matter how slight, immediately to you. The equipment causing the shock must be checked and any necessary corrective action taken immediately.

WAC 296-307-36412 What grounding and bonding requirements apply to equipment installation and maintenance? (1) The path to ground must have enough carrying capacity to conduct safely the currents likely to be imposed on it; and have low enough impedance to limit the potential above ground and to result in the operation of the overcurrent devices in the circuit.

(2) Driven rod electrodes must, where practical, have a resistance to ground of a maximum of 25 ohms. Where the resistance is over 25 ohms, two electrodes connected in parallel shall be used.

(3) Grounding circuits must be checked to ensure that the circuit between the ground and the grounded power conductor has a resistance that is low enough to permit sufficient current to flow to cause the fuse or circuit breaker to interrupt the current.

(4) Conductors used for bonding and grounding equipment must be large enough to carry the anticipated current.

WAC 296-307-36415 What requirements apply to disconnecting means? (1) Disconnecting means must be located or shielded so that employees will not be injured. Using open knife switches is prohibited.

(2) Boxes for disconnecting means must be securely and rigidly fastened to the surface upon which they are mounted, and fitted with covers.

WAC 296-307-36418 What requirements apply to identification and load rating of electrical equipment? (1) Name plates, rating data, and marks of identification on electrical equipment and electrically operated machines must not be removed, defaced or obliterated.

(2) In existing installations, no changes in circuit protection must be made to increase the load beyond the load rating of the circuit wiring, as specified in the National Electrical Code, NFPA 70-1973; ANSI C1-1972, Article 310.

(3) Tampering with, bridging, or using oversize fuses is prohibited. If fuses blow repeatedly, employees must immediately report the trouble to you or to an authorized electrician.

(4) Attempting to start electric motors that kick out repeatedly is prohibited.

(2005 Ed.)
WAC 296-307-36421 How must equipment be installed in wet locations? (1) Cabinets, cutout boxes, fittings, boxes, and panelboard enclosures in damp or wet locations must be installed to prevent moisture or water from entering and accumulating within the enclosures. In wet locations the enclosures must be weatherproof.

(2) Switches, circuit breakers, and switchboard enclosures in wet locations must be enclosed in weatherproof enclosures.

WAC 296-307-366 Wiring design and protection.

WAC 296-307-36603 How must grounded and grounding conductors be used and identified? (1) A conductor used as a grounded conductor must be identified separately from all other conductors. A conductor used as an equipment grounding conductor must be identified separately from all other conductors.

(2) A grounded conductor must not be attached to any terminal or lead to reverse the designated polarity.

(3) Using a grounding terminal or grounding-type device on a receptacle, cord connector, or attachment plug for anything other than grounding is prohibited.

WAC 296-307-36606 What ampere rating must outlet devices have? Outlet devices must have an ampere rating at least equal to the load served.

WAC 296-307-36609 What requirements apply to conductors? This section applies to branch circuit, feeder, and service conductors rated 600 volts, nominal, or less and run outdoors as open conductors.

(1) Conductors supported on poles must provide a horizontal climbing space of at least the following:

(a) For power conductors below communication conductors, 30 inches.

(b) For power conductors alone or above communication conductors:

- 300 volts or less, 24 inches;
- More than 300 volts, 30 inches.

(c) For communication conductors below power conductors with power conductors of:

- 300 volts or less, 24 inches;
- More than 300 volts, 30 inches.

(2) Open conductors must provide at least the following minimum clearances:

(a) 10 feet, above finished grade, sidewalks, or from any platform or projection from which they might be reached;

(b) 12 feet, over areas subject to vehicular traffic other than truck traffic;

(c) 15 feet, over areas that are subject to truck traffic; except

(d) 18 feet, over public streets, alleys, roads, and driveways.

(3) Conductors must have a clearance of at least 3 feet from windows, doors, porches, fire escapes, or similar locations. Conductors run above the top level of a window are considered to be out of reach from that window and, therefore, do not have to be 3 feet away.

(4) Conductors must have a clearance of at least 8 feet from the highest point of roofs they pass over.

Exceptions: (a) Where the voltage between conductors is 300 volts or less and the roof has a slope of at least 4 inches in 12, the clearance from the roofs must be at least 3 feet; or

(b) Where the voltage between conductors is 300 volts or less, the conductors do not pass over more than 4 feet of the overhang portion of the roof, and they are terminated at a through-the-roof raceway or approved support, the clearance from the roof must be at least 18 inches.

(5) Lamps for outdoor lighting must be located below all live conductors, transformers, or other electric equipment, unless such equipment is controlled by a disconnecting means that can be locked in the open position or unless adequate clearances or other safeguards are provided for relamping operations.

WAC 296-307-36612 What design and protection requirements apply to service-entrances? (1) Disconnecting means for service-entrances must meet the following requirements:

(a) Means must be provided to disconnect all conductors in a building or other structure from the service-entrance conductors. The disconnecting means must plainly indicate whether it is in the open or closed position and must be installed at a readily accessible location nearest the point of entrance of the service-entrance conductors.

(b) Each service disconnecting means must disconnect all ungrounded conductors at the same time.

(2) The following additional requirements apply to services over 600 volts, nominal.

(a) Service-entrance conductors installed as open wires must be guarded to make them accessible only to qualified persons.

(b) Signs warning of high voltage must be posted where other than qualified employees might come in contact with live parts.

WAC 296-307-36615 What overcurrent protection must be provided? (1) The following requirements apply to overcurrent protection of circuits rated 600 volts, nominal, or less.

(a) Conductors and equipment must be protected from overcurrent according to their ability to safely conduct current.
(b) Except for motor running overload protection, overcurrent devices must not interrupt the continuity of the grounded conductor unless all conductors of the circuit are opened at the same time.

(c) Except for service fuses, all cartridge fuses that are accessible to other than qualified persons and all fuses and thermal cutouts on circuits over 150 volts to ground must have disconnecting means. This disconnecting means must be installed so that the fuse or thermal cutout can be disconnected from its supply without disrupting service to equipment and circuits unrelated to those protected by the overcurrent device.

(d) Overcurrent devices must be readily accessible to each employee or authorized building management personnel. These overcurrent devices must be located where they will be protected against physical damage and away from easily ignitable material.

(e) Fuses and circuit breakers must be located or shielded so that employees will not be burned or otherwise injured by their operation.

(f) Circuit breakers must meet the following requirements:

(i) Circuit breakers must clearly indicate whether they are in the open (off) or closed (on) position.

(ii) Where circuit breaker handles on switchboards are operated vertically rather than horizontally or rotationally, the up position of the handle must be the closed (on) position.

(iii) If used as switches in 120-volt, fluorescent lighting circuits, circuit breakers must be approved for the purpose and marked "SWD."

(2) Feeders and branch circuits over 600 volts, nominal, must have short-circuit protection.

WAC 296-307-36618 What premises wiring systems must be grounded? The following systems that supply premises wiring must be grounded:

(1) All 3-wire DC systems must have their neutral conductor grounded.

(2) Two-wire DC systems operating at 50-300 volts between conductors must be grounded.

Exceptions: This requirement does not apply if:

(a) They supply only industrial equipment in limited areas and are equipped with a ground detector; or

(b) They are rectifier-derived from an AC system that meets the requirements of subsections (3), (4), and (5) of this section; or

(c) They are fire-protective signaling circuits with a maximum current of 0.030 amperes.

(3) AC circuits of less than 50 volts must be grounded if they are installed as overhead conductors outside of buildings or if they are supplied by transformers and the transformer primary supply system is ungrounded or exceeds 150 volts to ground.

(4) AC systems of 50-1000 volts must be grounded under any of the following conditions:

(a) If the system can be grounded so that the maximum voltage to ground on the ungrounded conductors is a maximum of 150 volts;

(b) If the system is nominally rated 480Y/277 volt, 3-phase, 4-wire in which the neutral is used as a circuit conductor;

(c) If the system is nominally rated 240/120 volt, 3-phase, 4-wire in which the midpoint of one phase is used as a circuit conductor; or

(d) If a service conductor is uninsulated.

(5) Exceptions: AC systems of 50-1000 volts are not required to be grounded under any of the following conditions:

(a) If the system is used exclusively to supply industrial electric furnaces for melting, refining, tempering, and the like.

(b) If the system is separately derived and is used exclusively for rectifiers supplying only adjustable speed industrial drives.

(c) If the system is separately derived and is supplied by a transformer that has a primary voltage rating less than 1000 volts, if all of the following conditions are met:

(i) The system is used exclusively for control circuits;

(ii) The conditions of maintenance and supervision ensure that only qualified persons will service the installation;

(iii) Continuity of control power is required; and

(iv) Ground detectors are installed on the control system.

WAC 296-307-36621 Must the conductor be grounded for AC premises wiring? For AC premises wiring systems the identified conductor must be grounded.

WAC 296-307-36624 What general requirements apply to grounding conductors? (1) For a grounded system, a grounding electrode conductor must be used to connect both the equipment grounding conductor and the grounded circuit conductor to the grounding electrode. Both the equipment grounding conductor and the grounding electrode conductor must be connected to the grounded circuit conductor on the supply side of the service disconnecting means, or on the supply side of the system disconnecting means or overcurrent devices if the system is separately derived.

(2) For an ungrounded service-supplied system, the equipment grounding conductor must be connected to the grounding electrode conductor at the service equipment. For an ungrounded separately derived system, the equipment grounding conductor must be connected to the grounding electrode conductor at, or ahead of, the system disconnecting means or overcurrent devices.

(3) On extensions of existing branch circuits that do not have an equipment grounding conductor, grounding-type receptacles may be grounded to a grounded cold water pipe near the equipment.
WAC 296-307-36627 Must the path to ground be continuous? The path to ground from circuits, equipment, and enclosures must be permanent and continuous.

WAC 296-307-36630 What supports, enclosures, and equipment must be grounded? (1) Metal cable trays, metal raceways, and metal enclosures for conductors must be grounded.

Exceptions: (a) Metal enclosures such as sleeves that are used to protect cable assemblies from physical damage need not be grounded; or (b) Metal enclosures for conductors added to existing installations of open wire, knob-and-tube wiring, and nonmetallic-sheathed cable need not be grounded if all of the following conditions are met:

(i) Runs are less than 25 feet;
(ii) Enclosures are free from probable contact with ground, grounded metal, metal laths, or other conductive materials; and
(iii) Enclosures are guarded against employee contact.

(2) Metal enclosures for service equipment must be grounded.

(3) Frames of electric ranges, wall-mounted ovens, counter-mounted cooking units, clothes dryers, and metal outlet or junction boxes that are part of the circuit for these appliances must be grounded.

(4) Exposed noncurrent-carrying metal parts of fixed equipment that may become energized must be grounded under any of the following conditions:

(a) If within 8 feet vertically or 5 feet horizontally of ground or grounded metal objects and subject to employee contact;
(b) If located in a wet or damp location and not isolated;
(c) If in electrical contact with metal;
(d) If in a hazardous (classified) location;
(e) If supplied by a metal-clad, metal-sheathed, or grounded metal raceway wiring method;
(f) If equipment operates with any terminal at over 150 volts to the ground; however, the following need not be grounded:

(i) Enclosures for switches or circuit breakers used for other than service equipment and accessible to qualified persons only;
(ii) Metal frames of electrically heated appliances that are permanently and effectively insulated from ground; and
(iii) The cases of distribution apparatus such as transformers and capacitors mounted on wooden poles that are over 8 feet above ground or grade level.

(5) Under any of the conditions below, exposed noncurrent-carrying metal parts of cord-connected and plug-connected equipment that may become energized must be grounded.

(a) When equipment is in hazardous (classified) locations.
(b) When equipment is operated at over 150 volts to ground.

Exception: Guarded motors and metal frames of electrically heated appliances need not be grounded if the appliance frames are permanently and effectively insulated from ground.

(c) When equipment is one of the following:

- Refrigerators, freezers, and air conditioners;
- Clothes-washing, clothes-drying and dishwashing machines, sump pumps, and electrical aquarium equipment;
- Hand-held motor-operated tools;
- The following motor-operated appliances: Hedge trimmers, lawn mowers, snow blowers, and wet scrubbers;
- Cord-connected and plug-connected appliances used in damp or wet locations or by employees standing on the ground or on metal floors or working inside of metal tanks or boilers;
- Tools likely to be used in wet and conductive locations; and
- Portable hand lamps.

Tools likely to be used in wet and conductive locations need not be grounded if supplied through an isolating transformer with an ungrounded secondary of a maximum of 50 volts. Listed or labeled portable tools and appliances protected by an approved system of double insulation, or its equivalent, need not be grounded. The equipment must be distinctively marked to indicate that the tool or appliance uses an approved system of double insulation.

(6) The metal parts of the following nonelectrical equipment must be grounded: Frames and tracks of electrically operated cranes; frames of nonelectrically driven elevator cars to which electric conductors are attached; hand operated metal shifting ropes or cables of electric elevators, and metal partitions, grill work, and other metal enclosures around equipment of over 750 volts between conductors.

WAC 296-307-36633 How must fixed equipment be grounded? (1) Noncurrent-carrying metal parts of fixed equipment, if required to be grounded by this section, must be grounded by an equipment grounding conductor that is contained within the same raceway, cable, or cord, or runs with or encloses the circuit conductors. For DC circuits only, the equipment ground conductor may be run separately from the circuit conductors.

(2) Electric equipment is considered grounded if it is secured to, and in electrical contact with, a metal rack or structure that is provided for its support and the metal rack or structure is grounded as described above.

For installations made before May 30, 1982, electric equipment is also considered grounded if it is secured to, and in metallic contact with, the grounded structural metal frame of a building. Metal car frames supported by metal hoisting cables attached to or running over metal sheaves or drums of grounded elevator machines are also considered grounded.

WAC 296-307-36636 How must high voltage systems be grounded? Grounded high voltage (1000 volts or more) systems and circuits must meet all requirements of WAC 296-307-366 and the additional requirements of this section.

(1) Systems supplying portable or mobile high voltage equipment, other than substations installed on a temporary basis, must meet the following requirements:

(2005 Ed.)
(a) Portable and mobile high voltage equipment must be supplied from a system having its neutral grounded through an impedance. If a delta-connected high voltage system is used to supply the equipment, a system neutral must be derived.

(b) Exposed noncurrent-carrying metal parts of portable and mobile equipment must be connected by an equipment grounding conductor to the point at which the system neutral impedance is grounded.

(c) Ground-fault detection and relaying must be provided to automatically deenergize any high voltage system component that has developed a ground fault. The continuity of the equipment grounding conductor must be continuously monitored to deenergize automatically the high voltage feeder to the portable equipment on loss of continuity of the equipment grounding conductor.

(d) The grounding electrode to which the portable or mobile equipment system neutral impedance is connected must be isolated from and separated in the ground by at least 20 feet from any other system or equipment grounding electrode. There must be no direct connection between the grounding electrodes, such as buried pipe, fence, etc.

(2) All noncurrent-carrying metal parts of portable equipment and fixed equipment including their associated fences, housings, enclosures, and supporting structures shall be grounded. However, equipment that is guarded by location and isolated from ground need not be grounded. Additionally, pole-mounted distribution apparatus over 8 feet above ground or grade level need not be grounded.

WAC 296-307-368 Wiring methods, components, and equipment for general use.

WAC 296-307-36803 Does this section apply to factory-assembled equipment? WAC 296-307-368 does not apply to conductors that are an integral part of factory-assembled equipment.

WAC 296-307-36806 What wiring methods must be used for temporary wiring? Temporary electrical power and lighting wiring methods may be of a class less than would be required for a permanent installation. All requirements for permanent wiring apply to temporary wiring installations, except as indicated in this section.

(1) Temporary electrical power and lighting installations 600 volts, nominal, or less must only be used:

   (a) During and for remodeling, maintenance, repair, or demolition of buildings, structures, or equipment, and similar activities;

   (b) For experimental or development work; and

   (c) For a maximum of 90 days for Christmas lighting and similar purposes.

(2) Temporary wiring over 600 volts, nominal, must only be used during periods of tests, experiments, or emergencies.

(3) General requirements for temporary wiring.

   (a) Working spaces, walkways, and similar locations must be kept clear of power cords.

   (b) All temporary wiring must be grounded. (See NFPA 70 Art. 250.)

   (c) All wiring equipment must be maintained as vapor-tight, dust-tight, or fiber-tight as their approval requires. There must be no loose or missing screws, gaskets, threaded connections, or other conditions that impair the required tightness.

   (d) Take precautions to make necessary open wiring accessible only to authorized personnel.

   (e) Feeders must originate in an approved distribution center. The conductors must be run as multiconductor cord or cable assemblies, or, where not subject to physical damage, they may be run as open conductors on insulators not more than 10 feet apart.

   (f) Branch circuits must originate in an approved power outlet or panelboard. Conductors must be multiconductor cord or cable assemblies or open conductors. If run as open conductors they must be fastened at ceiling height every 10 feet. A branch-circuit conductor must not be laid on the floor. Each branch circuit that supplies receptacles or fixed equipment must have a separate equipment grounding conductor if run as open conductors.

   (g) Receptacles must be of the grounding type. Unless installed in a complete metallic raceway, each branch circuit must have a separate equipment grounding conductor and all receptacles must be electrically connected to the grounding conductor.

   (h) A bare conductor or an earth return must not be used to wire any temporary circuit.

   (i) Suitable disconnecting switches or plug connectors must be installed to permit the disconnection of all ungrounded conductors of each temporary circuit.

   (j) Lamps for general illumination must be protected from accidental contact or breakage. Lamps must be elevated at least 7 feet from normal working surface or by a suitable fixture or lampholder with a guard.

   (k) Flexible cords and cables must be protected from accidental damage. Sharp corners and projections must be avoided. Where passing through doorways or other pinch points, flexible cords and cables must be protected to avoid damage.

(4) General requirements for temporary lighting.

   (a) Temporary lights must have guards to prevent accidental contact with the bulb.

   Note: Guards are not required when the entire bulb is below the rim and completely surrounded and protected by the reflector.

   (b) Temporary lights must have heavy duty electric cords with connections and insulation maintained in safe condition.

   (c) Temporary lights must not be suspended by their electric cords unless cords and lights are designed for suspension.
(d) Brass shell, paper-lined lamp holders are prohibited.

(e) Portable extension lamps used where flammable vapors or gases, combustible dusts, or easily ignitable fibers or flyings are present, must be specifically approved as complete assemblies for the type of hazard.

WAC 296-307-36809 When may cable trays be used?

(1) Only the following may be installed in cable tray systems:

(a) Mineral-insulated metal-sheathed cable (Type MI);
(b) Armored cable (Type AC);
(c) Metal-clad cable (Type MC);
(d) Power-limited tray cable (Type PLTC);
(e) Nonmetallic-sheathed cable (Type NM or NMC);
(f) Shielded nonmetallic-sheathed cable (Type SNM);
(g) Multiconductor service-entrance cable (Type SE or USE);
(h) Multiconductor underground feeder and branch-circuit cable (Type UF);
(i) Power and control tray cable (Type TC);
(j) Other factory-assembled, multiconductor control, signal, or power cables that are specifically approved for installation in cable trays;
(k) Any approved conduit or raceway with its contained conductors.

(2) In industrial establishments only, where conditions of maintenance and supervision ensure that only qualified persons will service the installed cable tray system, the following cables may also be installed in ladder, ventilated trough, or 4 inch ventilated channel-type cable trays:

Single conductor cables that are 250 MCM or larger and are Types RHH, RW, MV, USE, or THW, and other 250 MCM or larger single conductor cables if specifically approved for installation in cable trays. Where exposed to direct rays of the sun, cables must be sunlight-resistant.

(3) Cable trays in hazardous (classified) locations must contain only the cable types permitted in such locations.

Exception: Cable tray systems must not be used in hoistways or where subjected to severe physical damage.

WAC 296-307-36812 What requirements apply to open wiring on insulators?

(1) Open wiring on insulators is only permitted on systems of 600 volts, nominal, or less for industrial or agricultural establishments and for services.

(2) Conductors must be rigidly supported on noncombustible, nonabsorbent insulating materials and must not contact any other objects.

(3) In dry locations with no exposure to severe physical damage, conductors may be separately enclosed in flexible nonmetallic tubing. The tubing must be in continuous lengths a maximum of 15 feet and secured to the surface by straps at maximum intervals of 4 feet 6 inches.

(4) Open conductors must be separated from contact with walls, floors, and wood cross members, or partitions through which they pass by tubes or bushings of noncombustible, nonabsorbent insulating material. If the bushing is shorter than the hole, a waterproof sleeve of nonconductive material must be inserted in the hole and an insulating bushing slipped into the sleeve at each end to keep the conductors completely out of contact with the sleeve. Each conductor must be carried through a separate tube or sleeve.

(5) Conductors within 7 feet of the floor are considered exposed to physical damage. Where open conductors cross ceiling joints and wall studs and are exposed to physical damage, they must be protected.

WAC 296-307-36815 What wiring requirements apply to cabinets, boxes, and fittings?

(1) Conductors entering boxes, cabinets, or fittings must be protected from abrasion, and openings through which conductors enter must be closed. Unused openings in cabinets, boxes, and fittings must also be closed.

(2) All pull boxes, junction boxes, and fittings must have covers approved for the purpose. All metal covers must be grounded. In completed installations each outlet box must have a cover, faceplate, or fixture canopy. A cover of an outlet box with holes through which a flexible cord pendant passes must have bushings designed for the purpose or have a smooth, well-rounded surface for the cord to run on.

(3) All pull and junction boxes for systems over 600 volts, nominal, must meet the following requirements:

(a) Boxes must provide a complete enclosure for the contained conductors or cables.
(b) Boxes must be closed by suitable covers securely fastened in place. Underground box covers that weigh over 100 pounds meet this requirement. Covers for boxes must be permanently marked "HIGH VOLTAGE." The marking must be on the outside of the box cover and must be readily visible and legible.

WAC 296-307-36818 What requirements apply to switches?

(1) Single-throw knife switches must be connected so that the blades are dead when the switch is in the open position. Single-throw knife switches must be placed so that gravity will not tend to close them. Single-throw knife switches approved for use in the inverted position must have a locking device that keeps the blades open when set. Double-throw knife switches may be mounted so that the throw will be either vertical or horizontal. However, if the throw is vertical a locking device must be provided to ensure that the blades remain open when set.

(2) Flush snap switches that are mounted in ungrounded metal boxes and located within reach of conducting floors or other conducting surfaces must have faceplates of nonconducting, noncombustible material.

WAC 296-307-36821 Where must switchboards and panelboards be located? Switchboards that have any exposed live parts must be located in permanently dry locations and accessible only to qualified persons. Panelboards must be mounted in cabinets, cutout boxes, or enclosures approved for the purpose and must be dead front. However, panelboards other than the dead front externally operable type are permitted where accessible only to qualified persons. Exposed blades of knife switches must be dead when open.

WAC 296-307-36824 When must conductors be insulated? All conductors used for general wiring must be insulated unless otherwise permitted in this section. The conductor insulation must be approved for the voltage, operating temperature, and location of use. Insulated conductors must be distinguishable by appropriate color or other means as grounded conductors, ungrounded conductors, or equipment grounding conductors.

WAC 296-307-36827 When may flexible cords and cables be used? (1) Flexible cords and cables must be approved and suitable for conditions of use and location. Flexible cords and cables must be used only for:
   (a) Pendants;
   (b) Wiring of fixtures;
   (c) Connection of portable lamps or appliances;
   (d) Elevator cables;
   (e) Wiring of cranes and hoists;
   (f) Connection of stationary equipment to facilitate frequent interchange;
   (g) Prevention of the transmission of noise or vibration;
   (h) Appliances where the fastening means and mechanical connections are designed to permit removal for maintenance and repair; or
   (i) Data processing cables approved as a part of the data processing system.

   (2) If used as permitted above, the flexible cord must have an attachment plug and shall be energized from an approved receptacle outlet.

   (3) Unless permitted in subsection (1) of this section, flexible cords and cables must not be used:
      (a) As a substitute for the fixed wiring of a structure;
      (b) Where run through holes in walls, ceilings, or floors;
      (c) Where run through doorways, windows, or similar openings;
      (d) Where attached to building surfaces; or
      (e) Where concealed behind building walls, ceilings, or floors.

      (4) Flexible cords used in show windows and showcases must be Type S, SO, SJ, SJO, ST, STO, SJT, SJTO, or AFS except for the wiring of chain-supported lighting fixtures and supply cords for portable lamps and other merchandise being displayed or exhibited.

WAC 296-307-36830 How must flexible cords and cables be identified, spliced, and terminated? (1) A conductor of a flexible cord or cable that is used as a grounded conductor or an equipment grounding conductor must be distinguishable from other conductors. Types SJ, SJO, SJT, SJTO, S, SO, ST, and STO must be durably marked on the surface with the type designation, size, and number of conductors.

   (2) Flexible cords must be used only in continuous lengths without splice or tap. Vulcanized splices or equivalent means such as systems using shrinkable materials may be used to repair flexible cords. Hard service flexible cords No. 12 or larger may be repaired by splice if the splice retains the insulation, outer sheath properties, and usage characteristics of the cord being spliced.

   (3) Flexible cords must be connected to devices and fittings so that strain relief is provided to prevent pull from being directly transmitted to joints or terminal screws.

WAC 296-307-36833 What requirements apply to multiconductor portable cable? Multiconductor portable cable for use in supplying power to portable or mobile equipment at over 600 volts, nominal, must consist of No. 8 or larger conductors employing flexible stranding. Cables operated at over 2,000 volts must be shielded to confine the voltage stresses to the insulation. Grounding conductors must be provided. Connectors for these cables must be locking with provisions to prevent their opening or closing while energized. Strain relief must be provided at connections and terminations. Portable cables must not be operated with splices unless the splices are permanent molded, vulcanized, or other approved type. Termination enclosures must be suitably marked with a high voltage hazard warning, and terminations must be accessible only to authorized and qualified personnel.

WAC 296-307-36836 When may fixture wires be used? (1) A fixture wire must be approved for the voltage, temperature, and location of use. A fixture wire used as a grounded conductor must be identified.

   (2) Fixture wires may be used:
      (a) For installation in lighting fixtures and in similar equipment where enclosed or protected and not subject to bending or twisting in use; or
      (b) For connecting lighting fixtures to the branch-circuit conductors supplying the fixtures.

   (3) Fixture wires must not be used as branch-circuit conductors except as permitted for Class 1 power limited circuits.

(2005 Ed.)
WAC 296-307-36839 What requirements apply to wiring for lighting fixtures, lampholders, lamps, and receptacles? (1) Fixtures, lampholders, lamps, rosettes, and receptacles must have no live parts normally exposed to employee contact. However, rosettes and cleat-type lampholders and receptacles located at least 8 feet above the floor may have exposed parts.

(2) Handlamps of the portable type supplied through flexible cords must have a handle of molded composition or other material approved for the purpose, and a substantial guard must be attached to the lampholder or the handle.

(3) Lampholders of the screw-shell type must be installed for use as lampholders only. Lampholders installed in wet or damp locations must be weatherproof.

(4) Fixtures installed in wet or damp locations must be approved for the purpose and must be constructed or installed so that water cannot enter or accumulate in wireways, lampholders, or other electrical parts.

WAC 296-307-36842 What requirements apply to wiring for receptacles, cord connectors, and attachment plugs (caps)? (1) Receptacles, cord connectors, and attachment plugs must be constructed so that no receptacle or cord connector will accept an attachment plug with a different voltage or current rating than that for which the device is intended. However, a 20-ampere T-slot receptacle or cord connector may accept a 15-ampere attachment plug of the same voltage rating.

(2) A receptacle installed in a wet or damp location must be suitable for the location.

WAC 296-307-36845 What requirements apply to wiring for appliances? (1) Appliances, other than those in which the current-carrying parts at high temperatures are necessarily exposed, must have no live parts normally exposed to employee contact.

(2) Each appliance must have a disconnecting means.

(3) Each appliance must be marked with its rating in volts and amperes or volts and watts.

WAC 296-307-36848 What requirements apply to wiring for motors, motor circuits, and controllers? (1) If specified that one piece of equipment must be “in sight from” another piece of equipment, one shall be visible and not more than 50 feet from the other.

(2) Disconnecting means must meet the following requirements:

(a) A disconnecting means must be located in sight from the controller location. However, a single disconnecting means may be located adjacent to a group of coordinated controllers mounted adjacent to each other or a multimotor continuous process machine. The controller disconnecting means for motor branch circuits over 600 volts, nominal, may be out of sight of the controller, if the controller is marked with a warning label giving the location and identification of the disconnecting means which is to be locked in the open position.

(b) The disconnecting means must disconnect the motor and the controller from all ungrounded supply conductors and must be designed so that no pole can be operated independently.

(c) If a motor and the driven machinery are not in sight from the controller location, the installation must meet one of the following conditions:

(i) The controller disconnecting means must be able to be locked in the open position.

(ii) A manually operable switch that will disconnect the motor from its source of supply must be placed in sight from the motor location.

(d) The disconnecting means must plainly indicate whether it is in the open (off) or closed (on) position.

(e) The disconnecting means must be readily accessible. If more than one disconnect is provided for the same equipment, only one need be readily accessible.

(f) An individual disconnecting means must be provided for each motor, but a single disconnecting means may be used for a group of motors under any of the following conditions:

(i) If a number of motors drive special parts of a single machine or piece of apparatus, such as a metal or woodworking machine, crane, or hoist; or

(ii) If a group of motors is under the protection of one set of branch-circuit protective devices; or

(iii) If a group of motors is in a single room in sight from the location of the disconnecting means.

(2) Motors, motor-control apparatus, and motor branch-circuit conductors must be protected against overheating from motor overloads or failure to start, and against short-circuits or ground faults. Overload protection is not required if it will stop a motor where a shutdown is likely to introduce additional or increased hazards, as in the case of fire pumps, or where continued operation of a motor is necessary for a safe shutdown of equipment or process and motor overload sensing devices are connected to a supervised alarm.

(3) Motors, motor-control apparatus, and motor branch-circuit conductors must be guarded against accidental contact by any of the following:

(i) By installation in a room or enclosure that is accessible only to qualified persons;

(ii) By installation on a suitable balcony, gallery, or platform, elevated and arranged to exclude unqualified persons; or

(iii) By elevation 8 feet or more above the floor.

(b) Where live parts of motors or controllers operating at over 150 volts to ground are guarded against accidental contact only by location, and where adjustment or other attendance may be necessary during the operation of the appara-
WAC 296-307-36851  What requirements apply to wiring for transformers? (1) This section applies to the installation of all transformers.

Exception: (a) Current transformers;
(b) Dry-type transformers installed as a component part of other apparatus;
(c) Transformers that are an integral part of a high frequency or electrostatic-coating apparatus;
(d) Transformers used with Class 2 and Class 3 circuits, sign and outline lighting, electric discharge lighting, and power- limited fire-protective signaling circuits; and
(e) Liquid-filled or dry-type transformers used for research, development, or testing, where effective safeguard arrangements are provided.

(2) The operating voltage of exposed live parts of transformer installations must be indicated by warning signs or visible markings on the equipment or structure.

(3) Dry-type, high fire point liquid-insulated, and askarel-insulated transformers installed indoors and rated over 35kV must be in a vault.

(4) If they present a fire hazard to employees, oil-insulated transformers installed indoors must be in a vault.

(5) Combustible material, combustible buildings and parts of buildings, fire escapes, and door and window openings must be safeguarded from fires that may originate in oil-insulated transformers attached or adjacent to a building or combustible material.

(6) Transformer vaults must be constructed to contain fire and combustible liquids within the vault and to prevent unauthorized access. Locks and latches must be arranged so that a vault door can be readily opened from the inside.

(7) Any pipe or duct system foreign to the vault installation must not enter or pass through a transformer vault.

(8) Materials must not be stored in transformer vaults.

WAC 296-307-36854  What requirements apply to wiring for capacitors? (1) All capacitors, except surge capacitors or capacitors included as a component part of other apparatus, must have an automatic means of draining the stored charge after the capacitor is disconnected from its source of supply.

(2) Capacitors rated over 600 volts, nominal, must meet the following additional requirements:
(a) Isolating or disconnecting switches (with no interrupting rating) must be interlocked with the load interrupting device or must have prominently displayed caution signs to prevent switching load current.
(b) For series capacitors, the proper switching must be ensured by any of the following:
(i) Mechanically sequenced isolating and bypass switches;
(ii) Interlocks; or
(iii) Switching procedure prominently displayed at the switching location.

WAC 296-307-36857  How must storage batteries be ventilated? You must ensure that there is sufficient diffusion and ventilation of gases from storage batteries to prevent the accumulation of explosive mixtures.

WAC 296-307-36860  What other miscellaneous requirements apply to wiring methods? (1) Metal raceways, cable armor, and other metal enclosures for conductors must be metallically joined into a continuous electric conductor and must be connected to all boxes, fittings, and cabinets to provide effective electrical continuity.

(2) All wiring systems are prohibited from being installed in ducts used to transport dust, loose stock or flammable vapors. All wiring system are prohibited from being installed in any duct used for vapor removal or for ventilation of commercial-type cooking equipment, or in any shaft containing only such ducts.

WAC 296-307-370  Special purpose equipment and installations.

WAC 296-307-37003  What requirements apply to cranes, hoists, and runways? The installation of electric equipment and wiring used with cranes, monorail hoists, hoists, and all runways must meet the following requirements:

(1) Disconnecting means must meet the following requirements:
(a) A readily accessible disconnecting means is provided between the runway contact conductors and the power supply.
(b) Another disconnecting means, capable of being locked in the open position, is provided in the leads from the runway contact conductors or other power supply on any crane or monorail hoist.
(i) If this additional disconnection means is not readily accessible from the crane or monorail hoist operating station, means is provided at the operating station, to open the power circuit to all motors of the crane or monorail hoist.
(ii) The additional disconnect may be omitted if a monorail hoist or hand-propelled crane bridge installation meets all of the following:
(A) The unit is floor controlled;
(B) The unit is within view of the power supply disconnecting means; and
(C) No fixed work platform has been provided for servicing the unit.

(2) A limit switch or other device shall be provided to prevent the load block from passing the safe upper limit of travel of any hoisting mechanism.

(3) The dimension of the working space in the direction of access to live parts that may require examination, adjustment, servicing, or maintenance while alive must be a minimum of 2 feet 6 inches. Where controls are enclosed in cabinets, the door must either open at least 90 degrees or be removable.

WAC 296-307-37006 What requirements apply to elevators, dumbwaiters, escalators, and moving walks? (1) Elevators, dumbwaiters, escalators, and moving walks must have a single means for disconnecting all ungrounded main power supply conductors for each unit.

(2) If interconnections between control panels are necessary for operation of the system on a multicar installation that remains energized from a source other than the disconnecting means, a warning sign must be mounted on or adjacent to the disconnecting means. The sign must be clearly legible and shall read "Warning—Parts of the control panel are not deenergized by this switch."

(3) If control panels are not located in the same space as the drive machine, they must be located in cabinets with doors or panels capable of being locked closed.

WAC 296-307-37009 What requirements apply to the disconnecting means for electric welders? (1) A disconnecting means must be provided in the supply circuit for each motor-generator arc welder, and for each AC transformer and DC rectifier arc welder that is not equipped with a disconnect mounted as an integral part of the welder.

(2) A switch or circuit breaker must be provided by which each resistance welder and its control equipment can be isolated from the supply circuit. The ampere rating of this disconnecting means must not be less than the supply conductor ampacity.

WAC 296-307-37012 What requirements apply to electrically driven or controlled irrigation machines? (1) If an electrically driven or controlled irrigation machine has a stationary point, a driven ground rod must be connected to the machine at the stationary point for lightning protection.

(2) The main disconnecting means for a center pivot irrigation machine must be located at the point of connection of electrical power to the machine and must be readily accessible and capable of being locked in the open position. A disconnecting means must be provided for each motor and controller.
• All other locations where ignitable concentrations of flammable vapors or gases are likely to occur in the course of normal operations.

(b) Class I, Division 2 locations are those where:

(i) Volatile flammable liquids or flammable gases are handled, processed, or used, but in which the hazardous liquids, vapors, or gases are normally confined within closed containers or systems from which they can escape only in an accidental rupture or breakdown of containers or systems, or in case of abnormal operation of equipment; or

(ii) Hazardous concentrations of gases or vapors are normally prevented by positive mechanical ventilation, and which might become hazardous through failure or abnormal operation of the ventilating equipment; or

(iii) They are adjacent to a Class I, Division 1 location, and to which hazardous concentrations of gases or vapors might occasionally be communicated unless prevented by adequate positive-pressure ventilation from a source of clean air, and effective safeguards against ventilation failure are provided.

This classification usually includes locations where:

• Volatile flammable liquids or flammable gases or vapors are used, but which would become hazardous only in case of an accident or unusual operating condition. The quantity of flammable material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the record of the industry or business with respect to explosions or fires are all factors to consider in determining the classification.

• Piping without valves, checks, meters, and similar devices would not ordinarily introduce a hazardous condition even though used for flammable liquids or gases. Locations used for the storage of flammable liquids or a liquefied or compressed gases in sealed containers are not normally considered hazardous unless also subject to other hazardous conditions.

• Electrical conduits and their enclosures separated from process fluids by a single seal or barrier are Division 2 locations if the outside of the conduit and enclosures is a nonhazardous location.

(2) "Class II locations" are those that are hazardous because of the presence of combustible dust. They include the following:

(a) Class II, Division 1 locations are those where:

(i) Combustible dust is or may be suspended in the air under normal operating conditions, in quantities sufficient to produce explosives or ignitable mixtures; or

(ii) Mechanical failure or abnormal operation of machinery or equipment might produce explosive or ignitable, and might also provide a source of ignition through simultaneous failure of electric equipment, operation of protection devices, or from other causes; or

(iii) Combustible dusts of an electrically conductive nature may be present.

This classification may include areas of grain handling and processing plants, starch plants, sugar-pulverizing plants, malting plants, hay-grinding plants, coal pulverizing plants, areas where metal dusts and powders are produced or processed, and other similar locations that contain dust producing machinery and equipment (except where the equipment is dust-tight or vented to the outside). These areas would have combustible dust in the air, under normal operating conditions, in quantities sufficient to produce explosive or ignitable mixtures.

Combustible dusts that are electrically nonconductive include dusts produced in the handling and processing of grain and grain products, pulverized sugar and cocoa, dried egg and milk powders, pulverized spices, starch and pastes, potato and wood flour, oil meal from beans and seed, dried hay, and other organic materials that may produce combustible dusts when processed or handled. Dusts containing magnesium or aluminum are particularly hazardous and the use of extreme caution is necessary to avoid ignition and explosion.

(b) Class II, Division 2 location are those where:

(i) Combustible dust is not normally suspended in the air in quantities sufficient to produce explosive or ignitable mixtures; and dust accumulations are normally insufficient to interfere with the normal operation of electrical equipment or other apparatus; or

(ii) Dust may be in suspension in the air as a result of infrequent malfunctioning of handling or processing equipment, and resulting dust accumulations may be ignitble by abnormal operation or failure of electrical equipment or other apparatus.

This classification includes locations where dangerous concentrations of suspended dust would not be likely but where dust accumulations might form or in the vicinity of electric equipment. These areas may contain equipment from which appreciable quantities of dust would escape under abnormal operating conditions or be adjacent to a Class II Division 1 location into which an explosive or ignitable concentration of dust may be suspended under abnormal operating conditions.

(3) "Class III locations" are those that are hazardous because of the presence of easily ignitable fibers or flyings but in which such fibers or flyings are not likely to be suspended in the air in quantities sufficient to produce ignitable mixtures. They include the following:

(a) Class III, Division 1 locations are those where easily ignitable fibers or materials producing combustible flyings are handled, manufactured, or used.

Such locations usually include combustible fiber manufacturing and processing plants; cotton gins and cottonseed mills; flax-processing plants; and industries involving similar hazardous processes or conditions.

Easily ignitable fibers and flyings include rayon, cotton (including cotton linters and cotton waste), sisal or henequen, istle, jute, hemp, tow, cocoa fiber, oakum, baled waste kapok, Spanish moss, excelsior, and other materials of similar nature.

(b) Class III, Division 2 locations are those where easily ignitable fibers are stored or handled, except in process of manufacture.

WAC 296-307-37209 What equipment, wiring methods, and installations may be used in hazardous locations? Equipment, wiring methods, and installations of equipment in hazardous locations must be intrinsically safe, or approved for the hazardous location, or safe for the hazard-
ous location. Requirements for each of these options are as follows:

1. Equipment and associated wiring approved as intrinsically safe are permitted in any hazardous location for which it is approved.

2. Requirements to be approved for the hazardous location:
   a. Equipment must be approved for the class of location and for the ignitable or combustible properties of the specific gas, vapor, dust, or fiber that will be present.
   b. Equipment must be marked to show the class, group, and operating temperature or temperature range, based on operation in a 40 degrees C ambient, for which it is approved. The temperature marking must be a maximum of the ignition temperature of the specific gas or vapor to be encountered. The following provisions apply to specific equipment:
      i. Nonheat-producing equipment, such as junction boxes, conduit, and fittings, and heat-producing equipment with a maximum temperature of 100 degrees C (212 degrees F) need not have a marked operating temperature or temperature range.
      ii. Fixed lighting fixtures marked for use in Class I, Division 2 locations only, need not be marked to indicate the group.
      iii. Fixed general-purpose equipment in Class I locations (other than lighting fixtures) that is acceptable for use in Class I, Division 2 locations need not be marked with the class, group, division, or operating temperature.
      iv. Fixed dust-tight equipment (other than lighting fixtures) that is acceptable for use in Class II, Division 2 and Class III locations need not be marked with the class, group, division, or operating temperature.
   c. Equipment that is safe for the location shall be of a type and design that provides protection from the hazards arising from combustible and flammable vapors, liquids, gases, dusts, or fibers.

Note: Equipment that meets the requirements of The National Electrical Code, NFPA 70, shall be considered in compliance with the requirements of WAC 296-307-372.

WAC 296-307-37212 How must conduit be installed in hazardous locations? All conduits must be threaded and wrench-tight. Where it is impractical to make a threaded joint tight, a bonding jumper must be used.

WAC 296-307-37215 Which equipment may be used in Division 1 and 2 locations? Equipment that has been approved for a Division 1 location may be installed in a Division 2 location of the same class and group. General-purpose equipment or equipment in general-purpose enclosures may be installed in Division 2 locations if the equipment does not constitute a source of ignition under normal operating conditions.

WAC 296-307-37218 What requirements apply to motors and generators used in hazardous locations? In Class I, Division 1 locations, motors, generators and other rotating electric machinery must be:

1. Approved for Class I, Division 1 locations (explosion-proof); or
2. Of the totally enclosed type supplied with positive-pressure ventilation from a source of clean air with discharge to a safe area, arranged to prevent energizing of the machine until ventilation has been established and the enclosure has been purged with at least 10 volumes of air, and also arranged to automatically deenergize the equipment when the air supply fails; or
3. Of the totally enclosed inert-gas-filled type supplied with a suitable reliable source of inert gas for pressuring the enclosure, with devices provided to ensure a positive pressure in the enclosure and arranged to automatically deenergize the equipment when the gas supply fails; or
4. Of a type designed to be submerged in a liquid that is flammable only when vaporized and mixed with air, or in a gas or vapor at a pressure greater than atmospheric and which is flammable only when mixed with air; and the machine is arranged to prevent energizing it until it has been purged with the liquid or gas to exclude air, and also arranged to automatically deenergize the equipment when the supply of liquid, or gas or vapor fails or the pressure is reduced to atmospheric.

Totally enclosed type (2) and (3) motors must have no external surface with a Celsius operating temperature greater than 80% of the ignition temperature of the gas or vapor involved, as determined by ASTM test procedure (Designation: D-2155-69). Appropriate devices must be provided to detect an increase in temperature of the motor beyond design limits and automatically deenergize the equipment or provide an adequate alarm. Auxiliary equipment must be approved for the location in which it is installed.

WAC 296-307-374 Special systems.

WAC 296-307-37403 What requirements apply to systems over 600 volts, nominal? (1) Wiring methods for fixed installations over 600 volts, nominal, must meet the following requirements:

a. Above-ground conductors must be installed in rigid metal conduit, in intermediate metal conduit, in cable trays, in cablebus, in other suitable raceways, or as open runs of metal-clad cable suitable for the use and purpose. Open runs of nonmetallic-sheathed cable or of bare conductors or busbars must be installed in locations accessible only to qualified persons. Metallic shielding components, such as tapes, wires, or braids for conductors, must be grounded. Open runs of insulated wires and cables with a bare lead sheath or a

[Title 296 WAC—p. 2536]
braided outer covering must be supported to prevent physical damage to the braid or sheath.

(b) Conductors emerging from the ground must be enclosed in approved raceways.

(2) Interrupting and isolating devices must meet the following requirements:

(a) Circuit breaker installations located indoors must consist of metal-enclosed units or fire-resistant cell-mounted units. Circuit breakers must be open mounted only in locations that are accessible only to qualified persons. A means of indicating the open and closed position of circuit breakers must be provided.

(b) Fused cutouts installed in buildings or transformer vaults must be approved for the purpose. They must be readily accessible for fuse replacement.

(c) A means must be provided to completely isolate equipment for inspection and repairs. Isolating means that are not designed to interrupt the load current of the circuit must be either interlocked with an approved circuit interrupter or provided with a sign warning against opening them under load.

(3) Mobile and portable equipment must meet the following requirements:

(a) A metallic enclosure must be provided on the mobile machine for enclosing the terminals of the power cable. The enclosure must include provisions for a solid connection for the ground wire terminal to effectively ground the machine frame. The method of cable termination used must prevent any strain or pull on the cable from stressing the electrical connections. The enclosure must be lockable so that only authorized qualified persons may open it and must be marked with a sign warning of the presence of energized parts.

(b) All energized switching and control parts must be enclosed in grounded metal cabinets or enclosures. Circuit breakers and protective equipment must have the operating means projecting through the metal cabinet or enclosure so these units can be reset without opening locked doors. Enclosures and metal cabinets must be locked so that only authorized qualified persons have access and must be marked with a sign warning of the presence of energized parts. Collector ring assemblies on revolving machines (shovels, draglines, etc.) must be guarded.

(4) Tunnel installations of high-voltage power distribution and utilization equipment that is portable or mobile, such as substations, trailers, cars, mobile shovel, draglines, hoists, drills, dredges, compressors, pumps, conveyors, and underground excavators must meet the following requirements:

(a) Conductors in tunnels must be installed in one or more of the following:

(i) Metal conduit or other metal raceway;

(ii) Type MC cable; or

(iii) Other approved multiconductor cable.

Conductors must also be located or guarded to protect them from physical damage. Multiconductor portable cable may supply mobile equipment. An equipment grounding conductor must be run with circuit conductors inside the metal raceway or inside the multiconductor cable jacket. The equipment grounding conductor may be insulated or bare.

(b) Bare terminals of transformers, switches, motor controllers, and other equipment must be enclosed to prevent accidental contact with energized parts. Enclosures used in tunnels must be drip-proof, weatherproof, or submersible as required by environmental conditions.

(c) A disconnecting means that simultaneously opens all ungrounded conductors must be installed at each transformer or motor location.

(d) All nonenergized metal parts of electric equipment and metal raceways and cable sheaths must be effectively grounded and bonded to all metal pipes and rails at the portal and at maximum intervals of 1000 feet throughout the tunnel.

WAC 296-307-37406 What requirements apply to emergency power systems? This section applies to circuits, systems, and equipment intended to supply power for illumination and special loads, in the event of failure of the normal supply.

(1) Emergency circuit wiring must be kept entirely independent of all other wiring and equipment and must not enter the same raceway, cable, box, or cabinet as other wiring.

Exception: This does not apply where common circuit elements suitable for the purpose are required, or for transferring power from the normal to the emergency source.

(2) Where emergency lighting is necessary, the system must be arranged so that the failure of any individual lighting element, such as a burned out light bulb, cannot leave any space in total darkness.

WAC 296-307-37409 How are Class 1, Class 2, and Class 3 remote control, signaling, and power-limited circuits classified? (1) Class 1, Class 2, or Class 3 remote control, signaling, or power-limited circuits are characterized by their usage and electrical power limitation which differentiates them from light and power circuits. These circuits are classified according to their voltage and power limitations as follows.

(a) Class 1 circuits.

(i) A Class 1 power-limited circuit is supplied from a source with a maximum rated output of 30 volts and 1000 volt-amperes.

(ii) A Class 1 remote control circuit or a Class 1 signaling circuit has a maximum voltage of 600 volts; however, the power output of the source need not be limited.

(b) Class 2 and Class 3 circuits.

(i) Power for Class 2 and Class 3 circuits is limited either inherently (in which no overcurrent protection is required) or by a combination of a power source and overcurrent protection.

(ii) The maximum circuit voltage is 150 volts AC or DC for a Class 2 inherently limited power source, and 100 volts AC or DC for a Class 3 inherently limited power source.

(iii) The maximum circuit voltage is 30 volts AC and 60 volts DC for a Class 2 power source limited by overcurrent protection, and 150 volts AC or DC for a Class 3 power source limited by overcurrent protection.

(2005 Ed.)
WAC 296-307-37412  What requirements apply to fire protective signaling systems? (1) Fire protective signaling circuits must be classified either as nonpower limited or power limited.

(2) The power sources for use with fire protective signaling circuits must be either power limited or nonlimited as follows:

(a) The power supply of nonpower-limited fire protective signaling circuits must have a maximum output voltage of 600 volts.

(b) The power for power-limited fire protective signaling circuits must be either inherently limited, in which no overcurrent protection is required, or limited by a combination of power source and overcurrent protection.

(3) Nonpower-limited fire protective signaling circuits and Class 1 circuits may occupy the same enclosure, cable, or raceway if all conductors are insulated for maximum voltage of any conductor within the enclosure, cable or raceway. Power supply and fire protective signaling circuit conductors are permitted in the same enclosure, cable, or raceway only if connected to the same equipment.

(4) Where open conductors are installed, power-limited fire protective signaling circuits must be separated at least 2 inches from conductors of any light, power, Class 1, and non-power-limited fire protective signaling circuits unless using a special and equally protective method of conductor separation. Cables and conductors of two or more power-limited fire protective signaling circuits or Class 3 circuits are permitted in the same cable, enclosure, or raceway. Conductors of one or more Class 2 circuits are permitted within the same cable, enclosure, or raceway, or raceway with conductors of power-limited fire protective signaling circuits if the insulation of Class 2 circuit conductors in the cable, enclosure, or raceway is at least that needed for the power-limited fire protective signaling circuits.

(5) Fire protective signaling circuits must be identified at terminal and junction locations in a manner that will prevent unintentional interference with the signaling circuit during testing and servicing. Power-limited fire protective signaling circuits must be visibly and durably marked at terminations.

WAC 296-307-374  Working on or near exposed energized parts.

WAC 296-307-37603  What does this section cover? WAC 296-307-376 applies to work performed on exposed live parts (including either direct contact or contact by means of tools or materials) or near enough to them for employees to be exposed to any hazard they present.

WAC 296-307-37609  What requirements apply to working near low voltage lines? When employees are working near energized electrical service conductors operating at 750 volts or less, employees must work in a manner to prevent contact with the energized conductors.

WAC 296-307-37612  What requirements apply to qualified persons working near overhead lines? When a qualified person is working near overhead lines, whether in an elevated position or on the ground, the person must not approach, or take any conductive object without an approved insulating handle, closer to exposed energized parts than shown in WAC 296-307-150 unless:

(1) The person is insulated from the energized part (gloves, with sleeves if necessary, rated for the voltage involved are considered to be insulation of the person from the energized part on which work is performed); or

(2) The energized part is insulated both from all other conductive objects at a different potential and from the person; or

(3) The person is insulated from all conductive objects at a potential different from that of the energized part.

WAC 296-307-37615  What requirements apply to vehicles and mechanical equipment near overhead lines? (1) Any vehicle or mechanical equipment that may have parts of its structure elevated near energized overhead lines must be operated so that a clearance of 10 ft. is maintained. If the voltage is higher than 50kV, the clearance must be increased.
0.4 inch for every 1kV over the voltage. The clearance may be reduced only if:

(a) The vehicle is in transit with its structure lowered, the clearance may be reduced to 4 ft. If the voltage is higher than 50kV, the clearance must be increased 0.4 inch for every 1kV over that voltage.

(b) Insulating barriers are installed to prevent contact with the lines, and if the barriers are rated for the voltage of the line being guarded and are not a part of or an attachment to the vehicle or its raised structure, the clearance may be reduced to a distance within the designed working dimensions of the insulating barrier.

(2) If the equipment is an aerial lift insulated for the voltage involved, and if the work is performed by a qualified person, the clearance (between the uninsulated portion of the aerial lift and the power line) may be reduced to the distance given in WAC 296-307-150.

(3) Employees standing on the ground must not contact the vehicle or mechanical equipment or any of its attachments, unless:

(a) The employee is using protective equipment rated for the voltage; or

(b) The equipment is located so that no uninsulated part of its structure (that portion of the structure that provides a conductive path to employees on the ground) can come closer to the line than permitted in this section.

(4) If any vehicle or mechanical equipment that may have parts of its structure elevated near energized overhead lines is intentionally grounded, employees working on the ground near the point of grounding must not stand at the grounding location whenever there is a possibility of overhead line contact. Additional precautions, such as the use of barricades or insulation, must be taken to protect employees from hazardous ground potentials, depending on earth resistivity and fault currents, which can develop within the first few feet or more outward from the grounding point.

WAC 296-307-37618 What lighting must be provided for employees working near exposed energized parts? (1) Employees must not enter spaces containing exposed energized parts, unless lighting is provided that enables the employees to perform the work safely.

(2) Where lack of lighting or an obstruction prevents an employee from seeing the work to be performed, employees must not perform tasks near exposed energized parts. Employees shall not reach blindly into areas that may contain energized parts.

WAC 296-307-37621 What requirements apply to working near exposed energized parts in confined spaces? (1) For working in a confined or enclosed space (such as a manhole or vault) that contains exposed energized parts, the employer shall provide, and the employee must use, protective shields, protective barriers, or insulating materials that are necessary to avoid contact with these parts. Doors, hinged panels, and the like must be secured to prevent swinging into an employee and causing the employee to contact exposed energized parts.

(2) Conductive materials and equipment that are in contact with any part of an employee’s body shall be handled in a manner that will prevent them from contacting exposed energized conductors or circuit parts. If an employee handles long conductive objects (such as ducts and pipes) in areas with exposed live parts, you must institute work practices (such as the use of insulation, guarding, and material handling techniques) that will minimize the hazard.

(3) Portable ladders must have nonconductive siderails if they are used where the employee or the ladder could contact exposed energized parts.

(4) Conductive articles of jewelry and clothing shall not be worn if they might contact exposed energized parts.

WAC 296-307-37624 Who may defeat an electrical safety interlock? Only a qualified person following the requirements of this section may defeat an electrical safety interlock, and then only temporarily while he or she is working on the equipment. The interlock system must be returned to its operable condition when this work is completed.

WAC 296-307-37627 Safety-related work practices. (1) WAC 296-307-376 and 296-307-378 cover electrical safety-related work practices for both qualified persons (those who are trained in avoiding the electrical hazards of working on or near exposed energized parts) and unqualified persons (those with little or no such training) working on, near, or with the following installations:

[Title 296 WAC—p. 2539]
WAC 296-307-37803  How must employees be trained on safety practices?  (1) The training requirements in this section apply to employees who face a risk of electrical shock that is not reduced to a safe level by the electrical installation requirements of WAC 296-307-362 through 296-307-374.

(2) Training contents must include the following:

(a) Employees must be trained in and familiar with the safety-related work practices required by WAC 296-307-376 through 296-307-378 that apply to their job assignments.

(b) Employees who are covered by this section but who are not qualified persons must also be trained in and familiar with any electrically related safety practices that are not covered by this standard, but that are necessary for their safety.

(c) Qualified persons must, at a minimum, be trained in and familiar with the following:

(i) The skills and techniques necessary to distinguish exposed live parts from other parts of electric equipment;

(ii) The skills and techniques necessary to determine the nominal voltage of exposed live parts; and

(iii) The clearance distance specified in WAC 296-307-376 and the corresponding voltages to which the qualified person will be exposed.

Note 1: For the purposes of WAC 296-307-376 and 296-307-378, an employee must have the training required for a qualified person in order to be considered a qualified person.

Note 2: Qualified persons whose work on energized equipment involves either direct contact or contact by means of tools or materials must also have the training needed to meet WAC 296-307-376.

(3) You must provide either classroom or on-the-job training. The degree of training provided must be determined by the risk to the employee.

WAC 296-307-37805  How must safety-related work practices be chosen and used?  Safety-related work practices must be used to prevent electric shock or other injuries resulting from either direct or indirect electrical contacts, when work is performed near or on equipment or circuits that are or may be energized. The specific safety-related work practices must be consistent with the nature and extent of the associated electrical hazards.

(1) When an employee may be exposed to live parts, they must be deenergized before the employee works on or near them, unless deenergizing introduces other hazards or is infeasible due to equipment design or operational limitations. Live parts that operate at less than 50 volts to ground need not be deenergized if there will be no increased exposure to electrical burns or to explosion due to electric arcs.

Note 1: Examples of other hazards include deactivation of emergency alarm systems, shutdown of hazardous location ventilation equipment, or removal of illumination for an area.

Note 2: An example of work that may be performed on or near energized circuit parts because of unfeasibility due to equipment design or operational limitations is testing of electric circuits that can only be performed with the circuit energized.

(2) If the exposed live parts are not deenergized (for reasons of increased or additional hazards or infeasibility), other safety-related work practices must be used to protect employees who may be exposed to the electrical hazards involved. Such work practices must protect employees against contact with energized circuit parts directly with any part of their body or indirectly through some other conductive object. The work practices must be suitable for the voltage level of the exposed electric conductors or circuit parts.

[Title 296 WAC—p. 2540]
WAC 296-307-37807 What work practices must be followed for work on exposed deenergized parts? (1) This section applies to work on exposed deenergized parts or near enough to them to expose the employee to any electrical hazard they present. Conductors and parts of electric equipment that have been deenergized but have not been locked out or tagged must be treated as energized parts, and WAC 296-307-376 applies to work on or near them.

(2) While any employee is exposed to contact with parts of fixed electric equipment or circuits which have been deenergized, the circuits energizing the parts must be locked out or tagged or both according to the requirements of this section. The requirements must be followed in the order in which they are presented.

"Fixed equipment" means equipment that is fastened or connected by permanent wiring methods.

Note: Lockout and tagging procedures that comply with WAC 296-307-320 will also be deemed to comply with WAC 296-307-37807 through 296-307-37817 if:

• The procedures address the electrical safety hazards covered by this part; and
• The procedures include the requirements of WAC 296-307-37813(4) and 296-307-37815(2).

WAC 296-307-37809 Must an employer have a written copy of lockout-tagout procedures? The employer must maintain a written copy of the procedures outlined in WAC 296-307-37807 through 296-307-37817 and must make it available for inspection by us or by employees. The written procedures may be in the form of a copy of WAC 296-307-37807 through 296-307-37817.

WAC 296-307-37811 What work practices must be followed for deenergizing equipment? (1) Safe procedures for deenergizing circuits and equipment must be determined before circuits or equipment are deenergized.

(2) The circuits and equipment to be worked on must be disconnected from all electric energy sources. Control circuit devices, such as push buttons, selector switches, and interlocks, must not be used as the sole means for deenergizing circuits or equipment. Interlocks for electric equipment must not be used as a substitute for lockout and tagging procedures.

(3) Stored electric energy which might endanger employees must be released. Capacitors must be discharged and high capacitance elements must be short-circuited and grounded, if the stored electric energy might endanger employees.

Note: Capacitors or associated equipment handled in meeting this requirement must be treated as energized.

(4) Stored nonelectrical energy in devices that could reenergize electric circuit parts must be blocked or relieved to the extent that the circuit parts could not be accidently energized by the device.

WAC 296-307-37813 How must locks and tags be applied? (1) A lock and a tag must be placed on each disconnecting means used to deenergize circuits and equipment on which work is to be performed, except as provided in subsections (3) and (5) of this section. The lock must be attached to prevent anyone from operating the disconnecting means unless they resort to undue force or the use of tools.

(2) Each tag must have a statement prohibiting unauthorized operation of the disconnecting means and removal of the tag.

(3) If a lock cannot be applied, or if tagging procedures will provide a level of safety equivalent to that obtained by the use of a lock, a tag may be used without a lock.

(4) A tag used without a lock must be supplemented by at least one additional safety measure that provides a level of safety equivalent to that obtained by the use of a lock. Examples of additional safety measures include the removal of an isolating circuit element, blocking of a controlling switch, or opening of an extra disconnecting device.

(5) A lock may be placed without a tag only under the following conditions:

(a) Only one circuit or piece of equipment is deenergized; and

(b) The lockout period does not extend beyond the work shifts; and

(c) Employees exposed to the hazards associated with reenergizing the circuit or equipment are familiar with this procedure.

WAC 296-307-37815 What work practices must be followed to verify deenergization? The requirements of this section must be met before any circuits or equipment can be considered and worked as deenergized.

(1) A qualified person must operate the equipment operating controls or otherwise verify that the equipment cannot be restarted.

(2) A qualified person must use test equipment to test the circuit elements and electrical parts of equipment to which employees will be exposed and shall verify that the circuit elements and equipment parts are deenergized. The test must also determine if any energized conditions exists as a result of inadvertently induced voltage or unrelated voltage backfeed even though specific parts of the circuit have been deenergized and presumed to be safe. If the circuit to be tested is over 600 volts, nominal, the test equipment must be checked for proper operation immediately before and immediately after this test.

WAC 296-307-37817 What work practices must be followed when reenergizing equipment? These requirements must be met, in the order given, before circuits or equipment are reenergized, even temporarily.

(1) A qualified person must conduct tests and visual inspections as necessary to verify that all tools, electrical jumpers, shorts, grounds, and other devices have been removed, so that the circuits and equipment can be safely energized.

(2) Employees exposed to the hazards associated with reenergizing the circuit or equipment must be warned to stay clear of circuits and equipment.

(3) Each lock and tag must be removed by the employee who applied it or under his or her direct supervision. However, if this employee is absent from the workplace, then the lock or tag must be removed by a qualified person designated to perform this task if:

(a) The employer ensures that the employee who applied the lock or tag is not available at the workplace; and

(b) The employer ensures that the employee is aware that the lock or tag has been removed before resuming work at that workplace.

(4) There shall be a visual determination that all employees are clear of the circuits and equipment.

[bibliography]

WAC 296-307-37819 What safety-related work practices relate to portable electric equipment? This section applies to using cord-connected and plug-connected equipment, including flexible cord sets (extension cords).

(1) Portable equipment must be handled in a manner that will not cause damage. Flexible electric cords connected to equipment must not be used for raising or lowering the equipment. Flexible cords must not be fastened with staples or otherwise hung in a way that could damage the outer jacket or insulation.

(2) Visual inspection requirements:

(a) Portable cord-connected and plug-connected equipment and flexible cord sets must be visually inspected before use on any shift for external defects (such as loose parts, deformed and missing pins, or damage to outer jackets or insulation) and for evidence of possible internal damage (such as pinched or crushed outer jacket). Cord-connected and plug-connected equipment and flexible cord sets that remain connected once they are in place and are not exposed to damage need not be visually inspected until they are relocated.

(b) If there is a defect or evidence of damage that might expose an employee to injury, the defective or damaged items must be removed from service, and no employee shall use it until repairs and tests necessary to render the equipment safe have been made.

(c) When an attachment plug is to be connected to a receptacle (including any on a cord set), the relationship of the plug and receptacle contacts must first be checked to ensure they are of proper mating configurations.

(3) Requirements for grounding-type equipment:

(a) A flexible cord used with grounding-type equipment must contain an equipment grounding conductor.

(b) Attachment plugs and receptacles must not be connected or altered in a manner that would prevent proper continuity of the equipment grounding conductor at the point where plugs are attached to receptacles. These devices must not be altered to allow the grounding pole of a plug to be inserted into slots intended for connection to the current-carrying conductors.

(c) Adapters that interrupt the continuity of the equipment grounding connection are prohibited.

(4) Portable electric equipment and flexible cords used in highly conductive work locations, or in locations where employees are likely to contact water or conductive liquids, must be approved for those locations.

(5) Connecting attachment plugs.

(a) Employees’ hands must not be wet when plugging and unplugging flexible cords and cord-connected and plug-connected equipment, if energized equipment is involved.

(b) Energized plug and receptacle connections must be handled only with insulating protective equipment if the condition of the connection could provide a conducting path to the employee’s hand. For example: If a cord connector is wet from being immersed in water.

(c) Locking-type connectors must be properly secured after connection.

[bibliography]

WAC 296-307-37821 What safety-related work practices relate to electric power and lighting circuits? (1) Load rated switches, circuit breakers, or other devices specifically designed as disconnecting means must be used for the opening, reversing, or closing of circuits under load conditions. Any cable connectors other than the load-break type, fuses, terminal lugs, and cable splice connections are prohibited for such purposes, except in an emergency.

(2) After a circuit is deenergized by a circuit protective device, the circuit must not be manually reenergized until it has been determined that the equipment and circuit can be safety energized. This repetitive manual reclosing of circuit breakers or reenergizing circuits through replaced fuses is prohibited.

Note: When it can be determined from the design of the circuit and the overcurrent devices involved that the automatic operation of a device was caused by an overload rather than a fault connection, no examination of the circuit or connected equipment is needed before the circuit is reenergized.

(3) Overcurrent protection of circuits and conductors must not be modified, even on a temporary basis, beyond that allowed by this part for the installation safety requirements for overcurrent protection.

[bibliography]

WAC 296-307-37823 What safety-related work practices relate to test instruments and equipment? (1) Only qualified persons may perform testing work on electric circuits or equipment.

[Title 296 WAC—p. 2542] (2005 Ed.)
WAC 296-307-37825 What safety-related work practices relate to flammable materials? Where flammable materials are present only occasionally, electric equipment capable of igniting them must not be used, unless measures are taken to prevent hazardous conditions from developing.

Such materials include, but are not limited to: Flammable gases, vapors, or liquids; combustible dust; and ignitable fibers or flyings.

Note: Electrical installation requirements for locations where flammable materials are present on a regular basis are contained in WAC 296-307-372.

WAC 296-307-38003 How must protective equipment be used? (1) Employees working in the areas where there are potential electrical hazards must have and use electrical protective equipment that is appropriate for the specific parts of the body to be protected and for the work to be performed.

(2) If the insulating capability of protective equipment may be subject to damage during use, the insulating material must be protected.

For example: An outer covering of leather is sometimes used to protect rubber insulating material.

(3) Employees must wear nonconductive head protection wherever there is a danger of head injury from electric shock.

(4) Employees must wear protective equipment for the eyes or face wherever there is danger of injury to the eyes or face from electrical arcs or flashes or from flying objects resulting from electrical explosion.

WAC 296-307-38006 What requirements apply to general protective equipment and tools? (1) When working near exposed energized conductors or circuit parts, each employee must use insulated tools or handling equipment if the tools or handling equipment might make contact with such conductors or parts. If the insulating capability of insulated tools or handling equipment is subject to damage, the insulating material must be protected.

(2) Ropes and handlines used near exposed energized parts must be nonconductive.

(3) Protective shields, protective barriers, or insulating materials must be used to protect each employee from shock, burns, or other electrically related injuries while that employee is working near exposed energized parts that might be accidentally contacted or where dangerous electric heating or arcing might occur. When normally enclosed live parts are exposed for maintenance or repair, they must be guarded to protect unqualified persons from contact with the live parts.

(4) Altering techniques must be used to warn and protect employees from hazards that could cause injury due to electric shock, burns, or failure of electric equipment parts.

(5) Safety signs, safety symbols, or accident prevention tags must be used where necessary to warn employees about electrical hazards that may endanger them, as required by WAC 296-307-330.

WAC 296-307-38009 What manufacturing and marking requirements apply to electrical protective devices? Insulating blankets, matting, covers, line hose, gloves, and sleeves made of rubber must meet the following manufacture and marking requirements:

(1) Blankets, gloves, and sleeves must be produced by a seamless process.

(2) Each item must be clearly marked as follows:

(a) All classified equipment must be marked with its class number.

(b) Nonozone-resistant equipment other than matting must be marked Type I.

(c) Ozone-resistant equipment other than matting must be marked Type II.

(d) Other relevant markings, such as the manufacturer's identification and the size of the equipment, may also be provided.

(3) Markings must be nonconductive and shall be applied so they do not impair the insulating qualities of the equipment.

(4) Markings on gloves must be on the cuff.

WAC 296-307-38012 What electrical requirements apply to electrical protective devices? Insulating blankets, matting, covers, line hose, gloves, and sleeves made of rubber must meet the following electrical requirements:

(2005 Ed.)
(1) Equipment must be capable of withstanding the a-c proof-test voltage specified in Table 1 or the d-c proof-test voltage specified in Table 2.

   (a) The proof-test must reliably indicate that the equipment can withstand the voltage involved.

   (b) The test voltage must be applied continuously for three minutes for equipment other than matting and must be applied continuously for one minute for matting.

   (c) Gloves must also be capable of withstanding the a-c proof-test voltage specified in Table 1 after a sixteen-hour water soak.

   (2) When the a-c proof-test is used on gloves, the 60 hertz proof-test current must not exceed the values specified in Table 1 at any time during the test period.

   (a) If the a-c proof-test is made at a frequency other than 60 hertz, the permissible proof-test current must be computed from the direct ratio of the frequencies.

   (b) For the test, gloves (right side out) must be filled with tap water and immersed in water to a depth that is in accordance with Table 3. Water must be added to or removed from the glove, as necessary, so that the water level is the same inside and outside the glove.

   (c) After the sixteen-hour water soak, the 60 hertz proof-test current may exceed the values given in Table 1 by not more than 2 milliamperes.

   (3) Equipment that has been subjected to a minimum breakdown voltage test must not be used for electrical protection.

   (4) Material used for Type II insulating equipment must be capable of withstanding an ozone test, with no visible effects. The ozone test must reliably indicate that the material will resist ozone exposure in actual use. Any visible signs of ozone deterioration of the material, such as checking, cracking, breaks, or pitting, is evidence of failure to meet the requirements for ozone-resistant material.

Note: Rubber insulating equipment meeting the following national consensus standards is considered to be in compliance with WAC 296-307-38009, 296-307-38012, and 296-307-38015:

- ASTM D 178-93, Specification for Rubber Insulating Matting.
- ASTM D 1048-93, Specification for Rubber Insulating Blankets.
- ASTM D 1049-93, Specification for Rubber Insulating Covers.
- ASTM D 1050-90, Specification for Rubber Insulating Line Hose.
- ASTM D 1051-87, Specification for Rubber Insulating Sleeves.

These standards contain specifications for conducting the tests required in this section.

WAC 296-307-38015 What workmanship and finish requirements apply to electrical protective devices? Insulating blankets, matting, covers, line hose, gloves, and sleeves made of rubber must meet the following workmanship and finish requirements:

(1) Equipment must be free of harmful physical irregularities that can be detected by the tests or inspections required in WAC 296-307-38012.

(2) Surface irregularities that may be present on all rubber goods because of imperfections on forms or molds or because of inherent difficulties in the manufacturing process and that may appear as indentations, protuberances, or imbedded foreign material are acceptable if:

   (a) The indentation or protuberance blends into a smooth slope when the material is stretched.

   (b) Foreign material remains in place when the insulating material is folded and stretches with the insulating material surrounding it.

(3) Surface irregularities other than those described in (2) are not acceptable.

(4) The following specific requirements apply to insulating blankets, covers, line hose, gloves, and sleeves made of rubber:

   (a) Maximum use voltages must meet the requirements in Table 4.

   (b) Insulating equipment must be inspected for damage before each day's use and immediately following any incident that can reasonably be suspected of having caused damage. Insulating gloves must be given an air test, along with the inspection.

   (c) Insulating equipment with any of the following defects must not be used:

      (i) A hole, tear, puncture, or cut;

      (ii) Ozone cutting or ozone checking (the cutting action produced by ozone on rubber under mechanical stress into a series of interlacing cracks);

      (iii) An embedded foreign object;

      (iv) Any of the following texture changes: Swelling, softening, hardening, or becoming sticky or inelastic;

      (v) Any other defect that damages the insulating properties.

   (d) Insulating equipment found to have other defects that might affect its insulating properties must be removed from service and returned for testing under (h) of this subsection.

   (e) Insulating equipment must be cleaned as needed to remove foreign substances.

   (f) Insulating equipment must be stored in such a location and in such a manner as to protect it from light, temperature extremes, excessive humidity, ozone, and other injurious substances and conditions.

   (g) Protector gloves must be worn over insulating gloves.

   (h) Electrical protective equipment must be subjected to periodic electrical tests. Test voltages and the maximum intervals between tests must be according to Table 4 and Table 5.

   (i) The test method used must reliably indicate whether the insulating equipment can withstand the voltages involved.

[Title 296 WAC—p. 2544]
Note: Standard electrical test methods considered as meeting this requirement are given in the following national consensus standards:

- ASTM D 1048-93, Specification for Rubber Insulating Blankets.
- ASTM D 1049-93, Specification for Rubber Insulating Covers.
- ASTM D 1050-90, Specification for Rubber Insulating Line Hose.
- ASTM D 1051-87, Specification for Rubber Insulating Sleeves.
- ASTM F 478-92, Specification for In-Service Care of Insulating Line Hose and Covers.
- ASTM F 479-88a, Specification for In-Service Care of Insulating Blankets.
- ASTM F 496-93b, Specification for In-Service Care of Insulating Gloves and Sleeves.

(j) Insulating equipment that fails inspections or electrical tests must not be used by employees, except as follows:

(i) Rubber insulating line hose could be used in shorter lengths with the defective portion cut off.

(ii) Rubber insulating blankets could be repaired using a compatible patch that results in physical and electrical properties equal to those of the blanket.

(iii) Rubber insulating blankets could be salvaged by severing the defective area from the undamaged portion of the blanket. The resulting undamaged area must not be smaller than twenty-two inches by twenty-two inches (560 mm by 560 mm) for Class 1, 2, 3, and 4 blankets.

(k) Repaired insulating equipment must be retested before it may be used by employees.

(l) You must certify that equipment has been tested in accordance with the requirements of (h), (i), and (k) of this subsection. The certification must identify the equipment that passed the test and the date it was tested.

Note: This requirement may be met by marking the equipment and entering the results of the tests and the dates of testing onto logs.

^1The water level is given as the clearance from the cuff of the glove to the water line, with a tolerance of 13 mm. (0.5 in.).

^2If atmospheric conditions make the specified clearances impractical, the clearances may be increased by a maximum of 25 mm. (1 in.)
(3) Where switches or fuses of more than 150 volts to ground are not guarded during ordinary operations, suitable insulating floors, mats or platforms must be provided on which the operator must stand while handling the switches.

Note: Rubber gloves shall only be used on voltages of 5000 volts phase to phase or less.

(1) If there is no multiphase exposure in a system area and if the voltage exposure is limited to the phase-to-ground potential, or (b) If the electrical equipment and devices are insulated or isolated or both so that the multiphase exposure on a grounded wye circuit is removed.

\(^a\)The proof-test voltage shall be applied continuously for at least one minute, but no more than three minutes.

WAC 296-307-40001 What does this section cover? WAC 296-307-400 covers the transportation and application of anhydrous ammonia.

WAC 296-307-40003 What definitions apply to this section? "Certified" means the equipment has been tested by a nationally recognized testing laboratory and meets nationally recognized standards or is safe for a specific use; or is a kind whose production is periodically inspected by a nationally recognized testing laboratory, and bears identification of certification.

"DOT" means the Federal Department of Transportation.

"DOT container" means a container constructed according to the requirements of 49 CFR chapter I.

"DOT cylinder" means a cylinder that meets the requirements of 49 CFR chapter I.

"Labeled" means the equipment has an attached label, symbol, or other identifying mark of a nationally recognized testing laboratory that makes periodic inspections of the production of such equipment, and the label indicates compliance with nationally recognized standards or tests.

WAC 296-307-40005 What general requirements apply to the storage and handling of anhydrous ammonia? (1) All employees must use at least gloves and goggles and may supplement with a face shield while working on or with charged anhydrous ammonia equipment.

(2) You must ensure that equipment is inspected before each day’s work. Conditions that would contribute to leaks shall be corrected.

(3) Hose end-valves must be closed when not in use to prevent accidental discharge in case the main valve is opened.

(4) Relief and vapor valves must discharge away from the operator’s working position.
Safety Standards for Agriculture 296-307-40009

WAC 296-307-40007 What requirements apply to systems mounted on farm wagons (implements of husbandry) for the transportation of ammonia? All anhydrous ammonia containers with a capacity of 3,000 gallons or less and equipment mounted on farm wagons (implements of husbandry) that is used to transport ammonia must meet the requirements of this section.

WAC 296-307-40011 through 296-307-40037 also apply unless otherwise noted.

1) Containers must meet the following mounting requirements:
   a) The farm wagon or container has a stop so the container does not dislodge from its mounting when a farm wagon stops suddenly.
   b) The container is anchored to the farm wagon at one or more places on each side of the container.
   c) The weight of containers mounted on four-wheel farm wagons, is distributed evenly over both axles.
   d) When the cradle and the container are not welded together, material between them eliminates metal-to-metal friction.

2) Container accessories must meet the following requirements:
   a) Each container has a fixed maximum liquid-level gauge.
   b) All containers with more than 250-gallon capacity have a pressure gauge with a dial graduated from 0-400 psi.
   c) The filling connection is fitted with one of the following:
      i) A combination back-pressure check valve and excess-flow valve; or
      ii) One double or two single back-pressure check valves; or
      iii) A positive shut-off valve that has either an internal back-pressure check valve or an internal excess flow valve.
   d) All containers with more than 250-gallon capacity are equipped for spray loading or with an approved vapor return valve.
   e) All vapor and liquid connections have approved excess flow valves or quick-closing internal valves that are only open for operating.

Exception: Safety-relief valves and connections that are specifically exempted by WAC 296-307-40019(5) are exempt from this requirement.

f) Fittings are protected from physical damage by a rigid guard. The guard is designed to withstand force from any direction, equal to twice the weight of the container and lading, at a safety factor of four. If the guard is fully enclosed, the safety-relief valves are properly vented through the guard.

g) If a liquid withdrawal line is installed in the bottom of a container, the connections and hose are at least as high as the lowest horizontal edge of the farm wagon axle.

h) Both ends of the hose are secure while in transit.

3) Each side and the rear end of the container must be marked in letters at least four inches high, with the words "ANHYDROUS AMMONIA" or, "CAUTION—AMMONIA," or marked according to DOT regulations.

Exception: Safety-relief valves and connections that are specifically exempted by WAC 296-307-40019(5) are exempt from this requirement.

(2005 Ed.)

(4) Farm wagons (implements of husbandry) must meet all state regulations and the following requirements:
   a) All farm wagons must be securely attached to the vehicle drawing them by drawbars with safety chains.
   b) A farm wagon must be constructed so that it will follow the path of the towing vehicle and will prevent the towed wagon from whipping or swerving dangerously from side to side.
   c) All farm wagons must have five gallons or more of readily available clean water.

WAC 296-307-40009 What requirements apply to systems mounted on farm wagons (implements of husbandry) for the application of ammonia? This section applies to systems mounted on farm equipment that are used for the field application of ammonia.

WAC 296-307-40011 through 296-307-40037 also apply unless otherwise noted.

1) All containers must be securely mounted.

2) Container valves and accessories must meet the following requirements:
   a) Each container has a fixed maximum liquid-level gauge.
   b) The filling connection is fitted with one of the following:
      i) A combination back-pressure check valve and excess-flow valve; or
      ii) One double or two single back-pressure check valves; or
      iii) A positive shut-off valve that has either an internal back-pressure check valve or an internal excess flow valve.
   c) An excess-flow valve is not required in the vapor connection if the controlling orifice is a maximum of 7/16 inch in diameter and the valve is a hand-operated shut-off valve. To assist in filling applicator tanks, you may bleed vapors to the open air, if this requirement is met.
   d) Metering devices may be connected directly to the tank withdrawal valve. You may use a union type connection between the tank valve and metering device. You may use remote mounting of metering devices if the hose meets the requirements of Appendix B. When the applicator tank is trailed and the metering device is remotely mounted, such as on the tractor tool bar, you must use an automatic break-away type, self-closing coupling.
   e) No excess-flow valve is required in the liquid withdrawal line if the controlling orifice between the contents of the container and the outlet of the shut-off valve is a maximum of 7/16 inch in diameter.

WAC 296-307-40011 What requirements must approved anhydrous ammonia equipment meet? All equipment must be approved by one of the following methods:

(1) The equipment was installed before February 8, 1973, and was approved and tested, and installed according to either the requirements of the American National Standard for the Storage and Handling of Anhydrous Ammonia, K61.1, or the Fertilizer Institute Standards for the Storage and Handling of Agricultural Anhydrous Ammonia, M-1, in effect at the time of installation; or

(2) The equipment is accepted, or certified, or listed, or labeled, or otherwise determined to be safe by a nationally recognized testing laboratory; or

(3)(a) The equipment is a type that no nationally recognized testing laboratory accepts, certifies, lists, labels, or determines to be safe; and

(b) The equipment is inspected or tested by an authority responsible for enforcing occupational safety provisions of a law, code, or regulation pertaining to the storage, handling, transport, and use of anhydrous ammonia; and

(c) The equipment is found in compliance with either the requirements of the American National Standard for the Storage and Handling of Anhydrous Ammonia, K61.1, or the Fertilizer Institute Standards for the Storage and Handling of Agricultural Anhydrous Ammonia, M-1, in effect at the time of installation; or

(4) For a custom-designed and custom-built unit:

(a) You cannot find a nationally recognized testing laboratory or authority responsible for the enforcement of a law, code or regulation pertaining to the storage, transportation and use of anhydrous ammonia that is willing to accept, certify, list, label or determine to be safe your custom equipment; and

(b) You have on file a document attesting to its safe condition following appropriate tests. The document must be signed by a registered professional engineer or qualified person. The document must describe the test bases, test data and results, and also the qualifications of the certifying person.

(1) Containers used with systems covered in WAC 296-307-40005 and 296-307-40007 must be constructed and tested according to the code.

Exception: Construction under Table UW-12 at a basic joint efficiency of under 80% is prohibited. Containers built according to code are exempt from paragraphs UG-125 to UG-128, inclusive, and paragraphs UG-132 and UG-133 of the code.

Note: This subsection allows the continued use or reinstallation of containers constructed and maintained accord-

WAC 296-307-40015 How must nonrefrigerated containers and systems (other than DOT containers) be marked? (1) System nameplates, when required, must be permanently attached to the system so they are readily accessible for inspection.

(2) Each container or system covered in WAC 296-307-40005 and 296-307-40007 must be marked as follows:

(a) With indication that the container or system meets the requirements of the code under which the container is constructed.

(b) With indication on the container and system nameplate when the system is designed for underground installation.

(c) With the name and address of the supplier of the container or the trade name of the container and with the date of fabrication.

(d) With the water capacity of the container in pounds at 60°F or gallons, United States standard.

(e) With the design pressure in pounds per square inch gauge.

(f) With the wall thickness of the shell and heads.

(g) With indication of the maximum fill level for liquid anhydrous ammonia between 20°F and 100°F. Markings must be in increments of not more than 20°F.

Exception: Containers with fixed maximum level indicators, such as fixed length dip tubes, or containers that are filled by weight are exempt from this requirement.
Safety Standards for Agriculture

WAC 296-307-40017 Where may anhydrous ammonia containers be located? (1) When selecting the location for a storage container, you must take into account the physiological effects of ammonia and adjacent fire hazards. Containers located indoors must be in areas especially approved for container storage.

(2) Containers must be located at least fifty feet from a dug well or other sources of potable water supply, unless the container is a part of a water treatment installation.

(3) Permanent storage containers must be located outside densely populated areas.

(4) Containers must be located according to the following:

<table>
<thead>
<tr>
<th>Minimum capacity of container (gallons)</th>
<th>Line of adjoining property that may be built upon, highways &amp; main line of railroad</th>
<th>Place of public assembly</th>
<th>Institution occupancy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Over 500 to 2,000</td>
<td>25</td>
<td>150</td>
<td>250</td>
</tr>
<tr>
<td>Over 2,000 to 30,000</td>
<td>50</td>
<td>300</td>
<td>500</td>
</tr>
<tr>
<td>Over 30,000 to 100,000</td>
<td>50</td>
<td>450</td>

</tr>
<tr>
<td>Over 100,000</td>
<td>50</td>
<td>600</td>
<td>1,000</td>
</tr>
</tbody>
</table>

(h) With the outside surface area in square feet.

(i) With minimum temperature in Fahrenheit for which the container is designed.

(j) The marking must be on the container itself or on a permanently attached nameplate.

(3) All main operating valves on permanently installed containers with a capacity of over 3,000 water gallons must be identified to show whether the valve is in liquid or vapor service. The valve must be identified as follows:

(a) The word LIQUID (or LIQUID VALVE), VAPOR (or VAPOR VALVE), as appropriate, must be placed on or within twelve inches of the valve by means of a stencil tag or decal.

(b) Liquid valves must be painted orange and vapor valves must be painted yellow. The legend ORANGE - LIQUID, YELLOW - VAPOR must be displayed in one or more conspicuous places at each permanent storage location. The legend must have letters at least two inches high and must be placed against a contrasting background.

(4) "Marking refrigerated containers." Each refrigerated container must be marked with a name plate on the outer covering in an accessible place as specified in the following:

- With the notation, "Anhydrous Ammonia"
- With the name and address of the builder and the date of fabrication
- With the water capacity of the container in gallons, U.S. Standard
- With the design pressure
- With the minimum temperature in degrees Fahrenheit for which the container was designed
- The maximum allowable water level to which the container may be filled for test purposes
- With the density of the product in pounds per cubic foot for which the container was designed
- With the maximum level to which the container may be filled with liquid anhydrous ammonia.

(4) Where liquid transfer hose is not drained after transfer operations, the hose must have an approved shut-off valve at the discharge end. You must provide a method to prevent excessive hydrostatic pressure in the hose. (See WAC 296-307-40025.)

(5) On all hose 1/2-inch outside diameter and larger, used for the transfer of anhydrous ammonia liquid or vapor, you must ensure that the following information is etched, cast, or impressed at five-foot intervals:
   • Anhydrous Ammonia
   • xxx psig (Maximum working pressure)
   • Manufacturer's Name or Trademark
   • Year of Manufacture

[WAC 296-307-40018 What requirements apply to piping, tubing, and fittings? (1) All piping, tubing and fittings must be designed, constructed, and installed to prevent leaks when connected.

(2) All piping, tubing and fittings must be designed for a pressure of at least the maximum pressure to which they may be subjected in service.

(3) All piping must be well supported and allow for expansion and contraction. All refrigeration system piping must conform to the Refrigeration Piping Code (ANSI B31.5 1966 addenda B31.1a-1968), a section of the American Standard Code for Pressure Piping, as it applies to ammonia.

(4) Piping used on nonrefrigerated systems must meet the requirements of ASTM A-53-1969 Grade B Electric Resistance Welded and Electric Flash Welded Pipe. Pipe must be at least Schedule 40 when joints are welded, or welded and flanged. Pipe must be at least Schedule 80 when joints are threaded. Brass, copper, or galvanized steel pipe or tubing is prohibited.

(5) All metal flexible connections for permanent installations must have a minimum working pressure of 250 psig (safety factor of 4). For temporary installations, you may use hose that meets the requirements of WAC 296-307-40023.

(6) Cast iron fittings are prohibited. You must use fittings made especially for ammonia service of malleable or nodular iron that meet the requirements of Specification ASTM A47 or ASTM A395.

(7) All piping, tubing, and fittings must allow for expansion, contraction, jarring, vibration, and settling.

(8) You must make adequate provision to protect all exposed piping from physical damage from moving machinery, the presence of automobiles or trucks, or other strain on the piping.

(9) Joint compounds must be resistant to ammonia.

(10) After assembly, all piping and tubing must be tested and proved to be free from leaks at pressure that is at least equal to the normal operating pressure of the system.

[WAC 296-307-40025 What requirements apply to safety-relief devices? (1) Every container used in systems covered by WAC 296-307-400 must have one or more spring-loaded safety-relief valves or the equivalent.

(2) The discharge from safety-relief valves must be vented away from the container, upward, and unobstructed to the atmosphere. All safety-relief valve discharge openings must have suitable raincaps that allow free discharge of the vapor and prevent water from entering. You must provide a method to drain condensate. The rate of discharge must be as follows:

<table>

[Title 296 WAC—p. 2550] (2005 Ed.)
Surface area = total outside surface area of container in square feet. When the surface area is not stamped on the name plate or when the marking is not legible, calculate the area with one of the following formulas:

- Hemispherical heads:  
  \[ \text{Area} = (\text{Length in feet}) \times (\text{outside diameter in feet}) \times 3.1416. \]

- Other than hemispherical heads:  
  \[ \text{Area} = (\text{Length in feet}) + (0.3 \times \text{outside diameter in feet}) \times 3.1416. \]

- Spherical container:  
  \[ \text{Area} = (\text{outside diameter in feet})^2 \times 3.1416. \]

- Flow rate:  
  \[ \text{CFM air} = \text{cubic feet per minute of air} \times \text{required at standard conditions, 60°F and atmospheric pressure (14.7 psia)}. \]

For containers with total outside surface area greater than 2,500 sq. ft., the formula is:  
\[ \text{Flow rate CFM air} = 22.11 \times A^{0.82} \text{ where } A = \text{outside surface area of the container in square feet}. \]

3) Container safety-relief valves must be set for start to discharge as follows, according to the design pressure of the container.

<table>

</table>

*Note: Plus a relief valve manufacturer's tolerance of ten percent.

4) Safety-relief devices used in systems covered by WAC 296-307-400 must be constructed to discharge at a rate equal to or greater than the rates required in subsection (2) of this section before the pressure exceeds 120% (not including the tolerance referred to in subsection (3) of this section) of the maximum permitted start-to-discharge pressure setting of the device.

5) Safety-relief valves must be arranged to minimize tampering. If the pressure setting adjustment is external, the relief valves must have a sealable adjustment.

6) Shut-off valves installed between the safety-relief valves and the containers or systems described in WAC 296-307-400 are prohibited.

Exception: A shut-off valve may be used where the arrangement of the valve allows the required capacity flow through the relief valves.

Exception example 1: A three-way valve installed under two safety-relief valves, each of which has the required rate of discharge and is installed to allow either of the safety-relief valves to be closed off, but does not allow both safety valves to be closed off at the same time.

Exception example 2: Two separate relief valves are installed with individual shut-off valves. The two shut-off valve stems must be mechanically interconnected to allow the full required flow of one safety-relief valve at all times.

Exception example 3: A safety-relief valve manifold that allows one valve of two, three, four or more to be closed off and the remaining valve or valves will provide not less than the rate of discharge shown on the manifold name-plate.

(2005 Ed.)

7) Safety-relief valves must have direct communication with the vapor space of the container.

8) Each safety-relief valve used with systems described in WAC 296-307-400 must be plainly and permanently marked as follows:
   (a) With the letters “AA” or the symbol NH3.
   (b) The pressure in pounds per square inch gauge (psig) at which the valve is set to start to discharge.
   (c) The rate of discharge of the valve in cubic feet per minute of air at 60°F and atmospheric pressure (14.7 psia).
   (d) The manufacturers name and catalog number.

For example: A safety-relief valve marked AA-250-4200 (air) mean the valve is suitable for use on an anhydrous ammonia container, that it is set to start to discharge at 250 psig; and that its rate of discharge is 4,200 cubic feet per minute of air.

9) No connection to the safety-relief valve may restrict the flow capacity on either the upstream or downstream side.

10) The manufacturer or supplier of a safety-relief valve manifold must publish complete data showing the flow rating through the combined assembly of the manifold with safety-relief valves installed. The manifold flow rating must be determined by testing the manifold with all but one valve discharging. The flow rate must be determined by the restricted opening or openings or those having the lowest flow. The valve must be marked as required in subsection (7) of this section.

11) A hydrostatic relief valve must be installed between each pair of valves in the liquid ammonia piping or hose where liquid may be trapped to release into the atmosphere at a safe location.

12) Discharge from safety-relief devices must not terminate in or beneath any building.

WAC 296-307-40027 What emergency precautions are required when handling anhydrous ammonia? (1) You must train employees required to handle ammonia in the safe operating practices and the proper action to take in an emergency. Employees must be instructed to use the equipment listed in subsection (3) of this section in an emergency.

(2) If ammonia system leaks, the employees trained for designated to act in emergencies must:
   (a) See that anyone not required to deal with an emergency is evacuated from the contaminated area.
   (b) Have two suitable gas masks in readily accessible locations. Full face masks with ammonia canisters as certified by NIOSH under 42 CFR Part 84, are suitable for emergency action for most leaks, particularly those that occur outdoors. For protection in concentrated ammonia atmospheres, self-contained breathing apparatus is required.
   (c) Wear gauntlet type plastic or rubber gloves and wear plastic or rubber suits in heavily contaminated atmospheres.
   (d) Shut off the appropriate valves.

(3) All storage systems must have on hand at least the following equipment for emergency and rescue purposes:
(a) *One full face gas mask with anhydrous ammonia refill canisters.
(b) **One pair of protective gloves.
(c) **One pair of protective boots.
(d) **One protective slicker and/or protective pants and jacket.
(e) Easily accessible shower and/or at least 50 gallons of clean water in an open top container.
(f) Tight-fitting vented goggles or one full face shield.

*If ammonia vapors are detected when the mask is applied, leave the area immediately. The life of a canister in service is controlled by the percentage of vapors to which it is exposed. Canisters must not be opened until ready for use and should be discarded after use or as recommended by the canister manufacturer. Unopened canisters may be guaranteed for as long as three years and all should be dated when received. In addition, an independently supplied air mask of the type used by fire departments may be used for emergencies.

**Gloves, boots, slickers, jackets, and pants must be made of rubber or other material impervious to ammonia.

(4) Where several persons are usually present, additional safety equipment may be necessary.

(5) Each tank motor vehicle transporting anhydrous ammonia, except farm applicator vehicles, must carry a container of at least five gallons of water and must have a full face gas mask, a pair of tight-fitting goggles or one full face shield. The driver must be instructed in their use and the proper action to take to provide for the driver’s safety.

(6) If a leak occurs in transportation equipment and it is impractical to stop the leak, the driver should move the vehicle to an isolated location.

(7) If liquid ammonia contacts the skin or eyes, the affected area should be promptly and thoroughly flushed with water. Do not use neutralizing solutions or ointments on affected areas. A physician must treat all cases of eye exposure to liquid ammonia.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-10-068, § 296-307-40031, filed 5/6/03, effective 8/1/03; 97-09-013, recodified as § 296-307-40029, filed 4/7/97, effective 4/7/97. Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-40029, filed 10/31/96, effective 12/1/96.]

WAC 296-307-40029 What requirements apply to filling densities? Filling density means the percent ratio of the weight of the gas in a container to the weight of water at 60°F that the container will hold. One pound of water equals 27.737 cubic inches at 60°F. To determine the weight capacity of the tank in pounds, the weight of a gallon (231 cubic inches) of water at 60°F in air must be 8.32828 pounds.

(1) The filling densities for nonrefrigerated containers must not exceed the following:

<table>
<thead>
<tr>
<th></th>
<th>Aboveground</th>
<th>Underground</th>
</tr>
</thead>
<tbody>
<tr>
<td>(i) Uninsulated</td>
<td>56%</td>
<td>58%</td>
</tr>
<tr>
<td>(ii) Insulated</td>
<td>57%</td>
<td></td>
</tr>
<tr>
<td>(iii) DOT containers shall be filled according to DOT regulations.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

This corresponds to 82% by volume at -28°F, 85% by volume at 5°F, 87.5% by volume at 30°F, and 90.6% by volume at 60°F.

(2) When containers are filled according to liquid level by any gauging method other than a fixed length dip tube gauge, each container should have a thermometer well so that the internal liquid temperature can be easily determined and the amount of liquid and vapor in the container corrected to a 60°F basis.

WAC 296-307-40031 What requirements apply to the transfer of liquids? (1) Anhydrous ammonia must always be at a temperature suitable for the material of construction and design of the receiving containers. Ordinary steels are not suitable for refrigerated ammonia. See Appendix R of API Standard 620 "Recommended Rules for Design and Construction of Large Welded Low-Pressure Storage Tanks" for materials for low temperature service.

(2) At least one attendant must supervise the transfer of liquids from the time the connections are first made until they are finally disconnected.

(3) Flammable gases or gases that will react with ammonia (such as air) must not be used to unload tank cars or transport trucks.

(4) Containers must be charged or used only on authorization of the owner.

(5) Containers must be gauged and charged only in the open atmosphere or in buildings approved for that purpose.

(6) Pumps used for transferring ammonia must be recommended and labeled for ammonia service by the manufacturer.

(a) Pumps must be designed for at least 250 psig working pressure.

(b) Positive displacement pumps must have installed, off the discharge port, a constant differential relief valve discharging into the suction port of the pump through a line large enough to carry the full capacity of the pump at relief valve setting. The setting and installation must be according to the pump manufacturer’s recommendations.

(c) On the discharge side of the pump, before the relief valve line, there must be a pressure gauge graduated from 0 to 400 psig installed.

(d) Plant piping must contain shut-off valves located as close as practical to pump connections.

(7) Compressors used for transferring or refrigerating ammonia must be recommended and labeled for ammonia service by the manufacturer.

(a) Compressors, except those used for refrigeration, must be designed for at least 250 psig working pressure. Crank cases of compressors not designed to withstand system pressure must be protected with a suitable safety-relief valve.

(b) Plant piping must have shut-off valves located as close as practical to compressor connections.

(c) A safety-relief valve large enough to discharge the full capacity of the compressor must be connected to the discharge before any shut-off valve.
(d) Compressors must have pressure gauges at suction and discharge graduated to at least one and one-half times the maximum pressure that can develop.

(e) Adequate means, such as drainable liquid trap, must be provided on the compressor suction to minimize the entry of liquid into the compressor.

(f) Where necessary to prevent contamination, an oil separator must be provided on the discharge side of the compressor.

(8) Loading and unloading systems must be protected by suitable devices to prevent emptying of the storage container or the container being loaded or unloaded if the hose is cut. Backflow check valves or properly sized excess flow valves must be installed where necessary to provide this protection. In the event that valves are not practical, remotely operated shut-off valves may be installed.

(9) Meters used to measure liquid anhydrous ammonia must be recommended and labeled for ammonia service by the manufacturer.

(a) Liquid meters must be designed for a minimum working pressure of 250 psig.

(b) The metering system must incorporate devices that will prevent the inadvertent measurement of vapor.

WAC 296-307-40033 What requirements apply to tank car unloading points and operations? (1) Provisions for unloading tank cars must meet DOT requirements.

(2) Unloading operations must be performed by reliable employees who are properly instructed and responsible for careful compliance with all procedures.

(3) Caution signs must be placed on the track or car to give necessary warning to anyone approaching car from the open end of the siding. The signs must be left up until after car is unloaded and disconnected from discharge connections. Signs must be of metal or other suitable material, at least 12 by 15 inches, and bear the words "STOP—Tank car connected" or "STOP—Men at work." The word "STOP" must be in letters at least four inches high and the other words in letters at least two inches high. The letters must be white on a blue background.

(4) The track of a tank car siding must be substantially level.

(5) Brakes must be set and wheels blocked on all cars being unloaded.

(6) Tank cars of anhydrous ammonia must be unloaded only at approved locations meeting the requirements of WAC 296-307-40025(4) and 296-307-40031(8).

WAC 296-307-40035 What requirements apply to the liquid-level gauging device? (1) Each container except those filled by weight must have an approved liquid-level gauging device.

(2) All gauging devices must be arranged so that the maximum liquid level to which the container is filled is easily determined.

(3) Gauging devices that require bleeding of the product to the atmosphere such as the rotary tube, fixed tube, and slip tube devices, must be designed so that the maximum opening of the bleed valve is a maximum of No. 54 drill size unless provided with an excess flow valve.

(4) Gauging devices must have a design pressure equal to or greater than the design pressure of the container on which they are installed.

(5) Fixed liquid-level gauges must be designed so that the maximum volume of the container filled by liquid is a maximum of 85% of its water capacity. The coupling into which the fixed liquid-level gauge is threaded must be placed at the 85% level of the container. If located elsewhere, the dip tube of this gauge must be installed so that it cannot be readily removed.

Note: This does not apply to refrigerated storage.

(6) Columnar gauge glasses must be restricted to stationary storage installation. They must have shut-off valves having metallic hand wheels, excess flow valves, and extra heavy glass adequately protected by a metal housing applied by the gauge manufacturer. They must be shielded against the direct rays of the sun.

WAC 296-307-40037 How should aboveground uninsulated containers be maintained? Aboveground uninsulated containers should have a reflective surface maintained in good condition. We recommend white for painted surfaces, but other light reflecting colors are acceptable.

WAC 296-307-40039 What requirements apply to electrical equipment and wiring? (1) Electrical equipment and wiring for use in ammonia installations must be general purpose or weather resistant as appropriate.

(2) Where concentrations of ammonia in the air in excess of 16% by volume are likely to be encountered, electrical equipment and wiring must be specified by and installed according to chapter 296-307 WAC Part T, for Class I, Group D locations.

Part U-2 Hazardous Materials—Liquified Petroleum Gas

WAC 296-307-410 Storage and handling of liquefied petroleum gases.

[Title 296 WAC—p. 2553]
WAC 296-307-41001 What does this part cover? Chapter 296-307 WAC Part U2 covers the storage and handling of liquefied petroleum gases.

The requirements of WAC 296-307-410 to apply to all LP-gas installations covered by this part.

For additional requirements related to: See WAC:
Cylinder systems 296-307-415
Systems using non-DOT containers 296-307-420
LP-gas as a motor fuel 296-307-425
Storage of containers awaiting use or resale 296-307-430
LP-gas installations on commercial vehicles 296-307-435
LP-gas service stations 296-307-440

WAC 296-307-41003 Which LP-gas installations are not covered by this part? (1) This part does not apply to:
(a) LP-gas refrigerated storage systems;
(b) LP-gas used with oxygen;
(c) LP-gas used in utility gas plants (covered by the National Fire Protection Association Standard for the Storage and Handling of Liquefied Petroleum Gases at Utility Gas Plants, NFPA No. 59-1968);
(d) Low-pressure (less than 1/2 pound per square inch or 14 inches water column) LP-gas piping systems, and the installation and operation of residential and commercial appliances supplied through such systems. The National Fire Protection Association Standard for the Installation of Gas Appliances and Gas Piping, NFPA 54-1969 apply to these systems.

(2) LP-gas installations, equipment, and appliances that met the requirements of the National Fire Protection Association Standard for the Storage and Handling of Liquefied Petroleum Gases NFPA No. 58-1972, 1973 at the time of manufacture or installation may be used if they do not create a hazard to employees.

WAC 296-307-41005 What definitions apply to this part? "Adequate ventilation," for fire prevention during normal operation, means the concentration of the gas in a gas-air mixture does not exceed 25% of the lower flammable limit.

"Containers" means all vessels, such as tanks, cylinders, or drums, used to transport or store LP-gases.

"DOT" means the federal Department of Transportation.

"DOT container" means a container that meets DOT regulations.

"DOT cylinder" means a cylinder that meets DOT regulations.

"DOT regulations/requirements/specifications" means the DOT regulations of 49 CFR part 178.

"Liquefied petroleum gases" and "LP-gas" means any material that is composed mostly of any of the following: Hydrocarbons, or mixtures of them; propane; propylene; butanes (normal butane or iso-butane); and butylenes.

"PSIA" pounds per square inch absolute.

"PSIG" means pounds per square inch gauge.

"Systems" means an assembly of the container or containers, major devices such as vaporizers, safety-relief valves, excess flow valves, regulators, and piping connecting such parts.

"Vaporizer-burner" means an integral vaporizer-burner unit, dependent upon the heat generated by the burner to vaporize the liquid used for dehydrators or dryers.

WAC 296-307-41007 When must LP-gas be odorized? You must ensure that all LP-gas is odorized by an approved agent to indicate by distinct odor, the presence of gas down to concentration in air of a maximum of 1/5 the lower limit of flammability.

Exception: Odorization is not required if it will create a hazard in further processing, or if it serves no useful purpose as a warning agent.

Note: The odorization requirement may be met by using 1.0 pounds of ethyl mercaptan, 1.0 pounds of thiophene, or 1.4 pounds of amyl mercaptan per ten thousand gallons of LP-gas. You may use any odorant and quantity that meets the requirements of this section.

WAC 296-307-41009 Must LP-gas containers and equipment be approved? (1) Each system of DOT containers must have approved container valves, connectors, manifold valve assemblies, and regulators.

(2) Each non-DOT system using containers of 2,000 gallons or less water capacity, must have a container assembly, one or more regulators, and other necessary parts. The entire system, or the container assembly with the regulators, must be individually listed by a nationally recognized testing laboratory.

"Container assembly" means the container and fittings for all openings, including shut-off valves, excess flow valves, liquid-level gauging devices, safety-relief devices, and protective housing.

(3) In systems using containers of over 2,000 gallons water capacity, each regulator, container, valve, excess flow valve, gauging device, and relief valve, must be listed by a nationally recognized testing laboratory.

WAC 296-307-41011 What construction and test requirements must containers meet? (1) Containers must be designed, constructed, and tested according to the Rules for Construction of Unfired Pressure Vessels, section VIII, Division 1, American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code, 1968 edition, unless otherwise specified.

(2) Containers constructed according to the 1949 and earlier editions of the ASME Code are exempt from U-2

[Title 296 WAC—p. 2554] (2005 Ed.)
through U-10 and U-19 of the code. Containers constructed according to U-70 in the 1949 and earlier editions do not meet the requirements of this section.

(3) Containers designed, constructed, and tested prior to July 1, 1961, according to the Code for Unfired Pressure Vessels for Petroleum Liquids and Gases, 1951 edition with 1954 Addenda, of the American Petroleum Institute and the American Society of Mechanical Engineers are considered in compliance. Containers constructed according to API-ASME Code do not have to comply with section I or with the appendix to section I. W-601 through W-606 in the 1943 and earlier editions do not apply.

WAC 296-307-41013 How must containers be welded? (1) You must ensure that all welding to the shell, head, or any other part of the container subject to internal pressure, meets the requirements of the code under which the tank was fabricated. You may weld on saddle plates, lugs, or brackets attached to the container by the tank manufacturer.

(2) When you must repair or modify DOT containers by welding, you must return the container to a qualified manufacturer, making containers of the same type, to make the repair or modification according to DOT regulations.

WAC 296-307-41015 How must containers be marked? (1) You must ensure that containers are marked according to DOT regulations or with the following:

(a) Indication that the container meets the requirements of the code under which it is constructed, and all marks required by that code.

(b) Indication whether the container is designed for underground or aboveground installation or both. If intended for both and different style hoods are provided, the marking must indicate the proper hood for each type of installation.

(c) The name and address of the supplier of the container, or with the trade name of the container.

(d) The water capacity of the container in pounds or gallons, United States standard.

(e) The pressure in psig, for which the container is designed.

(f) The wording "This container must not contain a product with a vapor pressure greater than _ psig at 100°F."

(g) The tare weight, for containers with a water capacity of three hundred pounds or less.

(h) Indication of the maximum fill level for liquid at temperatures between 20°F and 130°F. Markings must be in maximum increments of 20°F. This marking may be located on the liquid level gauging device.

Exception: Containers provided with fixed maximum level indicators or that are filled by weighing are exempt from this requirement.

(i) The outside surface area in square feet.

(2) The markings must be on a metal nameplate attached to the container so that it is visible after the container is installed.

(2005 Ed.)

(3) When LP-gas and one or more other gases are stored or used in the same area, the containers must be marked to identify their content. Marking must be according to American National Standard Z48.1-1954, “Method of Marking Portable Compressed Gas Containers to Identify the Material Contained.”

WAC 296-307-41017 Where must containers be located? You must ensure that containers are located according to the following:

(1) Containers and first stage regulating equipment are located outdoors.

Containers may be located indoors under any of the following conditions:

(a) In buildings used exclusively for container charging, vaporization pressure reduction, gas mixing, gas manufacturing, or distribution;

(b) When portable use is necessary and meets the requirements of WAC 296-307-41509;

(c) LP-gas fueled stationary or portable engines that meet the requirements of WAC 296-307-42521 or 296-307-42523;

(d) LP-gas fueled industrial trucks that meet the requirements of WAC 296-307-42525;

(e) LP-gas fueled vehicles garaged according to WAC 296-307-42527; or

(f) Containers awaiting use or resale when stored according to WAC 296-307-430.

(2) Each individual container is located away from the nearest important building, group of buildings, or line of adjoining property that may be built on, according to Table U-1.

TABLE U-1

(a) If the total water capacity of a multicontainer installation at a consumer site is 501 gallons or more, the minimum distance must comply with this table, applying the aggregate...
capacity instead of the capacity per container. For multiple installations, installations must be at least twenty-five feet apart. Do not apply the MINIMUM DISTANCES BETWEEN ABOVEGROUND CONTAINERS to such installations.

(b) Distance requirements may be reduced to 10 feet for a single container of 1200 gallons water capacity or less, if the container is at least 25 feet from any other LP-gas container of more than 125 gallons water capacity.

(c) In buildings devoted exclusively to gas manufacturing and distributing operations, the distances may be reduced if no containers of more than 500 gallons water capacity are located closer than ten feet to gas manufacturing and distributing buildings.

(3) Containers installed for use must not be stacked one above the other.

(4) In industrial installations involving containers of 180,000 gallons total water capacity or more, where serious exposures from the container to adjacent properties are common, firewalls or other means of protection designed and constructed according to good engineering practices are required.

(5) Readily ignitible material such as weeds and long dry grass is removed within ten feet of any container.

(6) The minimum separation between LP-gas containers and flammable liquid tanks is twenty feet; the minimum separation between a container and the centerline of the dike is ten feet.

**EXCEPTION:** This does not apply when LP-gas containers of 125 gallons or less capacity are installed adjacent to Class III flammable liquid tanks of 275 gallons or less capacity.

(7) The accumulation of flammable liquids under adjacent LP-gas containers is prevented by a means such as diking, diversion curbs, or grading.

(8) When dikes are used with flammable liquid tanks, no LP-gas containers are located within the diked area.

**WAC 296-307-41019 What requirements apply to valves and accessories?**

1. Valves, fittings, and accessories connected directly to the container including primary shut-off valves, must have a rated working pressure of at least 250 psig and must be of material and design suitable for LP-gas service. The use of cast iron for container valves, fittings, and accessories is prohibited. Container valves may be made of malleable or nodular iron.

2. Connections to containers must have shut-off valves located as close to the container as practical.

**Exception:** This does not apply to safety-relief connections, liquid level gauging devices, and plugged openings.

3. All required excess flow valves must close automatically at the rated flows of vapor or liquid specified by the manufacturer. The connections, lines, valves, and fittings must have a greater capacity than the rated flow of the excess flow valve.

4. Liquid level gauging devices that are constructed so that outward flow is a maximum of that passed by a No. 54 drill size opening may be installed without excess flow valves.

5. Openings from container or through fittings attached directly on container to which pressure gauge connection is made, need not have shut-off or excess flow valves if such openings are restricted to not larger than No. 54 drill size opening.

6. Required excess flow and back pressure check valves must be located inside the container or outside where the line enters the container. When located outside, the installation must be made to prevent any stress beyond the excess flow or back pressure check valve from causing a break between the container and the valve.

**Exception:** This does not apply to systems using containers with a water capacity greater than 2-1/2 pounds (nominal one pound LP-gas capacity).

7. Excess flow valves must be designed with a bypass that is a maximum of No. 60 drill size opening to allow equalization of pressures.

8. Containers of more than 30 gallons water capacity and less than 2,000 gallons water capacity, filled on a volumetric basis, and manufactured after December 1, 1963, must be equipped for filling into the vapor space.

**WAC 296-307-41021 What requirements apply to piping, tubing, and fittings?**

1. Pipe must be wrought iron or steel (black or galvanized), brass, copper, or aluminum alloy. Aluminum alloy pipe must be at least Schedule 40 according to the specifications for Aluminum Alloy Pipe, ANSI H38.7-1969 (ASTM, B241-1969), and must be suitably marked at each end of each length indicating compliance with ANSI specifications. Alloy 5456 is prohibited.

**Exception:** This does not apply to piping for LP-gas used as a motor fuel or to piping on commercial vehicles.

2. Aluminum alloy pipe must be protected against external corrosion whenever:

   a. It is in contact with dissimilar metals other than galvanized steel; or

   b. Its location is subject to repeated wetting by such liquids as water (except rain water), detergents, sewage, or leaking from other piping; or

   c. It passes through flooring, plaster, masonry, or insulation.

   Galvanized sheet steel or pipe, galvanized inside and out, are considered suitable protection.

3. Aluminum pipe must be three-fourths inch nominal and shall not be used for pressures exceeding 20 psig. Aluminum alloy pipe must not be installed within six inches of the ground.

   a. Vapor piping with operating pressures not exceeding 125 psig must be suitable for a working pressure of at least 125 psig. Pipe must be at least Schedule 40 ASTM A-53-69, Grade B Electric Resistance Welded and Electric Flash Welded Pipe or equal.

   b. Vapor piping with operating pressures over 125 psig and all liquid piping must be suitable for a working pressure of at least 250 psig. Pipe must be at least Schedule 80 if joints

[Title 296 WAC—p. 2556]
are threaded or threaded and back welded. At least Schedule 40 (ASTM A-53-1969 Grade B Electric Resistance Welded and Electric Flash Welded Pipe or equal) must be used if joints are welded, or welded and flanged.

(4) Tubing must be seamless copper, brass, steel, or aluminum alloy. Copper tubing must be of Type K or L or equivalent as covered in the Specification for Seamless Copper Water Tube, ANSI H23.1-1970 (ASTM B88-1969). Aluminum alloy tubing must be of Type A or B or equivalent as covered in Specification ASTM B210-1968 and must be suitably marked every 18 inches indicating compliance with ASTM specifications. The minimum nominal wall thickness of copper tubing and aluminum alloy tubing must be as specified in Table U-2 and Table U-3.

1Based on data in Standard Specification for Aluminum-Alloy Drawn Seamless Coiled Tubes for Special Purpose Applications, ASTM B210-68.

(5) Aluminum alloy tubing must be protected against external corrosion whenever:

(a) It is in contact with dissimilar metals other than galvanized steel; or

(b) Its location is subject to repeated wetting by liquids such as water (except rainwater), detergents, sewage, or leakage from other piping; or

(c) It passes through flooring, plaster, masonry, or insulation.

Galvanized sheet steel or pipe, galvanized inside and out, are considered suitable protection.

(6) The maximum outside diameter for aluminum alloy tubing must be three-quarters inch and must not be used for pressures exceeding 20 psig. Aluminum alloy tubing installed within six inches of the ground is prohibited.

(7) In systems where the gas in liquid form enters the building without pressure reduction, only heavy walled seamless brass or copper tubing with an internal diameter a maximum of 3/32 inch, and a wall thickness of at least 3/64 inch shall be used.

Exception: This requirement does not apply to research and experimental laboratories, buildings or separate fire divisions of buildings used exclusively for housing internal combustion engines, and to commercial gas plants or bulk stations where containers are charged, nor to industrial vaporizer buildings, nor to buildings, structures, or equipment under construction or undergoing major renovation.

(8) Pipe joints must be screwed, flanged, welded, soldered, or brazed with a material having a melting point over 1,000°F. Joints on seamless copper, brass, steel, or aluminum alloy gas tubing shall be made by approved gas tubing fittings, or soldered or brazed with a material having a melting point over 1,000°F.

(9) For operating pressures of 125 psig or less, fittings must be designed for a pressure of at least 125 psig. For operating pressures above 125 psig, fittings must be designed for a minimum of 250 psig.

(10) Threaded cast iron pipe fittings are prohibited. Aluminum alloy fittings must be used with aluminum alloy pipe and tubing. Insulated fittings must be used where aluminum alloy pipe or tubing connects with a dissimilar metal. You may use malleable, nodular, or higher strength gray iron for fittings.

Note: Strainers, regulators, meters, compressors, pumps, etc., are not to be considered as pipe fittings.

(11) All materials such as valve seats, packing, gaskets, diaphragms, etc., must be resistant to the action of LP-gas under the service conditions to which they are subjected.

(12) All piping, tubing, or hose must be tested after assembly and proved free from leaks at least normal operating pressures. After installation, piping and tubing of all domestic and commercial systems must be tested and proved free of leaks using a manometer or equivalent device that will indicate a drop in pressure. Test made by flame is prohibited.

(13) You must ensure that piping allows for expansion, contraction, jarring, and vibration, and settling. You may use flexible connections.

(14) Piping outside buildings may be buried, above-ground, or both, but must be well supported and protected against physical damage. Where soil conditions warrant, all piping must be protected against corrosion. Where condensation may occur, the piping must be pitched back to the container, or you must provide a means for revaporization of the condensate.

**WAC 296-307-41023 What specifications must hoses meet?**

(1) Hose shall be fabricated of materials that are resistant to the action of LP-gas in the liquid and vapor phases. If wire braid is used for reinforcing the hose, it must be of corrosion-resistant material such as stainless steel.

(2) Hose subject to container pressure must be marked "LP-gas" or "LPG" at not greater than ten-foot intervals.

(52x244)
(3) Hose subject to container pressure must be designed for a bursting pressure of not less than 1,250 psig.

(4) Hose subject to container pressure must be listed by a nationally recognized testing laboratory.

(5) Hose connections subject to container pressure must be able to withstand, without leaking, a test pressure of not less than 500 psig.

(6) Hose and hose connections on the low-pressure side of the regulator or reducing valve must be designed for a bursting pressure of not less than 125 psig or five times the set pressure of the relief devices protecting that portion of the system, whichever is higher.

(7) Hose may be used on the low-pressure side of regulators to connect to other than domestic and commercial gas appliances under the following conditions:

(a) The appliances connected with hose are portable and need a flexible connection.

(b) For use inside buildings, the hose is of minimum practical length, but is a maximum of six feet. Hose must not extend from one room to another, nor pass through any walls, partitions, ceilings, or floors. Such hose must not be concealed from view or used in a concealed location.

(c) The hose must be approved and must not be used where it may be exposed to temperatures above 125°F. The hose must be securely connected to the appliance. Rubber slip ends are prohibited.

(d) The shut-off valve for an appliance connected by hose must be in the metal pipe or tubing and not at the appliance end of the hose. When shut-off valves are installed close to each other, precautions must be taken to prevent operation of the wrong valve.

(e) Hose used for connecting to wall outlets must be protected from physical damage.

WAC 296-307-41025 What requirements apply to safety devices? (1) Every container except those constructed according to DOT specifications and every vaporizer (except motor fuel vaporizers and vaporizers described in WAC 296-307-41029)(3) and 296-307-42007 (6)(a) whether heated by artificial means or not, must have one or more safety-relief valves of spring-loaded or equivalent type. These valves must be arranged to afford free vent to the outer air with discharge not less than five feet horizontally away from any opening into the building that is below such discharge. The rate of discharge must be according to the requirements of subsection (2) or (4) of this section.

(2) Minimum required rate of discharge in cubic feet per minute of air at one hundred twenty percent of the maximum permitted start to discharge pressure for safety-relief valves to be used on containers other than those constructed according to DOT specification must be as follows:

<table>

Surface area = total outside surface area of container in square feet.

(3) When the surface area is not stamped on the name plate or when the marking is not legible, calculate the area with one of the following formulas:

- Hemispherical heads: Area = (overall length) X (outside diameter) X 3.1416.
- Other than hemispherical heads: Area = (overall length) +0.3 (outside diameter) X (outside diameter) X 3.1416.

Note: This formula is not exact, but will give results within the limits of practical accuracy for the sole purpose of sizing relief valves.

- Spherical container: Area = (outside diameter)² X 3.1416.
- Flow rate: CFM air = required flow capacity in cubic feet per minute of air at standard conditions, 60°F and atmospheric pressure (14.7 psia).

For containers with total outside surface area greater than 2,000 sq. ft., the formula is: Flow rate CFM air = 53.632 A0.82 where A = outside surface area of the container in square feet.

Valves not marked "air" have flow rate marking in cubic feet per minute of LP-gas. These can be converted to ratings in cubic feet per minute of air by multiplying the LP-gas ratings by factors listed below. Air flow ratings can be con-
converted to ratings in cubic feet per minute of LP-gas by dividing
the air ratings by the factors listed below.

*Manufacturers of safety-relief valves are allowed a plus tolerance not exceeding 10% of the set pressure marked on the valve.

(6) Safety-relief devices used with systems employing non-DOT containers must be constructed to discharge at not less than the rates shown in subsection (2) of this section, before the pressure is in excess of 120% of the maximum (not including the 10% referred to in subsection (5) of this section) permitted start-to-discharge pressure setting of the device.

(7) In high temperature areas, you must use a lower vapor pressure product or a higher designed pressure vessel to prevent the safety valves from opening. The tanks may be protected by cooling devices such as spraying, shading, or other means.

(8) Safety-relief valves must be arranged to minimize tampering. For external pressure setting or adjustment, the relief valves must have an approved sealable adjustment.

(9) Shut-off valves are prohibited between safety-relief devices and the container, equipment, or piping.

EXCEPTION: A shut-off valve may be used where the arrangement of the valve allows the required capacity flow through the safety-relief device.

(10) Safety-relief valves must have direct communication with the vapor space of the container.
Section VIII of the ASME Boiler and Pressure Vessel Code, 1968, must have a design pressure of at least 250 psig and need not be permanently marked.

(3) Heating or cooling coils installed inside a storage container are prohibited.

(4) Vaporizers may be installed in buildings, rooms, sheds, or lean-tos used exclusively for gas manufacturing or distribution, or in other light, noncombustible structures that are well ventilated near the floor line and roof.

Exception: When vaporizing and/or mixing equipment is in a structure not used exclusively for gas manufacturing or distribution, the structure or room must be separated from the remainder of the building. The separation must be a wall designed to withstand a static pressure of at least 100 pounds per square foot. This wall must have no openings or pipe or conduit passing through it. Such structure or room must have adequate ventilation and must have a roof or at least one exterior wall of lightweight construction.

(5) All DOT vaporizers must have, at or near the discharge, a safety-relief valve providing an effective rate of discharge according to WAC 296-307-41025.

(6) The heating medium lines into and out of the vaporizer must have a mechanism to prevent the flow of gas into the heat systems in the event of tube rupture in the vaporizer. Vaporizers must have an automatic means to prevent liquid from passing through the vaporizers to the gas discharge piping.

(7) The device that supplies heat to produce steam, hot water, or other heat may be installed in a building, compartment, room, or lean-to ventilated near the floorline and roof to the outside. The device must be separated from all compartments or rooms containing LP-gas vaporizers, pumps, and central gas mixing devices by a wall designed to withstand a static pressure of at least 100 pounds per square foot. This wall must have no openings or pipes or conduit passing through it.

Exception: This requirement does not apply to the domestic water heaters that may supply heat for a vaporizer in a domestic system.

(8) Gas-fired heating systems supplying heat exclusively for vaporization must have automatic safety devices to shut off the flow of gas to main burners, if the pilot light should fail.

(9) Vaporizers may be an integral part of a fuel storage container directly connected to the liquid section or gas section or both.

(10) Fusible plugs are prohibited on vaporizers.

(11) Vaporizer housings must not have unprotected drains to sewers or sump pits.

WAC 296-307-41029 How must atmospheric vaporizers be constructed and installed? Atmospheric vaporizers using heat from the ground or surrounding air must be installed as follows:

(1) Buried underground; or

(2) Located inside the building near where the pipe enters the building, if the capacity of the unit does not exceed one quart;

(3) Vaporizers of less than one quart capacity heated by the ground or surrounding air, may be installed without safety-relief valves if tests show that the assembly is safe.

WAC 296-307-41031 How must direct gas-fired vaporizers be constructed and installed? Direct gas-fired vaporizers must be constructed, marked, and installed as follows:

(1) According to the requirements of the American Society of Mechanical Engineers Boiler and Pressure Vessel Code, 1968, that apply to the maximum working conditions for which the vaporizer is designed.

(2) With the name of the manufacturer; rated Btu input to the burner; the area of the heat exchange surface in square feet; the outside surface of the vaporizer in square feet; and the maximum vaporizing capacity in gallons per hour.

(3) Vaporizers may be connected to the liquid section or the gas section of the storage container, or both. The container must have a manually operated valve in each connection that completely shuts off when desired, all flow of gas or liquid from container to vaporizer.

(4) Vaporizers with a maximum capacity of 35 gallons per hour must be located at least 5 feet from container shut-off valves. Vaporizers more than 35 gallon capacity but a maximum of 100 gallons per hour must be located at least 10 feet from the container shut-off valves. Vaporizers having a capacity greater than 100 gallons per hour must be located at least 15 feet from container shut-off valves.

(5) Vaporizers may be installed in buildings, rooms, housings, sheds, or lean-tos used exclusively for vaporizing or mixing of LP-gas. Vaporizing housing structures must be noncombustible, and well ventilated near the floorline and the highest point of the roof. When vaporizer and/or mixing equipment is located in a structure or room attached to or within a building, such structure or room must be separated from the remainder of the building by a wall designed to withstand a static pressure of at least 100 pounds per square foot. This wall must have no openings or pipes or conduit passing through it. The structure or room must have adequate ventilation, and a roof or at least one exterior wall of lightweight construction.

(6) Vaporizers must have at or near the discharge, a safety-relief valve providing an effective rate of discharge according to WAC 296-307-41025. The relief valve must be located where it is not subjected to temperatures over 140°F.

(7) Vaporizers must have suitable automatic means to prevent liquid passing from the vaporizer to the gas discharge piping of the vaporizer.

(8) Vaporizers must have means for manually turning off the gas to the main burner and pilot.

(9) Vaporizers must have automatic safety devices to shut off the flow of gas to main burners if the pilot light should fail. When the flow through the pilot exceeds 2,000 Btu per hour, the pilot also must have an automatic safety device to shut off the flow of gas to the pilot should the pilot flame be extinguished.

(10) Pressure regulating and pressure reducing equipment located within 10 feet of a direct fired vaporizer must be
separates from the open flame by an airtight noncombustible partition.

(11) Except as provided in subsection (5) of this section, the following minimum distances must be maintained between direct fired vaporizers and the nearest important building, group of buildings, or line of adjoining property that may be built on:

(a) Ten feet for vaporizers with a vaporizing capacity of 15 gallons per hour or less;

(b) Twenty-five feet for vaporizers with a vaporizing capacity of 16-100 gallons per hour;

(c) Fifty feet for vaporizers with a vaporizing capacity over 100 gallons per hour.

(12) Direct fired vaporizers must not raise the product pressure above the design pressure of the vaporizer equipment or above the pressure shown in the second column of Table U-8.

(13) Fusible plugs are prohibited on vaporizers.

(14) Vaporizers must not have unprotected drains to sewers or sump pits.

WAC 296-307-41033 How must direct gas-fired tank heaters be constructed and installed? Direct gas-fired tank heaters must be constructed and installed as follows:

(1) Direct gas-fired tank heaters, and tanks to which they are applied, must only be installed aboveground.

(2) Tank heaters must be permanently marked with the name of the manufacturer, the rated Btu input to the burner, and the maximum vaporizing capacity in gallons per hour.

Note: Tank heaters may be an integral part of a fuel storage container directly connected to the container liquid section, or vapor section, or both.

(3) Tank heaters must have a means for manually turning off the gas to the main burner and pilot.

(4) Tank heaters must have an automatic safety device to shut off the flow of gas to main burners, if the pilot light should fail. When flow through pilot exceeds 2,000 Btu per hour, the pilot also must have an automatic safety device to shut off the flow of gas to the pilot should the pilot flame be extinguished.

(5) Pressure regulating and pressure reducing equipment if located within ten feet of a direct fired tank heater must be separated from the open flame by a substantially airtight non-combustible partition.

(6) The following minimum distances must be maintained between a storage tank heated by a direct fired tank heater and the nearest important building, group of buildings, or line of adjoining property that may be built on:

(a) Ten feet for storage containers of less than 500 gallons water capacity;

(b) Twenty-five feet for storage containers of 500-1,200 gallons water capacity;

(c) Fifty feet for storage containers of over 1,200 gallons water capacity.

(2005 Ed.)

(7) No direct fired tank heater may raise the product pressure within the storage container over 75% of the pressure in the second column of Table U-8.

WAC 296-307-41035 How must dehydrators be constructed and installed? The vaporizer section of vaporizer-burners used for dehydrators or dryers must be located outdoors; they must be constructed and installed as follows:

(1) Vaporizer-burners must have a minimum design pressure of 250 psig with a factor safety of five.

(2) Manually operated positive shut-off valves must be located at the containers to shut off all flow to the vaporizer-burners.

(3) Minimum distances between storage containers and vaporizer-burners must be as follows:

<table>
<thead>
<tr>
<th>Water capacity per container (gallons)</th>
<th>Minimum distances (feet)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 501</td>
<td>10</td>
</tr>
<tr>
<td>501 to 2,000</td>
<td>25</td>
</tr>
<tr>
<td>Over 2,000</td>
<td>50</td>
</tr>
</tbody>
</table>

(4) The vaporizer section of vaporizer-burners must be protected by a hydrostatic relief valve. The relief valve must be located where it is not subjected to temperatures over 140°F. The start-to-discharge pressure setting must protect the components involved, and be at least 250 psig. The discharge must be directed upward and away from component parts of the equipment and away from operating personnel.

(5) Vaporizer-burners must have means for manually turning off the gas to the main burner and pilot.

(6) Vaporizer-burners must have automatic safety devices to shut off the flow of gas to the main burner and pilot in the event the pilot is extinguished.

(7) Pressure regulating and control equipment must be located or protected so that the temperatures surrounding this equipment shall not exceed 140°F.

Exception: Equipment components may be used at higher temperatures if designed to withstand such temperatures.

(8) Pressure regulating and control equipment when located downstream of the vaporizer must be designed to withstand the maximum discharge temperature of the vapor.

(9) Fusible plugs are prohibited on the vaporizer section of vaporizer-burners.

(10) Vaporizer coils or jackets must be made of ferrous metal or high temperature alloys.

(11) Equipment utilizing vaporizer-burners must have automatic shutoff devices upstream and downstream of the vaporizer section connected so as to operate in the event of excessive temperature, flame failure, and, if applicable, insufficient airflow.

WAC 296-307-41037 What are the maximum filling densities? (1) "Filling density" means the percent ratio of the [Title 296 WAC—p. 2561]
weight of the gas in a container to the weight of water the container will hold at 60°F. All containers shall be filled according to the filling densities shown in Table U-4.

(2) Any container including mobile cargo tanks and portable tank containers regardless of size or construction, shipped under DOT jurisdiction or designed according to DOT specifications must be charged according to DOT requirements.

(3) Exception: Portable containers not subject to DOT jurisdiction must be filled either by weight, or by volume using a fixed length dip tube gauging device.

WAC 296-307-41039 What requirements apply to LP-gas in buildings? (1) Vapor may be piped into buildings at pressures over 20 psig only if the buildings or separate areas thereof:

(a) Are constructed according to this section;

(b) Are used exclusively to house equipment for vaporization, pressure reduction, gas mixing, gas manufacturing, or distribution, or to house internal combustion engines, industrial processes, research and experimental laboratories, or equipment and processes using such gas and having similar hazard;

(c) Are buildings, structures, or equipment under construction or undergoing major renovation.

(2) Liquid may be permitted in buildings as follows:

(a) In buildings, or separate areas of buildings, used exclusively to house equipment for vaporization, pressure reduction, gas mixing, gas manufacturing, or distribution, or to house internal combustion engines, industrial processes, research and experimental laboratories, or equipment and processes using such gas and having similar hazard; and when such buildings or separate areas are constructed according to this section.

(b) In buildings, structures, or equipment under construction or undergoing major renovation if the temporary piping meets the following conditions:

(i) Liquid piping inside the building meets the requirements of WAC 296-307-41021 and is a maximum of three-fourths iron pipe size. Copper tubing with an outside diameter of 3/4 inch or less may be used if it meets the requirements of Type K of Specifications for Seamless Water Tube, ANSI H23.1-1970 (ASTM B88-1969). (See Table U-2.) All such piping must be protected against construction hazards. Liquid piping inside buildings must be kept to a minimum. Such piping must be securely fastened to walls or other surfaces to provide adequate protection from breakage and located to subject the liquid line to the lowest ambient temperatures.

(ii) A shut-off valve must be installed in each intermediate branch line where it takes off the main line and must be readily accessible. A shut-off valve must also be placed at the appliance end of the intermediate branch line. Such shut-off valve must be upstream of any flexible connector used with the appliance.

(iii) Suitable excess flow valves must be installed in the container outlet line supplying liquid LP-gas to the building. A suitable excess flow valve must be installed immediately downstream of each shut-off valve. Excess flow valves must be installed where piping size is reduced and must be sized appropriately.

(iv) Hydrostatic relief valves must be installed according to WAC 296-307-41025(13).

(v) Using hose to carry liquid between the container and the building or at any point in the liquid line, except at the appliance connector, is prohibited.

(vi) Where flexible connectors are necessary for appliance installation, such connectors must be as short as practical and must meet the requirements of WAC 296-307-41021(4) or 296-307-41023.

(vii) Release of fuel when any section of piping or appliances is disconnected must be minimized by either of the following methods:

(A) Using an approved automatic quick-closing coupling (closing in both directions when coupled in the fuel line); or

(B) Closing the valve nearest to the appliance and allowing the appliance to operate until the fuel in the line is consumed.

(viii) See WAC 296-307-41509 for the conditions under which portable containers may be brought indoors.

WAC 296-307-41041 What requirements apply to transfer of liquids? When transferring liquids, you must ensure that:

(1) At least one attendant remains close to the transfer connection from the time the connections are made until they are finally disconnected, during the transfer of the product.

(2) Containers must be filled or used only upon authorization of the owner.

(3) Containers manufactured according to DOT specifications authorized by DOT as a “single trip” or “nonrefillable container” must not be refilled or reused in LP-gas service.
(4) Gas or liquid must not be vented to the atmosphere to assist in transferring contents of one container to another, except as provided in WAC 296-307-42509(4). A listed pump may use LP-gas in the vapor phase as a source of energy. The gas may be vented to the atmosphere at a rate not to exceed that from a No. 31 drill size opening, if venting and liquid transfer are located at least 50 feet from the nearest important building.

(5) Filling fuel containers for industrial trucks or motor vehicles from industrial bulk storage containers must be performed at least ten feet from the nearest important masonry-walled building or at least twenty-five feet from the nearest important building or other construction and always at least 25 feet from any building opening.

(6) Filling portable containers, containers mounted on skids, fuel containers on farm tractors, or similar applications, from storage containers used in domestic or commercial service, must be performed at least 50 feet from the nearest important building.

(7) The filling connection and the vent from the liquid level gauges in containers, filled at point of installation, must be at least ten feet in any direction from air openings into sealed combustion system appliances or mechanical ventilation air intakes.

(8) Fuel supply containers must be gauged and charged only in the open air or in buildings especially provided for that purpose.

(9) Marketers and users must exercise precaution to ensure that only those gases for which the system is designed, examined, and listed, are employed in its operation, particularly with regard to pressures.

(10) Pumps or compressors must be designed for use with LP-gas. When compressors are used they must normally take suction from the vapor space of the container being filled and discharge to the vapor space of the container being emptied.

(11) Pumping systems, when equipped with a positive displacement pump, must include a recirculating device that limits the differential pressure on the pump under normal operating conditions to the maximum differential pressure rating of the pump. The discharge of the pumping system must be protected so that pressure is a maximum of 350 psig. If a recirculation system discharges into the supply tank and contains a manual shut-off valve, an adequate secondary safety recirculation system must be incorporated that has no means of rendering it inoperative. Manual shut-off valves in recirculation systems must be kept open except during an emergency or when repairs are being made to the system.

(12) When necessary, unloading piping or hoses must have suitable bleeder valves for relieving pressure before disconnection.

(13) Agricultural air moving equipment, including crop dryers, shall be shut down when supply containers are filling unless the air intakes and sources of ignition on the equipment are located 50 feet or more from the container.

(14) Agricultural equipment employing open flames or equipment with integral containers, such as flame cultivators, weed burners, and tractors, must be shut down during refueling.

[Statutory Authority: RCW 49.17.040, 49.17.050 and 49.17.060. 96-22-048, § 296-306A-41041, filed 10/31/96, effective 12/1/96.]

WAC 296-307-41043 Must workers be trained? Workers performing installation, removal, operation, and maintenance work must be properly trained in that function.

WAC 296-307-41045 What fire protection must be provided for LP-gas installations? (1) Open flames or other sources of ignition are prohibited in vaporizer rooms (except those housing direct-fired vaporizers), pumphouses, container charging rooms or other similar locations. Direct-fired vaporizers are prohibited in pumphouses or container charging rooms.

Note: LP-gas storage containers do not require lightning protection. Since LP-gas is contained in a closed system of piping and equipment, the system need not be electrically conductive or electrically bonded for protection against static electricity. (See NFPA No. 77-1972-1973, Recommended Practice for Static Electricity.)

(2) Open flames (except as provided in subsection (1) of this section), cutting or welding, portable electric tools, and extension lights capable of igniting LP-gas, are prohibited within classified areas specified in Table U-5 unless the LP-gas facilities have been freed of all liquid and vapor, or special precautions observed under carefully controlled conditions.

WAC 296-307-41047 What electrical requirements apply to LP-gas installations? (1) Electrical equipment and wiring must be specified by and installed according to chapter 296-307 WAC Part T, for ordinary locations.

(2) Fixed electrical equipment and wiring installed within classified areas must comply with Table U-5 and must be installed according to chapter 296-307 WAC Part T.

EXCEPTION: This provision does not apply to fixed electrical equipment at residential or commercial installations of LP-gas systems, LP-gas used as a motor fuel, or to LP-gas system installations on commercial vehicles.

¹The classified area must not extend beyond an unpierced wall, roof, or solid vaportight partition.
²See chapter 296-46 WAC, and chapter 296-306A WAC Part T.
³When classifying the extent of a hazardous area, consider the possible variations in the spotting of tank cars and tank vehicles at the unloading points and the effect these variations of actual spotting point may have on the point of connection:
⁴Ventilation, either natural or mechanical, is considered adequate when the concentration of the gas in a gas-air mixture does not exceed twenty-five percent of the lower flammable limit under normal operating conditions.
WAC 296-307-41049 What requirements apply to liquid-level gauging devices? (1) Each container manufactured after December 31, 1965, and filled on a volumetric basis must have a fixed liquid-level gauge to indicate the maximum permitted filling level according to subsection (5) of this section. Each container manufactured after December 31, 1969, must have permanently attached to the container adjacent to the fixed level gauge a marking showing the percentage full that will be shown by that gauge. When used with a variable liquid-level gauge, the fixed liquid-level gauge will act as a check on the variable gauge. Gauges must be used in charging containers as required in WAC 296-307-41034.

(2) All variable gauging devices must be arranged so that the maximum liquid level for butane, for a 50/50 mixture of butane and propane, and for propane, to which the container may be charged, is easily determined. Liquid levels from empty to full must be marked on the nameplate or system nameplate or label. Gauges must be designed according to this section.

(3) Gauging devices that require bleeding of the product to the atmosphere, such as the rotary tube, fixed tube, and slip tube, shall be designed so that the bleed valve maximum opening is not larger than a No. 54 drill size, unless provided with excess flow valve.

(4) Gauging devices must have a design working pressure of at least 250 psig.

(5) Length of tube or position of fixed liquid-level gauge must be designed to indicate the maximum level to which the container may be filled for the product contained. This level shall be based on the volume of the product at 40°F at its maximum permitted filling density for aboveground containers and at 50°F for underground containers. You must calculate the filling point for which the fixed liquid level gauge must be designed according to this section.

Note: It is impossible to set out in a table the length of a fixed dip tube for various tank capacities because of the various tank diameters and lengths, and because the tank may be installed either vertically or horizontally. If you know the maximum permitted filling volume in gallons, however, you can determine the length of the fixed tube by using a strapping table from the container manufacturer.

The fixed tube should be long enough so that when its lower end touches the surface of the liquid in the container, the contents of the container will be the maximum permitted volume as determined by the following formula:

\[
\text{Maximum volume of LP-gas} = \frac{\text{Specific gravity of LP-gas} \times \text{X filling density} \times \text{correction factor} \times 100}{\text{Water capacity of container}}
\]

Note: It is impossible to set out in a table the length of a fixed dip tube for various tank capacities because of the various tank diameters and lengths, and because the tank may be installed either vertically or horizontally. If you know the maximum permitted filling volume in gallons, however, you can determine the length of the fixed tube by using a strapping table from the container manufacturer.

The fixed tube should be long enough so that when its lower end touches the surface of the liquid in the container, the contents of the container will be the maximum permitted volume as determined by the following formula:

\[
\text{Maximum volume of LP-gas} = \frac{\text{Specific gravity of LP-gas} \times \text{X filling density} \times \text{correction factor} \times 100}{\text{Water capacity of container}}
\]

(1) To determine maximum volume of LP-gas for which a fixed length of dip tube must be set:

<table>
<thead>
<tr>
<th>Specific gravity</th>
<th>Aboveground</th>
<th>Underground</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.500</td>
<td>1.033</td>
<td>1.017</td>
</tr>
<tr>
<td>0.510</td>
<td>1.031</td>
<td>1.016</td>
</tr>
<tr>
<td>0.520</td>
<td>1.029</td>
<td>1.015</td>
</tr>
<tr>
<td>0.530</td>
<td>1.028</td>
<td>1.014</td>
</tr>
<tr>
<td>0.540</td>
<td>1.026</td>
<td>1.013</td>
</tr>
<tr>
<td>0.550</td>
<td>1.025</td>
<td>1.013</td>
</tr>
<tr>
<td>0.560</td>
<td>1.024</td>
<td>1.012</td>

<td>1.021</td>
<td>1.011</td>
</tr>
<tr>
<td>0.590</td>
<td>1.020</td>
<td>1.010</td>
</tr>
</tbody>
</table>

(2) To calculate the maximum volume of LP-gas that can be placed in a container when determining the length of the dip tube expressed as a percentage of total water content of the container, use the formula in (c) of this subsection.

(3) Determine the maximum weight of LP-gas that may be placed in a container for determining the length of a fixed dip tube by multiplying the maximum volume of LP-gas from Table U-6 by the pounds of LP-gas in a gallon at 40°F for aboveground and at 50°F for underground containers. Typical pounds per gallon are specified below:

<table>
<thead>
<tr>
<th>Example:</th>
<th>Assume a one hundred gallon total water capacity tank for aboveground storage of propane having a specific gravity of 0.510 of 60°F.</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 (gals.) x 42 (filling density)</td>
<td>4200</td>
</tr>
<tr>
<td>0.510 x 1.031 (correction factor from Table U-6) x 100</td>
<td>52.6</td>
</tr>
</tbody>
</table>

Note: It is impossible to set out in a table the length of a fixed dip tube for various tank capacities because of the various tank diameters and lengths, and because the tank may be installed either vertically or horizontally. If you know the maximum permitted filling volume in gallons, however, you can determine the length of the fixed tube by using a strapping table from the container manufacturer.

The fixed tube should be long enough so that when its lower end touches the surface of the liquid in the container, the contents of the container will be the maximum permitted volume as determined by the following formula:

\[
\text{Maximum volume of LP-gas} = \frac{\text{Specific gravity of LP-gas} \times \text{X filling density} \times \text{correction factor} \times 100}{\text{Water capacity of container}}
\]

(1) To determine maximum volume of LP-gas for which a fixed length of dip tube must be set:

<table>
<thead>
<tr>

</tbody>
</table>

(2) To calculate the maximum volume of LP-gas that can be placed in a container when determining the length of the dip tube expressed as a percentage of total water content of the container, use the formula in (c) of this subsection.

(3) Determine the maximum weight of LP-gas that may be placed in a container for determining the length of a fixed dip tube by multiplying the maximum volume of LP-gas from Table U-6 by the pounds of LP-gas in a gallon at 40°F for aboveground and at 50°F for underground containers. Typical pounds per gallon are specified below:

<table>
<thead>
<tr>
<th>Example:</th>
<th>Assume a one hundred gallon total water capacity tank for aboveground storage of propane having a specific gravity of 0.510 of 60°F.</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 (gals.) x 42 (filling density)</td>
<td>4200</td>
</tr>
<tr>
<td>0.510 x 1.031 (correction factor from Table U-6) x 100</td>
<td>52.6</td>
</tr>
</tbody>
</table>

Note: It is impossible to set out in a table the length of a fixed dip tube for various tank capacities because of the various tank diameters and lengths, and because the tank may be installed either vertically or horizontally. If you know the maximum permitted filling volume in gallons, however, you can determine the length of the fixed tube by using a strapping table from the container manufacturer.

The fixed tube should be long enough so that when its lower end touches the surface of the liquid in the container, the contents of the container will be the maximum permitted volume as determined by the following formula:

\[
\text{Maximum volume of LP-gas} = \frac{\text{Specific gravity of LP-gas} \times \text{X filling density} \times \text{correction factor} \times 100}{\text{Water capacity of container}}
\]
296-307-41051 Title 296 WAC: Labor and Industries, Department of

Aboveground, pounds per gallon  Underground, pounds per gallon
Propane  4.37  4.31
N Butane  4.97  4.92

(6) Fixed liquid-level gauges used on non-DOT containers must be stamped on the exterior of the gauge with the letters DT followed by the vertical distance (expressed in inches and carried out to one decimal place) from the top of container to the end of the dip tube or to the centerline of the gauge when located at the maximum permitted filling level. For portable containers that may be filled in the horizontal and/or vertical position the letters DT must be followed by V with the vertical distance from the top of the container to the end of the dip tube for vertical filling, and with H followed by the proper distance for horizontal filling. For DOT containers the stamping must be placed both on the exterior of the gauge and on the container. On aboveground or cargo containers where the gauges are positioned at specific levels, the marking may be specified in percent of total tank contents and the marking must be stamped on the container.

(7) Columnar gauge glasses must be restricted to charging plants where the fuel is withdrawn in the liquid phase only. They must have valves with metallic handwheels, excess flow valves, and extra-heavy glass adequately protected with a metal housing applied by the gauge manufacturer. They must be shielded against the direct rays of the sun. Columnar gauge glasses are prohibited on tank trucks, motor fuel tanks, and containers used in domestic, commercial, and industrial installations.

(8) Float gauging devices or equivalent that do not require flow for their operation and that have connections extending outside the container do not have to have excess flow valves if the piping and fittings are adequately designed to withstand the container pressure and are properly protected against physical damage and breakage.

What additional requirements to appliances?

(1) New commercial and industrial gas consuming appliances must be approved.

Exception: Any appliance that was originally manufactured for operation with a gaseous fuel other than LP-gas and is in good condition may be used with LP-gas only after it is properly converted, adapted, and tested for performance with LP-gas before the appliance is placed in use.

(2) Unattended heaters used inside buildings for the purpose of animal or poultry production or care must have an approved automatic device designed to shut off the flow of gas to the main burners, and pilot if used, in case the flame goes out.

(3) All commercial, industrial, and agricultural appliances or equipment must be installed according to the requirements of these standards and according to the following:

(a) Domestic and commercial appliances, NFPA 54-1969, Standard for the Installation of Gas Appliances and Gas Piping.

(b) Industrial appliances, NFPA 54A-1969, Standard for the Installation of Gas Piping and Gas Equipment on Industrial Premises and Certain Other Premises.

What is a "cylinder system"?

A "cylinder system" includes the container base or bracket, containers, container valves, connectors, manifold valve assembly, regulators, and relief valves.

How must containers be marked for cylinder systems?

(1) Containers must be marked according to DOT regulations. Additional markings that do not conflict with DOT regulations may be used.

(2) Each container must be marked with its water capacity in pounds or other identified unit of weight.

(3) Exception: If you are the only one who fills and maintains the container and if the water capacity of the container is identified by a code, subsection (2) of this section does not apply.

(4) Each container must be marked with its tare weight in pounds or other identified unit of weight including all permanently attached fittings but not the cap.

What additional requirements apply to cylinder systems installed outdoors?

(1) Containers must not be buried below ground. However, systems may be installed in a compartment or recess below grade level, such as a niche in a slope or terrace wall that is used for no other purpose, if the container and regulating equipment are not in contact with the ground, and the compartment or recess is drained and ventilated horizontally to the outside air from its lowest level, with the outlet at least 3 feet away from any building opening below the level of the outlet.

(2) Except as provided in WAC 296-307-41025(14), the discharge from safety-relief devices must be located at least three feet away from any building opening that is below the level of discharge and must not terminate beneath any build-
ing unless the space is well ventilated to the outside and is not enclosed on more than two sides.

(3) Containers must be set on firm foundation or otherwise firmly secured; the possible effect of settling on the outlet piping must be guarded against by a flexible connection or special fitting.

WAC 296-307-41509 What additional requirements apply to cylinder system installed indoors? (1) When portable containers are necessary and it is not practical to use them outdoors, containers and equipment may be used indoors only if they meet the requirements of this section.

(a) "Containers in use" means connected for use.

(b) Systems using containers with a water capacity greater than 2-1/2 pounds (nominal one pound LP-gas capacity) must have excess flow valves. Such excess flow valves must be either integral with the container valves or in the connections to the container valve outlets. In either case, an excess flow valve must be installed so that any strain beyond the excess flow valve will not cause breakage between the container and the excess flow valve. The installation of excess flow valves must take into account the type of valve protection provided.

(c) Regulators must be either directly connected to the container valves or to manifolds connected to the container valves. The regulator must be suitable for use with LP-gas. Manifolds and fittings connecting containers to pressure regulator inlets must be designed for at least 250 psig service pressure.

(d) Valves on containers having a water capacity greater than fifty pounds (nominal twenty pounds LP-gas capacity) must be protected while in use.

(e) Aluminum pipe or tubing is prohibited.

(f) Hose must be designed for a working pressure of at least 250 psig. Hose and hose connections shall be listed by a nationally recognized testing laboratory.

(i) Hose must be as short as practical.

(ii) Hose must be long enough to allow required spacing without kinking, straining, or allowing hose to be close enough to a burner to be damaged by heat.

(g) Portable heaters, including salamanders, must have an approved automatic device to shut off the flow of gas to the main burner, and pilot if used, in case the flame goes out. Heaters with inputs above 50,000 Btu manufactured on or after May 17, 1967, and heaters with inputs above 100,000 Btu manufactured before May 17, 1967, must have either:

(i) A pilot that must be lighted and proved before the main burner can be turned on; or

(ii) An electric ignition system;

(iii) Container valves, connectors, regulators, manifolds, piping, and tubing must not be used as structural supports for heaters.

Exception: These requirements do not apply to tar kettle burners, torches, melting pots, nor do they apply to portable heaters under 7,500 Btu input when used with containers with a maximum water capacity of 2-1/2 pounds.

(h) Containers, regulating equipment, manifolds, piping, tubing, and hose must be located to minimize exposure to abnormally high temperatures (such as may result from exposure to convection or radiation from heating equipment or installation in confined spaces), physical damage, or tampering.

(i) Heat producing equipment must be located and used to minimize the possibility of igniting combustibles.

(j) Containers with water capacity greater than 2-1/2 pounds (nominal one pound LP-gas capacity) connected for use, must stand on a firm and substantially level surface and, when necessary, must be secured in an upright position.

(k) Containers, including the valve protective devices, must be installed to minimize the probability of impingement of discharge of safety-relief devices upon containers.

(2) Containers with a maximum water capacity of 2-1/2 pounds (nominal one pound LP-gas capacity) may be used indoors as part of approved self-contained hand torch assemblies or similar appliances.

(3) When buildings frequented by the public are open to the public, containers may be used for repair or minor renovation as follows:

(a) The maximum water capacity of individual containers must be 50 pounds (nominal twenty pounds LP-gas capacity).

(b) The number of LP-gas containers must not exceed the number of employees assigned to use LP-gas.

(c) Containers with a water capacity greater than 2-1/2 pounds (nominal one pound LP-gas capacity) must be attended at all times.

(4) When buildings frequented by the public are closed to the public, containers may be used in buildings or structures for repairs or minor renovation as follows:

(a) The maximum water capacity of individual containers must be 245 pounds (nominal one hundred pounds LP-gas capacity).

(b) For temporary heating such as curing concrete, drying plaster and similar applications, heaters (other than integral heater-container units) must be located at least six feet from any LP-gas container. You may use heaters specifically designed for attachment to the container or to a supporting standard, if they are designed and installed to prevent direct or radiant heat application from the heater onto the container. Blower and radiant type heater must not be directed toward any LP-gas container within 20 feet.

(c) If two or more heater-container units are located in an unpartitioned area on the same floor, the container or containers of each unit must be separated from the container or containers of any other unit by at least 20 feet.

(d) When heaters are connected to containers for use in an unpartitioned area on the same floor, the total water capacity of containers manifolded together for connection to a heater or heaters shall not be greater than 735 pounds (nominal three hundred pounds LP-gas capacity). Such manifolds must be separated by at least 20 feet.

(e) On floors on which heaters are not connected for use, containers may be manifolded together for connection to a heater or heaters on another floor, if:

(i) The total water capacity of containers connected to any one manifold is a maximum of 2,450 pounds (nominal one thousand pounds LP-gas capacity) and;
to the buildings or contents, when the permanent heating sys-
emergency heating purposes, if necessary to prevent damage
installation is not practical, must meet the requirements of
space heating is essential and where a permanent heating
tially noncombustible contents where portable equipment for
use must use the smallest practical quantity.

(5) Containers may be used in industrial occupancies for
processing, research, or experimental purposes as follows:
(a) The maximum water capacity of individual contain-
ers must be 245 pounds (nominal one hundred pounds LP-gas
capacity).
(b) Containers connected to a manifold must have a total
water capacity of a maximum of 735 pounds (nominal three
hundred pounds LP-gas capacity) and only one manifold may
be located in the same room unless separated at least 20 feet
from a similar unit.
(c) LP-gas in containers for research and experimental
use must use the smallest practical quantity.

(6) Containers used in industrial occupancies with essen-
tially noncombustible contents where portable equipment for
space heating is essential and where a permanent heating
installation is not practical, must meet the requirements of
subsection (5) of this section.

(7) Containers may be used in buildings for temporary
emergency heating purposes, if necessary to prevent damage
to the buildings or contents, when the permanent heating sys-
tem is temporarily out of service, as follows:
(a) Containers and heaters must meet the requirements of
subsection (5) of this section.
(b) The temporary heating equipment must be attended
at all times.

(8) Containers may be used temporarily in buildings for
training purposes related in installation and use of LP-gas
systems, as follows:
(a) The maximum water capacity of individual contain-
ers must be 245 pounds (nominal one hundred pounds LP-gas
capacity), but the maximum quantity of LP-gas that may be
placed in each container is 20 pounds.
(b) If more than one container is located in the same
room, the containers must be separated by at least 20 feet.
(c) Containers must be removed from the building when
the training class has terminated.

(ii) Where more than one manifold having a total water
capacity greater than 735 pounds (nominal three hundred
pounds LP-gas capacity) are located in the same unpartition-
tioned area, they shall be separated by at least 50 feet.

(f) Containers with a water capacity greater than 2-1/2
pounds (nominal one pound LP-gas capacity) must be
attended at all times.

(5) Containers may be used in industrial occupancies for
processing, research, or experimental purposes as follows:
(a) The maximum water capacity of individual contain-
ers must be 245 pounds (nominal one hundred pounds LP-gas
capacity).
(b) Containers connected to a manifold must have a total
water capacity of a maximum of 735 pounds (nominal three
hundred pounds LP-gas capacity) and only one manifold may
be located in the same room unless separated at least 20 feet
from a similar unit.
(c) LP-gas in containers for research and experimental
use must use the smallest practical quantity.

(6) Containers used in industrial occupancies with essen-
tially noncombustible contents where portable equipment for
space heating is essential and where a permanent heating
installation is not practical, must meet the requirements of
subsection (5) of this section.

(7) Containers may be used in buildings for temporary
emergency heating purposes, if necessary to prevent damage
to the buildings or contents, when the permanent heating sys-
tem is temporarily out of service, as follows:
(a) Containers and heaters must meet the requirements of
subsection (5) of this section.
(b) The temporary heating equipment must be attended
at all times.

(8) Containers may be used temporarily in buildings for
training purposes related in installation and use of LP-gas
systems, as follows:
(a) The maximum water capacity of individual contain-
ers must be 245 pounds (nominal one hundred pounds LP-gas
capacity), but the maximum quantity of LP-gas that may be
placed in each container is 20 pounds.
(b) If more than one container is located in the same
room, the containers must be separated by at least 20 feet.
(c) Containers must be removed from the building when
the training class has terminated.

Safety Standards for Agriculture

WAC 296-307-42001 What does this section cover? WAC 296-307-420 applies to systems using storage containers not constructed according to DOT specifications. Non-DOT containers must meet all requirements of WAC 296-307-410 (unless otherwise indicated) and the additional requirements of this section.

WAC 296-307-42003 How must non-DOT containers be designed and classified? Storage containers must be designed and classified according to Table U-8.

### TABLE U-8

1New type 80 storage containers have not been authorized since Dec. 31, 1947.

2Container type may be increased by increments of 25. The minimum design pressure of containers shall be 100% of the container type designations when constructed under 1949 or earlier editions of the ASME Code (Par. U-68 and U-69). The minimum design pressure of containers shall be 125% of the container type designation when constructed under:

1. The 1949 ASME Code (Par. U-200 and U-201);
3. All editions of the API-ASME Code.

3Construction of containers under the API-ASME Code is prohibited after July 1, 1961.

WAC 296-307-42005 What requirements apply to valves and accessories, filler pipes, and discharge pipes for non-DOT containers? (1) The filling pipe inlet terminal must not be located inside a building. For containers with a water capacity of 125 gallons or more, such terminals must be located at least 10 feet from any building, and preferably at least 5 feet from any driveway, and must have a protective housing.

2 The filling connection must be fitted with one of the following:

a) Combination back-pressure check valve and excess flow valve.

b) One double or two single back-pressure check valves.

c) A positive shut-off valve in conjunction with either:

i) An internal back pressure valve; or

ii) An internal excess flow valve.

3 All openings in a container must have approved automatic excess flow valves unless otherwise exempt.

4 An excess flow valve is not required in the withdrawal service line if the following requirements are met:

a) The total water capacity is a maximum of 2,000 U.S. gallons.

b) The discharge from the service outlet is controlled by a manually operated shut-off valve that is:

i) Threaded directly into the service outlet of the container;

ii) Is an integral part of a substantial fitting threaded into or on the service outlet of the container; or

iii) Threaded directly into a substantial fitting threaded into or on the service outlet of the container.

c) The shut-off valve is equipped with an attached handwheel or the equivalent.

d) The controlling orifice between the contents of the container and the outlet of the shut-off valve is a maximum of 5/16 inch in diameter for vapor withdrawal systems and 1/8 inch in diameter for liquid withdrawal systems.

e) An approved pressure-reducing regulator is directly attached to the outlet of the shut-off valve and is rigidly supported, or an approved pressure-reducing regulator is attached to the outlet of the shut-off valve by means of a suitable flexible connection, if the regulator is adequately supported and properly protected on or at the tank.

5 All inlet and outlet connections except safety-relief valves, liquid-level gauging devices and pressure gauges on containers of 2,000 gallons water capacity, or more, and on any container used to supply fuel directly to an internal combustion engine, must be labeled to designate whether they communicate with vapor or liquid space. Labels may be on valves.

6 Instead of an excess flow valve, openings may be fitted with a quick-closing internal valve that must remain closed when not in operation. The internal mechanism for such valves may have a secondary control that must have a fusible plug (not over 220°F melting point) that will cause the internal valve to close automatically in case of fire.

7 A maximum of two plugged openings may be used on a container of 2,000 gallons or less water capacity.

8 Containers of 125 gallons water capacity or more manufactured after July 1, 1961, must have an approved device for liquid evacuation, the size of which must be 3/4 inch national pipe thread minimum. A plugged opening does not satisfy this requirement.

(2005 Ed.)
WAC 296-307-42007 What additional requirements apply to safety devices for non-DOT containers? (1) All safety devices must comply with the following:

(a) All container safety-relief devices must be located on the containers.

(b) In industrial and gas manufacturing plants, discharge pipe from safety-relief valves on pipe lines within a building must discharge upward and be piped to a point outside a building.

(c) Safety-relief device discharge terminals must be located to provide protection against physical damage and must be fitted with loose raincaps. Return bends and restrictive pipe fittings are prohibited.

(d) If desired, discharge lines from two or more safety-relief devices located on the same unit, or similar lines from two or more different units, may be run into a common discharge header, if the cross-sectional area of the header is at least equal to the sum of the cross-sectional area of the individual discharge lines, and the setting of safety-relief valves are the same.

(e) Each storage container of over 2,000 gallons water capacity must have a suitable pressure gauge.

(f) A final stage regulator of an LP-gas system (excluding any appliance regulator) must have, on the low-pressure side, a relief valve that is set to start to discharge within the limits specified in Table U-7.

(g) When a regulator or pressure relief valve is installed indoors, the relief valve and the space above the regulator and relief valve diaphragms must be vented to the outside with the discharge outlet located not less than 3 feet horizontally away from any opening into the building that is below such discharge.

Exception: This requirement does not apply to individual appliance regulators already protected. In buildings devoted exclusively to gas distribution, the space above the diaphragm need not be vented to the outside.

(2) Safety devices for aboveground containers must be provided as follows:

(a) Containers of 1,200 gallons water capacity or less that may contain liquid fuel when installed aboveground must have the rate of discharge required by WAC 296-307-41025(2) provided by a spring-loaded relief valve or valves. In addition to the required spring-loaded relief valve, a suitable fuse plug may be used if the total discharge area of the fuse plug for each container does not exceed 0.25 square inch.

(b) The fusible metal of the fuse plugs must have a yield temperature of 208°F minimum and 220°F maximum. Relief valves and fuse plugs must have direct communication with the vapor space of the container.

(c) On a container having a water capacity between 125 and 2,000 gallons, the discharge from the safety-relief valves must be vented away from the container upwards and unobstructed to the open air so that it prevents any impingement of escaping gas upon the container; loose-fitting rain caps shall be used. Suitable provision must be made for draining condensate that may accumulate in the relief valve or its discharge pipe.

(d) On containers of 125 gallons water capacity or less, the discharge from safety-relief devices must be located at least 5 feet horizontally away from any opening into the building below the level of such discharge.

(e) On a container having a water capacity greater than 2,000 gallons, the discharge from the safety-relief valves must be vented away from the container upwards to a point at least 7 feet above the container, and unobstructed to the open air so that it prevents any impingement of escaping gas upon the container; loose-fitting rain caps shall be used. Suitable provision must be made so that any liquid or condensate that may accumulate inside of the safety-relief valve or its discharge pipe will not render the valve inoperative. If a drain is used, the container, adjacent containers, piping, or equipment must be protected against impingement of flame resulting from ignition of product escaping from the drain.

(3) On all containers that are installed underground and that contain no liquid fuel until buried and covered, the rate of discharge of the spring-loaded relief valve installed thereon may be reduced to a minimum of 30% of the rate of discharge specified in WAC 296-307-41025(2). Containers so protected must remain covered after installation until the liquid fuel has been removed. Containers that may contain liquid fuel before being installed underground and before being completely covered with earth are aboveground containers when determining the rate of discharge requirement of the relief valves.

(4) On underground containers of over 2,000 gallons water capacity, the discharge from safety-relief devices must be piped directly upward to a point at least 7 feet above the ground.

(5) Where the manhole or housing may become flooded, the discharge from regulator vent lines must be above the highest probable water level. All manholes or housings must have ventilated louvers or equivalent, and the area of openings must be equal to or exceed the combined discharge areas of the safety-relief valves and other vent lines that discharge their content into the manhole housing.

(6) Safety devices for vaporizers must be provided as follows:

(a) Vaporizers of less than 1 quart total capacity, heated by the ground or the surrounding air, need not have safety-relief valves if adequate tests demonstrate that the assembly is safe without safety-relief valves.

(b) Fusible plugs are prohibited on vaporizers.

(c) In industrial and gas manufacturing plants, safety-relief valves on vaporizers within a building must be piped to a point outside the building and be discharged upward.

WAC 296-307-42009 When may non-DOT containers be reinstalled? Containers may be reinstalled if they are free from harmful external corrosion or other damage. Where containers are reinstalled underground, the corrosion resistant coating must be put in good condition. Where containers are reinstalled aboveground, the safety devices and gauging devices must meet all requirements for aboveground containers.
WAC 296-307-42011 What is the maximum capacity allowed for non-DOT containers? A non-DOT storage container must have a maximum 90,000 gallons water capacity.

(1) Containers installed aboveground must have substantial masonry or noncombustible structural supports on firm masonry foundation, unless otherwise indicated.

(2) Aboveground containers must be supported as follows:
   (a) Horizontal containers must be mounted on saddles that permit expansion and contraction. Structural metal supports may be used when they are protected against fire. Suitable means of preventing corrosion must be provided on that portion of the container in contact with the foundations or saddles.
   (b) Containers of 2,000 gallons water capacity or less may be installed with nonfireproofed ferrous metal supports if mounted on concrete pads or footings, and if the distance from the outside bottom of the container shell to the concrete pad, footing, or the ground is a maximum of 24 inches.
   (3) Any container may be installed with nonfireproofed ferrous metal supports if mounted on concrete pads or footings, and if the distance from the outside bottom of the container to the ground is a maximum of 5 feet, if the container is in an isolated location.

(4) Partially buried containers must meet the following requirements:
   (a) The portion of the container below the surface and for a vertical distance not less than 3 inches above the surface of the ground is protected to resist corrosion, and the container is protected against settling and corrosion as required for fully buried containers.
   (b) Partially buried containers must meet the same spacing requirements as underground tanks.
   (c) Relief valve capacity must be the same as for aboveground containers.
   (d) Container is protected against vehicular damage by location or other means.
   (e) Partially buried containers must meet the same requirements for filling densities as for aboveground containers.

(5) Containers buried underground must be placed so that the top of the container is at least 6 inches below grade. Underground containers subject to abrasive action or physical damage must be:
   (a) Placed not less than 2 feet below grade; or
   (b) Otherwise protected against such physical damage.

It is not necessary to cover the portion of the container to which manhole and other connections are affixed. When necessary to prevent floating, containers must be securely anchored or weighted.

(6) Containers must be given a protective coating before being placed underground. This coating must be equivalent to hot-dip galvanizing or to two coatings of red lead followed by a heavy coating of coal tar or asphalt. In lowering the container into place, take care to prevent damage to the coating. Any damage to the coating must be repaired before backfilling.

Containers must be set on a firm foundation (firm earth may be used) and surrounded with earth or sand firmly tamped in place. Backfill should be free of rocks or other abrasive materials.

(7) Containers with foundations attached (portable or semipermanent containers with suitable steel runners or skids popularly known as "skid tanks") must meet the requirements of WAC 296-307-410 and the following:
   (a) If they are to be used at a given general location for a temporary period of 6 months at most, they may be without fire-resisting foundations or saddles but must have adequate ferrous metal supports.
   (b) They may not be located with the outside bottom of the container shell more than 5 feet above the surface of the ground unless fire-resisting supports are provided.
   (c) The bottom of the skids must be between 2 and 12 inches below the outside bottom of the container shell.
   (d) Flanges, nozzles, valves, fittings, and the like, having communication with the interior of the container, must be protected against physical damage.
   (e) When not permanently located on fire-resisting foundations, piping connections must be flexible enough to minimize breakage or leakage of connections if the container settles, moves, or is otherwise displaced.
   (f) Skids, or lugs for attachment of skids, must be secured to the container according to the rules under which the container is designed and built (with a minimum factor of safety of four) to withstand loading in any direction equal to four times the weight of the container and attachments when filled to the maximum permissible loaded weight.

(8) Field welding where necessary must be made only on saddle plates or brackets that were applied by the manufacturer of the tank.

(9) For aboveground containers, secure anchorage or adequate pier height must be provided against possible container flotation wherever high floodwater might occur.

(10) When permanently installed containers are interconnected, you must allow for expansion, contraction, vibration, and settling of containers, and interconnecting piping. Where flexible connections are used, they must be approved and designed for a bursting pressure of at least five times the vapor pressure of the product at 100°F. Nonmetallic hose is prohibited for permanently interconnecting containers.

(11) Container assemblies listed for interchangeable installation aboveground or underground must meet the requirements for aboveground installations for safety-relief capacity and filling density. For installation aboveground all other requirements for aboveground installations apply. For installation underground all other requirements for underground installations apply.

WAC 296-307-42015 How must non-DOT containers be protected? (1) Valves, regulating, gauging, and other container accessory equipment must be protected against tampering and physical damage. Such accessories must also be protected during the transit of containers intended for installation underground.

(2) On underground or combination aboveground-underground containers, the service valve handwheel, the terminal for connecting the hose, and the opening through which there can be a flow from safety-relief valves must be at least 4 inches above the container and this opening must be located in the dome or housing. Underground systems must be installed so that all openings, including the regulator vent, are located above the normal maximum water table.

(3) All connections to the underground containers must be located within a substantial dome, housing, or manhole, with access protected by a substantial cover.

(4) When standard watch service is provided, it must be extended to the LP-gas installation and personnel shall be properly trained.

(5) If loading and unloading are normally done during the night, adequate lights must be provided to illuminate storage containers, control valves, and other equipment.

(6) Suitable roadways or means of access for extinguishing equipment such as wheeled extinguishers or fire department apparatus must be provided.

WAC 296-307-42017 What requirements apply to non-DOT containers in industrial plants? General provisions applicable to systems in industrial plants (of 2,000 gallons water capacity and more) to bulk filling plants.

(1) When standard watch service is provided, it must be extended to the LP-gas installation and personnel shall be properly trained.

(2) If loading and unloading are normally done during the night, adequate lights must be provided to illuminate storage containers, control valves, and other equipment.

(3) Suitable roadways or means of access for extinguishing equipment such as wheeled extinguishers or fire department apparatus must be provided.

WAC 296-307-42019 What requirements apply to container-charging plants? (1) The container-charging room must be located at least:

(a) Ten feet from bulk storage containers.
(b) Twenty-five feet from line of adjoining property that may be built on.

(2) Tank truck filling station outlets must be located at least:

(a) Twenty-five feet from line of adjoining property that may be built on.
(b) Ten feet from pumps and compressors if housed in one or more separate buildings.

(3) The pumps or compressors may be located in the container-charging room or building, in a separate building, or outside of buildings. When housed in separate building, such building (a small noncombustible weather cover is not to be construed as a building) must be located at least:

(a) Ten feet from bulk storage tanks.
(b) Twenty-five feet from line of adjoining property that may be built on.
(c) Twenty-five feet from sources of ignition.

(4) When a part of the container-charging building is to be used for a boiler room or where open flames or similar sources of ignition exist or are employed, the space to be occupied must be separated from container charging room by a partition wall or walls of fire-resistant construction continuous from floor to roof or ceiling. Such separation walls must be without openings and must be joined to the floor, other walls, and ceiling or roof to provide a permanent gas-tight joint.

WAC 296-307-42021 What fire protection must be provided for non-DOT containers? (1) Each bulk plant must have at least one approved portable fire extinguisher with a minimum rating of 12-B, C.

(2) In industrial installations involving containers of 150,000 gallons aggregate water capacity or more, you must provide an adequate supply of water at the container site for fire protection in the container area, unless other adequate means for fire control are provided. Water hydrants must be readily accessible and spaced to provide water protection for all containers. Enough fire hose must be provided to facilitate easy movement of the hose in the container area. You should equip the outlet of each hose line with a combination fog nozzle. A shelter must be provided to protect the hose and its conveyor from the weather.

WAC 296-307-42023 What other requirements apply to non-DOT containers? (1) Aboveground containers must be kept properly painted.

(2) Vaporizers for internal combustion engines must meet the requirements of WAC 296-307-42515.

(3) Gas regulating and mixing equipment for internal combustion engines must meet the requirements of WAC 296-307-42517.

(4) Where vaporized gas on the low-pressure side of the system may condense to a liquid at normal operating temperatures and pressures, means must be provided to revaporize condensate.

(5) You must protect LP-gas systems against damage from vehicular traffic.

(6) Avoid the use of pits when possible, except pits fitted with automatic flammable vapor detecting devices. No drains or blowoff lines must be directed into or in proximity to sewer systems used for other purposes.

WAC 296-307-42501 What does this section cover?

(1) WAC 296-307-425 applies to internal combustion engines, fuel containers, and pertinent equipment for the use of LP-gases as a motor fuel on easily movable, readily portable units including self-propelled vehicles. This section does not apply to containers for transportation of LP-gases nor to marine fuel use.

(2) All uses of LP-gas as a motor fuel must meet all requirements of WAC 296-307-410 (unless otherwise indicated) and the additional requirements of this section.

[Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-42501, filed 10/31/96, effective 12/1/96.]

WAC 296-307-42503 What general requirements apply to LP-gas used as a motor fuel? (1) Fuel may be used from the cargo tank of a truck while in transit, but not from cargo tanks on trailers or semitrailers. Fuel may be used from the cargo tanks to operate stationary engines if the wheels are securely blocked.

(2) Passenger-carrying vehicles must not be fueled while passengers are on board.

(3) Industrial trucks (including lift trucks) equipped with permanently mounted fuel containers must be charged outdoors. Charging equipment must meet the requirements of WAC 296-307-440.

(4) LP-gas fueled industrial trucks must comply with the Standard for Type Designations, Areas of Use, Maintenance and Operation of Powered Industrial Trucks, NFPA 505-1969.

(5) Engines on vehicles must be shut down while fueling if the fueling operation involves venting to the atmosphere.

WAC 296-307-42505 How must fuel containers be designed and classified? (1) Containers must meet the following requirements:

<table>
<thead>
<tr>
<th>Container type</th>
<th>Minimum design pressure of container lb. per sq. in. gauge</th>
</tr>
</thead>
<tbody>
<tr>
<td>For gases with vapor press. Not to exceed lb. per sp. in. gauge at 100°F (37.8°C.)</td>
<td>200</td>
</tr>
</tbody>
</table>

(1) Container type may be increased by increments of 25. The minimum design pressure of containers shall be 100% of the container type designation when constructed under 1949 or earlier editions of the ASME Code (Par. U-68 and U-69). The minimum design pressure of containers shall be 125% of the container type designation when constructed under:

1. The 1949 ASME Code (Par. U-200 and U-201);
3. All editions of the API-ASME Code.

(2) DOT containers used as fuel containers must meet all requirements of this section.

(3) All container inlets and outlets except safety-relief valves and gauging devices must be labeled to designate whether they communicate with vapor or liquid space. (Labels may be on valves.)

WAC 296-307-42507 How must fuel containers be installed? (1) Containers must be located to minimize the possibility of damage to the container. Containers located in the rear of trucks and buses, when protected by substantial bumpers meet this requirement. Fuel containers on passenger-carrying vehicles must be installed as far from the engine as is practical, and the passenger space and any space containing radio equipment must be sealed from the container space to prevent direct seepage of gas to these spaces. The container compartment must be vented to the outside. In case the fuel container is mounted near the engine or the exhaust system, the container must be shielded against direct heat radiation.

(2) Containers must be installed with as much clearance as practical and at least the minimum road clearance of the vehicle under maximum spring deflection. This minimum clearance must be to the bottom of the container or to the lowest fitting on the container or housing, whichever is lower.

(3) Permanent and removable fuel containers must be securely mounted to prevent jarring loose, slipping, or rotating, and the fastenings must be designed and constructed to withstand static loading in any direction equal to twice the weight of the tank and attachments when filled with fuel using a safety factor of at least four based on the ultimate strength of the material to be used. Field welding, when necessary, must be made only on saddle plates, lugs or brackets, attached to the container by the manufacturer.

(4) Fuel containers on buses must be permanently installed.

(5) Containers from which only vapor is to be withdrawn must be installed and equipped with suitable connections to minimize the accidental withdrawal of liquid.

[Title 296 WAC—p. 2573]
WAC 296-307-42509 What requirements apply to valves and accessories? (1) Container valves and accessories must have a rated working pressure of at least 250 psig, and must be suitable for LP-gas service.

(2) The filling connection must be fitted with an approved double back-pressure check valve, or a positive shut-off in conjunction with an internal back-pressure check valve. On a removable container the filler valve may be a hand operated shut-off valve with an internal excess flow valve. Main shut-off valves on the container on liquid and vapor must be readily accessible.

(3) Filling connections equipped with approved automatic back-pressure check valves, and safety-relief valves, all connections to the containers having openings for the flow of gas in excess of a No. 54 drill size must have approved automatic excess flow valves to prevent discharge of content in case connections are broken.

(4) Liquid-level gauging devices must meet the following requirements:

(a) Variable liquid-level gauges that require the venting of fuel to the atmosphere are prohibited on fuel containers of industrial trucks (including lift trucks).

(b) On portable containers that may be filled in the vertical and/or horizontal position, the fixed liquid-level gauge must indicate maximum permitted filling level for both vertical and horizontal filling with the container oriented to place the safety-relief valve in communication with the vapor space.

(c) For containers used solely in farm tractor service and charged at a point at least 50 feet from any important building, the fixed liquid-level gauge may be constructed so that the outward flow of container content exceeds that passed by a No. 54 drill size opening, but must never exceed that passed by a No. 31 drill-size opening. An excess flow valve is not required. Fittings equipped with restricted drill size opening and the container on which they are used must be marked to indicate the size of the opening.

(d) All valves and connections on containers must be adequately protected to prevent damage due to accidental contact with stationary objects or from loose objects thrown up from the road. All valves must be safeguarded against damage due to collision, overturning or other accident. Farm tractors where parts of the vehicle provide protection to valves and fittings meet this requirement. However, on removable type containers the protection for the fittings must be permanently attached to the container.

(e) You should normally exchange removable fuel outdoors. When removable fuel containers are used, means shall be provided in the fuel system to minimize the escape of fuel when the containers are exchanged. You must use one of the following methods:

(i) Using an approved automatic quick-closing coupling (a type closing in both directions when uncoupled) in the fuel line; or

(ii) Closing the valve at the fuel container and allowing the engine to run until the fuel in the line is consumed.

WAC 296-307-42511 What requirements apply to piping, tubing, and fittings? (1) Pipe from fuel container to first-stage regulator must be at least schedule 80 wrought iron or steel (black or galvanized), brass or copper; or seamless copper, brass, or steel tubing. Steel tubing must have a minimum wall thickness of 0.049 inch. Steel pipe or tubing must be adequately protected against exterior corrosion. Copper tubing must be types K or L or equivalent with a minimum wall thickness of 0.032 inch. Approved flexible connections may be used between container and regulator or between regulator and gas-air mixer. Using aluminum pipe or tubing is prohibited. For removable containers, an approved flexible connection must be used between the container and the fuel line.

(2) All piping must be installed, braced, and supported to minimize vibration strains or wear.

WAC 296-307-42513 What requirements apply to safety devices? (1) Spring-loaded internal safety-relief valves must be used on all motor fuel containers.

(2) The discharge outlet from safety-relief valves must be located on the outside of enclosed spaces and as far as practical from possible sources of ignition, and vented upward within 45 degrees of the vertical to prevent impingement of escaping gas upon containers, or parts of vehicles, or on vehicles in adjacent lines of traffic. A rain cap or other protector must be used to keep water and dirt from collecting in the valve.

(3) When a discharge line from the container safety-relief valve is used, the line shall be metallic, other than aluminum, and must be sized, located, and maintained so as not to restrict the required flow of gas from the safety-relief valve. The discharge line must be able to withstand the pressure resulting from the discharge of vapor when the safety-relief valve is in the full open position. Flexible metal hose or tubing must be used when necessary.

(4) Portable containers equipped for volumetric filling may be filled in either the vertical or horizontal position only when oriented to place the safety-relief valve in communication with the vapor space.

WAC 296-307-42515 What requirements apply to vaporizers? (1) Vaporizers, their parts, and other devices that may be subjected to container pressure must have a design pressure of at least 250 psig.

(2) Each vaporizer must have a valve or suitable plug that will permit substantially complete draining of the vaporizer. It must be located at or near the lowest portion of the section occupied by the water or other heating medium.

(3) Vaporizers must be securely fastened to minimize the possibility of loosening.

(4) Each vaporizer must be permanently marked at a visible point as follows:

(a) With the design pressure of the fuel-containing portion in psig.
(b) With the water capacity of the fuel-containing portion of the vaporizer in pounds.

(5) Devices to supply heat directly to a fuel container must have an automatic device to cut off the supply of heat before the pressure inside the fuel container reaches 80% of the start-to-discharge pressure setting of the safety-relief device on the fuel container.

(6) Engine exhaust gases may be used as a direct source of heat supply for the vaporization of fuel if the materials of construction of those parts of the vaporizer in contact with exhaust gases are resistant to the corrosive action of exhaust gases and the vaporizer system is designed to prevent excessive pressures.

(7) Fusible plugs are prohibited on vaporizers.

WAC 296-307-42517 What requirements apply to gas regulating and mixing equipment? (1) Approved automatic pressure reducing equipment must be installed securely between the fuel supply container and gas-air mixer to reduce the pressure of the fuel delivered to the gas-air mixer.

(2) An approved automatic shut-off valve must be provided in the fuel system at some point ahead of the inlet of the gas-air mixer, designed to prevent flow of fuel to the mixer when the ignition is off and the engine is not running. For industrial trucks and engines operating in buildings other than those used exclusively to house engines, the automatic shut-off valve must be designed to operate if the engine stops. Atmospheric regulators (zero governors) are adequate as an automatic shut-off valve only in cases of outdoor operation such as farm tractors, construction equipment, irrigation pump engines, and other outdoor stationary engine installations.

(3) The source of air for combustion must be completely isolated from the passenger compartment, ventilating system, or air-conditioning system.

[Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-42517, filed 10/31/96, effective 12/1/96.]

WAC 296-307-42519 What is the maximum container capacity allowed? A single fuel container used on passenger carrying vehicles must have a maximum of 200 gallons water capacity. A single fuel container on other vehicles normally operating on the highway must have a maximum of 300 gallons water capacity except as provided in WAC 296-307-42520(1).

WAC 296-307-42523 What requirements apply to portable engines used indoors? (1) Portable engines may be used in buildings only for emergency use, and according to WAC 296-307-42521.

(2) Exhaust gases must be discharged outside the building or to an area where they will not constitute a hazard.

(3) Provision must be made to supply sufficient air for combustion and cooling.

(4) An approved automatic shut-off valve must be provided in the fuel system ahead of the engine, designed to prevent flow of fuel to the engine when the ignition is off or if the engine should stop.

WAC 296-307-42525 What requirements apply to industrial trucks used indoors? (1) LP-gas-fueled industrial trucks may be used in buildings and structures.

(2) No more than two LP-gas containers must be used on an industrial truck for motor fuel purposes.

(3) LP-gas-fueled industrial trucks may be used in buildings frequented by the public, when occupied by the public. The total water capacity of containers on each industrial truck must be a maximum of 105 pounds (nominal 45 pounds LP-gas).

(4) Trucks must be attended at all times in areas occupied by the public.

(5) Industrial trucks must not be parked and left unattended in areas of possible excessive heat or sources of ignition.

WAC 296-307-42527 How must LP-gas-fueled vehicles be garaged? (1) LP-gas-fueled vehicles may be stored or serviced inside garages if there are no leaks in the fuel system and the fuel tanks are not filled beyond the maximum filling capacity allowed.

(2) LP-gas-fueled vehicles being repaired in garages must have the container shut-off valve closed except when fuel is required for engine operation.

(3) Such vehicles must not be parked near sources of heat, open flames, or similar sources of ignition or near open pits unless such pits are adequately ventilated.

[Title 296 WAC—p. 2575]
**WAC 296-307-430** Storage of containers awaiting use or resale.

**WAC 296-307-43001** What does this section cover? WAC 296-307-430 applies to the storage of portable containers a maximum of 1,000 pounds water capacity, filled or partially filled, at user location but not connected for use, or in storage for resale by dealers or resellers. This section does not apply to containers stored at charging plants or at plants devoted primarily to the storage and distribution of LP-gas or other petroleum products.

[Statutory Authority: RCW 49.17.040, [49.17.050 and 49.17.060. 96-22-048, § 296-306A-430, filed 10/31/96, effective 12/1/96.]

**WAC 296-307-43003** What general requirements apply to storage of containers? (1) Containers in storage must be located to minimize exposure to excessive temperature rise, physical damage, or tampering.

(2) Containers stored inside must be located away from exits, stairways, or in areas normally used or intended for the safe exit of people.

(3) Container valves must be protected while in storage as follows:
   (a) By setting into recess of container to prevent the possibility of their being struck if the container is dropped upon a flat surface; or
   (b) By ventilated cap or collar, fastened to container capable of withstanding blow from any direction equivalent to that of a thirty-pound weight dropped four feet. Construction must be such that a blow will not be transmitted to a valve or other connection.

(4) The outlet valves of containers in storage must be closed.

(5) Empty containers that have been in LP-gas service should preferably be stored in the open. When stored inside, they must be considered full containers for the purpose of determining the maximum quantity of LP-gas permitted by this section.

**WAC 296-307-43005** How must containers be stored within buildings frequented by the public? DOT containers with a maximum individual water capacity of 2-1/2 pounds, used with completely self-contained hand torches and similar applications, may be stored or displayed in a building frequented by the public. The display of such containers must be limited to a total of 24 units of each brand and size. The total quantity on display and in storage must not exceed 200 pounds LP-gas.

**WAC 296-307-43007** How must containers be stored in buildings not frequented by the public? (1) The quantity of LP-gas stored must be a maximum of 300 pounds (approximately 2,550 cubic feet in vapor form), except when stored within special buildings or rooms.

(2) Containers carried as a part of service equipment on highway mobile vehicles are not considered in the total storage capacity if the vehicles are stored in private garages, and are limited to one container per vehicle with a maximum LP-gas capacity of 100 pounds. All container valves must be closed.

**WAC 296-307-43009** How must containers be stored within special buildings or rooms? (1) The quantity of LP-gas stored in special buildings or rooms must be a maximum of 10,000 pounds.

(2) The walls, floors, and ceilings of container storage rooms that are within or adjacent to other parts of the building must be constructed of material having at least a two-hour fire resistance rating.

(3) At least 10% of the exterior walls or roof must be of explosion relieving construction.

(4) Each opening from storage rooms to other parts of the building must be protected by a listed one and one-half hour "(B)" fire door.

(5) Such rooms must have no open flames for heating or lighting.

(6) Such rooms must be adequately ventilated both top and bottom to the outside only. The openings from such vents must be at least five feet away from any other opening into any building.

(7) The floors of such rooms must not be below ground level. Any space below the floor must be of solid fill or properly ventilated to the open air.

(8) Such storage rooms must not be located adjoining the line of property occupied by schools, churches, hospitals, athletic fields or other points of public gathering.

**WAC 296-307-43011** How must containers be stored outdoors? (1) Storage outside of buildings, for containers awaiting use or resale, must be located according to the table below with respect to:

(a) The nearest important building or group of buildings;
(b) The line of adjoining property that may be built on;
(c) Busy thoroughfares;
(d) The line of adjoining property occupied by schools, churches, hospitals, athletic fields, or other points of public gathering.

[Title 296 WAC—p. 2576] (2005 Ed.)
WAC 296-307-43013 What fire protection must be provided for stored containers? Storage locations other than supply depots separated and located apart from dealer, reseller, or user establishments must have at least one approved portable fire extinguisher having a minimum rating of 8-B, C.

WAC 296-307-435 LP-gas system installations on commercial vehicles.

WAC 296-307-43501 What does this section cover?

1) WAC 296-307-435 applies to:
   (a) LP-gas system installations on vehicles (self-propelled, trailers, or semitrailers) used for commercial or construction purposes;
   (b) All exchangeable container systems with container capacities greater than 105 pounds water capacity (approximately 45 pounds LP-gas capacity); and
   (c) Systems using containers permanently mounted on vehicles.

2) All LP-gas installations on commercial vehicles must meet all requirements of WAC 296-307-410 (unless otherwise indicated) and the additional requirements of this section. When such a vehicle is permanently parked, and LP-gas is supplied from a system not mounted on and secured to the unladen vehicle, WAC 296-307-415 and 296-307-420 also apply.

3) This section does not apply to LP-gas motor fuel systems covered by WAC 296-307-425.

WAC 296-307-43503 How must containers be constructed? Containers must be constructed according to WAC 296-307-41011, and marked according to the applicable requirements of WAC 296-307-41015, and must also meet the following:

1) Containers designed for use as portable cylinders must be constructed according to DOT specifications.

2) All other containers whether designed for permanent mounting, or for portable or semiportable use (such as skid tanks), must be constructed as provided for by WAC 296-307-41009(4) and 296-307-41011(1).

3) Nonrecessed container fittings and accessories must be protected against damage by either:
   (a) Their location;
   (b) The vehicle frame or bumper; or
   (c) Protective housing. The housing must meet the requirements under which the tanks are fabricated with respect to design and construction and must be designed to withstand static loading in any direction equal to twice the weight of the tank and attachments when filled with the liquid at a safety factor of at least four, based on the ultimate strength of the material used. The housing must have a weather cover if necessary to ensure proper operation of valves and safety devices.

4) Manually operated shut-off valves or self-closing internal valves must be closed except during transfer operations.

5) Permanently installed containers must meet the following requirements:
   (a) Tank motor vehicles with frames not made integral with the tank, as by welding, must have turnbuckles or similar positive devices for drawing the tank down tight on the frame. In addition, suitable stops or anchors must be attached to the frame and/or the tank to prevent relative motion between them from starting, stopping, and turning. The stops and anchors must be installed to be accessible for inspection and maintenance.
   (b) Any tank motor vehicle designed and constructed so that the cargo tank constitutes the stress member used instead of a frame must be supported by external cradles enclosing at least 120 degrees of the shell circumference. The design calculations must include beam stress, shear stress, torsion stress, bending moment, and acceleration stress for the cargo tank as a whole using a factor of safety of four, based on the ultimate tensile strength of the material. Maximum concentrated stresses that might be created at pads and cradles due to shear, bending, and torsion shall also be calculated according to Appendix G of the American Society of Mechanical Engineers, Unfired Pressure Vessel Code, 1968. Fully loaded vehicles must be assumed to be operating under highway conditions equal to two “g” loading. The effects of fatigue shall be taken into consideration. Cargo tanks mounted on frames may be supported by upright supports attached to pads if these factors are taken into account.
   (c) Where any tank support is attached to any part of a tank head, the stresses imposed upon the head must be provided for as required above.
   (d) Tank supports, stops, anchors, and bumpers must not be welded directly to the tank but must be attached by means of pads of the same material as the tank. The pad thickness must be at least 1/4 inch, or the thickness of the shell material if less, and no greater than the shell material. Each pad must extend at least four times its thickness, in each direction, beyond the weld attaching the support, bumper, stop, or anchor. Each pad must be preformed to an inside radius no greater than the outside radius of the tank at the place of attachment. Each pad corner must be rounded to a radius at least one-fourth the width of the pad, and no greater than one-half the width of the pad. Weepholes and tell-tale holes, if used, must be drilled or punched before the pads are attached to the tank. Each pad must be attached to the tank by continuous fillet welding using fillet material having properties that meet the recommendations of the maker of the shell and head material.

(2005 Ed.)
(6) Portable or semiportable containers must meet the applicable requirements of WAC 296-307-42507(3). Containers designed for permanent installation as part of systems under WAC 296-307-420 are prohibited.

(a) Filling connections must have an approved automatic back pressure check valve, excess flow check valve, or quick closing internal valve to prevent excessive escape of gas in case the filling connection is broken.

Exception: Where the filling and discharge connect on a common opening in the container shell, and the opening is fitted with a quick-closing internal valve, the automatic valve is not required.

Every inlet and outlet connection must have a manually or automatically operated shut-off valve. Liquid discharge openings, except those for engine fuel lines, on tanks built after September 1, 1965, must be fitted with a remotely controlled internal shut-off valve. Valves must meet the following requirements:

(i) The seat of the valve must be inside the tank, or in the opening nozzle or flange, or in a companion flange bolted to the nozzle or flange.

(ii) All parts of the valve inside the tank, nozzle, or companion flange must be made of material that protects against corrosion or other deterioration in the presence of the lading.

(iii) The parts must be arranged so that damage to parts exterior to the tank will not prevent effective seating of the valve.

(iv) The valve may be operated mechanically, by hydraulically, or by air, or gas pressure.

(v) The valve must have remote means of automatic closure, both mechanical and thermal, in at least two places for tanks over 3,500 gallons water capacity. These remote control stations must be located at each end of the tank and diagonally opposite. The thermal control mechanism must have a fusible element with a melting point between 220°F and 208°F. At least one remote control station must be provided for tanks of 3,500 gallons water capacity or less, and such actuating means may be mechanical.

(b) All other connections to containers, except those used for gauging devices, thermometer wells, safety-relief devices, and plugged openings, must have suitable automatic excess flow valves, or may instead be fitted with quick-closing internal valves.

The control mechanism for the internal valve must have a secondary control, remote from the fill or discharge connections (for use in the event of accidents or fire during delivery operations), and such control mechanism must have a fusible element with a melting point not over 220°F or less than 208°F.

(c) Excess flow valves must close automatically at the rated flow of vapor or liquid as specified by the valve manufacturers. The flow rating of the piping beyond the excess flow valve must be greater than that of the excess flow valve and such rating must include valves, fittings, and hose.

Exception: When branching or necessary restrictions are incorporated in a piping system so that flow ratings are less than that of the excess flow valve and the tank, then additional excess flow valves must be installed in the piping where such flow rate is reduced.

(d) Container inlets and outlets, except those used for safety-relief valves, liquid-level gauging devices, and pressure gauges, must be labeled to designate whether they communicate with vapor or liquid space when the container is filled to maximum permitted filling density. Labels may be on the valves.

WAC 296-307-43505 What is the maximum capacity allowed for LP-gas installations on commercial vehicles?

A single fuel container used on passenger carrying vehicles must not exceed 200 gallons water capacity.

WAC 296-307-43507 Where must systems be located?

(1) Containers must not be installed, transported, or stored (even temporarily) inside any vehicle covered by these standards except as provided by the DOT regulations.

(2) Containers, control valves, and regulating equipment comprising a complete system must be suitably protected against damage and weather. Systems may be installed in a recess vaportight to the inside of the vehicle and accessible from and vented to the outside.

(3) Systems installed outside of mobile units must be located so that discharge from safety-relief devices must be at least 3 feet horizontally away from any opening into the unit below the level of such discharge. When the system is located in a recess vaportight to the inside, vent openings in the recess must be at least 3 feet horizontally away from any opening into the mobile unit below the level of these vents.

(4) There must be no fuel connection between tractor and trailer or other vehicle units.

(5) The container or container carrier must be secured in place by fastenings designed and constructed with a minimum safety factor of four to withstand loading in any direction equal to twice the weight of the container when filled to normal capacity with LP-gas.

WAC 296-307-43509 What requirements apply to valves and accessories?

Container valves and accessories must be provided, protected and mounted as follows:

(1) Systems using DOT cylinders according to WAC 296-307-41511.

(2) All other systems according to WAC 296-307-42005 (2) through (8).

(3) Portable, semiportable and permanently mounted containers shall be mounted and protected as provided under WAC 296-307-43503 (2), (5), and (6).
**WAC 296-307-43511 What requirements apply to safety devices?** (1) DOT containers must have safety-relief devices as required by DOT regulations.

(2) A final stage regulator of an LP-gas system (excluding any appliance regulator) must have, on the low-pressure side, a relief valve that is set to start to discharge within the limits specified in Table U-7.

(3) The relief valve and space above the regulator and relief valve diaphragms must be vented to the outside air and terminate at a position to minimize the possibility of vapors accumulating at sources of ignition.

(4) Whenever equipment such as a cargo heater or cooler on commercial vehicles is designed to be in operation while in transit, suitable means to stop the flow such as an excess flow valve or other device, must be installed. This device will be actuated to stop the flow in the event of the break in the fuel supply line. All excess flow valves must comply with WAC 296-307-41019(3).

(WAC 296-307-43513 What types of systems may be used on commercial vehicles? Commercial vehicles must use either vapor withdrawal or liquid withdrawal systems.)

(WAC 296-307-43515 What requirements apply to enclosures and mounting? (1) Housing or enclosures must be designed to provide proper ventilation.

(2) Hoods, domes, or removable portions of cabinets must have means to keep them firmly in place during transit.

(3) The assembly must hold the containers firmly in position and prevent their movement during transit according to WAC 296-307-42507(3).

(4) Containers must be mounted on a substantial support or base secured firmly to the vehicle chassis. Neither the container nor its support must extend below the frame.

(WAC 296-307-43517 What requirements apply to piping, tubing, and fittings? (1) Regulators must be connected directly to the container valve outlet or mounted securely by means of support bracket and connected to the container valve or valves with a listed high pressure flexible connector.

(2) Provision must be made between the regulator outlet and the gas service lines by either a flexible connector or a tubing loop to provide for expansion, contraction, jarring, and vibration.

(3) Aluminum alloy piping is prohibited. Steel tubing must have a minimum wall thickness of 0.049 inch. Steel piping or tubing must be adequately protected against exterior corrosion.

(4) Approved gas tubing fittings must be used for tubing connections.

(5) The fuel line must be firmly fastened in a protected location and where under the vehicle and outside and below any insulation or false bottom, fastenings must prevent abrasion or damage to the gas line due to vibration. Where the fuel line passes through structural members or floors, a rubber grommet or equivalent must be installed to prevent chafing.

(6) The fuel line must be installed to enter the vehicle through the floor directly beneath or adjacent to the appliance that it serves. When a branch line is required, the tee connection must be in the main fuel line and located under the floor and outside the vehicle.

(7) All parts of the system assembly must be designed and secured to preclude such parts working loose during transit.

**WAC 296-307-43519 What requirements apply to appliances?** (1) LP-gas appliances must be approved for use on commercial vehicles.

(2) In vehicles not intended for human occupancy, where the gas-fired heating appliance is used to protect the cargo, such heater may be unvented, but provision must be made to dispose of the products of combustion to the outside.

(3) In vehicles intended for human occupancy, all gas-fired heating appliances, including water heaters, must be designed or installed to provide for complete separation of the combustion system from the atmosphere of the living space. Such appliances must be installed with the combustion air inlet assembly furnished as a component of the appliance, and with either:

(a) The flue gas outlet assembly furnished as a component of the appliance; or

(b) A listed roof jack if the appliance is listed for such use.

The combustion air inlet assembly, flue gas outlet assembly, and roof jack must extend to the outside atmosphere.

(4) Provision must be made to ensure an adequate supply of outside air for combustion.

(5) All gas-fired heating appliances and water heaters must have an approved automatic device designed to shut off the flow of gas to the main burner and to the pilot in the event the pilot flame is extinguished.

(6) Gas-fired appliances installed in the cargo space must be readily accessible.

(7) Appliances must be constructed or protected to minimize the possible damage or impaired operation resulting from cargo shifting or handling.

(8) Appliances inside the vehicle must be located so that a fire at an appliance will not block the exit route.

(2005 Ed.)
WAC 296-307-43521 What general precautions must be followed for LP-gas system installations on commercial vehicles? (1) DOT containers must be marked, maintained, and requalified for use according to DOT regulations.

(2) Containers that have not been requalified according to DOT regulations must be removed from service. Requalified containers must be stamped with the date of requalification. When DOT cylinders are requalified by retesting, the retest must be made according to DOT regulations.

(3) Containers must not be charged with fuel unless they bear the proper markings of the code under which they were constructed, and with their water capacity. In the case of cylinders or portable containers filled by weight, the container must be marked with its tareweight.

(4) DOT containers that have been involved in a fire must not be recharged until they have been requalified for service according to DOT regulations.

(5) API-ASME containers or ASME containers that have been involved in a fire must not be recharged until they have been retested according to the requirements for their original hydrostatic test and found to be suitable for continued service.

"API-ASME (ASME) container" means a container constructed according to the Rules for Construction of Unfired Pressure Vessels, section VIII, Division 1, American Society of Mechanical Engineers (ASME) Boiler and Pressure Vessel Code, 1968 edition.

(6) Containers must not be charged without the consent of the owner.

(7) A permanent caution plate must be provided on the appliance or adjacent to the container outside of any enclosure. It must include the word "caution" and the following or similar instructions:

(a) Be sure all appliance valves are closed before opening container valve.

(b) Connections at appliances, regulators, and containers must be checked periodically for leaks with soapy water or its equivalent.

(c) A match or flame must not be used to check for leaks.

(d) Container valves must be closed except when the equipment is in use.

WAC 296-307-43523 How must containers be charged? Containers must be charged according to DOT specifications.

WAC 296-307-43525 What fire protection must be provided for mobile cook units? Mobile cook units must have at least one approved portable fire extinguisher having a minimum rating of B-B, C.

WAC 296-307-440 LP-gas service stations.

WAC 296-307-44001 What does this section cover? WAC 296-307-440 applies to storage containers, dispensing devices, and pertinent equipment in service stations where LP-gas is stored and dispensed into fuel tanks of motor vehicles. LP-gas service stations must meet all requirements of WAC 296-307-410 and the requirements of this section.

WAC 296-307-44003 How must storage containers be designed and classified? Storage containers must be designed and classified according to the following table:

<table>
<thead>
<tr>
<th>Container type</th>
<th>For gases with vapor press. Not to exceed lb. per sq. in. gauge 100°F (37.8°C)</th>
<th>Minimum design pressure of container lb. per sq. in. gauge</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
<td>215</td>
<td>250</td>
</tr>
</tbody>
</table>

WAC 296-307-44005 What requirements apply to valves and accessories? (1) A filling connection on the container must be fitted with one of the following:

(a) A combination back-pressure check and excess flow valve.

(b) One double or two single back-pressure valves.

(c) A positive shut-off valve, in conjunction with either:

(i) An internal back-pressure valve; or

(ii) An internal excess flow valve.

Instead of an excess flow valve, filling connections may be fitted with a quick-closing internal valve that only opens during operating periods. The mechanism for such valves may have a secondary control that will close automatically in case of fire. The melting point for a fusible plug must be a minimum of 220°F.

(2) A filling pipe inlet terminal off the container must have a positive shut-off valve and either:

(a) A back pressure check valve; or

(b) An excess flow check valve.

[Title 296 WAC—p. 2580]
(3) All openings in the container must have approved excess flow check valves.

Exceptions: (a) Filling connections;
(b) Safety-relief connections;
(c) Liquid-level gauging devices; and
(d) Pressure gauge connections.

(4) All container inlets and outlets must be labeled to designate whether they connect with vapor or liquid (labels may be on valves).

Exceptions: (a) Safety-relief valves;
(b) Liquid-level gauging devices; and
(c) Pressure gauges.

(5) Each storage container must have a suitable pressure gauge.

WAC 296-307-44007 What requirements apply to safety devices? (1) All safety-relief devices must be installed as follows:

(a) On the container and directly connected with the vapor space.

(b) Safety-relief valves and discharge piping shall be protected against physical damage. The outlet must have loose-fitting rain caps. There shall be no return bends or restrictions in the discharge piping.

(c) The discharge from two or more safety-relief valves with the same pressure settings may be run into a common discharge header. The cross-sectional area of such header must be at least equal to the sum of the individual discharges.

(d) Discharge from a safety-relief device that terminates in or beneath any building is prohibited.

(2) Aboveground containers must have safety-relief valves as follows:

(a) The rate of discharge, which may be provided by one or more valves, must be at least that specified in WAC 296-307-41025(2).

(b) The discharge from safety-relief valves must be vented upward to the open air to prevent impingement of escaping gas upon the container. You must use loose-fitting rain caps. On a container having a water capacity greater than 2,000 gallons, the discharge from the safety-relief valves must be vented upward away from the container to a point at least 7 feet above the container. Provisions must be made so that any liquid or condensate accumulation inside the relief valve or its discharge pipe will not render the valve inoperative. If a drain is used, you must protect the container, adjacent containers, piping, or equipment against impingement of flame resulting from ignition of the product escaping from the drain.

(c) If no liquid is put into a container until after it is buried and covered, the rate of discharge of the relief valves may be reduced to at least 30 percent of the rate shown in WAC 296-307-41025(2). If liquid fuel is present during installation of containers, the rate of discharge must be the same as for aboveground containers. Only empty containers may be uncovered.

WAC 296-307-44009 What is the maximum capacity allowed for containers? Individual storage containers must be a maximum of 30,000 gallons water capacity.

WAC 296-307-44011 How must storage containers be installed? (1) Each storage container used exclusively in service station operation must comply with the following table. This table outlines the minimum distances from a container to a building, group of buildings, or adjoining property lines that may be built on.

<table>
<thead>
<tr>
<th>Water capacity per container (gallons)</th>
<th>Aboveground and underground (feet)</th>
<th>Between aboveground containers (feet)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Up to 2,000</td>
<td>25</td>
<td>3</td>
</tr>
<tr>
<td>Over 2,000</td>
<td>50</td>
<td>5</td>
</tr>
</tbody>
</table>

Note: The above distances may be reduced to at least 10 feet for service station buildings of other than wood frame construction.

(a) Readily ignitable material including weeds and long dry grass, must be removed within 10 feet of containers.

(b) The minimum separation between LP-gas containers and flammable liquid tanks must be 20 feet and the minimum separation between a container and the centerline of the dike must be 10 feet.

(c) LP-gas containers located near flammable liquid containers must be protected against the flow or accumulation of flammable liquids by diking, diversion curbs, or grading.

(d) LP-gas containers located within diked areas for flammable liquid containers are prohibited.

(e) Field welding is permitted only on saddle plates or brackets that were applied by the container manufacturer.

(f) When permanently installed containers are interconnected, you must allow for expansion, contraction, vibration, and settling of containers and interconnecting piping. Where flexible connections are used, they must be approved and designed for a bursting pressure of at least five times the vapor pressure of the product at 100°F. Using nonmetallic hose is prohibited for interconnecting containers.

(g) Where high water table or flood conditions may be encountered, you must protect against container flotation.

(2) Aboveground containers must be installed according to this section.

(a) Containers may be installed horizontally or vertically.

(2005 Ed.)
(b) Containers must be protected by crash rails or guards to prevent physical damage unless they are protected by location. Servicing vehicles within 10 feet of containers is prohibited.

(c) Container foundations must be of substantial masonry or other noncombustible material. Containers must be mounted on saddles that permit expansion and contraction, and must provide against excess stresses. Corrosion protection must be provided for tank-mounting areas. Structural metal container supports must be protected against fire.

Exception: This protection is not required on prefabricated storage and pump assemblies, mounted on a common base, with container bottom a maximum of 24 inches above ground with water capacity of 2,000 gallons or less, if the piping connected to the storage and pump assembly is flexible enough to minimize breakage or leakage in case container supports fail.

(3) Underground containers must be installed according to this section.

(a) Containers must be given a protective coating before being placed underground. This coating must be equivalent to hot-dip galvanizing or to two coatings of red lead followed by a heavy coating of coal tar or asphalt. During installation, take care to minimize abrasion or other damage to the coating. Repair coating damage before back-filling.

(b) Containers must be set on a firm foundation (firm earth may be used) and surrounded with earth or sand firmly tamped in place. Backfill should be free of rocks or other abrasive materials.

(c) A minimum of 2 feet of earth cover must be provided. Where ground conditions make impractical, equivalent protection against physical damage must be provided. The portion of the container to which manhole and other connections are attached may be left uncovered. If there is vehicle traffic at the site, containers must be protected by a concrete slab or other cover to prevent the weight of a loaded vehicle imposing a load on the container shell.

WAC 296-307-44013 What equipment must be protected against tampering? Valves, regulators, gauges, and other container fittings must be protected against tampering and physical damage.

WAC 296-307-44017 What requirements apply to piping, valves, and fittings? (1) Piping may be underground, aboveground, or a combination of both. It must be well supported and protected against physical damage and corrosion.

(2) Piping laid beneath driveways must be installed to prevent physical damage by vehicles.

(3) Piping must be wrought iron or steel (black or galvanized), brass or copper pipe; or seamless copper, brass, or steel tubing and must be suitable for a minimum pressure of 250 psig. Pipe joints may be screwed, flanged, brazed, or welded. The use of aluminum alloy piping or tubing is prohibited.

(4) All shut-off valves (liquid or gas) must be suitable for LP-gas service and designed for at least the maximum pressure to which they may be subjected. Valves that may be subjected to container pressure must have a rated working pressure of at least 250 psig.

(5) All materials used for valve seats, packing, gaskets, diaphragms, etc., must be resistant to the action of LP-gas.

(6) Fittings must be steel, malleable iron, or brass having a minimum working pressure of 250 psig. Cast iron pipe fittings, such as ells, tees and unions must not be used.

(7) All piping must be tested after assembly and proved free from leaks at least at the normal operating pressures.

(8) You must allow for expansion, contraction, jarring, and vibration, and for settling. You may use flexible connections.

WAC 296-307-44019 What requirements apply to pumps and accessory equipment? All pumps and accessory equipment must be suitable for LP-gas service, and designed for at least the maximum pressure to which they may be subjected. Accessories must have a minimum rated working pressure of 250 psig. Positive displacement pumps must have suitable pressure actuated bypass valves permitting flow from pump discharge to storage container or pump suction.

WAC 296-307-44021 What requirements apply to LP-gas dispensing devices? (1) Meters, vapor separators, valves, and fittings in the dispenser must be suitable for LP-gas service and must be designed for a minimum working pressure of 250 psig.

(2) Provisions must be made for venting LP-gas from a dispensing device to a safe location.

(3) Pumps used to transfer LP-gas must allow control of the flow and to prevent leakage or accidental discharge. Means must be provided outside the dispensing device to readily shut off the power in the event of fire or accident.

(4) A manual shut-off valve and an excess flow check valve must be installed downstream of the pump and ahead of the dispenser inlet.

(a) Dispensing hose must be resistant to the action of LP-gas in the liquid phase and designed for a minimum bursting pressure of 1,250 psig.
(b) An excess flow check valve or automatic shut-off valve must be installed at the terminus of the liquid line at the point of attachment of the dispensing hose.

(5) LP-gas dispensing devices must be located at least 10 feet from aboveground storage containers greater than 2,000 gallons water capacity. The dispensing devices must be at least 20 feet from any building (not including canopies), basement, cellar, pit, or line of adjoining property that may be built on and at least 10 feet from sidewalks, streets, or thoroughfares. No drains or blowoff lines must be directed into or in proximity to the sewer systems used for other purposes.

(a) LP-gas dispensing devices must be installed on a concrete foundation or as part of a complete storage and dispensing assembly mounted on a common base, and must be adequately protected from physical damage.

(b) LP-gas dispensing devices must not be installed within a building.

Exception: Dispensing devices may be located under a weather shelter or canopy if the area is not enclosed on more than two sides. If the enclosing sides are adjacent, the area shall be properly ventilated.

(6) Dispensing LP-gas into the fuel container of a vehicle shall be performed by a competent attendant who shall remain at the LP-gas dispenser during the entire transfer operation.

WAC 296-307-44023 Is smoking allowed at LP-gas service stations? Smoking is prohibited on the driveway of service stations in the dispensing areas or transport truck unloading areas. Conspicuous signs prohibiting smoking must be posted within sight of the customer being served. Letters on such signs must be at least 4 inches high. The motors of all vehicles being fueled must be shut off during the fueling operations.

WAC 296-307-44025 What fire protection must be provided at LP-gas service stations? Each service station must have at least one approved portable fire extinguisher with at least an 8-B, C, rating.

Part U-3 Other Hazardous Materials

Dipping and Coating Operations (Dip Tanks)

IMPORTANT: A dip tank is a container holding a liquid other than plain water that is used for dipping or coating. An object may be completely or partially immersed (in a dip tank) or it may be suspended in a vapor coming from the tank.

Exemption: Dip tanks that use a molten material (molten metal, alloy, salt, etc.) are not covered by this chapter.

This chapter applies to:

- A dip tank that uses a liquid other than plain water, or the vapor of the liquid, to:
  - Clean an object
  - Coat an object
  - Alter the surface of an object
- OR
  - Change the character of an object.
- Draining or drying an object that has been dipped or coated.

Examples of covered dipping and coating operations include, but are not limited to:

- Paint dipping
- Anodizing
- Pickling
- Quenching
- Tanning
- Degreasing
- Stripping
- Cleaning
- Dyeing.

Reference: You have to do a hazard assessment to identify hazards or potential hazards in your workplace and determine if PPE is necessary to protect your employees. See personal protective equipment (PPE), WAC 296-307-100 through 296-307-1025.

WAC 296-307-450 General requirements.

Summary.

Your responsibility: Safeguard employees working with dip tanks.

You must:

CONSTRUCTION
Construct safe dip tanks
WAC 296-307-4505

VENTILATION
Provide proper ventilation for the vapor area
WAC 296-307-45010

Take additional precautions if you recirculate ventilation system exhaust air into the workplace
WAC 296-307-45015

Take additional precautions when using an exhaust hood
WAC 296-307-45020

INSPECTION
Periodically inspect your dip tanks and associated equipment and correct any deficiencies
WAC 296-307-45025

FIRST AID
Make sure employees working near dip tanks know appropriate first-aid procedures
WAC 296-307-45030

CLEANING
Prepare dip tanks before cleaning
WAC 296-307-45035

WELDING
Protect employees during welding, burning or other work using open flames
WAC 296-307-45045
LIQUIDS HARMFUL TO SKIN
Provide additional protection for employees working near dip tanks that use liquid that may burn, irritate, or otherwise harm the skin.

WAC 296-307-45050.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-10-068, § 296-307-45005, filed 5/6/03, effective 8/1/03; 97-09-013, recodified as § 296-307-450, filed 4/7/97, effective 4/7/97. Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-10-068, § 296-307-45020, filed 5/6/03, effective 8/1/03; 97-09-013, recodified as § 296-307-45015, filed 5/6/03, effective 8/1/03.

WAC 296-307-45015 Take additional precautions if you recirculate ventilation system exhaust air into the workplace.

You must:
- Only recirculate air that contains no substance at a concentration that could pose a health or safety hazard to employees.
- Make sure any exhaust system that recirculates air into the workplace:
  - Passes the air through a device that removes contaminants.
  - Sounds an alarm and automatically shuts down the dip tank operation, if the vapor concentration of any substance in the exhaust air exceeds twenty-five percent of its LFL.
  - Monitors the concentration of vapor from flammable or combustible liquids with approved equipment.

Note: The LFL concentration in the air must be determined after the air passes through the air-cleaning device and before the air reenters the workplace.

WAC 296-307-45020 Take additional precautions when using an exhaust hood.

You must:
- Make sure each room with an exhaust hood has a source of outside air that:
  - Enters the room in a way that will not interfere with the function of the hood.
  - Replaces at least ninety percent of the air taken in through the hood.

Note: Some, or all, of the consensus standards (such as ANSI and NFPA) may have been revised. If you comply with a later version of a consensus standard, you will be considered to have complied with any previous version of the same consensus standard.

WAC 296-307-45025 Periodically inspect your dip tanks and associated equipment and correct any deficiencies.

You must:
- Inspect or test your dip tanks and associated equipment periodically, including:
  - Covers.
  - Overflow pipes.
  - Bottom drains and valves.
  - Electrical wiring, equipment, and grounding connections.
  - Ventilating systems.
  - Fire extinguishing equipment.
- Inspect the hoods and ductwork of the ventilation system for corrosion and damage and make sure the airflow is adequate:
  - At least quarterly during operation.
  - Prior to operation after a prolonged shutdown.

Reference: You need to keep employee exposure within safe levels when the liquid in a dip tank creates an exposure hazard. See Respiratory hazards, chapter 296-307 WAC, Part Y-6.

Note: You may use a tank cover or material that floats on the surface of the liquid to replace or assist ventilation. The method or combination of methods you choose has to maintain the airborne concentration of the hazardous material and the employee’s exposure within safe limits.
• Promptly fix any deficiencies found.

Note: • To assist you in tracking your inspections and actions taken from those inspections, you may want to keep a written record
• It is recommended that inspections be at least quarterly even if the system is not operating. Depending on the chemicals in use more frequent inspection may be required.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-10-068, § 296-307-45050, filed 5/6/03, effective 8/1/03; 97-09-013, recodified as § 296-307-45025, filed 4/7/97, effective 4/7/97. Statutory Authority: RCW 49.17.010, 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-307-45035, filed 12/21/04, effective 4/2/05; 03-10-068, § 296-307-45035, filed 10/31/96, effective 12/1/96.]

**First Aid**

WAC 296-307-45030 Make sure employees working near dip tanks know appropriate first-aid procedures.

You must:
• Make sure your employees know the appropriate first-aid procedures for the hazards of your dipping and coating operations.

Note: • First-aid procedures are contained in the material safety data sheet (MSDS) for the chemicals used in the dip tank
• First-aid supplies appropriate for the hazards of the dipping or coating operation need to be located near the dip tank to be considered “readily available” as required by WAC 296-307-03920.

Reference: There are additional requirements that may include providing emergency washing facilities and employee training. See first aid, WAC 296-307-039, and employer chemical hazard communication, WAC 296-307-550.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-10-068, § 296-307-45030, filed 5/6/03, effective 8/1/03.]

**Cleaning**

WAC 296-307-45035 Prepare dip tanks before cleaning. You must:
(1) Drain the contents of the tank and open any cleanout doors.

(2) Ventilate the tank to clear any accumulated hazardous vapors.

Reference: There may be requirements that apply before an employee enters a dip tank. See Confined spaces, WAC 296-307-642 and safety procedures, WAC 296-307-320.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060, 03-10-068, § 296-307-45035, filed 12/21/04, effective 4/2/05; 03-10-068, § 296-307-45035, filed 5/6/03, effective 8/1/03.]

**Welding**

WAC 296-307-45045 Protect employees during welding, burning, or other work using open flames.

You must:
• Make sure the dip tank and the area around it are thoroughly cleaned of solvents and vapors before performing work involving:
  – Welding
  – Burning
  OR
  – Open flames.

Reference: There are additional requirements for this type of work. See Welding, cutting and brazing, WAC 296-307-475, and Respirators, chapter 296-307 WAC, Part Y-5.

(2005 Ed.)

Liquids Harmful to Skin

WAC 296-307-45050 Protect employees that use liquids that may burn, irritate, or otherwise harm the skin. You must:
(1) Make sure washing facilities, including hot water, are available for every ten employees that work with dip tank liquids.

(2) Satisfy medical requirements:
• Make sure an employee with any small skin abrasion, cut, rash, or open sore receives treatment by a properly designated person
• Make sure an employee with a sore, burn, or other skin lesion that needs medical treatment, has a physician’s approval before they perform their regular work
• Make sure employees who work with chromic acid receive periodic examinations of their exposed body parts, especially their nostrils.

Note: • Periodic means on a yearly basis unless otherwise indicated
• Any time chromic acid spills onto an employee’s skin or their clothing is saturated, a physician should be responsible for evaluating and monitoring the area where chromic acid made contact with the skin.

You must:
(3) Provide lockers or other storage space to prevent contamination of street clothes.

Reference: You have to do a hazard assessment to identify hazards or potential hazards in your workplace and determine if PPE is necessary to protect your employees. See Personal protective equipment (PPE), WAC 296-307-100.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-10-068, § 296-307-45050, filed 5/6/03, effective 8/1/03.]

WAC 296-307-455 Additional requirements for dip tanks using flammable or combustible liquids.

Summary.
IMPORTANT:
This section applies to:
• Flammable and combustible liquids (flashpoint below 200°F)
• Liquids that have a flashpoint of 200°F (93.3°C) or higher if you:
  – Heat the liquid
  – Dip a heated object in the tank

Your responsibility:
Safeguard employees working with dip tanks containing flammable or combustible liquids

You must:
CONSTRUCTION
Include additional safeguards when constructing dip tanks

WAC 296-307-45505
Provide overflow pipes
WAC 296-307-45510
Provide bottom drains
WAC 296-307-45515
FIRE PROTECTION
Provide fire protection in the vapor area

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-45045, filed 12/21/04, effective 4/2/05; 03-10-068, § 296-307-45045, filed 5/6/03, effective 8/1/03.]
WAC 296-307-45520
Provide additional fire protection for large dip tanks
WAC 296-307-45525

ELECTRICAL WIRING AND EQUIPMENT AND SOURCES OF IGNITION
Prevent static electricity sparks or arcs when adding liquids to a dip tank
WAC 296-307-45535
Control ignition sources
WAC 296-307-45540
Provide safe wiring and electrical equipment where the liquid can drip or splash
WAC 296-307-45545

HOUSEKEEPING
Keep the area around dip tanks clear of combustible material and properly dispose of waste
WAC 296-307-45550

HEATING LIQUID
Make sure heating the liquid in your dip tanks does not cause a fire
WAC 296-307-45555

HEAT DRYING
Make sure a heating system used for drying objects does not cause a fire
WAC 296-307-45560

CONVEYORS
Make sure the conveyor system for dip tanks is safe
WAC 296-307-45565

Construction
WAC 296-307-45505 Include additional safeguards when constructing dip tanks.
You must:
1. Make sure the dip tank, drain boards (if provided), and supports are made of noncombustible material.
2. Make sure piping connections on drains and overflow pipes allow easy access to the inside of the pipe for inspection and cleaning.

WAC 296-307-45510 Provide bottom drains.
Exemption:
A bottom drain is not required if:
– The viscosity of the liquid makes it impractical to empty the tank by gravity or pumping
OR
– The dip tank has an automatic closing cover that meets the requirements of WAC 296-307-45530.
You must:
Provide a bottom drain on all dip tanks that hold more than five hundred gallons of liquid
Make sure the bottom drain:
– Is properly trapped
– Will empty the dip tank during a fire
– Has pipes large enough to empty the tank within five minutes
– Uses automatic pumps if gravity draining is not practical
– Is capable of both manual and automatic operation
– Discharges to a safe location.
Note: Discharges to a safe location could be a:
• Safe location outside the building
OR
• Closed, properly vented salvage tank or tanks that can hold more than the dip tank.
You must:
Make sure manual operation of the bottom drain is performed from a safe and easily accessible location.

WAC 296-307-45520 Provide fire protection in the vapor area.
You must:
Provide a manual fire extinguisher near the tank that is suitable for putting out flammable and combustible liquid fires.

WAC 296-307-45525 Provide additional fire protection for large dip tanks.
You must:
Provide at least one automatic fire extinguishing system or an automatic dip tank cover if the tank:
– Holds one hundred fifty gallons or more of liquid
OR
– Has four square feet or more of liquid surface area.
Make sure automatic fire extinguishing systems or automatic dip tank covers meet the requirements of Table 1.

You must:
Make sure the bottom of the overflow pipe is at least six inches (15.2 cm) below the top of the tank.
Note: The overflow pipe should be large enough to remove water applied to the liquid surface of the dip tank from automatic sprinklers or other sources in the event of fire. Smaller dip tanks should be equipped with overflow pipes, if practical.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-10-068, § 296-307-45510, filed 5/6/03, effective 8/1/03.]
Safety Standards for Agriculture

296-307-45560

Holds less than five hundred gallons
OR
Has less than twenty-five square feet of liquid surface area.

Table 1: Automatic Fire Protection System Requirements

<table>
<thead>
<tr>
<th>If you provide:</th>
<th>Then you must:</th>
</tr>
</thead>
</table>
| An automatic fire extinguishing system  | • Use extinguishing materials suitable for a fire fueled by the liquid in the tank  
                                        | • Make sure the system protects the:  
                                          – Tanks  
                                          – Drain boards  
                                          – Stock over drain boards.                                                                 |
| A dip tank cover                       | • Make sure the cover is:  
                                        – Closed by approved automatic devices in the event of fire  
                                        – Able to be manually activated  
                                        – Kept closed when the tank is not being used  
                                        – Made of noncombustible material or metal-clad material with locked metal joints.       |

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-10-068, § 296-307-45525, filed 5/6/03, effective 8/1/03.]

Electrical Wiring and Equipment and Sources of Ignition

WAC 296-307-45535 Prevent static electricity sparks or arcs when adding liquids to a dip tank.

You must:
• Make sure any portable container used to add liquid to the tank is:
  – Electrically bonded to the dip tank  
  – Positively grounded.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-10-068, § 296-307-45535, filed 5/6/03, effective 8/1/03.]

WAC 296-307-45540 Control ignition sources.

You must:
(1) Make sure the vapor areas and adjacent areas do not have any:
• Open flames  
• Spark producing devices  
• Heated surfaces hot enough to ignite vapors.
(2) Use explosion-proof wiring and equipment in the vapor area.

Reference: Electrical wiring and equipment has to meet the requirements of the applicable hazardous (classified) location. See Hazardous (classified) locations, WAC 296-307-37209.

You must:
(3) Prohibit smoking in any vapor area:
• Post an easily seen "NO SMOKING" sign near each dip tank.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-10-068, § 296-307-45540, filed 5/6/03, effective 8/1/03.]

WAC 296-307-45545 Provide safe electrical wiring and equipment where the liquid can drip or splash.

You must:
• Make sure all electrical wiring and equipment in the vapor area is approved for areas that have:
  – Deposits of easily ignited residue  
  – Explosive vapor.

Exemption: This does not apply to wiring that is:
• In rigid conduit, threaded boxes or fittings  
• Has no taps, splices, or terminal connections.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-10-068, § 296-307-45545, filed 5/6/03, effective 8/1/03.]

Housekeeping

WAC 296-307-45550 Keep the area around dip tanks clear of combustible material and properly dispose of waste.

You must:
(1) Make sure the area surrounding dip tanks is:
  – Completely free of combustible debris  
  – As free of combustible stock as possible.
(2) Provide approved metal waste cans that are:
  – Used for immediate disposal of rags and other material contaminated with liquids from dipping or coating operations  
  – Emptied and the contents properly disposed of at the end of each shift.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-10-068, § 296-307-45550, filed 5/6/03, effective 8/1/03.]

Heating Liquid

WAC 296-307-45555 Make sure heating the liquid in your dip tanks does not cause a fire.

You must:
• Keep the temperature of the liquid in the dip tank:
  – Below the liquid's boiling point  
  – At least 100°F below the liquid's autoignition temperature.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-10-068, § 296-307-45555, filed 5/6/03, effective 8/1/03.]

Heat Drying

WAC 296-307-45560 Make sure a heating system used for drying objects does not cause a fire.

You must:
• Make sure the heating system used in a drying operation that could cause ignition:
  – Has adequate mechanical ventilation that operates before and during the drying operation  
  – Shuts down automatically if a ventilating fan fails to maintain adequate ventilation  

Note: Some, or all, of the consensus standards (such as ANSI and NFPA) may have been revised. If you comply with a later version of a consensus standard, you will be considered to have complied with any previous version of the same consensus standard.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-10-068, § 296-307-45560, filed 5/6/03, effective 8/1/03.]
Conveyors

WAC 296-307-45565 Make sure conveyor systems are safe.

You must:
- Make sure the conveyor system shuts down automatically if:
  - The ventilation system fails to maintain adequate ventilation
  OR
  - There is a fire.

You must:
- Make sure conveyor systems shut down automatically if:
  - The ventilation system fails to maintain adequate ventilation
  OR
  - There is a fire.

WAC 296-307-460 Additional requirements for dip tanks used for specific processes.

Summary.
Your responsibility:
Safeguard employees working with dip tanks used for specific processes

You must:
HARDENING OR TEMPERING
Meet specific requirements if you use a hardening or tempering tank

WAC 296-307-46005

VAPOR DEGREASING
Provide additional safeguards for vapor degreasing tanks

WAC 296-307-46025

SPRAY CLEANING OR DEGREASING
Control liquid spray over an open surface cleaning or degreasing tank

WAC 296-307-46030.

Hardening or Tempering

WAC 296-307-46005 Meet specific requirements if you use a hardening or tempering tank.

You must:
1. Provide an automatic fire extinguishing system or an automatic dip tank cover for any hardening and tempering tank that uses flammable or combustible liquids and:
   - Holds five hundred gallons (1893 L) or more of liquid
   OR
   - Has twenty-five square feet (2.37 m²) or more of liquid surface area.
2. Prevent fires.
   - Make sure hardening and tempering tanks are:
     - Not located on or near combustible flooring
     - Located as far away as practical from furnaces
     - Equipped with noncombustible hoods and vents (or equally effective devices) for venting to the outside.
   - Treat vent ducts as flues and keep them away from combustible material, particularly roofs.
3. Make sure air under pressure is not used to:
   - Fill the tank
   OR
   - Agitate the liquid in the tank.

Note: The bottom drain of the tank may be combined with the oil circulating system if the requirements for bottom drains in WAC 296-307-45515 are satisfied.

Vapor Degreasing

WAC 296-307-46025 Provide additional safeguards for vapor degreasing tanks.

You must:
1. Make sure, if the tank has a condenser or a vapor-level thermostat, that it keeps the vapor level at least:
   - Thirty-six inches (91 cm) below the top of the tank if the width of the tank is seventy-two inches or more
   OR
   - One-half the tank width below the top of the tank if the tank is less than seventy-two inches wide.
2. Make sure, if you use gas as a fuel to heat the tank liquid, that the combustion chamber is airtight (except for the flue opening) to prevent solvent vapors from entering the air-fuel mixture.
3. Make sure the exhaust flue:
   - Is made of corrosion-resistant material
   - Extends to the outside
   - Has a draft diverter if mechanical exhaust is used.
4. Take special precautions to keep solvent vapors from mixing with the combustion air of the heater if chlorinated or fluorinated hydrocarbon solvents (for example, trichloroethylene or freon) are used in the dip tank.
5. Keep the temperature of the heating element low enough to keep a solvent or mixture from:
   - Decomposing
   OR
   - Generating excessive vapor.

Spray Cleaning or Degreasing

WAC 296-307-46030 Control liquid spray over an open surface cleaning or degreasing tank.

You must:
1. Control the spray to the greatest extent feasible by:
   - Enclosing the spraying operation as completely as possible
   - Using mechanical ventilation to provide enough inward air velocity to prevent the spray from leaving the vapor area.

Note: Mechanical baffles may be used to help prevent the discharge of spray.

ACGIH: American Conference of Governmental Industrial Hygienists.

Adjacent area: Any area within twenty feet (6.1 m) of a vapor area that is not separated from the vapor area by tight partitions.

Approved: Approved or listed by a nationally recognized testing laboratory. Refer to Federal Regulation 29 CFR 1910.7, for definition of nationally recognized testing laboratory.

Autoignition temperature: The minimum temperature required to cause self-sustained combustion without any other source of heat.

Combustible liquid: A liquid having a flashpoint of at least 100°F (37.8°C) and below 200°F (93.3°C). Mixtures with at least ninety-nine percent of their components having flashpoints of 200°F (93.3°C) or higher are not considered combustible liquids.

Detearing: A process for removing excess wet coating material from the bottom edge of a dipped or coated object or material by passing it through an electrostatic field.

Dip tank: A container holding a liquid other than plain water that is used for dipping or coating. An object may be immersed (or partially immersed) in a dip tank or it may be suspended in a vapor coming from the tank.

Flammable liquid: Any liquid having a flashpoint below 100°F (37.8°C), except any mixture having components with flashpoints of 100°F (37.8°C) or higher, the total of which make up ninety-nine percent or more of the total volume of the mixture.

Flashpoint: The minimum temperature at which a liquid gives off a vapor in sufficient concentration to ignite when tested by any of the measurement methods described in the definition of flashpoint in WAC 296-307-55060.

Lower flammable limit: The lowest concentration of a material that will propagate a flame. The LFL is usually expressed as a percent by volume of the material in air (or other oxidant).

Vapor area: Any area in the vicinity of dip tanks, their drain boards or associated drying, conveying, or other equipment where the vapor concentration could exceed twenty-five percent of the lower flammable limit (LFL) for the liquid in the tank.

You: Means the employer.

WAC 296-307-475 Welding, cutting, and brazing.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-10-068, § 296-307-465, filed 5/6/03, effective 8/1/03.]

Part V

Welding

WAC 296-307-47501 What definitions apply to this part? "Welder" and "welding operator" mean any operator of electric or gas welding and cutting equipment.

All other welding terms are defined according to American Welding Society, Terms and Definitions, A3.0-1969. [97-09-013, recodified as § 296-307-47501, filed 4/7/97, effective 4/7/97. Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-47501, filed 10/31/96, effective 12/1/96.]

WAC 296-307-480 Installation and operation of oxygen fuel gas systems for welding and cutting.

WAC 296-307-48001 What general requirements apply to oxygen fuel gas systems? (1) Explosive mixtures of fuel gases and air or oxygen must be guarded against. No accessory that allows air or oxygen to mix with flammable gases prior to use must be allowed unless approved for that purpose.

Exception: Air or oxygen may mix with flammable gases at the burner or in a standard torch.

(2) Acetylene must never be generated, piped (except in approved cylinder manifolds) or used at a pressure in excess of 15 psi gauge pressure or 30 psi absolute pressure. (The 30 psi absolute pressure limit is intended to prevent unsafe use of acetylene in pressurized chambers such as caissons, underground excavations or tunnel construction.) Using liquid acetylene is prohibited.

Exception: This requirement does not apply to storage of acetylene dissolved in a suitable solvent in cylinders manufactured and maintained according to DOT requirements, or to acetylene for chemical use.

(3) Only approved apparatus such as torches, regulators or pressure-reducing valves, acetylene generators, and manifolds must be used. Replacement tips may be used on approved torches, if the replacement tips are made to the same specifications as the original, or when replacements are used with convertor/adaptors that meet the same specifications.

(4) Before leaving any employee in charge of the oxygen or fuel-gas supply equipment, including generators, and oxygen or fuel-gas distribution piping systems, you must ensure that the employee has received proper instruction and is competent to do the work. Rules and instructions covering the operation and maintenance of oxygen or fuel-gas supply equipment including generators, and oxygen or fuel-gas distribution piping systems must be readily available.

WAC 296-307-48003 What requirements apply to portable cylinders? All portable cylinders used for storing and shipping compressed gases must be constructed and maintained according to DOT regulations.

(1) Compressed gas cylinders must be legibly marked with either the chemical or the trade name of the gas. The marking must be a permanent stencil, stamp, or label. When-
WAC 296-307-48005 What general requirements apply to storing compressed gas cylinders? (1) Cylinders must be kept away from radiators and other sources of heat.

(2) Indoors, cylinders must be stored in a well-protected, well-ventilated, dry area, at least twenty feet from highly combustible materials such as oil or excelsior. Cylinders should be stored in assigned places away from elevators, stairs, or gangways. Assigned storage spaces must be located where cylinders will not be knocked over or damaged by passing or falling objects, or subject to tampering. All cylinder enclosures must be ventilated.

(3) Empty cylinders must have their valves closed.

(4) Valve protection caps on cylinders designed to accept a cap, must always be in place and hand-tight, except when cylinders are in use or connected for use.

WAC 296-307-48007 How must fuel-gas cylinders be stored? Cylinders stored indoors, except those in use or attached ready for use, must be limited to a total gas capacity of 2,000 cubic feet or 300 pounds of LP-gas.

(1) Cylinders in excess of 2,000 cubic feet total gas capacity or 300 pounds of LP-gas, must be stored in a separate room or compartment that meets the requirements of 252 (a)(8) and (9) CFR, or cylinders must be kept outside or in a special building. Special buildings, rooms or compartments must be free from open flame for heating or lighting and must be well ventilated. They may also be used for storage of a maximum of 600 pounds of calcium carbide, when contained in metal containers complying with 252 (a)(7)(a) and (b) CFR. Signs should be conspicuously posted in such rooms reading, "Danger—No smoking, matches or open lights," or other equivalent wording.

(2) Acetylene cylinders must be stored valve end up.

WAC 296-307-48009 How must oxygen cylinders be stored? (1) Oxygen cylinders must not be stored near highly combustible material, especially oil and grease; or near reserve stocks of carbide and acetylene or other fuel-gas cylinders, or near any other substance likely to cause or accelerate fire; or in an acetylene generator compartment.

(2) Oxygen cylinders stored in outside generator houses must be separated from the generator or carbide storage rooms by a noncombustible partition having a fire-resistance rating of at least one hour. This partition must be without openings and must be gastight.

(3) Oxygen cylinders in storage must be separated from fuel-gas cylinders or combustible materials (especially oil or grease), a minimum of 20 feet or by a noncombustible barrier at least five feet high having a fire-resistance rating of at least one-half hour. (Cylinders "in-use," secured to a hand truck or structural member, with regulators, hoses, and torch temporarily removed for security purposes overnight or weekends, are not considered "in-storage.")

(4) Where a liquid oxygen system is to be used to supply gaseous oxygen for welding or cutting and the system has a storage capacity of more than 13,000 cubic feet of oxygen (measured at 14.7 psi(a) and 70°F), connected in service or ready for service, or more than 25,000 cubic feet of oxygen (measured at 14.7 psi(a) and 70°F), including unconnected reserves on hand at the site, it must meet the requirements of the Standard for Bulk Oxygen Systems at Consumer Sites, NFPA No. 566-1965.

WAC 296-307-48011 What general operating procedures apply to working with cylinders and containers? (1) The numbers and markings stamped into cylinders must not be tampered with.

(2) Cylinders, cylinder valves, couplings, regulators, hose, and apparatus must be kept free from oily or greasy substances. Oxygen cylinders or apparatus must not be handled with oily hands or gloves. A jet of oxygen must never be permitted to strike an oily surface, greasy clothes, or enter a fuel oil or other storage tank.

(3) Cylinders must be kept far enough away from the actual welding or cutting operation so that sparks, hot slag, or flame will not reach them, or fire-resistant shields must be provided.

(4) No person, other than the gas supplier, may attempt to mix gases in a cylinder. No one, except the owner of the cylinder or person authorized by the owner, may refill a cylinder.

(5) Cylinders must not be placed where they might become part of an electric circuit. Contacts with third rails, trolley wires, etc., must be avoided.

(6) Fuel-gas cylinders must be placed with valve end up whenever they are in use. Liquefied gases must be stored and shipped with the valve end up.

(7) A suitable cylinder truck, chain, or other steadying device must be used to prevent cylinders from being knocked over while in use.

WAC 296-307-48013 What requirements apply to safety devices on cylinders? (1) Valve-protection caps must not be used for lifting cylinders from one vertical position to another. Bars must not be used under valves or valve-protection caps to pry cylinders loose when frozen to the ground or otherwise fixed; we recommend using warm (not boiling)
water. Valve-protection caps are designed to protect cylinder valves from damage.

(2) Cylinders without fixed hand wheels must have keys, handles, or nonadjustable wrenches on valve stems while these cylinders are in service. In multiple cylinder installations only one key or handle is required for each manifold.

(3) No one may tamper with safety devices in cylinders or valves.

(4) Nothing may be placed on top of an acetylene cylinder when in use that may damage the safety device or interfere with the quick closing of the valve.

(5) Where a special wrench is required it must be left in position on the stem of the valve while the cylinder is in use so that the fuel-gas flow can be quickly turned off in case of emergency. In the case of manifolded or coupled cylinders at least one such wrench must always be available for immediate use.

(6) Cylinders with leaking fuse plugs or other leaking safety devices should be plainly marked with a warning not to approach them with a lighted cigarette or other source of ignition. You should notify the supplier promptly and follow the supplier’s instructions as to their return.

WAC 296-307-48015 How must cylinders be transported? (1) When transporting cylinders by a crane or derrick, a cradle, boat, or suitable platform must be used. Slings or electric magnets are prohibited for this purpose. Valve-protection caps, where cylinder is designed to accept a cap, must always be in place.

(2) Unless cylinders are secured on a special truck, regulators must be removed and valve-protection caps, when provided for, must be put in place before cylinders are moved.

(3) When cylinders are transported by powered vehicle they must be secured in a vertical position.

WAC 296-307-48017 How must cylinders be handled? (1) Cylinders must not be dropped or struck or permitted to strike each other violently.

(2) Cylinders must be handled carefully. Cylinders must not be subjected to rough handling, knocks, or falls that are liable to damage the cylinder, valve or safety devices and cause leakage.

(3) Cylinders must never be used as rollers or supports, whether full or empty.

WAC 296-307-48019 What requirements apply to cylinder valves? (1) Cylinder valves must be closed before moving cylinders.

(2) Cylinder valves must be closed when work is finished.

(3) Valves of empty cylinders must be closed.
WAC 296-307-48025 What requirements apply to high pressure oxygen manifolds? This section applies to cylinders with a DOT service pressure above 200 psig.

1. Manifolds must be approved either separately for each component or as an assembled unit.

2. Oxygen manifolds must not be located in an acetylene generator room. Oxygen manifolds must be separated from fuel-gas cylinders or combustible materials (especially oil or grease), a minimum distance of 20 feet or by a noncombustible barrier at least 5 feet high having a fire-resistance rating of at least one-half hour.

3. Oxygen cylinders connected to one manifold must be limited to a total gas capacity of 6,000 cubic feet. More than one such manifold with connected cylinders may be located in the same room if the manifolds are at least 50 feet apart or separated by a noncombustible barrier at least 5 feet high having a fire-resistance rating of at least one-half hour.

4. Exception: An oxygen manifold, to which cylinders having an aggregate capacity of more than 6,000 cubic feet of oxygen are connected, should be located outdoors or in a separate noncombustible building. Such a manifold, if located inside a building having other occupancy, must be located in a separate room of noncombustible construction having a fire-resistance rating of at least one-half hour or in an area with no combustible material within 20 feet of the manifold.

5. An oxygen manifold or oxygen bulk supply system that has storage capacity of more than 13,000 cubic feet of oxygen (measured at 14.7 psia and 70°F), connected in service or ready for service, or more than 25,000 cubic feet of oxygen (measured at 14.7 psia and 70°F), including unconnected reserves on hand at the site, must meet the requirements of the Standard for Bulk Oxygen Systems at Consumer Sites, NFPA No. 566-1965.

6. High-pressure oxygen manifolds must have approved pressure-regulating devices.

Note: DOT-4L200 cylinders have safety devices that relieve at a maximum pressure of 250 psig (or 235 psig if vacuum insulation is used).

(2) Hose and hose connections subject to cylinder pressure must meet the requirements of WAC 296-307-48049. Hose must have a minimum bursting pressure of 1,000 psig.

(3) The assembled manifold including leads must be tested and proven gas-tight at a pressure of 300 psig. The fluid used for testing oxygen manifolds must be oil-free and not combustible.

(4) The location of manifolds must meet the requirements of WAC 296-307-48025.

(5) The following sign must be conspicuously posted at each manifold:

Low-Pressure Manifold
Do Not Connect High-Pressure Cylinders
Maximum Pressure—250 PSIG

WAC 296-307-48029 What requirements apply to manifolding portable outlet headers? (1) Portable outlet headers must not be used indoors except for temporary service where the conditions preclude a direct supply from outlets located on the service piping system.

(2) Each outlet on the service piping from which oxygen or fuel-gas is withdrawn to supply a portable outlet header must have a readily accessible shut-off valve.

(3) Hose and hose connections used for connecting the portable outlet header to the service piping must meet the requirements of WAC 296-307-48051.

(4) Master shut-off valves for both oxygen and fuel-gas must be provided at the entry end of the portable outlet header.

(5) Portable outlet headers for fuel-gas service must have an approved hydraulic back-pressure valve installed at the inlet and preceding the service outlets, unless an approved pressure-reducing regulator, an approved backflow check valve, or an approved hydraulic back-pressure valve is installed at each outlet. Outlets provided on headers for oxygen service may be fitted for use with pressure-reducing regulators or for direct hose connection.

(6) Each service outlet on portable outlet headers must have a valve assembly that includes a detachable outlet seal cap, chained or otherwise attached to the body of the valve.

(8) Portable outlet headers must have frames that will support the equipment securely in the correct operating position and protect them from damage during handling and operation.

Note: DOT-4L200 cylinders have safety devices that relieve at a maximum pressure of 250 psig (or 235 psig if vacuum insulation is used).

(2) Hose and hose connections subject to cylinder pressure must meet the requirements of WAC 296-307-48049. Hose must have a minimum bursting pressure of 1,000 psig.

(3) The assembled manifold including leads must be tested and proven gas-tight at a pressure of 300 psig. The fluid used for testing oxygen manifolds must be oil-free and not combustible.

(4) The location of manifolds must meet the requirements of WAC 296-307-48025.

(5) The following sign must be conspicuously posted at each manifold:

Low-Pressure Manifold
Do Not Connect High-Pressure Cylinders
Maximum Pressure—250 PSIG
WAC 296-307-48031 What operating procedures apply to cylinder manifolds? (1) Cylinder manifolds must be installed under the supervision of someone familiar with the proper practices of construction and use.

(2) All component parts used in the methods of manifolding described in WAC 296-307-48023 must have the materials, design and construction approved either separately or as an assembled unit.

(3) All manifolds and parts used in methods of manifolding must be used only for the gas or gases for which they are approved.

(4) When acetylene cylinders are coupled, approved flash arresters must be installed between each cylinder and the coupler block. For outdoor use only, and when the number of cylinders coupled does not exceed three, one flash arrester installed between the coupler block and regulator is acceptable.

(5) Each fuel-gas cylinder lead should have a backflow check valve.

(6) The maximum aggregate capacity of fuel-gas cylinders connected to a portable manifold inside a building must be 3,000 cubic feet of gas.

(7) Acetylene and liquefied fuel-gas cylinders must be manifol ded vertically.

(8) The pressure in the gas cylinders connected to and discharged simultaneously through a common manifold must be approximately equal.

WAC 296-307-48033 How must service piping systems be designed? (1) Piping and fittings must comply with Section 2, Industrial Gas and Air Piping Systems, of the American National Standard Code for Pressure Piping, ANSI B 31.1-1967, if they do not conflict with subsections (2) and (3) of this section.

(2) Pipe must be at least Schedule 40 and fittings must be at least standard weight in sizes up to and including 6-inch nominal.

(3) Copper tubing must be Types K or L according to the Standard Specification for Seamless Copper Water Tube, ASTM B88-66a.

(4) Piping must be steel, wrought iron, brass or copper pipe, or seamless copper, brass or stainless steel tubing, except as provided in subsections (5) through (9) of this section.

(5) Oxygen piping and fittings at pressures in excess of 700 psig, must be stainless steel or copper alloys.

(6) Hose connections and hose complying with WAC 296-307-48051 may be used to connect the outlet of a manifold pressure regulator to piping if the working pressure of the piping is 250 psig or less and the length of the hose is a maximum of 5 feet. Hose must have a minimum bursting pressure of 1,000 psig.

(7) When oxygen is supplied to a service piping system from a low-pressure oxygen manifold without an intervening pressure regulating device, the piping system must have a minimum design pressure of 250 psig. A pressure regulating device must be used at each station outlet when the connected equipment is for use at pressures less than 250 psig.

(8) Piping for acetylene or acetylenic compounds must be steel or wrought iron.

(9) Unalloyed copper must only be used for acetylene or acetylenic compounds in listed equipment.

WAC 296-307-48035 What requirements apply to piping joints? (1) Joints in steel or wrought iron piping must be welded, threaded or flanged. Fittings, such as ells, tees, couplings, and unions, must be rolled, forged or cast steel, malleable iron or nodular iron. Gray or white cast iron fittings are prohibited.

(2) Joints in brass or copper pipe must be welded, brazed, threaded, or flanged. Socket type joints must be brazed with silver-brazing alloy or similar high melting point (not less than 800°F) filler metal.

(3) Joints in seamless copper, brass, or stainless steel tubing must be approved gas tubing fittings or the joints must be brazed. Socket type joints must be brazed with silver-brazing alloy or similar high melting point (not less than 800°F) filler metal.

WAC 296-307-48037 How must service piping systems be installed? (1) Distribution lines must be installed and maintained in a safe operating condition.

(2) Piping may be above or below ground. All piping must be run as directly as practical, protected against physical damage, with an allowance for expansion and contraction, jarring and vibration. Pipe laid underground in earth must be below the frost line and protected against corrosion. After assembly, piping must be thoroughly blown out with air or nitrogen to remove foreign materials. For oxygen piping, only oil-free air, oil-free nitrogen, or oil-free carbon dioxide must be used.

(3) Only piping that has been welded or brazed must be installed in tunnels, trenches or ducts. Shut-off valves must be located outside such conduits. Oxygen piping may be placed in the same tunnel, trench or duct with fuel-gas pipelines, if there is good natural or forced ventilation.

(4) Low points in piping carrying moist gas must be drained into drip pots constructed to permit pumping or draining out the condensate at necessary intervals. Drain valves must be installed for this purpose having outlets normally closed with screw caps or plugs. Open end valves or petcocks are prohibited, except that in drips located outdoors, underground, and not readily accessible, valves may be used at such points if they have means to secure them in the closed position. Pipes leading to the surface of the ground must be cased or jacketed where necessary to prevent loosening or breaking.

(5) Gas cocks or valves must be provided for all buildings at points where they will be readily accessible for shut-
ting off the gas supply to these buildings in any emergency. Underground valve boxes or manholes should be avoided wherever possible. There must be a shut-off valve in the discharge line from the generator, gas holder, manifold or other source of supply.

(6) Shut-off valves must not be installed in safety-relief lines in such a manner that the safety-relief device can be rendered ineffective.

(7) Fittings and lengths of pipe must be examined internally before assembly and, if necessary, freed from scale or dirt. Oxygen piping and fittings must be washed out with a suitable solution that will effectively remove grease and dirt but will not react with oxygen.

Note: Hot water solutions of caustic soda or trisodium phosphate are effective for this purpose.

(8) Piping must be thoroughly blown out after assembly to remove foreign materials. For oxygen piping, oil-free air, oil-free nitrogen, or oil-free carbon dioxide must be used. For other piping, air or inert gas may be used.

(9) When flammable gas lines or other parts of equipment are being purged of air or gas, open lights or other sources of ignition are prohibited near uncapped openings.

(10) No welding or cutting must be performed on an acetylene or oxygen pipeline, including the attachment of hangers or supports, until the line has been purged. Only oil-free air, oil-free nitrogen, or oil-free carbon dioxide must be used to purge oxygen lines.

WAC 296-307-48039 How must service piping systems be protected? Service piping systems must be protected by pressure relief devices set to function at not more than the design pressure of the systems and discharging upwards to a safe location.

WAC 296-307-48047 What requirements apply to piping protective equipment? (1) The fuel-gas and oxygen piping systems, including portable outlet headers must incorporate the protective equipment shown in Figures V-1, V-2, and V-3.

When only a portion of a fuel-gas system is to be used with oxygen, only that portion must meet this requirement.

(2) Approved protective equipment (designated PF in Figs. V-1, V-2, and V-3) must be installed in fuel-gas piping to prevent:

(a) Backflow of oxygen into the fuel-gas supply system;
(b) Passage of a flash back into the fuel-gas supply system; and
(c) Excessive back pressure of oxygen in the fuel-gas supply system. The three functions of the protective equipment may be combined in one device or may be provided by separate devices.
(3) The protective equipment must be located in the main supply line, as in Figure 1 or at the head of each branch line, as in Figure 2 or at each location where fuel-gas is withdrawn, as in Figure 3. Where branch lines are of 2-inch pipe size or larger or of substantial length, protective equipment (designated as PF) shall be located as shown in either 2 or 3.

(4) Backflow protection must be provided by an approved device that will prevent oxygen from flowing into the fuel-gas system or fuel from flowing into the oxygen system (see SF, Figs. 1 and 2).

(5) Flash-back protection must be provided by an approved device that will prevent flame from passing into the fuel-gas system.

(6) Back-pressure protection must be provided by an approved pressure-relief device set at a pressure not greater than the pressure rating of the backflow or the flashback protection device, whichever is lower. The pressure-relief device must be located on the downstream side of the backflow and flashback protection devices. The vent from the pressure-relief device must be at least as large as the relief device inlet and must be installed without low points that may collect moisture. If low points are unavoidable, drip pots with drains closed with screw plugs or caps shall be installed at the low points. The vent terminus must not endanger personnel or property through gas discharge; must be located away from ignition sources; and must terminate in a hood or bend.

(7) If pipeline protective equipment incorporates a liquid, the liquid level must be maintained, and a suitable anti-freeze may be used to prevent freezing.

(8) Fuel-gas for use with equipment not requiring oxygen must be withdrawn upstream of the piping protective devices.

**WAC 296-307-48049** What requirements apply to station outlet protective equipment? (1) A check valve, pressure regulator, hydraulic seal, or combination of these devices must be provided at each station outlet, including those on portable headers, to prevent backflow, as shown in Figures 1, 2, and 3 and designated as SF and SO.

(2) When approved pipeline protective equipment (designated PF) is located at the station outlet as in Figure 3, no additional check valve, pressure regulator, or hydraulic seal is required.

(3) Each station outlet must have a shut-off valve (designated VF and VO) installed on the upstream side of other station outlet equipment.

(4) If the station outlet is equipped with a detachable regulator, the outlet must terminate in a union connection that meets the requirements of the Regulator Connection Standards, 1958, Compressed Gas Association.

(5) If the station outlet is connected directly to a hose, the outlet must terminate in a union connection that meets the requirements of the Standard Hose Connection Specifications, 1957, Compressed Gas Association.

(6) Station outlets may terminate in pipe threads to which permanent connections are to be made, such as to a machine.

(7) Station outlets must have a detachable outlet seal cap secured in place. This cap must be used to seal the outlet except when a hose, a regulator, or piping is attached.

(8) Where station outlets are equipped with approved backflow and flashback protective devices, as many as four torches may be supplied from one station outlet through rigid piping, if each outlet from such piping, is equipped with a shut-off valve and if the fuel-gas capacity of any one torch...

(2005 Ed.)
does not exceed 15 cubic feet per hour. This rule does not apply to machines.

(2) The generally recognized colors are red for acetylene and other fuel-gas hose, green for oxygen hose, and black for inert-gas and air hose.

(3) When parallel lengths of oxygen and acetylene hose are taped together for convenience and to prevent tangling, a maximum of 4 inches out of 12 inches must be covered by tape.

(4) Hose connections must meet the requirements of the Standard Hose Connection Specifications, 1957, Compressed Gas Association.

(5) Hose connections must be clamped or otherwise securely fastened so they will withstand, without leakage, twice the pressure to which they are normally subjected in service, but never less than a pressure of 300 psi. Oil-free air or an oil-free inert gas must be used for the test.

(6) Hose showing leaks, burns, worn places, or other defects rendering it unfit for service must be repaired or replaced.

[97-09-013, recodified as § 296-307-48051, filed 4/7/97, effective 4/7/97, Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-48051, filed 10/31/96, effective 12/1/96.]

**WAC 296-307-48053** What requirements apply to pressure-reducing regulators? (1) Pressure-reducing regulators must be used only for the gas and pressures for which they are intended. The regulator inlet connections must meet the requirements of the Regulator Connection Standards, 1958, Compressed Gas Association.

(2) When regulators or parts of regulators, including gauges, need repair, the work must be performed by skilled mechanics who have been properly instructed.

(3) Gauges on oxygen regulators must be marked "USE NO OIL."

(4) Union nuts and connections on regulators must be inspected before use to detect faulty seats that may cause leakage of gas when the regulators are attached to the cylinder valves. Damaged nuts or connections must be destroyed.

[97-09-013, recodified as § 296-307-48053, filed 4/7/97, effective 4/7/97, Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-48053, filed 10/31/96, effective 12/1/96.]

**WAC 296-307-485** Installation and operation of resistance welding equipment.

**WAC 296-307-48501** What general requirements apply to resistance welding equipment? (1) All equipment must be installed by a qualified electrician according to the requirements of chapter 296-307 WAC Part T. There must be a safety-type disconnecting switch or a circuit breaker or circuit interrupter to open each power circuit to the machine, conveniently located at or near the machine, so that the power can be shut off when the machine or its controls are to be serviced.

(2) Ignitron tubes used in resistance welding equipment must have a thermal protection switch.

(3) Employees designated to operate resistance welding equipment must have been properly instructed and judged competent to operate such equipment.

(4) Controls of all automatic or air and hydraulic clamps must be arranged or guarded to prevent the operator from accidentally activating them.

**WAC 296-307-48503** What requirements apply to portable welding machines? (1) All portable welding guns must have suitable counter-balanced devices for supporting the guns, including cables, unless the design of the gun or fixture makes counterbalancing impractical or unnecessary.

(2) All portable welding guns, transformers, and related equipment that is suspended from overhead structures, eye beams, or trolleys must have safety chains or cables. Safety chains or cables shall be able to support the total shock load in the event of failure of any component of the supporting system.

(3) When trolleys are used to support portable welding equipment, they must have suitable forged steel clevis for the attachment of safety chains. Each clevis must be able to support the total shock load of the suspended equipment in the event of trolley failure.

(4) All initiating switches, including retraction and dual schedule switches, located on the portable welding gun must have suitable guards able to prevent accidental initiation through contact with fixturing, operator’s clothing, etc. Initiating switch voltage must be a maximum of 24 volts.

(5) The movable holder, where it enters the gun frame, must have enough clearance to prevent the shearing of the operator’s fingers if placed on the operating movable holder.

(6) The secondary and case of all portable welding transformers must be grounded. Secondary grounding may be by center tapped secondary or by a center tapped grounding reactor connected across the secondary.

[97-09-013, recodified as § 296-307-48503, filed 4/7/97, effective 4/7/97, Statutory Authority: RCW 49.17.040, [49.17.]050 and [49.17.]060. 96-22-048, § 296-306A-48503, filed 10/31/96, effective 12/1/96.]

**WAC 296-307-48505** What requirements apply to flash welding equipment? (1) Flash welding machines must have a hood to control flying flash. In cases of high production, where materials may contain a film of oil and where toxic elements and metal fumes are given off, ventilation must be provided according to WAC 296-307-50009 through 296-307-50029.

(2) For the protection of the operators of nearby equipment, fire-resistant curtains or suitable shields must be set up.

[Title 296 WAC—p. 2596]
WAC 296-307-48507 Who must perform a job hazard analysis? A qualified person must perform a job hazard analysis on the operations to be performed on each welding machine to determine the safeguards and personal protective equipment that shall be used for each job.

WAC 296-307-48509 What maintenance requirements apply to resistance welding equipment? Qualified maintenance personnel must periodically inspect the equipment and maintain records of the inspections. The operator must be instructed to report any equipment defects to the supervisor and the use of the equipment must be discontinued until safety repairs have been completed.

WAC 296-307-490 Application, installation, and operation of arc welding and cutting equipment.

WAC 296-307-49001 What environmental conditions must be taken into account when selecting arc welding equipment?

Note: You may ensure that your equipment is designed for safety by choosing equipment that complies with the Requirements for Electric Arc-Welding Apparatus, NEMA EW-1-1962, National Electrical Manufacturers Association or the Safety Standard for Transformer-Type Arc-Welding Machines, ANSI C33.2-1956, Underwriters’ Laboratories.

(1) Standard machines for arc welding service must be designed and constructed to carry their rated load with rated temperature rises where the temperature of the cooling air is a maximum of 40°C (104°F) and where the altitude is a maximum of 3,300 feet, and must be suitable for operation in atmospheres containing gases, dust, and light rays produced by the welding arc.

(2) When exposed to the following or other conditions, machines must be designed to safely meet the requirements of the service.

- Unusually corrosive fumes;
- Steam or excessive humidity;
- Excessive oil vapor;
- Flammable gases;
- Abnormal vibration or shock;
- Excessive dust;
- Weather;
- Unusual seacoast or shipboard conditions.

WAC 296-307-49003 What voltages must arc welding equipment use? Open circuit (no load) voltages of arc welding and cutting machines should be as low as possible consistent with satisfactory welding or cutting being done. Following are the maximum limits:

1. For alternating-current machines:
   b. Automatic (machine or mechanized) arc welding and cutting—100 volts.

2. For direct-current machines:
   b. Automatic (machine or mechanized) arc welding and cutting—100 volts.

3. When special welding and cutting processes require values of open circuit voltages higher than the above, means must be provided to prevent the operator from making accidental contact with the high voltage by adequate insulation or other means.

Note: For a.c. welding under wet conditions or warm surroundings where perspiration is a factor, the use of reliable automatic controls for reducing no load voltage is recommended to reduce the shock hazard.

WAC 296-307-49005 How must arc welding equipment be designed?

1. A controller integrally mounted in an electric motor driven welder must be able to carry the rated motor current, must be able to make and interrupt stalled rotor current of the motor, and may serve as the running overcurrent device if provided with the number of over-current units as specified by chapter 296-307 WAC Part T. Starters with magnetic undervoltage release should be used with machines installed more than one to a circuit to prevent circuit overload caused by simultaneously starting several motors upon return of voltage.

2. On all types of arc welding machines, control apparatus must be enclosed except for the operating wheels, levers, or handles.

Note: Control handles and wheels should be large enough to be easily grasped by a gloved hand.

3. Input power terminals, tap change devices, and live metal parts connected to input circuits must be completely enclosed and accessible only by tools.

4. Terminals for welding leads should be protected from accidental electrical contact by employees or by metal objects i.e., vehicles, crane hooks, etc. You may provide protection with:

- Dead-front receptacles for plug connections;
- Recessed openings with nonremovable hinged covers;
- Heavy insulating sleeving or taping; or
- Other equivalent electrical and mechanical protection.

If a welding lead terminal that is intended to be used exclusively for connection to the work is connected to the...
grounded enclosure, it must be done by a conductor at least two AWG sizes smaller than the grounding conductor and the terminal must be marked to indicate that it is grounded.

(5) No connections for portable control devices (such as push buttons to be carried by the operator) must be connected to an a.c. circuit of higher than 120 volts. Exposed metal parts of portable control devices operating on circuits above 50 volts must be grounded by a grounding conductor in the control cable.

(6) Auto transformers or a.c. reactors must not be used to draw welding current directly from any a.c. power source having a voltage exceeding 80 volts.

WAC 296-307-49007 How must arc welding equipment be installed? Arc welding equipment, including the power supply, must be installed according to the requirements of chapter 296-307 WAC Part T.

WAC 296-307-49009 How must arc welding equipment be grounded? (1) The frame or case of the welding machine (except engine-driven machines) must be grounded according to the requirements of chapter 296-307 WAC Part T.

(2) Conduits containing electrical conductors must not be used for completing a work-lead circuit. Pipelines must not be used as a permanent part of a work-lead circuit, but may be used during construction, extension or repair if current is not carried through threaded joints, flanged bolted joints, or caulked joints and special precautions are used to avoid sparking at connection of the work-lead cable.

(3) Using chains, wire ropes, cranes, hoists, and elevators to carry welding current is prohibited.

(4) Where a structure, conveyor, or fixture is regularly used as a welding current return circuit, joints must be bonded or provided with adequate current collecting devices and appropriate periodic inspection should be conducted to ensure that no electrocution, shock, or fire hazard exists.

(5) All ground connections must be checked to determine that they are mechanically strong and electrically adequate for the required current.

WAC 296-307-49011 What requirements apply to supply connections and conductors? (1) A disconnecting switch or controller must be provided at or near each welding machine without a switch or controller mounted as an integral part of the machine. The switch must meet the requirements of chapter 296-307 WAC Part T. Overcurrent protection must be provided as specified in chapter 296-307 WAC Part T. A disconnect switch with overload protection or equivalent disconnect and protection means, permitted by chapter 296-307 WAC Part T must be provided for each outlet intended for connection to a portable welding machine.

(2) For individual welding machines, the rated current-carrying capacity of the supply conductors must be at least that of the rated primary current of the welding machines.

(3) For groups of welding machines, the rated current-carrying capacity of conductors may be less than the sum of the rated primary currents of the welding machines supplied. The conductor rating must be determined according to the machine loading based on the use to be made of each welding machine and the allowance permissible in the event that all the welding machines supplied by the conductors will not be in use at the same time.

(4) In operations involving several welders on one structure, d.c. welding process requirements may require the use of both polarities; or supply circuit limitations for a.c. welding may require distribution of machines among the phases of the supply circuit. In such cases, no load voltages between electrode holders will be two times normal in d.c. or 1, 1.4, 1.73, or 2 times normal on a.c. machines. Similar voltage differences will exist if both a.c. and d.c. welding are done on the same structure.

(a) All d.c. machines must be connected with the same polarity.

(b) All a.c. machines must be connected to the same phase of the supply circuit and with the same instantaneous polarity.

(2) Before starting operations, all connections to the machine must be checked to make certain they are properly made. The work lead must be firmly attached to the work; magnetic work clamps shall be freed from adherent metal particles of spatter on contact surfaces. Coiled welding cable must be spread out before use to avoid serious overheating and damage to insulation.

(3) You must ensure that the welding machine frame grounding is checked with special attention given to safety ground connections of portable machines.

(4) Cylinders must be kept away from radiators, piping systems, layout tables, etc., that may be used for grounding electric circuits. Any practice such as the tapping of an electrode against a cylinder to strike an arc is prohibited.

(5) There must be no leaks of cooling water, shielding gas or engine fuel.

(6) You must ensure that the machine has proper switching equipment for shutting down.
(7) Printed rules and instructions covering operation of equipment supplied by the manufacturers must be strictly followed.

(8) Electrode holders when not in use must be placed so that they cannot make electrical contact with persons, conducting objects, fuel or compressed gas tanks.

(9) Cables with splices within 10 feet of the holder are prohibited. The welder should not coil or loop welding electrode cable around parts of the body.

[Statutory Authority: RCW 49.17.040, 49.17.050 and 49.17.060. 96-22-048, § 296-306A-49013, filed 10/31/96, effective 12/1/96.]

WAC 296-307-49015 How must arc welding equipment be maintained? (1) The operator should report any equipment defect or safety hazard to the supervisor and discontinue using the equipment until its safety is ensured. Repairs must be made only by qualified persons.

(2) Machines that have become wet must be thoroughly dried and tested before being used.

(3) Work and electrode lead cables should be frequently inspected for wear and damage. Cables with damaged insulation or exposed bare conductors must be replaced. Lengths of work and electrode cables must be joined by connecting means specifically intended for the purpose. The connecting means must have insulation adequate for the service conditions.

WAC 296-307-495 Fire prevention and protection.

[97-09-013, recodified as § 296-307-495, filed 4/7/97, effective 4/7/97. Statutory Authority: RCW 49.17.040, 49.17.050 and 49.17.060. 96-22-048, § 296-306A-495, filed 10/31/96, effective 12/1/96.]

WAC 296-307-49501 What basic fire prevention precautions must be taken? For more information on these basic precautions and the special precautions of WAC 296-307-49503, including fire protection and prevention responsibilities of welders, cutters, their supervisors (including outside contractors), and management, see the Standard for Fire Prevention in Use of Cutting and Welding Processes, NFPA Standard 51B, 1962.

The basic precautions for fire prevention in welding or cutting work are:

(1) If the object to be welded or cut cannot readily be moved, all movable fire hazards in the vicinity must be taken to a safe place.

(2) If the object to be welded or cut cannot be moved and if all the fire hazards cannot be removed, then guards must be used to confine the heat, sparks, and slag, and to protect the fire hazards.

(3) If the requirements of this section cannot be met, then welding and cutting are prohibited.

WAC 296-307-49503 What special fire prevention precautions must be taken? When the nature of the work to be performed falls within the scope of WAC 296-307-49501(2), certain additional precautions may be necessary:

(1) Wherever there are floor openings or cracks in the flooring that cannot be closed, precautions must be taken so that no readily combustible materials on the floor below will be exposed to sparks that drop through. The same precautions must be observed with regard to cracks or holes in walls, open doorways, and open or broken windows.

(2) Suitable fire extinguishing equipment must be maintained in a state of readiness for instant use. Such equipment may consist of pails of water, buckets of sand, hose, or portable extinguishers depending upon the nature and quantity of the combustible material exposed.

(3) The following requirements apply to fire watch:

(a) Fire watchers are required whenever welding or cutting is performed in locations where other than a minor fire might develop, or any of the following conditions exist:

(i) Appreciable combustible material, in building construction or contents, closer than 35 feet to the point of operation.

(ii) Appreciable combustibles are more than 35 feet away but are easily ignited by sparks.

(iii) Wall or floor openings within a 35-foot radius expose combustible material in adjacent areas including concealed spaces in walls or floors.

(iv) Combustible materials are adjacent to the opposite side of metal partitions, walls, ceilings, or roofs and are likely to be ignited by conduction or radiation.

(b) Fire watchers must have fire extinguishing equipment readily available and be trained in its use. They must be familiar with facilities for sounding an alarm in the event of a fire. They must watch for fires in all exposed areas, try to extinguish them only when obviously within the capacity of the equipment available, or otherwise sound the alarm. A fire watch must be maintained for at least a half hour after completion of welding or cutting operations to detect and extinguish possible smoldering fires.

(4) Before cutting or welding is permitted, the area must be inspected by the individual responsible for authorizing cutting and welding operations. The responsible individual must designate precautions to be followed in granting authorization to proceed, preferably in the form of a written permit.

(5) Where combustible materials such as paper clippings, wood shavings, or textile fibers are on the floor, the floor must be swept clean for a radius of 35 feet. Combustible floors must be kept wet, covered with damp sand, or protected by fire-resistant shields. Where floors have been wet down, employees operating arc welding or cutting equipment must be protected from possible shock.

(6) Cutting and welding are prohibited in the following situations:

(a) In areas not authorized by management.

(b) In sprinklered buildings while such protection is impaired.

(c) In the presence of explosive atmospheres (mixtures of flammable gases, vapors, liquids, or dusts with air), or where explosive atmospheres may develop inside uncleaned or improperly prepared tanks or equipment that have previ-
nously contained such materials, or that may develop in areas with an accumulation of combustible dusts.

(d) In areas near the storage of large quantities of exposed, readily ignitable materials such as bulk sulphur, baled paper, or cotton.

(7) Where practical, all combustibles must be relocated at least 35 feet from the worksite. Where relocation is impractical, combustibles must be protected with flame-proofed covers or otherwise shielded with metal or asbestos guards or curtains. Edges of covers at the floor should be tight to prevent sparks from going under them. This precaution is also important in overlaps where several covers are used to protect a large pile.

(8) Ducts and conveyor systems that might carry sparks to distant combustibles must be suitably protected or shut down.

(9) Where cutting or welding is done near walls, partitions, ceiling, or roof of combustible construction, fire-resistant shields or guards must be provided to prevent ignition.

(10) If welding is to be done on a metal wall, partition, ceiling, or roof, precautions must be taken to prevent ignition of combustibles on the other side, due to conduction or radiation, preferably by relocating combustibles. Where combustibles are not relocated, a fire watch on the opposite side from the work must be provided.

(11) Welding must not be attempted on a metal partition, wall, ceiling, or roof having a combustible covering or on walls or partitions of combustible sandwich-type panel construction.

(12) Cutting or welding on pipes or other metal in contact with combustible walls, partitions, ceilings or roofs must not be undertaken if the work is close enough to cause ignition by conduction.

(13) You are responsible for the safe use of cutting and welding equipment on your property and:

(a) Based on fire potentials of plant facilities, you must establish areas and procedures for cutting and welding;

(b) You must designate an individual responsible for authorizing cutting and welding operations in areas not specifically designed for such processes;

(c) You must insist that cutters or welders and their supervisors are suitably trained in the safe operation of their equipment and the safe use of the process; and

(d) You must advise all contractors about flammable materials or hazardous conditions of which they may not be aware.

(14) The supervisor must:

(a) Ensure that cutting and welding equipment is handled and used safely.

(b) Determine the combustible materials and hazardous areas present or likely to be present in the work location.

(c) Protect combustibles from ignition by the following:

(i) Have the work moved to a location free from dangerous combustibles;

(ii) If the work cannot be moved, have the combustibles moved to a safe distance from the work or have the combustibles properly shielded against ignition; and

(iii) See that cutting and welding are so scheduled that plant operations that might expose combustibles to ignition are not started during cutting or welding.
WAC 296-307-500 Protection of employees.

WAC 296-307-50001 How must eye protection be selected? (1) Helmets or hand shields must be used during all arc welding or arc cutting operations, excluding submerged arc welding. Goggles should also be worn during arc welding or cutting operations to provide protection from injurious rays from adjacent work, and from flying objects. The goggles may have either clear or colored glass, depending on the amount of exposure to adjacent welding operations. Helpers or attendants must have proper eye protection.

(2) Goggles or other suitable eye protection must be used during all gas welding or oxygen cutting operations. Spectacles without side shields, with suitable filter lenses are permitted for use during gas welding operations on light work, for torch brazing, or for inspection.

(3) All operators and attendants of resistance welding or resistance brazing equipment must use transparent face shields or goggles, depending on the job, to protect their faces or eyes as required.

(4) Suitable goggles must be provided where needed for brazing operations not above.

WAC 296-307-50003 What specifications must eye protection meet? (1) Helmets and hand shields must be made of a material that is an insulator for heat and electricity. Helmets, shields and goggles must be not readily flammable and must be able to be sterilized.

(2) Helmets and hand shields must be arranged to protect the face, neck and ears from direct radiant energy from the arc.

(3) Helmets must have filter plates and cover plates designed for easy removal.

(4) All parts must be constructed of a material that will not readily corrode or discolor the skin.

(5) Goggles must be ventilated to prevent fogging of the lenses as much as practical.

(6) Cover lenses or plates should be provided to protect each helmet, hand shield, or goggles filter lens or plate.

(7) All glass for lenses must be tempered, substantially free from scratches, air bubbles, waves and other flaws. Except when a lens is ground to provide proper optical correction for defective vision, the front and rear surfaces of lenses and windows must be smooth and parallel.

(8) Lenses must be marked with the source and shade.

(9) Following is a guide to select proper shade numbers. Individual needs may vary.

<table>
<thead>
<tr>
<th>Welding Operation</th>
<th>Shade No.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shielded metal-arc welding—1/16-, 3/32-, 1/8-, 5/32-inch electrodes</td>
<td>10</td>
</tr>
<tr>
<td>Gas-shielded arc welding (nonferrous)—1/16-, 3/32-, 1/8-, 5/32-inch electrodes</td>
<td>11</td>
</tr>
<tr>
<td>Gas-shielded arc welding (ferrous)—1/16-, 3/32-, 1/8-, 5/32-inch electrodes</td>
<td>12</td>
</tr>
</tbody>
</table>

Note: In gas welding or oxygen cutting where the torch produces a high yellow light it is desirable to use a filter or lens that absorbs the yellow or sodium line in the visible light of the operation.

(11) Where the work permits, an arc welder should be enclosed in an individual booth painted with a finish of low-reflectivity such as zinc oxide (an important factor for absorbing ultraviolet radiations) and lamp black, or must be enclosed with noncombustible screens similarly painted. Booths and screens must permit circulation of air at floor level. Employees or other persons adjacent to the welding areas must be protected from the rays by noncombustible or flameproof screens or shields or must be required to wear appropriate goggles.

WAC 296-307-50005 What protective clothing must welders wear? (1) Employees exposed to the hazards created by welding, cutting, or brazing operations must be protected by personal protective equipment according to the requirements of chapter 296-307 WAC Part H. Appropriate protective clothing required for any welding operation will vary with the size, nature and location of the work to be performed.

(2) The following suggestions may be helpful when choosing protective clothing:

(a) Except when engaged in light work, all welders should wear flameproof gauntlet gloves.

(b) Flameproof aprons made of leather, asbestos, or other suitable material may help to protect against radiated heat and sparks.

(c) Woolen clothing is better than cotton because it is less easily ignited and helps to protect the welder from changes in temperature. Cotton clothing, if used, should be chemically treated to reduce its combustibility. All outer clothing such as jumpers or overalls should be reasonably free from oil or grease.

(d) Sparks may lodge in rolled-up sleeves, pockets, or cuffs. Therefore sleeves and collars should be buttoned, and clothing should have no front pockets. Trousers or overalls should be uncuffed.
(e) For heavy work, fire-resistant leggings, high boots, or other equivalent means should be used.

(f) In production work a sheet metal screen in front of the employee’s legs can provide further protection against sparks and molten metal in cutting operations.

(g) Capes or shoulder covers made of leather or other suitable materials should be worn during overhead welding or cutting operations. Leather skull caps may be worn under helmets to prevent head burns.

(h) For welding and cutting overhead or in extremely confined spaces, ear protection is sometimes desirable.

(i) Where there is exposure to sharp or heavy falling objects, or a hazard of bumping in confined spaces, hard hats or head protectors must be used.

**WAC 296-307-50007 What other requirements apply to employee protection?** (1) You must ensure that a welder or helper working on platforms, scaffolds, or runways is protected against falling by using railings, safety belts, life lines, or other equally effective safeguards.

(2) Welders must place welding cable and other equipment so that it is clear of passageways, ladders, and stairways.

**WAC 296-307-50009 What employee protection must be provided in confined spaces?** “Confined space” means a relatively small or restricted space such as a tank, boiler, pressure vessel, or small compartment of a ship.

(1) Confined spaces must be ventilated. For ventilation requirements see WAC 296-307-50011 through 296-307-50029.

(2) When welding or cutting in a confined space, the gas cylinders and welding machines must be left outside. Before operations are started, heavy portable equipment mounted on wheels must be securely blocked to prevent accidental movement.

(3) Where a welder must enter a confined space through a manhole or other small opening, means must be provided for quickly removing the welder in case of emergency. When safety belts and lifelines are used, they must be attached so that the welder’s body cannot be jammed in a small exit opening. An attendant with a preplanned rescue procedure must be stationed outside to observe the welder at all times and be able to put rescue operations into effect.

(4) After welding operations are completed, the welder must mark the hot metal or provide some other means of warning other employees.

**WAC 296-307-50011 What general requirements apply to welding ventilation?** (1) The following three factors in arc and gas welding must be considered when determining the amount of contamination to which welders may be exposed:

(a) Dimensions of space in which welding is to be done (especially ceiling height);

(b) Number of welders; and

(c) The possibility of hazardous fumes, gases, or dust according to the metals involved.

(2) Other factors involved may require ventilation or respiratory protective devices as needed to meet the requirements of this section. Such factors include:

(a) Atmospheric conditions;

(b) Heat generated; and

(c) Presence of volatile solvents.

(3) When welding must be performed in a space entirely screened on all sides, the screens must be arranged so that no serious restriction of ventilation exists. The screens should be mounted so that they are about 2 feet above the floor unless the work is performed at so low a level that the screen must be extended nearer to the floor to protect nearby employees from the glare of welding.

(4) Local exhaust or general ventilating systems must be provided and arranged to keep the amount of toxic fumes, gases, or dusts below the maximum allowable in chapter 296-62 WAC.

[Note: A number of potentially hazardous materials are employed in fluxes, coatings, coverings, and filler metals used in welding and cutting or are released to the atmosphere during welding and cutting. These include but are not limited to the materials itemized in WAC 296-307-50019 through 296-307-50029.]

(5) You must determine which potentially hazardous materials are associated with welding and cutting and inform employees through signs, labels or other appropriate means.

(a) Welding may produce fumes and gases hazardous to health. Avoid breathing these fumes and gases. Use adequate ventilation. See ANSI Z 49.1-1967, Safety in Welding and Cutting, published by the American Welding Society.

(b) Brazing (welding) filler metals containing cadmium in significant amounts must carry the following notice on tags, boxes, or other containers:

**WARNING**

CONTAINS CADMIUM—POISONOUS FUMES MAY BE FORMED ON HEATING

- Do not breathe fumes. Use only with adequate ventilation such as fume collectors, exhaust ventilators, or air-supplied respirators. See ANSI Z 49.1-1967.

- If chest pain, cough, or fever develops after use call physician immediately.

- Keep children away when using.

(c) Brazing and gas welding fluxes containing fluorine compounds must have a cautionary wording to indicate that they contain fluorine compounds. The American Welding Society recommends the following for brazing and gas welding fluxes:
CAUTION
CONTAINS FLUORIDES

This flux when heated gives off fumes that may irritate eyes, nose and throat.

- Avoid fumes. Use only in well-ventilated spaces.
- Avoid contact of flux with eyes or skin.
- Do not take internally.

WAC 296-307-50013 What ventilation must be provided for general welding and cutting? (1) Mechanical ventilation must be provided when welding or cutting is done on metals not covered in WAC 296-307-50019 through 296-307-50029 in the following locations:

(a) In a space of less than 10,000 cubic feet per welder.
(b) In a room with a ceiling height of less than 16 feet.
(c) In confined spaces or where the welding space contains partitions, balconies, or other structural barriers to the extent that they significantly obstruct cross-ventilation.

(2) Ventilation must be at the minimum rate of 2,000 cubic feet per minute per welder.

Exception: This requirement does not apply where local exhaust hoods and booths that meet the requirements of WAC 296-307-50015, or airline respirators approved by the Mine Safety and Health Administration (MSHA) and the National Institute for Occupational Safety and Health (NIOSH) for such purposes are provided. Natural ventilation is considered sufficient for welding or cutting operations where the restrictions in subsection (1) of this section are not present.

(3) In areas immediately hazardous to life, hose masks with blowers or self-contained breathing equipment must be used. The breaching equipment must be approved by the Mine Safety and Health Administration (MSHA) and the National Institute for Occupational Safety and Health (NIOSH). (4) Where welding operations are carried on in confined spaces and where welders and helpers are provided with hose masks, hose masks with blowers or self-contained breathing equipment approved by the Mine Safety and Health Administration (MSHA) and the National Institute for Occupational Safety and Health (NIOSH), an employee must be stationed on the outside of such confined spaces to ensure the safety of those working within.

(5) Oxygen must not be used for ventilation.

WAC 296-307-50015 What requirements apply to local exhaust hoods and booths? Mechanical local exhaust ventilation may be provided by either of the following:

(1) Freely movable hoods intended to be placed by the welder as near as practical to the work being welded and provided with a rate of airflow sufficient to maintain a velocity in the direction of the hood of 100 linear feet per minute in the zone of welding when the hood is at its most remote distance from the point of welding. The rates of ventilation required to accomplish this control velocity using a 3-inch wide flanged suction opening are shown in the following table:

<table>
<thead>
<tr>
<th>Welding zone</th>
<th>Minimum air flow cubic feet/minutes</th>
<th>Duct diameter inches</th>
</tr>
</thead>
<tbody>
<tr>
<td>4 to 6 inches from arc or torch</td>
<td>150</td>
<td>3</td>
</tr>
<tr>
<td>6 to 8 inches from arc or torch</td>
<td>275</td>
<td>3-1/2</td>
</tr>
<tr>
<td>8 to 10 inches from arc or torch</td>
<td>425</td>
<td>4-1/2</td>
</tr>
<tr>
<td>10 to 12 inches from arc or torch</td>
<td>600</td>
<td>5-1/2</td>
</tr>
</tbody>
</table>

(2005 Ed.)

Note: The need for local exhaust ventilation or airline respirators for welding or cutting in other than confined spaces will depend on the circumstances. However, such protection is desirable for fixed-location production welding and for all production welding on stainless steels. Where air samples taken at the welding location indicate that the fluorides liberated are below the maximum allowable concentration, such protection is not necessary.

WAC 296-307-50017 What ventilation must be provided in confined spaces? (1) All welding and cutting operations carried on in confined spaces must be adequately ventilated to prevent the accumulation of toxic materials or possible oxygen deficiency. This applies to welders, helpers, and other employees in the immediate vicinity. All replacement air must be clean and respirable.

(2) In circumstances where it is impossible to provide such ventilation, airline respirators or hose masks approved by the Mine Safety and Health Administration (MSHA) and the National Institute for Occupational Safety and Health (NIOSH) for this purpose must be used.

(3) In areas immediately hazardous to life, hose masks with blowers or self-contained breathing equipment must be used. The breaching equipment must be approved by the Mine Safety and Health Administration (MSHA) and the National Institute for Occupational Safety and Health (NIOSH).

(4) Where welding operations are carried on in confined spaces and where welders and helpers are provided with hose masks, hose masks with blowers or self-contained breathing equipment approved by the Mine Safety and Health Administration (MSHA) and the National Institute for Occupational Safety and Health (NIOSH), an employee must be stationed on the outside of such confined spaces to ensure the safety of those working within.

(5) Oxygen must not be used for ventilation.

Powered Industrial Trucks (Forklifts)

WAC 296-307-520 Powered industrial trucks (forklifts).

WAC 296-307-5201 What does this section cover? WAC 296-307-520 applies to all powered industrial trucks used in agricultural operations.

WAC 296-307-52003 What is a "powered industrial truck"? "Powered industrial truck" (or "truck") means a fork truck, industrial tractor, platform lift truck, motorized hand truck, or other specialized industrial trucks, powered by electric motors or internal combustion engines. The definition does not include compressed gas-operated industrial trucks, tractor-mounted forklifts, or vehicles intended primarily for earth moving or over-the-road hauling.
WAC 296-307-52005 What manufacturer’s requirements apply to powered industrial trucks? (1) All powered industrial trucks in use by an employer must meet the applicable requirements of design, construction and stability as defined by the American National Standards Institute B56.1-1969, Safety Standards for Powered Industrial Trucks, except for vehicles intended primarily for earth moving or over-the-road hauling. All new powered industrial trucks acquired and used by an employer on or after March 1, 2000, must meet the applicable requirements of design, construction and stability as defined in ASME B56.1-1993. The employer must ensure that all powered industrial trucks are inspected, maintained and operated in accordance with this section and the manufacturer’s recommendations and specifications.

(2) Approved trucks must have a label indicating approval by the testing laboratory as meeting the specifications and requirements of ANSI B56.1-1969.

(3) Modifications or additions must only be performed with the manufacturer’s prior written approval. When modifications or additions are made, capacity, operation, and maintenance instruction plates, tags, or decals must be changed accordingly.

(4) If the truck is equipped with front-end attachments other than factory installed attachments, it must be marked to identify the attachments and show the approximate weight of the truck and attachment combination at maximum elevation with the load centered from side to side.

(5) The user must ensure that all nameplates and markings are in place and legible.

WAC 296-307-52007 What are the classifications of powered industrial trucks? Powered industrial trucks are identified according to the following classifications:

(1) "D" refers to trucks that are diesel engine powered that have minimum safeguards against inherent fire hazards.

(2) "DS" refers to diesel powered trucks that, in addition to meeting all the requirements for the type D trucks, with additional safeguards to the exhaust, fuel, and electrical systems.

(3) "DY" refers to diesel powered trucks that have all the safeguards of the DS trucks; in addition, any electrical equipment is completely enclosed. They are equipped with temperature limitation features.

(4) "E" refers to electrically powered trucks with minimum acceptable safeguards against inherent fire hazards.

(5) "ES" refers to electrically powered trucks that, in addition to all of the requirements for the E trucks, are provided with additional safeguards to the electrical system to prevent emission of hazardous sparks and to limit surface temperatures.

(6) "EE" refers to electrically powered trucks that have, in addition to all of the requirements for the E and ES type trucks, have their electric motors and all other electrical equipment completely enclosed.

(7) "EX" refers to electrically powered trucks that differ from E, ES, or EE type trucks in that the electrical fittings and equipment are so designed, constructed, and assembled to be used in atmospheres containing flammable vapors or dusts.

(8) "G" refers to gasoline powered trucks that have minimum acceptable safeguards against inherent fire hazards.

(9) "GS" refers to gasoline powered trucks with additional safeguards to the exhaust, fuel, and electrical systems.

(10) "LP" refers to liquified petroleum gas-powered trucks that have minimum acceptable safeguards against inherent fire hazards.

(11) "LPS" refers to LP-gas powered trucks that in addition to meeting the requirements for LP trucks, are provided with additional safeguards to the exhaust, fuel, and electrical systems.

WAC 296-307-52009 What must a user consider before choosing a powered industrial truck? Before choosing the industrial truck to use, the user must determine whether the atmosphere or location is hazardous or nonhazardous. The type of industrial truck must be chosen according to the requirements of WAC 296-307-52011.

WAC 296-307-52011 What requirements determine which trucks to use in specific hazardous environments? Following are the minimum truck types required in specific hazardous environments. You may choose to use industrial trucks having greater safeguards. Tables W-1 and W-2 give specific vehicle usage information by Group and Class.
### TABLE W-1
SUMMARY TABLE ON USE OF INDUSTRIAL TRUCKS IN VARIOUS LOCATIONS

**Trucks conforming to these types may also be used.

1. Powered industrial trucks are prohibited in atmospheres with a hazardous concentration of:
   - Acetaldehyde,
   - Acetylene,
   - Butadiene,
   - Cyclopropane,
   - Diethyl ether,
   - Ethylene,
   - Ethylene oxide,
   - Hydrogen (or gases or vapors equivalent in hazard to hydrogen, such as manufactured gas),

• Propylene oxide, or
• Unsymmetrical dimethyl hydrazine (UDMH).

(a) Only approved EX trucks, or other trucks approved by the manufacturer, may be used in atmospheres containing hazardous concentrations of metal dust, including:
• Aluminum, magnesium, and their commercial alloys;
• Other dusts of similarly hazardous characteristics; or
• In atmospheres containing:
  ❑ Carbon black,
  ❑ Coal, or
  ❑ Coke dust.

(b) In atmospheres where dust of magnesium, aluminum or aluminum bronze may be present, fuses, switches, motor controllers, and circuit breakers of trucks must have enclosures specifically approved for such locations.

(2) Only approved EX trucks, or other trucks approved by the manufacturer, may be used in atmospheres containing
• Acetone,
• Acrylonitrile,
• Alcohol,
• Ammonia,
• Benzine,
• Benzol,
• Butane,
• Ethylene dichloride,
• Gasoline,
• Hexane,
• Lacquer solvent vapors,
• Naphtha,
• Natural gas,
• Propane,
• Propylene,
• Styrene,
• Vinyl acetate,
• Vinyl chloride, or
• Xylenes

in quantities sufficient to produce explosive or ignitable mixtures.

(3) Only approved DY, EE, or EX trucks, or other trucks approved by the manufacturer, may be used in locations where volatile flammable liquids or flammable gases are handled, processed or used, if the hazardous liquids, vapors or gases are normally confined within closed containers or closed systems from which they can escape only in case of accidental rupture or breakdown, or in case of abnormal equipment operation.

Only approved DY, EE, or EX trucks, or other trucks approved by the manufacturer, may also be used in locations in which hazardous concentrations of gases or vapors are normally prevented by mechanical ventilation but that might become hazardous through failure or abnormal operation of the ventilating equipment.

(4) Only approved DS, ES, GS, or LPS trucks, or other trucks approved by the manufacturer, may be used in locations used for the storage of hazardous liquids in sealed containers or liquefied or compressed gases in containers. This classification includes locations where volatile flammable liquids or flammable gases or vapors are used but are hazardous only in case of an accident or an unusual operation condition.

The quantity of hazardous material that might escape in case of accident, the adequacy of ventilating equipment, the total area involved, and the business’s history of explosions or fires are all factors that should be considered in determining which truck has sufficient safeguards for the location.

(a) Only approved EX trucks, or other trucks approved by the manufacturer, may be used in atmospheres in which combustible dust is or may be suspended in quantities sufficient to produce explosive or ignitable mixtures, or where mechanical failure or abnormal operation of machinery or equipment might cause such mixtures to be produced.

(b) The EX classification, or other trucks approved by the manufacturer as having equal or greater safeguards, usually includes the working areas of:
• Grain handling and storage plants,
• Rooms containing grinders or pulverizers,
• Cleaners,
• Graders,
• Scalphers,
• Open conveyors or spouts,
• Open bins or hoppers,
• Mixers or blenders,
• Automatic or hopper scales,
• Packing machinery,
• Elevator heads and boots,
• Stock distributors,
• Dust and stock collectors (except all-metal collectors vented to the outside),

and all similar dust producing machinery and equipment in:
• Grain processing plants,
• Starch plants,
• Sugar pulverizing plants,
• Malting plants,
• Hay grinding plants, and other similar locations; and,
• Areas where combustible dust may, under normal operating conditions, be present in the air in quantities sufficient to produce explosive or ignitable mixtures.

(5) Only approved DY, EE, or EX trucks, or other trucks approved by the manufacturer, may be used in atmospheres in which deposits or accumulations of combustible dust may be ignited by arcs or sparks from the truck, if combustible dust will not normally be suspended or thrown into suspension by the normal operation of equipment or apparatus in quantities sufficient to produce explosive or ignitable mixtures.

(6) Only approved DY, EE, or EX trucks, or other trucks approved by the manufacturer, may be used in locations with easily ignitable fibers or flyings if the fibers or flyings are not likely to be suspended in quantities sufficient to produce ignitable mixtures.

(7) Only approved DS, DY, ES, EE, EX, GS, or LPS trucks, or other trucks approved by the manufacturer, may be used in locations, including outside storage, where easily ignitable fibers are stored or handled, but are not processed or manufactured. E trucks that have been previously used in these locations may continue to be used.

(8) If storage warehouses and outside storage locations are hazardous, the specified approved truck, or other truck approved by the manufacturer, must be used. If not classified as hazardous, any approved D, E, G, or LP truck, or other
truck approved by the manufacturer, may be used, or trucks meeting the requirements for these types may be used.

WAC 296-307-52013 What requirements apply to converted trucks? When powered industrial trucks that were originally approved to use gasoline are converted to use LP-gas according to WAC 296-307-52047(12), they may be used in locations where G, GS or LP, and LPS trucks are specified.

[Statutory Authority: RCW 49.17.040. 98-24-096, § 296-307-52013, filed 12/1/96. 49.17.050 and [49.17].060. 96-22-048, § 296-306A-52013, filed 10/31/96, effective 12/1/96.]

WAC 296-307-52015 What requirements apply to overhead safety guards? (1) High-lift rider trucks must be fitted with an overhead guard manufactured according to WAC 296-307-52005(1), unless operating conditions do not permit.

Note: An overhead guard is intended to offer protection from the impact of small packages, boxes, bagged material, and other objects involved in the job, but not to withstand the impact of a falling capacity load.

WAC 296-307-52017 What requirements apply to load backrests? (1) A load backrest extension must be used whenever necessary to minimize the possibility of the load or part of it from falling rearward.

(2) If the type of load presents a hazard, the user must equip forklift trucks with a vertical load backrest extension manufactured according to WAC 296-307-52005(1).

WAC 296-307-52019 What requirements apply to fuel handling and storage? (1) You must ensure that liquid fuels such as gasoline and diesel fuel are stored and handled according to NFPA Flammable and Combustible Liquids Code (NFPA No. 30-1996).

(2) You must ensure that LP-gas fuel is stored and handled according to NFPA Storage and Handling of Liquefied Petroleum Gases (NFPA No. 58-1998).

WAC 296-307-52021 What requirements apply to lighting for operating areas? (1) Adequate lighting should be provided in operating areas. (See ANSI Practice for Industrial Lighting, ANSI/IES RP-7 1990.)

(2) Where general lighting is inadequate, directional lighting must be provided on the truck.

WAC 296-307-52023 What level of carbon monoxide gas is allowed? Concentration levels of carbon monoxide gas created by truck operations must not exceed the levels specified in WAC 296-62-075, Part L (general occupational health standards).

Note: Questions concerning degree of concentration and methods of sampling should be referred to a qualified industrial hygienist.

WAC 296-307-52025 What requirements apply to dockboards (bridge plates)? (1) Portable and powered dockboards must be strong enough to support the load carried on them.

(2) Portable dockboards must be secured in position, either by anchors or anti-slipping devices.

(3) Powered dockboards must meet the design and construction requirements of Commercial Standard CS202-56 (1956) “Industrial Lifts and Hinged Loading Ramps” published by the U.S. Department of Commerce.

(4) Dockboard or bridge plates must be driven over carefully and slowly and their rated capacity never exceeded.

(5) Portable dockboards must have handholds for safe handling.

(6) Railroad cars must be kept stationary while dockboards or bridge plates are in position.

WAC 296-307-52027 What rules apply to loading trucks, trailers, and railroad cars with powered industrial trucks? (1) Wheel stops or other positive protection must be provided to prevent railroad cars from moving during loading or unloading.

(2) Fixed jacks may be necessary to support a semi-trailer and prevent up-ending during loading or unloading if the trailer is not coupled to a tractor.

(3) Many truck-trailers are equipped with a rear-end protection device to prevent cars from wedging underneath during a collision. These protection devices must be used with equipment that secures the truck-trailer to the loading dock. Wheel chocks are not required under the following conditions:

[Title 296 WAC—p. 2608] (2005 Ed.)
(a) Trucks or trailers are secured to the loading dock with a mechanical system that prevents movement away from the dock during loading, unloading, and boarding.

(b) All of the mechanical equipment is installed, maintained, and used as recommended by the manufacturer.

(c) Any damaged mechanical equipment is removed from service immediately and is not used to secure trucks and trailers.

(4) The flooring of trucks, trailers, and railroad cars must be checked for breaks and weakness before use.

[97-09-013, recodified as § 296-307-52027, filed 4/7/97, effective 4/7/97.

WAC 296-307-52029 What are the operator training requirements for powered industrial trucks? (1) Safe operation.

(a) The employer must ensure that each powered industrial truck operator is trained in the safe operation of a powered industrial truck, and is competent to operate a powered industrial truck safely.

(b) Prior to permitting an employee to operate a powered industrial truck (except for training purposes), the employer must ensure that each operator has successfully completed the training required by this section.

(2) Training program implementation.

(a) Trainees may operate a powered industrial truck only under the direct supervision of persons who have the knowledge, training, and experience to train operators and where such operation does not endanger the trainee or other employees.

Note: The employer, or any other qualified person of the employer's choosing, may give required training and evaluation.

(b) Training must consist of formal instruction and/or practical training, conveyed in a manner that the trainee understands.

Note: Formal instruction may include lecture, discussion, interactive computer learning, video tape and/or written material. Practical training may include demonstrations performed by the trainer and practical exercises performed by the trainee.

(3) Training program content. Powered industrial truck operators must receive initial training in the topics that follow, except in topics that the employer can demonstrate are not applicable to safe operation of the truck in the employer's workplace.

(a) Truck-related topics:
• Operating instructions, warnings and precautions for the types of truck the operator will be authorized to operate;
• Differences between the truck and the automobile;
• Truck controls and instrumentation: Where they are located, what they do, and how they work;
• Engine or motor operation;
• Steering and maneuvering;
• Visibility (including restrictions due to loading);
• Fork and attachment adaption, operation, and use limitations;
• Vehicle capacity;
• Vehicle stability;

(b) Prior to permitting an employee to operate a powered industrial truck, the employer must ensure that each operator has successfully completed the training in that topic is not required if the operator can provide proof of such training within three years, and the employer can verify operator competency.

(4) Retraining.

(a) Retraining in relevant topics must be provided to the operator when:
• The operator has been observed to operate the vehicle in an unsafe manner;
• The operator has been involved in an accident or near-miss incident;
• The operator has received an evaluation that reveals that the operator is not operating the truck safely;
• The operator is assigned to drive a different type of truck; or
• The condition in the workplace changes in a manner that could affect safe operation of the truck.

(b) Retraining must be provided to an operator if three years has elapsed since he or she last received training.

(5) Avoidance of duplicative training. If an operator has previously received training in a topic specified in subsection (3) of this section, and such training is appropriate to the truck and working conditions encountered, additional training in that topic is not required if the operator can provide proof of such training within three years, and the employer can verify operator competency.

(6) Recordkeeping. Employers must keep records showing that each operator has been trained or received retraining as required by this section. These records must include the name of the operator, the date of the training or retraining, and the name of the person(s) giving the training or retraining.

(7) Implementation dates. The employer must ensure that operators of powered industrial trucks are trained, as appropriate, by the effective date of this section. Employees hired on or after the effective date of this section must be trained and found competent prior to being assigned to operate a powered industrial truck.

(8) Nonmandatory guidance. To assist employers in implementing operator training requirements, a nonmandatory appendix has been added as WAC 296-307-52030. This
appendix does not add to, alter, or reduce the requirements of this section.

**WAC 296-307-52030** Is there any additional (non-mandatory) information that may assist me with powered industrial truck operator training? (1) Definitions. The following definitions may help to explain the principle of stability:

- "Center of gravity" means the point on an object at which all of the object's weight is concentrated. For symmetrical loads, the center of gravity is at the middle of the load.
- "Counterweight" means the weight that is built into the truck's basic structure and is used to offset the load's weight and to maximize the vehicle's resistance to tipping over.
- "Fulcrum" means the truck's axis of rotation when it tips over.
- "Grade" means the slope of a surface, which is usually measured as the number of feet of rise or fall over a hundred foot horizontal distance (the slope is expressed as a percent).
- "Lateral stability" means a truck's resistance to overturning sideways.
- "Line of action" means an imaginary vertical line through an object's center of gravity.
- "Load center" means the horizontal distance from the load's edge (or the fork's or other attachment's vertical face) to the line of action through the load's center of gravity.
- "Longitudinal stability" means the truck's resistance to overturning forward or rearward.
- "Moment" means the product of the object's weight times the distance from a fixed point (usually the fulcrum). In the case of a powered industrial truck, the distance is measured from the point at which the truck will tip over to the object's line of action. The distance is always measured perpendicular to the line of action.
- "Track" means the distance between the wheels on the same axle of the truck.
- "Wheelbase" means the distance between the centerline of the vehicle's front and rear wheels.

(2) General.

(a) Determining the stability of a powered industrial truck is simple once a few basic principles are understood. There are many factors that contribute to a vehicle's stability: The vehicle's wheelbase, track, and height; the load's weight distribution; and the vehicle's counterweight location (if the vehicle is so equipped).

(b) The "stability triangle," used in most stability discussions, demonstrates stability simply (see Figures 1 and 2).

(3) Basic principles.

(a) Whether an object is stable depends on the object's "moment" (see definitions, this section) at one end of a system being greater than, equal to, or smaller than the object's moment at the system's other end. This principle can be seen in the way a seesaw or teeter-totter works: That is, if the product of the load and distance from the fulcrum (moment) is equal to the moment at the device's other end, the device is balanced and it will not move. However, if there is a greater

(b) The longitudinal stability of a counterbalanced powered industrial truck depends on the vehicle's moment and the load's moment. In other words, if the mathematic product of the load-moment (the distance from the front wheels, the approximate point at which the vehicle would tip forward) to the load's center of gravity times the load's weight is less than the vehicle's moment, the system is balanced and will not tip forward. However, if the load's moment is greater than the vehicle's moment, the greater load-moment will force the truck to tip forward.

(4) The stability triangle.

(a) Almost all counterbalanced powered industrial trucks have a three-point suspension system, that is, the vehicle is supported at three points. This is true even if the vehicle has four wheels. The truck's steer axle is attached to the truck by a pivot pin in the axle's center. When the points are connected with imaginary lines, this three-point support forms a triangle called the stability triangle. Figure 1 depicts the stability triangle.

**Figure 1**

Notes: 1. When the vehicle is loaded, the combined center of gravity shifts toward line B-C. Theoretically, the maximum load will result in the center of gravity at the line B-C. In actual practice, the combined center of gravity should never be at line B-C.
   2. The addition of additional counterweight will cause the truck center of gravity to shift toward point A and result in a truck that is less stable laterally.

(b) When the vehicle's line of action, or load center, falls within the stability triangle, the vehicle is stable and will not tip over. However, when the vehicle's line of action or the vehicle/load combination falls outside the stability triangle, the vehicle is unstable and may tip over.
(5) **Longitudinal stability.**

(a) The axis of rotation when a truck tips forward is the front wheels' points of contact with the pavement. When a powered industrial truck tips forward, the truck will rotate about this line. When a truck is stable, the vehicle-moment must exceed the load-moment. As long as the vehicle-moment is equal to or exceeds the load-moment, the vehicle will not tip over. On the other hand, if the load-moment slightly exceeds the vehicle-moment, the truck will begin to tip forward, thereby causing the rear to lose contact with the floor or ground and resulting in loss of steering control. If the load-moment greatly exceeds the vehicle-moment, the truck will tip forward.

(b) To determine the maximum safe load-moment, the truck manufacturer normally rates the truck at a maximum load at a given distance from the front face of the forks. The specified distance from the front face of the forks to the line of action of the load is commonly called the load center. Because larger trucks normally handle loads that are physically larger, these vehicles have greater load centers. Trucks with a capacity of 30,000 pounds or less are normally rated at a given load weight at a 24-inch load center. Trucks with a capacity greater than 30,000 pounds are normally rated at a given load weight at a 36- or 48-inch load center. To safely operate the vehicle, the operator should always check the data plate to determine the maximum allowable weight at the rated load center.

(c) Although the true load-moment distance is measured from the front wheels, this distance is greater than the distance from the front face of the forks. Calculating the maximum allowable load-moment using the load-center distance always provides a lower load-moment than the truck was designed to handle. When handling unusual loads, such as those that are larger than 48 inches long (the center of gravity is greater than 24 inches) or that have an offset center of gravity, etc., a maximum allowable load-moment should be calculated and used to determine whether a load can be safely handled. For example, if an operator is operating a 3,000-pound capacity truck (with a 24-inch load center), the maximum allowable load-moment is 72,000 inch-pounds (3,000 times 24). If a load is 60 inches long (30-inch load center), then the maximum that this load can weigh is 2,400 pounds (72,000 divided by 30).

(6) **Lateral stability.**

(a) The vehicle's lateral stability is determined by the line of action's position (a vertical line that passes through the combined vehicle's and load's center of gravity) relative to the stability triangle. When the vehicle is not loaded, the truck's center of gravity location is the only factor to be considered in determining the truck's stability. As long as the line of action of the combined vehicle's and load's center of gravity falls within the stability triangle, the truck is stable and will not tip over. However, if the line of action falls outside the stability triangle, the truck is not stable and may tip over. Refer to Figure 3.

(b) Factors that affect the vehicle's lateral stability include the load's placement on the truck, the height of the load above the surface on which the vehicle is operating, and the vehicle's degree of lean.

(7) **Dynamic stability.**

(a) Up to this point, the stability of a powered industrial truck has been discussed without considering the dynamic forces that result when the vehicle and load are put into motion. The weight's transfer and the resultant shift in the center of gravity due to the dynamic forces created when the machine is moving, braking, cornering, lifting, tilting, and lowering loads, etc., are important stability considerations.

(b) When determining whether a load can be safely handled, the operator should exercise extra caution when handling loads that cause the vehicle to approach its maximum design characteristics. For example, if an operator must handle a maximum load, the load should be carried at the lowest position possible, the truck should be accelerated slowly and evenly, and the forks should be tilted forward cautiously. However, no precise rules can be formulated to cover all of these eventualities.

WAC 296-307-52031 What requirements apply to operating powered industrial trucks? (1) No operator may drive a truck up to anyone standing in front of a fixed object.

(2) No one may stand or pass under the elevated portion of any truck, whether loaded or empty.

(3) Employers must not allow people to ride on powered industrial trucks unless a safe place to ride is provided.

(4) Employers must prohibit employees from placing any body parts between the uprights of the mast or outside the running lines of the truck.

(5) When an operator leaves a powered industrial truck unattended:

(a) The load must be fully lowered;

(b) The controls must be neutralized;

(c) The power must be shut off; and

(d) The brakes must be set.

(e) If the truck is parked on an incline, the wheels must be blocked.

A powered industrial truck is "unattended" when the operator is 25 feet or more away from the vehicle, which remains in view, or whenever the operator leaves the vehicle and it is not in view.
(6) When a truck operator is dismounted, within 25 feet of the truck, and still in view, the load must be fully lowered, the controls must be neutralized, and the brakes must be set to prevent movement.

(7) The operator must maintain a safe distance from the edge of ramps or platforms while operating on any elevated dock, or platform or freight car.

(8) There must be enough headroom for trucks to operate under overhead installations, lights, pipes, sprinkler systems, or other overhead projections.

(9) An active operator protection restraint device (such as a seatbelt or lap-bar) or system must be used, when provided.

WAC 296-307-52033 When may trucks be used to open or close freight car doors? Trucks may only be used for opening or closing freight car doors with an approved device that meets the following requirements:

(1) The door opening or closing device requires that the force applied by the device to the door is parallel to the door travel.

(2) The truck operator is trained in the use of the door opening or closing device and keeps the operation in full view while opening and closing.

(3) The area is clear of people while the door is moved with a device.

WAC 296-307-52035 What requirements apply to lifting employees on the forks of trucks? Employees may be lifted on the lifting carriage or forks of a powered industrial truck under the following conditions:

(1) The truck is equipped with vertical only, or vertical and horizontal controls elevable with the lifting carriage or forks.

(2) A safety platform is firmly secured to the lifting carriage and/or forks.

(3) Employees on the platform have a mechanism to shut off power to the truck.

(4) Employees on the platform are protected from falling objects according to the operating conditions.

WAC 296-307-52037 What requirements apply to using platforms for hoisting employees? A platform built specifically for hoisting people may be used to lift employees when:

(1) The platform is securely attached to the forks and has standard guardrails and toeboards installed on all sides.

(2) The hydraulic system is designed so that the lift mechanism will not drop faster than 135 feet per minute in the event of a failure in any part of the system. Forklifts used for elevating work platforms are identified as meeting this requirement.

(3) A safety strap is installed or the control lever is locked to prevent the boom from tilting.

(4) An operator attends the lift equipment while employees are on the platform.

(5) The operator is in the normal operating position while raising or lowering the platform.

(6) The vehicle remains stationary while employees are on the platform.

Exception: inching or maneuvering at very slow speed is permissible.

(7) The area between employees on the platform and the mast is adequately guarded to prevent contact with chains or other shear points.

WAC 296-307-52039 What requirements apply to traveling in a powered industrial truck? (1) The operator must maintain a safe distance of approximately three truck lengths from the truck ahead. The truck must be kept under control at all times.

(2) The operator must yield the right of way to ambulances, fire trucks, or other vehicles in emergency situations.

(3) Passing other trucks traveling in the same direction at intersections, blind spots, or other dangerous locations is prohibited.

(4) Railroad tracks must be crossed diagonally wherever possible. The operator must not park closer than 8 feet from the center of railroad tracks.

(5) The operator must look in the direction of, and keep a clear view of, the path of travel.

(6) Stunt driving and horseplay are prohibited.

(7) The operator must approach elevators slowly, and then enter squarely after the elevator car is properly leveled. Once on the elevator, the operator must neutralize controls, shut off power, and set the brakes.

(8) Motorized hand trucks must enter elevator or other confined areas with load end forward.

(9) The operator must avoid running over loose objects on the roadway surface.

(10) Access to fire aisles, stairways, and fire equipment must be kept clear.

WAC 296-307-52041 What requirements apply to traveling speeds of powered industrial trucks? (1) The operator must observe all traffic regulations, including authorized plant speed limits.

(2) The operator must slow down and sound the horn at cross aisles and other locations where vision is obstructed. If the load obstructs a forward view, the driver must travel with the load trailing.

Exception: If traveling with the load trailing creates new hazards, it is not required.
(3) The operator must ascend and descend grades slowly.
   (a) At grades over 10 percent, loaded trucks must be
       driven with the load upgrade.
   (b) Unloaded trucks should be operated on all grades
       with the load carrier downgrade.
   (c) On all grades the load and load carrier must be tilted
       back if applicable, and raised only as far as necessary to clear
       the road surface.
   (4) Under all travel conditions, the truck must be operated
       at a speed that will permit it to be stopped safely.
   (5) The driver must slow down for wet and slippery
       surfaces.
   (6) While negotiating turns, the operator must slow to a
       safe speed and turn the wheel in a smooth, sweeping motion.

[Statutory Authority:  RCW 49.17.040, [49.17.],050 and [49.17.],060. 96-22-048, § 296-306A-52041, filed 10/31/96, effective 12/1/96.]

WAC 296-307-52043  What requirements apply to
loading powered industrial trucks? (1) All loads must be
stable or safely arranged. Exercise caution when handling
off-center loads that cannot be centered.
(2) All loads must be within the rated capacity of the
truck.
(3) Take care securing, manipulating, positioning, and
transporting loads when attachments are used. Trucks with
attachments must be operated as partially loaded trucks when
not handling a load.
(4) Place the load carrier under the load as far as possible.
Tilt the mast backward to stabilize the load.
(5) Use extreme care when tilting the load forward or
backward, particularly when high tiering. Avoid tilting the
load forward with the load carrier elevated except to pick up
a load, or when the load is in a deposit position over a rack or
stack. When stacking or tiering, use only enough backward
tilt to stabilize the load.

[Statutory Authority:  RCW 49.17.040, [49.17.],050 and [49.17.],060. 96-22-048, § 296-306A-52043, filed 10/31/96, effective 12/1/96.]

WAC 296-307-52045  What requirements apply to
servicing powered industrial trucks? (1) Powered indus-
trial trucks that need repairs, are defective, or in any way
unsafe must be taken out of service until restored to safe
operating condition.
   (2) Stop the engine before filling fuel tanks. Avoid spilling
   fuel.
   (3) When oil or fuel spills, wash the spill away carefully
   or evaporate the spill completely and replace the fuel tank cap
   before restarting engine.
   (4) No truck may be operated with a leak in the fuel sys-
   tem.
   (5) Open flames are prohibited for checking electrolyte
   level in storage batteries or gasoline level in fuel tanks.

[Statutory Authority:  RCW 49.17.040, [49.17.],050 and [49.17.],060. 96-22-048, § 296-306A-52045, filed 10/31/96, effective 12/1/96.]

WAC 296-307-52047  What requirements apply to
maintaining powered industrial trucks? (1) Powered
industrial trucks must be removed from service when not in
safe operating condition. All repairs must be made by an
authorized employee.
(2) No repairs may be made in Class I, II, and III loca-
tions.
(3) When repairs to fuel and ignition systems of indus-
trial trucks involve fire hazards, the repairs must be con-
ducted only in designated locations.
(4) Trucks in need of repairs to the electrical system
must have the battery disconnected prior to repair.
(5) Industrial truck parts must be replaced only by parts
of equivalent safety.
(6) Industrial trucks must not be altered so that the rela-
tive positions of parts are different from when they were
manufactured. Industrial trucks must not have parts added or
eliminated, except as provided in WAC 296-307-52005.
Fork trucks must not have additional counterweighting added
unless approved by the truck manufacturer.
(7) Industrial trucks must be examined at least daily
before being placed in service. Industrial trucks must not be
placed in service if the examination shows any unsafe condi-
tion.

Where industrial trucks are used on a round-the-clock
basis, they shall be examined after each shift. Defects must be
immediately reported and corrected.
(8) Water mufflers must be filled daily or as frequently
as necessary to prevent the water supply from dropping
below 75 percent. Vehicles must not be operated if muffler
screens or other parts are clogged. Any vehicle that emits
hazardous sparks or flames from the exhaust system must
immediately be removed from service until the emission of
such sparks and flames has been eliminated.
(9) When the temperature of any part of any truck
exceeds its normal operating temperature, the vehicle must be
removed from service until the cause for overheating has
been eliminated.

(10) Industrial trucks must be kept clean and free of
excess accumulations of combustible materials, oil, and
grease. Noncombustible agents should be used for cleaning
trucks. Low flash point (below 100°F) solvents must not be
used. High flash point (at or above 100°F) solvents may be
used. Take precautions regarding toxicity, ventilation, and
fire hazard according to the agent or solvent used.
(11) Industrial trucks originally approved to use gasoline
fuel may be converted to use LP-gas fuel if the converted
truck has the features specified for LP or LPS designated
trucks. The converted equipment must be approved. You
may find a description of the conversion system and the rec-
commended method of installation in the "listed by report" of
a nationally recognized testing laboratory.

Part X
Rim Wheel Servicing

WAC 296-307-530 Rim wheel servicing.

WAC 296-307-53001 What does this section cover?
WAC 296-307-530 applies to the servicing of multipiece and single-piece rim wheels used on large vehicles such as trucks, tractors, trailers, buses and off-road machines. It does not apply to servicing rim wheels used on automobiles, or on pickup trucks and vans with automobile tires or truck tires designated "LT."

WAC 296-307-53003 What definitions apply to rim wheel servicing? "Barrier" means a fence, wall, or structure placed between a single-piece rim wheel and an employee during tire inflation, to contain the rim wheel components in the event of the sudden release of the contained air of the single-piece rim wheel.

"Charts" means the United States Department of Labor, Occupational Safety and Health Administration (OSHA) publications entitled "Demounting and Mounting Procedures for Truck/Bus Tires" and "Multi-Piece Rim Matching Chart," the National Highway Traffic Safety Administration (NHTSA) publications entitled "Demounting and Mounting Procedures for Truck/Bus Tires" and "Multi-Piece Rim Matching Chart," or any other poster that contains at least the same instructions, safety precautions and other information contained in the charts that is applicable to the types of wheels being serviced.

"Installing a rim wheel" means the transfer and attachment of an assembled rim wheel onto a vehicle axle hub. "Removing" means the opposite of installing.

"Mounting a tire" means the assembly or putting together of the wheel and tire components to form a rim wheel, including inflation. "Demounting" means the opposite of mounting.

"Multipiece rim wheel" means the assembly of a multipiece wheel with the tire tube and other components.

"Multipiece wheel" means a vehicle wheel consisting of two or more parts, one of which is a side or locking ring designed to hold the tire on the wheel by interlocking components, when the tire is inflated.

"Restraining device" means a cage, rack, assembly of bars, or other components that will constrain all rim wheel components during an explosive separation of a multipiece rim wheel, or during the sudden release of the contained air of a single-piece rim wheel.

"Rim manual" means a publication containing instructions from the manufacturer or other qualified organization for correct mounting, demounting, maintenance, and safety precautions peculiar to the type of wheel being serviced.

"Rim wheel" means an assembly of tire, tube and liner (where appropriate), and wheel components.

"Service" or "servicing" means the mounting and demounting of rim wheels, and related activities such as inflating, deflating, installing, removing, and handling.

"Service area" means that part of an employer's premises used for the servicing of rim wheels, or any other place where an employee services rim wheels.

"Single-piece rim wheel" means the assembly of single-piece rim wheel with the tire and other components.

"Single-piece wheel" means a vehicle wheel consisting of one part, designed to hold the tire on the wheel when the tire is inflated.

"Trajectory" means:
- Any potential path that a rim wheel component may travel during an explosive separation, or the sudden release of the pressurized air; or
- An area at which an air blast from a single-piece rim wheel may be released.

The trajectory may deviate from paths that are perpendicular to the assembled position of the rim wheel. (See Figure for examples of trajectories.)
WAC 296-307-53005 What training must an employer provide for employees who service rim wheels? (1) You must implement a training program that covers at least the following: (a) The hazards involved in servicing rim wheels; (b) The safe operating procedures for the types of wheel serviced, described in WAC 296-307-53013 and 296-307-53015; and (c) The applicable data contained in the charts (rim manuals) and the contents of this standard.

(2) You must ensure that each employee demonstrates and maintains the ability to service rim wheels safely, including the following: (a) Demounting tires (including deflation); (b) Inspecting and identifying the rim wheel components; (c) Mounting tires (including inflation with a restraining device or other safeguard required by this section); (d) Using the restraining device and other equipment required by this section; (e) Handling rim wheels; (f) Inflating the tire when a single-piece rim wheel is mounted on a vehicle; (g) Understanding the necessity of standing outside the trajectory both during inflation of the tire and during inspection of the rim wheel following inflation; and (h) Installing and removing rim wheels.

(3) If you believe that any employee is unable to read and understand the charts or rim manual, you must instruct the employee in the contents of the charts and rim manual in a manner that the employee can understand.

(4) You must evaluate each employee's ability to perform these tasks safely, and provide additional training as necessary to ensure that each employee maintains proficiency.

WAC 296-307-53007 What requirements apply to restraining devices? (1) You must furnish a restraining device for inflating tires on multipiece wheels.

(2) You must provide a restraining device for inflating tires on single-piece wheels unless the rim wheel will be bolted onto a vehicle during inflation.

(3) Restraining devices must:
(a) Withstand the force of a rim wheel separation occurring at 150% of the maximum tire pressure for the rim wheel being serviced.
(b) Prevent the rim wheel components from being thrown out of the device.

(c) The restraining device is visually inspected before each day's use and after any rim wheel separation or sudden release of contained air. Any damaged restraining device is immediately removed from service.
(d) If the restraining device is removed from service, it is not returned to service until repaired and reinspected. If the restraining device requires structural repair, it is not returned to service until certified by either the manufacturer or a registered professional engineer to meet the strength requirements of (a) of this subsection.

WAC 296-307-53009 What other equipment must an employer provide for rim wheel servicing? (1) You must furnish an air line assembly and ensure that employees use it for inflating tire.

(2) The air line assembly must contain the following components:
(a) A clip-on chuck;
(b) An in-line valve with a pressure gauge or a presettable regulator; and
(c) Enough hose between the clip-on chuck and the in-line valve (if one is used) to allow the employee to stand outside the trajectory.

(3) Current charts or rim manuals for the types of wheels being serviced shall be available in the service area.

(4) You must furnish the tools recommended in the rim manual for the type of wheel being serviced and ensure that they are the only tools used to service rim wheels.

WAC 296-307-53011 What requirements apply to wheel component assembly? (1) You must ensure that multipiece wheel components are not interchanged except as provided in the charts or rim manual.

(2) Multipiece wheel components and single-piece wheels must be inspected prior to assembly. Any wheel or wheel component that is bent out of shape, pitted from corrosion, broken, or cracked shall not be used. Mark damaged wheels or components "unserviceable" and remove from the service area. Replace damaged or leaky valves.

(3) Rim flanges, rim gutters, rings, bead seating surfaces and the bead areas of tires must be free of any dirt, surface rust, scale or loose or flaked rubber build-up prior to mounting and inflation.

(4) The size (bead diameter and tire/wheel widths) and type of both the tire and the wheel must be checked for compatibility before assembly.

WAC 296-307-53013 What are the safe operating procedures for servicing multipiece rim wheels? You must establish safe operating procedures for servicing multipiece rim wheels, and ensure that employees are instructed in and
follow the procedures. Your procedures must include at least the following:

1. Before demounting, remove the valve core to completely deflate the tire.

2. Mount and demount tires only from the narrow ledge side of the wheel. Take care to avoid damaging the tire beads while mounting. Only mount tires on compatible wheels of matching bead diameter and width.

3. Apply nonflammable rubber lubricant to bead and wheel mating surfaces before rim wheel assembly, unless the tire or wheel manufacturer recommends against it.

4. When using a tire changing machine, inflate tires only to the minimum pressure necessary to force the tire bead onto the rim ledge while on the tire changing machine.

5. When using a bead expander, remove the bead expander before the valve core is installed and as soon as the rim wheel becomes airtight (the tire bead slips onto the bead seat).

6. Always inflate tires within a restraining device, positioned behind a barrier, or bolted on the vehicle with the lug nuts fully tightened.

7. Inflate tires only when the trajectory area is clear of flat, solid objects.

8. Employees stay out of the trajectory when inflating a tire.

9. Tires must not be inflated to more than the inflation pressure stamped in the sidewall unless a higher pressure is recommended by the manufacturer.

10. Tires must not be inflated above the maximum pressure recommended by the manufacturer to seat the tire bead firmly against the rim flange.

11. Heat must not be applied to a single-piece wheel.

12. Cracked, broken, bent, or otherwise damaged wheel components shall not be reworked, welded, brazed, or otherwise heated.

WAC 296-307-53015 What are the safe operating procedures for servicing single-piece rim wheels? You must establish safe operating procedures for servicing single-piece rim wheels, and ensure that employees are instructed in and follow the procedures. Your procedures must include at least the following:

1. Before demounting, remove the valve core to completely deflate the tire.

2. Mount and demount tires only from the narrow ledge side of the wheel. Take care to avoid damaging the tire beads while mounting. Only mount tires on compatible wheels of matching bead diameter and width.

3. Apply nonflammable rubber lubricant to bead and wheel mating surfaces before rim wheel assembly, unless the tire or wheel manufacturer recommends against it.

4. When using a tire changing machine, inflate tires only to the minimum pressure necessary to force the tire bead onto the rim ledge while on the tire changing machine.

5. When using a bead expander, remove the bead expander before the valve core is installed and as soon as the rim wheel becomes airtight (the tire bead slips onto the bead seat).

6. Always inflate tires within a restraining device, positioned behind a barrier, or bolted on the vehicle with the lug nuts fully tightened.

7. Inflate tires only when the trajectory area is clear of flat, solid objects.

8. Employees stay out of the trajectory when inflating a tire.

9. Tires must not be inflated to more than the inflation pressure stamped in the sidewall unless a higher pressure is recommended by the manufacturer.

10. Tires must not be inflated above the maximum pressure recommended by the manufacturer to seat the tire bead firmly against the rim flange.

11. Heat must not be applied to a single-piece wheel.

12. Cracked, broken, bent, or otherwise damaged wheel components shall not be reworked, welded, brazed, or otherwise heated.

WAC 296-307-53017 How can an employer order the OSHA charts? OSHA charts are available through OSHA area offices. You may find the address and telephone number of the nearest OSHA office in the local telephone directory under U.S. Government, U.S. Department of Labor, Occupational Safety and Health Administration. Single copies are available without charge.

If you want multiple copies of these charts, you may order them from the Publications Office, U.S. Department of Labor, Room N3101, Washington, D.C. 20210. Telephone: (202) 523-9667.

WAC 296-307-550 Employer chemical hazard communication—Introduction. Important:

Thousands of chemicals can be found in today's workplaces. These chemicals may have the capacity to cause health problems, from minor skin irritations to serious injuries or diseases like cancer.

The employer chemical hazard communication rule was developed to make sure employers and employees are informed about chemical hazards in the workplace.

This rule applies to:

• Employers engaged in businesses where chemicals are used, distributed, or produced for use or distribution.
• Contractors or subcontractors that work for employers engaged in businesses where chemicals are used, distributed, or produced for use or distribution.

Note:  • If you produce, import, distribute and/or repackage chemicals, or choose not to rely on labels or material safety data sheets provided by the manufacturer or importer, you must comply with Material safety data sheets and label preparation, WAC 296-307-560 through 296-307-56050.

• You may withhold trade secret information under certain circumstances, see Trade secrets, WAC 296-62-053, to find out what information may be withheld as a trade secret and what information must be released.

EXEMPTIONS:  • For the purposes of this employer hazard communication rule, if you are engaged in agricultural production of crops or livestock, "employee" does not mean:
  - Immediate family members of the officers of any corporation, partnership, sole proprietorship or other business entity or officers of any closely held corporation.
  - Certain products, chemicals, or items are exempt from this rule. Below is a summarized list of these exemptions. See WAC 296-307-55055 at the end of this rule to get complete information about these exemptions:
    - Any hazardous waste or substance
    - Tobacco or tobacco products
    - Wood or wood products that are not chemically treated and will not be processed, for example, by sawing and sanding
    - Food or alcoholic beverages
    - Some drugs, such as retail or prescription medications
    - Retail cosmetics
    - Ionizing and nonionizing radiation
    - Biological hazards
    - Any consumer product or hazardous substance when workplace exposure is the same as that of a consumer
  - Retail products used in offices in the same manner and frequency used by consumers can be termed "consumer products." Consumer products include things such as: Correction fluid, glass cleaner, and dishwashing liquid.

Example:  If you use a household cleaner in your workplace in the same way that a consumer would use it when cleaning their house, the exposure should be the same as the consumer’s. ("In the same way" means using the household cleaner in the same manner and frequency.) A janitor using a household cleaner, such as bleach, throughout the day, is not considered to be consumer use.

• Manufactured items that remain intact are exempt from this rule.

Your responsibility:

To inform and train your employees about the hazards of chemicals they may be exposed to during normal working conditions, or in foreseeable emergencies by:

• Making a list of the hazardous chemicals present in your workplace
• Preparing a written Chemical Hazard Communication Program for your workplace
• Informing your employees about this rule and your program

(2005 Ed.)

- Providing training to your employees about working in the presence of hazardous chemicals
- Getting and keeping the material safety data sheets (MSDSs) for the hazardous chemicals
- Making sure that labels on containers of hazardous chemicals are in place and easy to read

You must:

Develop, implement, maintain, and make available a written Chemical Hazard Communication Program

WAC 296-307-55005

Identify and list all the hazardous chemicals present in your workplace

WAC 296-307-55010

Obtain and maintain material safety data sheets (MSDSs) for each hazardous chemical used

WAC 296-307-55015

Make sure that material safety data sheets (MSDSs) are readily accessible to your employees

WAC 296-307-55020

Label containers holding hazardous chemicals

WAC 296-307-55025

Inform and train your employees about hazardous chemicals in your workplace

WAC 296-307-55030

Follow these rules for laboratories using hazardous chemicals

WAC 296-307-55035

Follow these rules for handling chemicals in factory sealed containers

WAC 296-307-55040

The department must:

Translate certain chemical hazard communication documents upon request

WAC 296-307-55045

Attempt to obtain a material safety data sheet (MSDS) upon request

WAC 296-307-55050

Exemption: Items or chemicals exempt from the rule, and exemptions from labeling

WAC 296-307-55055

Definitions

WAC 296-307-55060

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-550, filed 12/21/04, effective 4/2/05. Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050. 01-17-033, § 296-307-550, filed 8/8/01, effective 9/1/01.]

WAC 296-307-55005 Develop, implement, maintain, and make available a written Chemical Hazard Communication Program. You must:

• Develop, implement, maintain, and make available a written Chemical Hazard Communication Program specifically for your workplace. The Chemical Hazard Communication Program must, at a minimum, include:
  - A list of hazardous chemicals known to be present in your workplace
  - Procedures for making sure all containers are properly labeled
  - A description of how you are going to obtain and maintain your material safety data sheets (MSDSs)
Identify and list all the hazardous chemicals present in your workplace. You must:

- Identify all hazardous chemicals in your workplace. This includes any chemical that is known to be present in your workplace in such a way that employees may be exposed to it under normal conditions of use or in a foreseeable emergency.
- A list of these chemicals using the chemical or common name on the material safety data sheet (MSDS).
- Must be compiled for the workplace as a whole, or for individual work areas.

WAC 296-307-55010 Identify and list all the hazardous chemicals present in your workplace. You must:

- A description of how you are going to train and inform your employees about hazardous chemicals in their workplace.
- A description of how you are going to inform your employees about:
  - Chemical hazards used during nonroutine tasks
  - The hazards associated with chemicals contained in unlabeled pipes in their work areas

You must:

- Make sure your written Chemical Hazard Communication Program includes the following communication methods you will apply if you produce, use, or store hazardous chemicals at your workplace(s) in such a way that the employees of other employer(s) may be exposed.
  - Provide the other employer(s) with a copy of the relevant material safety data sheets (MSDSs), or provide access to the MSDSs in a central location at the workplace
  - Inform the other employer(s) of any precautionary measures that need to be taken to protect employees during normal operating conditions and in foreseeable emergencies
  - Describe how to inform the other employer(s) of the labeling system used in the workplace

Note:
- Examples of employees of other employers who could be exposed to chemical hazards that you produce, use, or store in your workplace include employees of construction companies, cleaning services, or maintenance contractors visiting or working on-site.
- Your employees have the right to get chemical hazard communication information from other employers at workplaces where they are working; and employees of other employers have the right to get the information from you when they are working at your workplace.
- Include in your written Chemical Hazard Communication Program the methods that you will use to share information with other employers and their employees at your workplace(s) regarding:
  - Access to MSDSs
  - Precautionary measures such as personal protective equipment (PPE) and emergency plans
  - Any labeling systems used at the workplace.

If you rely on another employer’s chemical hazard communication program to share the information required and the program meets the requirements of this rule, document in your own written Chemical Hazard Communication Program.

You must:

- Make your Chemical Hazard Communication Program available to your employees.

Note:
- Where employees must travel between workplaces during a workshift, that is, if their work is carried out at more than one geographical location, the written Chemical Hazard Communication Program may be kept at the primary workplace facility.

WAC 296-307-55015 Obtain and maintain material safety data sheets (MSDSs) for each hazardous chemical used.

You must:

- Obtain a MSDS for each hazardous chemical used as soon as possible if the MSDS is not provided with the shipment of a hazardous chemical from the chemical manufacturer or importer.

Note:
- To obtain a MSDS, you may try calling the manufacturer or checking their website.
- If you have a commercial account with a retailer or wholesaler, you have the right to request and receive a MSDS about hazardous chemicals you purchase.
- If a chemical is purchased from a retailer with no commercial accounts, you have the right to request and receive the manufacturer's name and address so that you can contact them and request a MSDS for the chemical.
- Whoever prepares the MSDS is required to mark all blocks on the form, even if there is no relevant information for that section.
- If you have problems getting a MSDS within 30 calendar days after making a written request to the chemical manufacturer, importer, or distributor, you can get help from WISHA. You may contact your local regional office for assistance or make a written request for assistance to the Department of Labor and Industries Right-to-Know Program P.O. Box 44610 Olympia, Washington 98504-4610
  - Include in your request:
    - A copy of the purchaser’s written request to the chemical manufacturer, importer, or distributor
    - The name of the product suspected of containing a hazardous chemical
    - The identification number of the product, if available
    - A copy of the product label, if available
    - The name and address of the chemical manufacturer, importer, or distributor from whom the product was obtained

You must:

- Maintain a MSDS for each hazardous chemical:
  - Keep copies of the required MSDSs for each hazardous chemical present in your workplace. These may be kept in any form, including as a part of operating procedures.
  - Each MSDS must be in English. You may also keep copies in other languages.

Note:
- If you choose not to rely on MSDSs or labels provided by the manufacturer or importer, you must comply with the chemical hazard communication standard for manufacturers, importers, and distributors, WAC 296-307-560 through 296-307-56050.
- It may be more appropriate to address the hazards of a process rather than individual hazardous chemicals.
EXEMPTIONS: The following is a summary of items that are exempt.

You must:
• Make sure that MSDSs are readily accessible, easily obtained without delay during each work shift to employees when they are in their work area(s).
• Make sure that employees, who must travel between workplaces during a work shift, such as when their work is carried out at more than one geographical location, can immediately obtain the required MSDS information in an emergency. (MSDSs may be kept at a central location at the primary workplace facility and accessed by means such as voice communication or laptop computer.)

Note: • Electronic access (such as computer or fax), microfiche, and other alternatives to maintaining paper copies of the MSDSs are permitted as long as they do not create barriers to immediate employee access in each workplace.
• Barriers to immediate access of electronic MSDSs may include:
  – Power outages
  – Equipment failure
  – System delays
  – Deficient user knowledge to operate equipment
  – Location of equipment outside the work area
  Solutions to eliminating these and other possible barriers to access may require the availability of back-up systems, employee training, and providing access equipment in the work areas.

You must:
• Make sure that each container of hazardous chemicals in the workplace is labeled, tagged, or marked with the following information:
  – The identity of the hazardous chemical(s) using either the chemical or common name
  – Appropriate hazard warnings which give general information about the relevant health and physical hazards of the chemicals. This includes health effects information, such as information about organs most likely to be affected by the chemicals.

EXAMPLES OF LABEL:

You must:
• Not remove or deface existing labels on incoming containers of hazardous chemicals (such as those marked with United States Department of Transportation (USDOT) markings, placards, and labels), unless the container is immediately labeled with the required information. You do not need to put on new labels if existing labels already provide the required information. If the package or container is sufficiently cleaned of residue and purged of vapors to remove any potential health or physical hazard, existing labels can be removed.
• Make sure that labels or other forms of warning are legible, in English, and prominently displayed on the container, or readily available in the work area throughout each work shift.

Note: • Employers with non-English speaking employees may use other languages in the warning information in addition to the English language.

(2005 Ed.)
• Above is an example of a labeled container. You may use a laminated or coated label, affixed to the container with a wire, to avoid deterioration of labels due to a solvent, such as acetone.

You must:
• Make sure if the hazardous chemical is regulated by WISHA or OSHA in a substance-specific health rule, that the labels or other warnings are used according to those rules.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-17-033, § 296-307-55025, filed 8/8/01, effective 9/1/01.]

WAC 296-307-55030 Inform and train your employees about hazardous chemicals in your workplace.

Note: The employer chemical hazard communication information and training requirements also apply to pesticides. Employers who have employees who are exposed to pesticides must be in compliance with this rule and the worker protection standards, WAC 296-307-12040.

You must:
• Provide employees with effective information on hazardous chemicals in their work area at the time of their initial job assignment. Whenever a new physical or health hazard related to chemical exposure is introduced into their employees’ work areas, information must be provided.
  – Inform employees of:
    ◆ The requirements of this rule.
    ◆ Any operations in their work area where hazardous chemicals are present.
    ◆ The location and availability of your written Chemical Hazard Communication Program, including the list(s) of hazardous chemicals and material safety data sheets (MSDSs) required by this rule.
• Provide employees with effective training about hazardous chemicals in their work area at the time of their initial job assignment. Whenever a new physical or health hazard related to chemical exposure is introduced, the employees must be trained.
  – Make sure that employee training includes:
    – Methods and observations that may be used to detect the presence or release of a hazardous chemical in the work area. Examples of these methods and observations may include:
      ◆ Monitoring conducted by you
      ◆ Continuous monitoring devices
      ◆ Visual appearance or odor of hazardous chemicals when being released
    – Physical and health hazards of the chemicals in the work area, including the likely physical symptoms or effects of overexposure
    – Steps employees can take to protect themselves from the chemical hazards in your workplace, including specific procedures implemented by you to protect employees from exposure to hazardous chemicals. Specific procedures may include:
      ■ Appropriate work practices
      ■ Engineering controls
      ■ Emergency procedures
      ■ Personal protective equipment to be used
      – Details of the Chemical Hazard Communication Program developed by you, including an explanation of the labeling system and the MSDS, and how employees can obtain and use the appropriate hazard information.
    – Tailor information and training to the types of hazards to which employees will be exposed. The information and training may be designed to cover categories of hazards, such as flammability or cancer-causing potential, or it may address specific chemicals. Chemical-specific information must always be available through labels and MSDSs.
  – Make reasonable efforts to post notices in your employees’ native languages (as provided by the department) if those employees have trouble communicating in English.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-17-033, § 296-307-55025, filed 8/8/01, effective 9/1/01.]

WAC 296-307-55035 Follow these rules for laboratories using hazardous chemicals.

Note: Laboratories are required to have a written Chemical Hygiene Plan under WAC 296-62-400, if applicable. They are not required to have a written Chemical Hazard Communication Program. You may combine your Accident Prevention Program and Chemical Hazard Communication Program to assist you in developing a Chemical Hygiene Plan for your laboratory.

You must:
1. Make sure that labels on incoming containers of hazardous chemicals are in place and readable.
2. Maintain material safety data sheets (MSDSs) received with incoming shipments of hazardous chemicals and make them available to laboratory employees when they are in their work areas.
3. Provide laboratory employees with information and training as described in: "Inform and train your employees about hazardous chemicals in your workplace." WAC 296-307-55030, except for the part about the location and availability of the written Chemical Hazard Communication Program.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-17-033, § 296-307-55035, filed 8/8/01, effective 9/1/01.]

WAC 296-307-55040 Follow these rules for handling chemicals in factory-sealed containers. You must:

This applies to situations where employees only handle chemicals in factory-sealed containers that are not opened under normal use (such as those found in marine cargo handling, trucking, warehousing, or retail sales).

You must:
1. Make sure that labels on incoming containers of hazardous chemicals are in place and readable.
2. Make sure that all labels on incoming containers of hazardous chemicals are in place and readable.
3. Maintain material safety data sheets (MSDSs) received with incoming shipments of hazardous chemicals and make them available to laboratory employees when they are in their work areas.
4. Provide laboratory employees with information and training as described in: "Inform and train your employees about hazardous chemicals in your workplace." WAC 296-307-55030, except for the part about the location and availability of the written Chemical Hazard Communication Program.
WAC 296-307-55045  Translate certain chemical hazard communication documents upon request. The department must:

- Upon receipt of a written or verbal request, prepare and make available (within available resources) to employers or the public, a translation into Cambodian, Chinese, Korean, Spanish, or Vietnamese of any of the following:
  
  - An employer's written Chemical Hazard Communication Program
  - A material safety data sheet or
  - Written materials prepared by the department to inform employees of their rights described in this rule, regarding chemical hazard communication

Note: Written requests for translations should be directed to:
Department of Labor and Industries
Right-to-Know Program
P.O. Box 44610
Olympia, Washington 98504-4610

WAC 296-307-55050  Attempt to obtain a material safety data sheet (MSDS) upon request. The department must:

- Upon receipt of an employer's written request for a material safety data sheet, attempt to obtain the MSDS from the chemical manufacturer, importer, or distributor. When the department receives the MSDS, the department must forward a copy of it to the purchaser at no cost. Small business employers will be given priority for this service.

WAC 296-307-55055  Items or chemicals exempt from the rule, and exemptions from labeling.

- Listed below are the full descriptions of the items or chemicals that are exempt, or not covered, by this rule:
  
  - Any consumer product or hazardous substance, defined in the Consumer Product Safety Act (15 U.S.C. 2051 et seq.) and Federal Hazardous Substance Act (15 U.S.C. 1261 et seq.) respectively, where you can show that it is used in the workplace for the purpose intended by the chemical manufacturer or importer of the product, and the use results in a duration and frequency of exposure that is not greater than the range of exposures that could reasonably be experienced by consumers when used for the purpose intended.
  
  - Any hazardous waste, defined by the Hazardous Waste Management Act chapter 70.105 RCW, when subject to regulations issued under that act by the department of ecology, that describes specific safety, labeling, personnel training, and other rules for the accumulation, handling, and management of hazardous waste.
  
  - Any hazardous waste, defined by the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act of 1976, as amended (42 U.S.C. 6901 et seq.), when subject to regulations issued under that act by the Environmental Protection Agency.
  
  - Any hazardous substance, defined by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. 9601 et seq.), when the hazardous substance is the focus of remedial or removal action being conducted under CERCLA in accordance with Environmental Protection Agency regulations.
  
  - Tobacco or tobacco products.
  
  - Wood or wood products, including lumber that will not be processed, where the chemical manufacturer or importer can establish that the only hazard they pose to the employees is the potential for flammability or combustibility. Wood or wood products that have been treated with hazardous chemicals covered by this rule, and wood that may be subsequently sawed or cut, generating dust, are not exempt.
  
  - Articles, meaning manufactured items other than a fluid or particle that:
    - Are formed to a specific shape or design during manufacture;
    - Have end use function(s) dependent in whole or in part upon their shape or design during end use; and
    - Under normal conditions of use, do not release more than very small quantities, for example minute or trace amounts of a hazardous chemical such as emissions from a marking pen or a newly varnished wood chair, and do not pose a physical hazard or health risk to employees.
  
  - Food or alcoholic beverages that are sold, used, or prepared in a retail establishment such as a grocery store, restaurant, or drinking place, and foods intended for personal consumption by employees while in the workplace.
  
  - Any drug, defined in the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 301 et seq.), when it is in solid, final form for direct administration to the patient (for example, tablets or pills); drugs that are packaged by the chemical manufacturer for sale to consumers in a retail establishment (for example over-the-counter drugs); and drugs intended for personal consumption by employees while in the workplace (for example, first-aid supplies). Aerosolized or cytotoxic drugs administered by a health care worker are not excluded.
  
  - Cosmetics packaged for sale to consumers in a retail establishment, and cosmetics intended for personal consumption by employees while in the workplace.
  
  - Ionizing and nonionizing radiation.
  
  - Biological hazards.
  
  - Any pesticide, defined in the Federal Insecticide, Fungicide, and Rodenticide Act (7 U.S.C. 136 et seq.), when subject to the labeling requirements of that act and labeling reg-
ulations issued under that act by the Environmental Protection Agency.

– Any chemical substance or mixture, in the Toxic Substance Control Act (15 U.S.C. 2601 et seq.), when subject to the labeling requirements of that act, and labeling requirements issued under that act by the Environmental Protection Agency.

– Any food, food additive, color additive, drug, cosmetic, or medical/veterinary device or product, including materials intended for use as ingredients in such products (for example, flavors and fragrances), as such terms are defined in the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 301 et seq.) or the Virus-Serum Toxin Act of 1913 (21 U.S.C. 151 et seq.) and regulations issued under those acts, when they are subject to the labeling requirements under those acts by either the Food and Drug Administration or the Department of Agriculture.

– Any distilled spirits (beverage alcohols), wine, or malt beverage intended for nonindustrial use, defined in the Federal Alcohol Administration Act (27 U.S.C. 201 et seq.) and regulations issued under that act, when subject to the labeling requirements of that act and labeling regulations issued under that act by the Bureau of Alcohol, Tobacco, and Firearms.

– Any consumer product or hazardous substance, as defined in the Consumer Product Safety Act (15 U.S.C. 2051 et seq.) and Federal Hazardous Substances Act (15 U.S.C. 1261 et seq.) respectively, when subject to a consumer product safety rule or labeling requirement of those acts, or regulations issued under those acts by the Consumer Product Safety Commission.

– Agricultural or vegetable seed treated with pesticides and labeled in accordance with the Federal Seed Act (7 U.S.C. 1551 et seq.), and the labeling requirements issued under that act by the Department of Agriculture.

[Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050.01-17-033, § 296-307-55055, filed 8/8/01, effective 9/1/01.]

WAC 296-307-55060 Definitions.

Chemical
An element or mixture of elements
OR
A compound or mixture of compounds
OR
A mixture of elements and compounds
Included are manufactured items (such as bricks, welding rods, and sheet metal) that are not exempt as an article.

Chemical manufacturer
An employer with a workplace where one or more chemicals are produced for use or distribution.

Chemical name
The scientific designation of a chemical developed by:
– International Union of Pure and Applied Chemistry (IUPAC)
OR
– Chemical abstracts service (CAS) rules of nomenclature
OR
– A name that clearly identifies the chemical for the purpose of conducting a hazard evaluation.

Combustible liquid
Liquids with a flashpoint of at least 100°F (37.8°C) and below 200°F (93.3°C). A mixture with at least 99% of its components having flashpoints of 200°F (93.3°C), or higher, is not considered a combustible liquid.

Commercial account
An arrangement where a retailer is selling hazardous chemicals to an employer
• Generally in large quantities over time
OR
• At costs below regular retail price.

Common name
Any designation or identification used to identify a chemical other than the chemical name, such as a:
• Code name or number
OR
• Trade or brand name
OR
• Generic name.

Compressed gas
A contained gas or mixture of gases with an absolute pressure greater than:
• 40 psi at 70°F (21.1°C)
OR
• 104 psi at 130°F (54.4°C) regardless of the pressure at 70°F (21.1°C)
OR
A liquid with a vapor pressure greater than 40 psi at 100°F (37.8°C) as determined by ASTM D323-72.

Container
A vessel, other than a pipe or piping system, that holds a hazardous chemical. Examples include:
• Bags
• Barrels
• Bottles
• Boxes
• Cans
• Cylinders
• Drums
• Rail cars
• Reaction vessels
• Storage tanks.

Designated representative
An individual or organization with written authorization from an employee.
OR
• A recognized or certified collective bargaining agent (not necessarily authorized by an employee).
OR
• A legal representative of a deceased or legally incapacitated employee.

Director
The director means the director of the department of labor and industries or their designee.

Distributor
A business, other than a chemical manufacturer or importer, that supplies hazardous chemicals to other distributors or to employers. See WAC 296-307-560 through 296-307-56050 for requirements dealing with manufacturers, distributors and importers - hazard communication.
Employee

The term employee and other terms of like meaning, unless the context of the provision containing such term indicates otherwise, means an employee of an employer who is employed in the business of his or her employer whether by way of manual labor or otherwise and every person in this state who is engaged in the employment of or who is working under an independent contract the essence of which is personal labor for an employer under this standard whether by way of manual labor or otherwise.

Employer

An employer is any person, firm, corporation, partnership, business trust, legal representative, or other business entity which engages in any business, industry, profession, or activity in this state and employs one or more employees or who contracts with one or more persons, the essence of which is the personal labor of such person or persons and includes the state, counties, cities, and all municipal corporations, public corporations, political subdivisions of the state, and charitable organizations: Provided, That any persons, partnership, or business entity not having employees, and who is covered by the Industrial Insurance Act must be considered both an employer and an employee.

Explosive

A chemical that causes a sudden, almost instant release of pressure, gas, and heat when exposed to a sudden shock, pressure, or high temperature.

Exposure or exposed

An employee has been, or may have possibly been, subjected to a hazardous chemical, toxic substance or harmful physical agent while working. An employee could have been exposed to hazardous chemicals, toxic substances, or harmful physical agents in any of the following ways:

- Inhalation
- Ingestion
- Skin contact
- Absorption
- Related means.

The terms exposure and exposed only cover workplace exposure involving a toxic substance or harmful physical agent in the workplace different from typical nonoccupational situations in the way it is:

- Used
- Handled
- Stored
- Generated
- Present.

Flammable

A chemical in one of the following categories:

- Aerosols that, when tested using a method described in 16 CFR 1500.45, yield either a:
  - Flame projection of more than eighteen inches at full valve opening
  OR
  - A flashback (a flame extending back to the valve) at any degree of valve opening
- Gases that, at the temperature and pressure of the surrounding area, form a:
  - Flammable mixture with air at a concentration of thirteen percent, by volume, or less

- Range of flammable mixtures with air wider than twelve percent, by volume, regardless of the lower limit

- Liquids with a flashpoint below 100°F (37.8°C). A mixture with at least ninety-nine percent of its components having flashpoints of 100°F (37.8°C), or higher, is not considered a flammable liquid

- Solids, other than blasting agents or explosives, as defined in WAC 296-52-417 or 29 CFR 1910.109(a), that:
  - Is likely to cause fire through friction, moisture, absorption, spontaneous chemical change or retained heat from manufacturing or processing
  OR
  - That can be readily ignited (and when ignited burns so vigorously and persistently that it creates a serious hazard)
  OR
  - When tested by the method described in 16 CFR 1500.44, ignite and burn with a self-sustained flame at a rate greater than one-tenth of an inch per second along its major axis.

Flashpoint

The minimum temperature at which a liquid gives off an ignitable concentration of vapor, when tested by any of the following measurement methods:

- Tagliabue closed tester. Use this for liquids with a viscosity less than 45 Saybolt Universal Seconds (SUS) at 100°F (37.8°C), that do not contain suspended solids and do not tend to form a surface film under test. See American National Standard Method of Test for Flashpoint by Tag Closed Tester, Z11.24.1979 (ASTM D 56-79)
- Pensky-Martens closed tester for liquids with a viscosity equal to, or greater than, 45 SUS at 100°F (37.8°C), or for liquids that contain suspended solids, or have a tendency to form a surface film under test. See American National Standard Method of Test for Flashpoint by Pensky-Martens Closed Tester, Z11.7.1979 (ASTM D 93-79)
- Setalight closed tester: See American National Standard Method of Test for Flash Point by Setalight Closed Tester (ASTM D 3278-78).

Organic peroxides, which undergo auto accelerating thermal decomposition, are excluded from any of the flashpoint measurement methods specified above.

Foreseeable emergency

Any potential event that could result in an uncontrolled release of a hazardous chemical into the workplace. Examples of foreseeable emergencies include equipment failure, rupture of containers, or failure of control equipment.

Hazardous chemical

A chemical, which is a physical or health hazard.

Hazard warning

Words, pictures, or symbols (alone or in combination), that appear on labels (or other forms of warning such as placards or tags) that communicate specific physical and health hazard(s), (including target organ effects), associated with chemical(s) in a container.

Health hazard

A chemical that may cause health effects in short or long-term exposed employees based on statistically significant evidence from a single study conducted by using estab-
lished scientific principles. Health hazards include, but are not limited to, any of the following:

- Carcinogens
- Toxic or highly toxic substances
- Reproductive toxins
- Irritants
- Corrosives
- Sensitizers
- Hepatotoxins (liver toxins)
- Nephrotoxins (kidney toxins)
- Neurotoxins (nervous system toxins)
- Substances that act on the hematopoietic system (blood or blood forming system)
- Substances that can damage the lungs, skin, eyes, or mucous membranes.

**Identity**
A chemical or common name listed on the material safety data sheet (MSDS) and label.

**Importer**
The first business within the customs territory of the USA that:
- Receives hazardous chemicals produced in other countries
- Supplies them to manufacturers, distributors or employers within the USA.

**Material safety data sheet (MSDS)**
Written, printed or electronic information (on paper, microfiche, or on-screen) that informs manufacturers, distributors or employers about the chemical, its hazards and protective measures as required by this rule.

**Mixture**
A combination of 2 or more chemicals that retain their chemical identity after being combined.

**Organic peroxide**
An organic compound containing the bivalent-0-0-structure. It may be considered a structural derivative of hydrogen peroxide if one or both of the hydrogen atoms has been replaced by an organic radical.

**Oxidizer**
A chemical, other than a blasting agent or explosive as defined in WAC 296-52-417 or CFR 1910.109(a), that starts or promotes combustion in other materials, causing fire either of itself or through the release of oxygen or other gases.

**Permissible exposure limits (PELs)**
See WAC 296-307-628 for the definition of this term.

**Physical hazard**
A chemical that has scientifically valid evidence to show it is one of the following:
- A combustible liquid
- A compressed gas
- Explosive
- Flammable
- An organic peroxide
- An oxidizer
- Pyrophoric
- Unstable (reactive)
- Water reactive.

**Produce**
To do one or more of the following:
- Manufacture
- Process
- Formulate
- Blend
- Extract
- Generate
- Emit
- Repackage.

**Purchaser**
An employer who buys one or more hazardous chemicals to use in their workplace.

**Pyrophoric**
Chemicals that ignite spontaneously in the air at a temperature of 130°F (54.4°C) or below.

**Responsible party**
Someone who can provide more information about the hazardous chemical and appropriate emergency procedures.

**Specific chemical identity**
This term applies to chemical substances. It can mean the:
- Chemical name
- Chemical abstracts service (CAS) registry number
- Any other information that reveals the precise chemical designation of the substance.

**Trade secret**
Any confidential:
- Formula
- Pattern
- Process
- Device
- Information
- Collection of information.

The trade secret is used in an employer's business and gives an opportunity to gain an advantage over competitors who do not know or use it.

See WAC 296-62-053 for requirements dealing with trade secrets.

**Unstable (reactive)**
A chemical in its pure state, or as produced or transported, that will vigorously polymerize, decompose, condense, or become self-reactive under conditions of shocks, pressure or temperature.

**Use**
To do one or more of the following:
- Package
- Handle
- React
- Emit
- Extract
- Generate as a by-product
- Transfer.

**Water-reactive**
A chemical that reacts with water to release a gas that is either flammable or presents a health hazard.

**Work area**
A room or defined space in a workplace where hazardous chemicals are produced or used, and where employees are present.

**Workplace**
The term workplace means an establishment, job site, or project, at one geographical location containing one or more work areas.

[Title 296 WAC—p. 2624]
Part Y-2
Material Safety Data Sheets and Label Preparation

WAC 296-307-560  Scope. This chapter sets minimum requirements for content and distribution of material safety data sheets (MSDSs) and labels for hazardous chemicals.

- This chapter applies when you do one or more of the following:
  - Import, produce, or repackage chemicals, including manufactured items (such as bricks, welding rods, and sheet metal) that are not exempt as articles
  - Sell or distribute hazardous chemicals to manufacturers, distributors or employers
  - Choose not to rely on material safety data sheets (MSDSs) provided by the importer, manufacturer or distributor.

Note:  
- You are not required to evaluate chemicals or create MSDSs for chemicals you did not produce or import. If you decide to evaluate chemicals or create MSDSs, then the requirements of this chapter will apply to you.
- Use Table 2 to determine which sections in this chapter apply to your workplace.

Exemptions:  
- All of the following are always exempt from this chapter:
  - Ionizing and nonionizing radiation
  - Biological hazards
  - Tobacco and tobacco products
  - The chemicals and items listed in Table 1 are exempt from this chapter under the conditions specified.

| Table 1

<tr>
<td><strong>This chapter does NOT apply to</strong></td>
</tr>
</tbody>
</table>
| • Alcoholic beverages  
OR  
• Foods | • Sold, used, or prepared in a retail establishment (such as a grocery store, restaurant, bar, or tavern) |
| • An article (manufactured item) | • It is not a fluid or particle
- It is formed to a specific shape or design during manufacture for a particular end use function
- It releases only trace amounts of a hazardous chemical during normal use
- does not pose a physical or health risk to employees |
| • Consumer products | • Both criteria apply:  
- They are used in the workplace for the same purpose as intended by the manufacturer or importer  
- The duration and frequency of an employee's exposure is no more than the range of exposures that consumers might reasonably experience  
- They are packaged and sold in retail establishments  
- In solid, final form (for example, tablets, or pills) for direct administration to the patient  
- They are packaged and sold in retail establishments (for example, over-the-counter drugs)  
OR
- They are intended for employee consumption while in the workplace (for example, first-aid supplies)  
- Subject to the United States Environmental Protection Agency (EPA) regulations  
- Meeting the definition of "hazardous wastes" in the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act of 1976 (see U.S. Code, Title 42, Chapter 82, Subchapter I, section 6903)  
- Hazardous substances |

WAC 296-307-56005 Hazard evaluation.
Your responsibility:
To make sure the hazardous chemicals are identified.
You must:
Conduct complete hazard evaluations
WAC 296-307-56010
Provide access to hazard evaluation procedures
WAC 296-307-56015.

WAC 296-307-56010 Conduct complete hazard evaluations.

IMPORTANT:
• Hazard evaluation is a process where hazards of chemicals are identified by reviewing available research or testing information. You are not required to perform your own laboratory research or testing to meet the requirements of this section
  – Information from hazard evaluations is used to complete material safety data sheets (MSDSs) and labels
  – MSDSs from your suppliers may be used to complete the hazard evaluation for chemicals you produce
  – MSDSs and labels are NOT required for chemicals that are determined to be nonhazardous
• Importers and manufacturers are required to develop MSDSs and labels. If you decide to develop your own MSDSs and labels, then this chapter also applies to you.
You must:
(1) Describe in writing your procedures for conducting hazard evaluations.
(2) Conduct a complete hazard evaluation for ALL chemicals you produce or import to determine if they are hazardous chemicals.

- Identify and consider available scientific evidence of health and physical hazards
- Evidence that meets the criteria in Table 3 must be used to establish a hazard
- Chemicals identified in a Table 4 source must be regarded as hazardous
- The scope of health hazards considered must include the categories in Tables 5 and 6
  - If the chemical is a mixture, follow the additional criteria in Table 7
  - If you find evidence that meets the criteria in Table 3, use it in your hazard evaluation.

### Table 3

</tbody>
</table>

1If human data is not available, use results of tests done on animals and other available studies to predict health effects on employees (for example, effects resulting from short and long-term exposures to chemicals).
2In vitro studies alone do not generally form the basis of a finding of hazard.
3These terms are defined in WAC 296-307-56050.

Chemicals identified in the sources listed in Table 4 must be assumed to be hazardous (including carcinogens and potential carcinogens).

### Table 4

**Information Sources Identifying Hazardous Chemicals**

- Sources that address a broad range of hazard categories:
  - Chapter 296-62 WAC, General Occupational Health Standards, WISHA
  - 29 CFR Part 1910, Subpart Z, Toxic and Hazardous Substances, Occupational Safety and Health Administration (OSHA)
  - Threshold Limit Values for Chemical Substances and Physical Agents in the Work Environment, American Conference of Governmental Industrial Hygienists (ACGIH) (latest edition).
- Sources that identify carcinogens or potential carcinogens:
  - Chapter 296-62 WAC, General Occupational Health Standards, WISHA
  - 29 CFR Part 1910, Subpart Z, Toxic and Hazardous Substances, Occupational Safety and Health Administration (OSHA)
  - National Toxicology Program (NTP), Annual Report on Carcinogens (latest edition)
  - International Agency for Research on Cancer (IARC) Monographs (latest editions).

**Note:**

The *Registry of Toxic Effects of Chemical Substances* is published by the National Institute for Occupational Safety and Health (NIOSH) and identifies chemicals found to be potential carcinogens by the NTP and IARC.

Chemicals meeting Table 5 definitions, along with the criteria for established evidence in Table 3, must be regarded as hazardous.

**Table 5 is NOT intended to present all hazard categories or test methods.** Available scientific data involving other test methods and animal species must also be evaluated to determine a chemical’s hazards.

### Table 5

**Standard Health Hazard Categories**

<table>
<thead>

</tr>
<tr>
<td></td>
<td>• The National Toxicity Program (NTP) (latest edition) lists it as a carcinogen or potential carcinogen OR</td>
</tr>
<tr>
<td></td>
<td>• It is regulated by WISHA or OSHA as a carcinogen</td>
</tr>
<tr>
<td>• Corrosive</td>
<td>• It causes visible destruction of, or irreversible alterations in, living tissue (not inanimate surfaces) by chemical action at the site of contact Example:</td>
</tr>
</tbody>
</table>
### Table 5: Standard Health Hazard Categories

<table>
<thead>
<tr>
<th>A chemical is considered to be</th>
<th>If</th>
</tr>
</thead>
</table>
| **Toxic** | - It has a median lethal dose (LD50) greater than 50 milligrams per kilogram, but no more than 500 milligrams per kilogram of body weight, when administered orally to albino rats weighing between 200 - 300 grams each  
- It has a median lethal dose (LD50) greater than 200 milligrams per kilogram, but not more than 1,000 milligrams per kilogram, of body weight when administered by continuous contact for twenty-four hours (or less if death occurs within twenty-four hours) with the bare skin of albino rabbits weighing between 2 - 3 kilograms each  
- It has a median lethal concentration (LC50), in air:  
  - Greater than 200 parts per million, but not more than 2,000 parts per million (by volume of gas or vapor)  
  - Greater than 2 milligrams per liter, or less, of mist, fume, or dust, when administered by continuous inhalation for one hour (or less if death occurs within one hour) to albino rats weighing between 200 - 300 grams each |
| **Highly toxic** | - It has a median lethal dose (LD50) of 50 milligrams, or less, per kilogram of body weight when administered orally to albino rats weighing between 200 - 300 grams each  
- It has a median lethal concentration (LC50) of 200 parts per million (by volume), or less, of gas or vapor |

**An irritant**
- It is NOT corrosive, but causes a reversible inflammatory effect on living tissue by chemical action at the contact site
  - The chemical is a skin irritant when tested on the intact skin of albino rabbits (by the methods of 16 CFR 1500.41) for four hours exposure (or by other appropriate techniques), and the exposure results in an empirical score of five or more
  - A chemical is an eye irritant if so determined under the procedure listed in 16 CFR 1500.42 or other appropriate techniques

**A sensitizer**
- It causes a substantial proportion of exposed people or animals to develop an allergic reaction in normal tissue after repeated exposure

Categories provided in Table 6 illustrate the broad range of target organ effects that must be considered when conducting hazard evaluations. Chemicals meeting Table 6 definitions, along with the criteria for established evidence in Table 3, must be regarded as hazardous.

Examples provided in Table 6 are NOT intended to be a complete list.
**Table 6 Examples of Target Organ Effect Categories**

**WAC 296-307-56015 Provide access to hazard evaluation procedures.**

You must:
- Provide access to your written hazard evaluation procedures when requested by any of the following:
  - Employees
  - Designated representatives of employees
  - Representatives of the department of labor and industries
  - Representatives of the National Institute for Occupational Safety and Health (NIOSH).

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-10-068, § 296-307-56015, filed 5/6/03, effective 8/1/03.]

**WAC 296-307-56020 Material safety data sheets. Your responsibility:**

To provide complete and accurate material safety data sheets (MSDSs).

You must:
- Develop or obtain MSDSs
- WAC 296-307-56025
- Provide MSDSs
- WAC 296-307-56030
- Follow-up if an MSDS is not provided
- WAC 296-307-56035.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-10-068, § 296-307-56020, filed 5/6/03, effective 8/1/03.]

**WAC 296-307-56025 Develop or obtain material safety data sheets (MSDSs).**

You must:
- Develop or obtain a complete and accurate material safety data sheet (MSDS) for each hazardous chemical or mixture according to ALL of the following:
  - ALL information in Table 8 must be completed. If there is no relevant information for a required item, this must be noted. Blank spaces are not permitted.
  - Note: No specific format is required for MSDSs; however, an example format (OSHA form 174) can be found online at: http://www.osha.gov
  - One MSDS can be developed for a group of complex mixtures (for example, jet fuels or crude oil) IF the health and physical hazards of the mixtures are similar (the amounts of chemicals in the mixture may vary).
  - Content of MSDSs must accurately represent the available scientific evidence.
  - Note: You may report results of scientifically valid studies that tend to refute findings of hazards.
  - MSDSs must be in English.
  - Note: You may develop copies of MSDSs in other languages.
  - You must:
    - Revise an MSDS when you become aware of new and significant information regarding the hazards of a chemical, or how to protect against the hazards
    - Within three months after you first become aware of the information
    - Before the chemical is reintroduced into the workplace if the chemical is no longer being used, produced or imported.
## Table 8

**Information Required on MSDSs**

<table>

</table>
| A contact for additional information about the hazardous chemical and appropriate emergency procedures | Include all of the following:  
  - Name                      
  - Address                   
  - Telephone number of the responsible party preparing or distributing the MSDS |
| The chemical’s hazardous ingredients1 as determined by your hazard evaluation | For a single substance chemical, include the chemical and common name(s) of the substance  
  - For mixtures tested as a whole  
    - Include the common name(s) of the mixture AND  
    - List the chemical and common name(s) of ingredients that contribute to the known hazards  
  - For mixtures NOT tested as a whole, list the chemical and common name(s) of hazardous ingredients  
    - That make up 1% or more of the mixture, by weight or volume, including carcinogens (if 0.1% concentration or more, by weight or volume)  
    - If ingredients are less than the above concentrations but may present a health risk to employees (for example, allergic reaction or exposure could exceed the permissible exposure limits, or PEL) they must be listed here |
| Exposure limits for airborne concentrations. Include ALL of the following, when they exist: |  
  - WISHA or OSHA PELs2  
    - The 8-hour time weighted average (TWA)  
    - The short-term exposure limit (STEL), if available  
    - Ceiling values, if available  
  - Threshold limit values (TLVs) including 8-hour TWAs, STELs, and ceiling values  
  - Other exposure limits used or recommended by the employer preparing the MSDS |
| Physical and chemical characteristics                                      | For example, boiling point, vapor pressure, and odor                        |
| Fire, explosion data, and related information                              | For example, flashpoint, flammable and explosion limits, extinguishing media, and unusual fire or explosion hazards |
| Physical hazards of the chemical including reactivity information          | For example, incompatibilities, decomposition products, by-products, and conditions to avoid |
| Health hazard information including ALL of the following:                 |  
  - Primary routes of exposure  
  - For example, inhalation, ingestion, and skin absorption or other contact1:  
    - Health effects (or hazards) associated with:  
      - Short-term exposure4  
      - Long-term exposure4 |

### Notes:

1. The identities of some chemicals may be protected as trade secret information (see chapter 296-62 WAC, Part B-1, Trade secrets).
2. WISHA PEL categories are defined, and values are provided, in chapter 296-307 WAC, Part Y-6.
3. A “skin notation” listed with either an ACGIH TLV or WISHA/OSHA PEL indicates that skin absorption is a primary route of exposure.
4. Examples of:
   - Short-term health effects (or hazards) include eye irritation, skin damage caused by contact with corrosives, narcosis, sensitization, and lethal dose.
   - Long-term health effects (or hazards) include cancer, liver degeneration, and silicosis.

### Additional Information:

- **Table 8**
  - Whether the chemical is listed or described as a carcinogen or potential carcinogen in the latest editions of each of the following:  
    - The National Toxicology Program (NTP) Annual Report on Carcinogens  
    - The International Agency for Research on Cancer (IARC) Monographs as a potential carcinogen  
    - WISHA or OSHA rules  
    - Signs and symptoms of exposure4  
    - Medical conditions generally recognized as being aggravated by exposure

- **Emergency and first-aid procedures**
  - Generally applicable precautions for safe handling and use known to the employer preparing the MSDS  
    - For example, appropriate procedures for clean-up of spills and leaks, waste disposal method, precautions during handling and storing

- **Generally applicable and appropriate control measures known to the employer preparing the MSDS, including ALL of the following:**  
  - Engineering controls (for example, general or local exhaust ventilation)  
  - Work practices  
  - Personal protective equipment (PPE)  
  - Personal hygiene practices  
  - Protective measures during repair and maintenance of contaminated equipment

---

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060, 05-01-166, § 296-307-56025, filed 12/21/04, effective 4/2/05; 03-10-068, § 296-307-56025, filed 5/6/03, effective 8/1/03.]

**WAC 296-307-56030 Provide MSDSs for products shipped, transferred or sold over-the-counter.**

**You must:**

- Provide the correct MSDS to manufacturers, distributors and employers:  
  - With the initial shipment or transfer of the product  
  - With the first shipment or transfer after an MSDS is updated  
  - Whenever one is requested.
Note: • MSDSs may be provided separately from containers as long as they are provided before or at the same time as the containers. For example, you may fax, or e-mail the MSDS
• You are NOT required to provide MSDSs to retailers who inform you they
  – Do not sell the product to commercial accounts
  AND
  – Do not open the sealed product containers for use in their workplace.

You must:
• Follow the requirements in Table 9 for chemicals sold over-the-counter.

### Table 9

**Requirements for Chemicals Sold Over-the-Counter (NOT Shipped)**

<table>
<thead>
<tr>
<th>If you are a</th>
<th>Then</th>

Table 11

[Title 296 WAC—p. 2632] (2005 Ed.)
WAC 296-307-56050 Definitions. The following definitions apply to this chapter:

**Article (manufactured item)**
A manufactured item that
- Is not a fluid or particle
  - AND
- Is formed to a specific shape or design during manufacture for a particular end use function

**Chemical**
- An element or mixture of elements
  - OR
- A compound or mixture of compounds
  - OR
- A mixture of elements and compounds
  - Included are manufactured items (such as bricks, welding rods and sheet metal) that are not exempt as an article.

**Chemical name**
- The scientific designation of a chemical developed by the
  - International union of pure and applied chemistry (IUPAC)
  - OR
  - Chemical abstracts service (CAS) rules of nomenclature
  - OR
  - A name that clearly identifies the chemical for the purpose of conducting a hazard evaluation.

**Combustible liquid**
Liquids with a flashpoint of at least 100°F (37.8°C) and below 200°F (93.3°C). A mixture with at least 99% of its components having flashpoints of 200°F (93.3°C), or higher, is not considered a combustible liquid.

**Commercial account**
An arrangement where a retailer is selling hazardous chemicals to an employer
- Generally in large quantities over time
  - OR
- At costs below regular retail price.

**Common name**
Any designation or identification used to identify a chemical other than the chemical name, such as a
- Code name or number
  - OR
- Trade or brand name
  - OR
- Generic name.

**Compressed gas**
A contained gas or mixture of gases with an absolute pressure greater than:
- 40 psi at 70°F (21.1°C)
  - OR
- 104 psi at 130°F (54.4°C) regardless of the pressure at 70°F (21.1°C)
  - OR
- A liquid with a vapor pressure greater than 40 psi at 100°F (37.8°C), as determined by ASTM D323-72.

**Container**
A vessel, other than a pipe or piping system, that holds a hazardous chemical. Examples include:
- Bags
- Barrels
- Bottles
- Boxes
- Cans
Cylinders
Drums
Reaction vessels
Storage tanks
Rail cars.

**Designated representative**
- An individual or organization with written authorization from an employee
  OR
- A recognized or certified collective bargaining agent (not necessarily authorized by an employee)
  OR
- A legal representative of a deceased or legally incapacitated employee.

**Distributor**
A business that supplies hazardous chemicals to other employers. Included are employers who conduct retail and wholesale transactions.

**Explosive**
A chemical that causes a sudden, almost instant release of pressure, gas, and heat when exposed to a sudden shock, pressure, or high temperature.

**Flammable**
A chemical in one of the following categories:
- Aerosols that, when tested using a method described in 16 CFR 1500.45, yield either a:
  - Flame projection of more than eighteen inches at full valve opening
  OR
  - A flashback (a flame extending back to the valve) at any degree of valve opening
- Gases that, at the temperature and pressure of the surrounding area, form a:
  - Flammable mixture with air at a concentration of thirteen percent, by volume, or less
  OR
  - Range of flammable mixtures with air wider than twelve percent, by volume, regardless of the lower limit
- Liquids with a flashpoint below 100°F (37.8°C). A mixture with at least ninety-nine percent of its components having flashpoints of 100°F (37.8°C), or higher, is not considered a flammable liquid
- Solids, other than blasting agents or explosives, as defined in WAC 296-52-417 or 29 CFR 1910.109(a), that:
  - Is likely to cause fire through friction, moisture, absorption, spontaneous chemical change or retained heat from manufacturing or processing
  OR
  - That can be readily ignited (and when ignited burns so vigorously and persistently that it creates a serious hazard)
  OR
  - When tested by the method described in 16 CFR 1500.44, ignite and burn with a self-sustained flame at a rate greater than 1/10th of an inch per second along its major axis.

**Flashpoint**
The minimum temperature at which a liquid gives off an ignitable concentration of vapor, when tested by any of the following measurement methods:
- Tagliabue closed tester. Use this for liquids with a viscosity less than 45 Saybolt Universal Seconds (SUS) at 100°F (37.8°C), that do not contain suspended solids and do not tend to form a surface film under test. See American National Standard Method of Test for Flashpoint by Tag Closed Tester, Z11.24-1979 (ASTM D 56-79)
- Pensky-Martens closed tester. Use this for liquids with a viscosity equal to, or greater than, 45 SUS at 100°F (37.8°C) or for liquids that contain suspended solids or have a tendency to form a surface film under test. See American National Standard Method of Test for Flashpoint by Pensky-Martens Closed Tester, Z11.7-1979 (ASTM D 93-79)
- Setaflash closed tester. See American National Standard Method of Test for Flashpoint by Setaflash Closed Tester (ASTM D 3278-78)

Organic peroxides, which undergo auto accelerating thermal decomposition, are excluded from any of the flashpoint measurement methods specified above.

**Hazardous chemical**
A chemical, which is a physical or health hazard.

**Hazard warning**
Words, pictures or symbols (alone or in combination) that appear on labels (or other forms of warning such as placards or tags) that communicate specific physical and health hazards (including target organ effects) associated with chemicals in a container.

**Health hazard**
A chemical that may cause health effects in short or long-term exposed employees based on statistically significant evidence from a single study conducted by using established scientific principles.

Health hazards include, but are not limited to, any of the following:
- Carcinogens
- Toxic or highly toxic substances
- Reproductive toxins
- Irritants
- Corrosives
- Sensitizers
- Hepatotoxins (liver toxins)
- Nephrotoxins (kidney toxins)
- Neurotoxins (nervous system toxins)
- Substances that act on the hematopoietic system (blood or blood forming system)
- Substances that can damage the lungs, skin, eyes, or mucous membranes.

**Identity**
A chemical or common name listed on the material safety data sheet (MSDS) and label.

**Importer**
The first business, within the Customs Territory of the United States, that receives hazardous chemicals produced in other countries and supplies them to manufacturers, distributors or employers within the United States.

**Label**
Written, printed, or graphic material displayed on, or attached to, a container of hazardous chemicals.

**Manufacturer**
An employer with a workplace where one or more chemicals (including items not exempt as "articles," see Table 1 in this part) are produced for use or distribution.
Material safety data sheet (MSDS)
Written, printed or electronic information (on paper, microfiche, or on-screen) that informs manufacturers, distributors or employers about the chemical, its hazards and protective measures as required by this rule.

Mixture
A combination of two or more chemicals that retain their chemical identify after being combined.

Organic peroxide
An organic compound containing the bivalent-O-O-structure. It may be considered a structural derivative of hydrogen peroxide if one or both of the hydrogen atoms has been replaced by an organic radical.

Oxidizer
A chemical, other than a blasting agent or explosive as defined in WAC 296-52-417 or 29 CFR 1910.109(a), that starts or promotes combustion in other materials, causing fire either of itself or through the release of oxygen or other gases.

Permissible exposure limits
See WAC 296-307-628, for definition of this term.

Physical hazards
A chemical that has scientifically valid evidence to show it is one of the following:
- A combustible liquid
- A compressed gas
- Explosive
- Flammable
- An organic peroxide
- An oxidizer
- Pyrophoric
- Unstable (reactive)
- Water-reactive.

Produce
To do one or more of the following:
- Manufacture
- Process
- Formulate
- Blend
- Extract
- Generate
- Emit
- Repackage.

Pyrophoric
Chemicals that ignite spontaneously in the air at a temperature of 130°F (54.4°C) or below.

Responsible party
Someone who can provide more information about the hazardous chemical and appropriate emergency procedures.

Retailer
See "distributor."

Threshold limit values (TLVs)
Airborne concentrations of substances established by the American Conference of Governmental Industrial Hygienists (ACGIH), and represent conditions under which it is believed that nearly all workers may be repeatedly exposed day after day without adverse health effects.

TLVs are specified in the most recent edition of the Threshold Limit Values for Chemical Substances and Physical Agents and Biological Exposure Indices and include the following categories:
- Threshold limit value-time-weighted average (TLV-TWA)
- Threshold limit value-short-term exposure limit (TLV-STEL)
- Threshold limit value-ceiling (TLV-C).

Unstable (reactive)
A chemical in its pure state, or as produced or transported, that will vigorously polymerize, decompose, condense, or become self-reactive under conditions of shocks, pressure or temperature.

Use
To do one or more of the following:
- Package
- Handle
- React
- Emit
- Extract
- Generate as a by-product
- Transfer.

Water-reactive
A chemical that reacts with water to release a gas that is either flammable or presents a heath hazard.

Wholesaler
See "distributor."

WAC 296-307-570 Lighting rule. Your responsibility:
To provide an maintain adequate lighting in your workplace.

WAC 296-307-57005 Provide and maintain adequate lighting.

Note: This section establishes minimal levels of lighting for safety purposes only. Guidelines pertaining to optimal levels of lighting and illumination may be found in Practice for Industrial Lighting, ANSI/IES RP7-1979.

You must:
- Provide and maintain adequate lighting for all work activities in your workplace. See the following table.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Minimum Acceptable average lighting level in an area: (Foot-candles)</th>
<th>Any one single measurement used to determine the average lighting level cannot be less than: (Foot-candles)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indoor task</td>
<td>10</td>
<td>5</td>
</tr>
<tr>
<td>Outdoor task</td>
<td>5</td>
<td>2.5</td>
</tr>
<tr>
<td>Nontask activities for both indoor and outdoor</td>
<td>3</td>
<td>1.5</td>
</tr>
</tbody>
</table>

- Lighting levels must be measured at thirty inches above the floor/working surface or at the task.

You must:
- Have adequate light for employees to see nearby objects that might be potential hazards or to see to operate
emergency controls or other equipment, if general lighting is not available.

Note: • Lighting levels can be measured with a light meter.
         • Conversion information: 1 foot candle = 1 lumen incident per square foot = 10.76 lux.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-17-033, § 296-307-57005, filed 8/8/01, effective 9/1/01.]

WAC 296-307-590  Environmental tobacco smoke in the office. Your responsibility:
To control exposure to environmental tobacco smoke in your office work environment
You must:
Control tobacco smoke in your building
WAC 296-307-59005
Control tobacco smoke that comes in from the outside
WAC 296-307-59010

Note: This rule does not preempt any federal, state, municipal, or other local authority's regulation of indoor smoking that is more protective than this section.

Definitions: Office work environment is an indoor or enclosed occupied space where clerical work, administration, or business is carried out. In addition, it includes:
• Other workplace spaces controlled by the employer and used by office workers, such as cafeterias, meeting rooms, and washrooms.
• Office areas of manufacturing and production facilities, not including process areas.
• Office areas of businesses such as food and beverage establishments, agricultural operations, construction, commercial trade, services, etc.

Smoking
A person is smoking if they are:
• Lighting up
• Inhaling
• Exhaling
• Carrying a pipe, cigar or cigarette of any kind that is burning.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-17-033, § 296-307-590, filed 8/8/01, effective 9/1/01.]

WAC 296-307-59005  Control tobacco smoke in your building.

EXEMPTION: The minimum criteria specified in this rule do not apply to outdoor structures provided for smokers such as gazebos or lean-tos.

You must:
• Prohibit smoking in your office work environment
OR
• Restrict smoking inside your office work environment to designated enclosed smoking rooms that meet the following minimum criteria:
  – Identify smoking rooms clearly with signs.
  – Make sure the designated smoking rooms are not in common areas, such as:
    ✦ Places where nonsmoking employees are required to work or visit
    ✦ Restrooms
    ✦ Washrooms
    ✦ Stairways
    ✦ Cafeterias/lunchrooms
    ✦ Meeting rooms
  – Make sure that no employee is required to enter a designated smoking room while someone is smoking there.

Note: This ventilation rate is recommended for occupancies of no more than 7 people for every 100 square feet of net occupied space in the designated smoking room.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-17-033, § 296-307-59010, filed 8/8/01, effective 9/1/01.]

WAC 296-307-59010  Control tobacco smoke that comes in from the outside. You must:
• Use engineering or administrative controls to minimize the amount of tobacco smoke that comes into your office(s) from outside the building.
  – Make sure that outside smoking areas used by your employees are not close to doorways, air intakes, and other openings that may allow airflow directly into an office.

Note: By changing the way workers do their job, you can reduce work exposure to potential hazards. These changes are called administrative controls and include such things as:
  – Job rotation
  – Wetting down dusty areas
  – Having employees shower after exposure to potentially harmful substances
  – Maintaining equipment properly
  – Cleaning up work areas to control the effect of potential hazards

Engineering controls let you plan or physically change the machinery or work environment to prevent employee exposure to potential hazards. This includes any modification of plant equipment, processes, or materials to reduce employees' exposure to toxic materials or harmful physical agents.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-17-033, § 296-307-59010, filed 8/8/01, effective 9/1/01.]

Part Y-3
Lighting

Part Y-4
Environmental Tobacco Smoke in the Office

Part Y-5
Respirators

WAC 296-307-594  Scope. This part applies to all use of respirators at work.

IMPORTANT:
Before you decide to use respirators, you are required to evaluate respiratory hazards and implement control methods...

The term "respiratory hazards" will be used throughout this part to refer to oxygen deficient conditions and harmful airborne hazards.

Definition:
Respirators are a type of personal protective equipment designed to protect the wearer from respiratory hazards.

You can use Table 1 for general guidance on which sections apply to you.

### Table 1

<table>
<thead>
<tr>
<th>If employees...</th>
<th>Then the sections marked with an &quot;X&quot; apply...</th>

</tbody>
</table>

Reference: See WAC 296-307-100, Personal protective equipment (PPE) to find requirements for other types of personal protective equipment (PPE), such as eye, hand, and head protection.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-594, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-596** Respirator program administrator.

**Your responsibility:**
To make sure a capable individual is in charge of respirator program development and management.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-596, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-59605** Designate a program administrator.

**Exemption:** You do not need to designate a program administrator if employees use only filtering-facepiece respirators and do so only as voluntary use.

**Definition:**
Voluntary use is respirator use that is requested by the employee AND permitted by the employer when NO respiratory hazard exists.

**You must:**
- Designate a program administrator who has overall responsibility for your program and has sufficient training or experience to:
  - Oversee program development and coordinate implementation
  - Conduct required evaluations of program effectiveness outlined in WAC 296-307-60005.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-596, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-598** Voluntary respirator use requirements. Your responsibility:
To make sure voluntary use of respirators by employees does not create job safety or health hazards.

**You must:**
- Make sure voluntary use of respirators is safe WAC 296-307-59805
- Keep voluntary use respirator program records WAC 296-307-59810.

**IMPORTANT:**
- Respirator use is NOT voluntary if a respiratory hazard, such as exposure to a substance over the permissible exposure limit (PEL) or hazardous exposure to an airborne biological hazard, is present.
- To evaluate respiratory hazards in your workplace, see WAC 296-307-624, Respiratory hazards.
- Some requirements in this section do not apply if only filtering-facepiece respirators are used voluntarily. Some filtering-facepiece respirators are equipped with a sorbent layer for absorbing "nuisance" organic vapors. These can be used for voluntary use, but are not NIOSH certified for protection against hazardous concentrations of organic vapor.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-596, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-59805** Make sure voluntary use of respirators is safe.

**Definition:**
Voluntary use is respirator use that is requested by the employee AND permitted by the employer when NO respiratory hazard exists.

**IMPORTANT:** If you choose to require respirator use, use is NOT voluntary and the required use sections of this part apply.

**You must:**
1. Make sure voluntary respirator use does NOT:
   - Interfere with an employee's ability to work safely, such as restricting necessary vision or radio communication OR
   - Create health hazards.

**Note:** Examples of health hazards include:
- Skin irritation, dermatitis, or other health effects caused by using a dirty respirator
- Illness created by sharing contaminated respirators
- Health effects caused by use of an unsafe air supply, such as carbon monoxide poisoning.

**You must:**
2. Provide all voluntary respirator users with the advisory information in Table 2 at no cost to them.

**Note:** If you have provided employees with the advisory information required in the previous section, WAC 296-307-598, you do not need to provide the additional information in Table 2 to those employees.

(2005 Ed.)
You must:

(3) Develop and maintain a written program that includes the following:

- Medical evaluation provisions as specified in WAC 296-307-604.
- Procedures to properly clean and disinfect respirators, according to WAC 296-307-62015, if they are reused.
- How to properly store respirators, according to WAC 296-307-61010, so that using them does not create hazards.
- Procedures to make sure there is a safe air supply, according to WAC 296-307-616, when using air-line respirators and SCBAs.

- Training according to WAC 296-307-608 when necessary to ensure respirator use does NOT create a hazard.

Note:
- Pay for medical evaluations, training, travel related costs, and wages. You do NOT need to pay for respirators employees use only voluntarily.
- If you have both voluntary and required respirator users, you may choose to treat voluntary users as required users. Doing this exceeds the requirements in this section.

Exemption:
- If employees use only filtering-facepiece respirators and do so only voluntarily, you do not need to develop and maintain a written program.

Use Table 2 to provide information to employees who voluntarily use any type of respirator.

Table 2

Advisory Information for Employees Who Voluntarily Use Respirators

| Respirators protect against airborne hazards when properly selected and used. WISHA recommends voluntary use of respirators when exposure to substances is below WISHA permissible exposure limits (PELs) because respirators can provide you an additional level of comfort and protection. |
| If you choose to voluntarily use a respirator (whether it is provided by you or your employer) be aware that respirators can create hazards for you, the user. You can avoid these hazards if you know how to use your respirator properly AND how to keep it clean. Take these steps: |
| Read and follow all instructions provided by the manufacturer about use, maintenance (cleaning and care), and warnings regarding the respirator's limitations. |
| Choose respirators that have been certified for use to protect against the substance of concern. The National Institute for Occupational Safety and Health (NIOSH) certifies respirators. If a respirator is not certified by NIOSH, you have no guarantee that it meets minimum design and performance standards for workplace use. |
| A NIOSH approval label will appear on or in the respirator packaging. It will tell you what protection the respirator provides. |
| Keep track of your respirator so you do not mistakenly use someone else's. |
| DO NOT wear your respirator into: |
| Atmospheres containing hazards that your respirator is not designed to protect against. For example, a respirator designed to filter dust particles will not protect you against solvent vapor, smoke or oxygen deficiency. |
| Situations where respirator use is required. |

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-59805, filed 12/21/04, effective 4/2/05.]

WAC 296-307-59810 Keep voluntary use program records.

Exemption: If employees use only filtering-facepiece respirators voluntarily, you do not need to follow these record-keeping requirements.

You must:

- Keep copies of:
  - Your current written respirator program
  - Written recommendations from the LHCP
- Allow records required by this section to be examined and copied by affected employees and their representatives.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-59810, filed 12/21/04, effective 4/2/05.]

WAC 296-307-600 Written respirator program and recordkeeping.

Your responsibility:

To develop, implement, and maintain a written program that provides clear instruction for safe and reliable respirator use.

You must:

- Develop and maintain a written program WAC 296-307-60005
- Keep respirator program records WAC 296-307-60010.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-60005, filed 12/21/04, effective 4/2/05.]

WAC 296-307-60005 Develop and maintain a written program.

Exemption: This section does NOT apply to respirator use that is voluntary. See WAC 296-307-59805 for voluntary use program requirements.

You must:

(1) Develop a complete worksite-specific written respiratory protection program that includes the applicable elements listed in Table 3.

Note: Pay for respirators, medical evaluations, fit testing, training, maintenance, travel costs, and wages.

You must:

(2) Keep your program current and effective by evaluating it and making corrections. Do ALL of the following:

- Make sure procedures and program specifications are followed and appropriate.
- Make sure selected respirators continue to be effective in protecting employees. For example:
  - If changes in work area conditions, level of employee exposure, or employee physical stress have occurred, you need to reevaluate your respirator selection.
Have supervisors periodically monitor employee respirator use to make sure employees are using them properly.

- Respirators being appropriate for the hazards encountered
- Proper use under current worksite conditions
- Proper maintenance.

When developing your written program include applicable elements listed in Table 3.

### Table 3

</table>

| **Procedures to ensure a safe air quantity and quality IF atmosphere-supplying respirators (air-line or SCBA) are selected** |
| **Procedures for evaluating program effectiveness on a regular basis** |

---

**WAC 296-307-60010  Keep respirator program records.**

**You must:**
- Keep the following records:
  - Your current respirator program
  - Each employee's current fit test record, if fit testing is conducted. Fit test records must include:
    - Employee name
    - Test date
    - Type of fit-test performed
    - Description (type, manufacturer, model, style, and size) of the respirator tested
    - Results of fit tests, for example, for quantitative fit tests include the overall fit factor AND a print out, or other recording of the test.
    - Training records that include employee's names and the dates trained

**WAC 296-307-602 Respirator selection.**

**Your responsibility:**
To select and provide respirators that are appropriate for the hazard, user, and worksite conditions.

**Exemption:**
This section does NOT apply to voluntary respirator use. See WAC 296-307-598 of this part for voluntary use program requirements.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-60010, filed 12/21/04, effective 4/2/05.]
Respirator Selection Process

Step 1: If your only respirator use is for escape, skip to Step 8 to select appropriate respirators.

Step 2: If the respiratory hazard is a biological aerosol, such as TB (tuberculosis), anthrax, psittacosis (parrot fever), or hantavirus, select a respirator appropriate for nonemergency activities recognized to present a health risk to workers and skip to Step 8.

Step 3: If the respiratory hazard is a pesticide, follow the respirator specification on the pesticide label AND skip to Step 8.

Step 4: Determine the expected exposure concentration for each respiratory hazard of concern. Use the results from the evaluation required by WAC 296-307-624, Respiratory hazards.

Step 5: Determine if the respiratory hazard is classified as IDLH; if it is NOT IDLH skip to Step 7.

Step 6: Select an appropriate respirator from one of the following respirators for IDLH conditions and skip to Step 8:

- Full-facepiece, pressure demand air-line respirator equipped with an auxiliary self-contained air supply

Step 7: If the respiratory hazard is oxygen deficiency AND you can show oxygen concentrations can be controlled within the ranges listed in Table 4 under ALL foreseeable conditions, you are allowed to select ANY type of SCBA or air-line respirator.

Step 8: If your measured or estimated expected exposure concentration is below NIOSH’s IDLH values, proceed to Step 7.

- The respiratory hazard IS classified as IDLH if:
  - The atmosphere is oxygen deficient or oxygen enriched

- OR
  - You CANNOT measure or estimate your expected exposure concentration

- OR
  - Your measured or estimated expected exposure concentration is greater or equal to the IDLH value in the NIOSH Pocket Guide to Chemical Hazards

Note: WISHA uses the IDLH values in the 1990 edition of the NIOSH Pocket Guide to Hazardous Chemicals to determine the existence of IDLH conditions. You may use more recent editions of this guide. Visit www.cdc.gov/niosh for more information.

Step 9: Evaluate user and workplace factors that might compromise respirator performance, reliability or safety.

- If the respiratory hazard is a pesticide, follow the requirements on the pesticide label and skip to Step 11.

Examples:
- High humidity or temperature extremes in the workplace.
- Necessary voice communication.
- High traffic areas and moving machinery.
- Time or distance for escape.

Step 10: Follow Table 6 requirements to select an air-purifying respirator.

- If Table 6 requirements cannot be met, you must select an air-line respirator or an SCBA.

Step 11: Make sure respirators you select are certified by the National Institute for Occupational Safety and Health (NIOSH).

- To maintain certification, make sure the respirator is used according to cautions and limitations specified on the NIOSH approval label.

Note: While selecting respirators, you will need to select a sufficient number of types, models or sizes to provide for fit testing. You can also consider other respirator use issues, such as accommodating facial hair with a loose-fitting respirator.

Use Table 5 to identify the assigned protection factor for different types of respirators.

Table 4
Concentration Ranges for Oxygen Deficiency

<table>

</thead>
<tbody>
<tr>
<td><strong>Gas or vapor</strong></td>
<td><strong>Provide a respirator with canisters or cartridges equipped with a NIOSH-certified, end-of-service-life indicator (ESLI)</strong> OR <strong>Select a respirator that is NIOSH certified as &quot;dust and mist,&quot; &quot;dust, fume, or mist,&quot; or &quot;pesticides.&quot; Note: These respirators are no longer sold for occupational use.</strong></td>
</tr>
</tbody>
</table>

Use Table 6 to select air-purifying respirators for particle, vapor, or gas contaminants.
WAC 296-307-60405 Provide medical evaluations.

IMPORTANT:
If you have provided an employee with a medical evaluation addressing respirator use, as required by another chapter, that evaluation will meet the requirements of this section.

You must:
• Follow the medical evaluation process, Steps 1 through 7 in this section, to provide medical evaluations for employees at no cost to them.

Medical Evaluation Process

Step 1: Identify employees who need medical evaluations AND determine the frequency of evaluations from Table 7. Include employees who:
• Are required to use respirators
OR
• Voluntarily use respirators that are not filtering-facepiece respirators

Note: You may use a previous employer's medical evaluation for an employee if you can:
• Show the employee's previous work and use conditions were substantially similar to yours
AND
• Obtain a copy of the licensed healthcare professional's (LHCP's) written recommendation approving the employee's use of the respirator chosen by you.

Step 2: Identify a licensed healthcare professional (LHCP) to perform your medical evaluations.

Note: If you select a different LHCP, you do not need to have new medical evaluations done.

Step 3: Make sure your LHCP has the following information before the evaluation is completed:
• Information describing the respirators employees may use, including the weight and type.
• How the respirators will be used, including:
  – How often the respirator will be used, for example, daily, or once a month
  – The duration of respirator use, for example, a minimum of one hour, or up to twelve hours
  – The employee's expected physical work effort
  – Additional personal protective clothing and equipment to be worn
  – Temperature and humidity extremes expected during use
• A copy of your written respiratory protection program and this part.

Note: You may choose to send the questionnaire to the LHCP ahead of time, giving time to review it and add any necessary questions
• The LHCP determines what questions to add to the questionnaire, if any; however, questions in Parts 1-3 may not be deleted or substantially altered.

Step 4: Administer the medical questionnaire in WAC 296-307-61605 to employees, OR provide them a medical exam that obtains the same information.

Note: You may use on-line questionnaires if the questions are the same and requirements of this section are met.
• Administer the examination or questionnaire at no cost to employees:
  – During the employee's normal working hours
OR
  – At a time and place convenient to the employee
• Maintain employee confidentiality during examination or questionnaire administration:
  – Do not view employee's answers on the questionnaire
  – Do not act in a manner that may be considered a breach of confidentiality

Note: Providing confidentiality is important for securing successful medical evaluations. It helps make sure the LHCP gets complete and dependable answers on the questionnaire.
• Make sure employees understand the content of the questionnaire.
• Provide the employee with an opportunity to discuss the questionnaire or exam results with the LHCP.

Step 5: Provide follow-up evaluation for employees when:
• The LHCP needs more information to make a final recommendation
OR
• An employee gives any positive response to questions 1-8 in Part 2 OR to questions 1-6 in Part 3 of the WISHA medical evaluation questionnaire in WAC 296-307-61605.

Note: Follow-up may include:
• Employee consultation with the LHCP such as a telephone conversation to evaluate positive questionnaire responses
• Medical exams
• Medical tests or other diagnostic procedures.

Step 6: Obtain a written recommendation from the LHCP that contains only the following medical information:
• Whether or not the employee is medically able to use the respirator
• Any limitations of respirator use for the employee
• What future medical evaluations, if any, are needed
• A statement that the employee has been provided a copy of the written recommendation.

Step 7: Provide a powered, air-purifying respirator (PAPR) when the LHCP determines the employee should not wear a negative-pressure air-purifying respirator AND is able to wear a PAPR.

Note: You may discontinue medical evaluations for an employee when the employee no longer uses a respirator.
• If you have staff conducting your medical evaluations, they may keep completed questionnaires and findings as confidential medical records, if they are maintained separately from other records.

Use Table 7 to determine medical evaluation frequency.
**Safety Standards for Agriculture 296-307-608**

**WAC 296-307-606 Fit testing.**

**Your responsibility:**

To make sure negative and positive-pressure tight-fitting respirators can provide an adequate fit and acceptable level of comfort to employees.

**Exemption:** This section does NOT apply to any respirators that are:
- Voluntarily used. See WAC 296-307-598 for voluntary use requirements.
- Mouthpiece respirators.

**IMPORTANT:**
- Fit testing is an activity where the seal of a respirator is tested to determine if it is adequate.
- This section covers general requirements for fit testing. Fit-testing procedures are covered in WAC 296-307-62010 of this part.

**WAC 296-307-60605 Conduct fit testing.**

**You must:**
- Provide, at no cost to the employee, fit tests for ALL tight fitting respirators on the following schedule:
  - Before employees are assigned duties that may require the use of respirators
  - At least every twelve months after initial testing
  - Whenever any of the following occurs:
    - A different respirator facepiece is chosen such as a different type, model, style, or size
    - You become aware of a physical change in an employee that could affect respirator fit. For example, you may observe, or be told about, facial scarring, dental changes, cosmetic surgery, or obvious weight changes
    - An employee notifies you, or your LHCP, that the respirator fit is unacceptable. During the retest, you must give an employee reasonable opportunity to select a different respirator facepiece (size, model, etc.).

**Note:** You may accept a fit test completed by a previous employer IF:
- You obtain written documentation of the fit test
- The results of the fit test are not more than twelve months old

AND
- The employee will use the same respirator (the same type, model, style, and size)

AND
- The fit test was conducted in a way that meets the requirements of WAC 296-307-606 and 296-307-62010.

**WAC 296-307-608 Training.**

**Your responsibility:**

To make sure employees who are required to use respirators understand and can demonstrate proper respirator use and maintenance.

**IMPORTANT:**
- This section applies to employees who voluntarily use respirators only when training is necessary to prevent the res-voluntary use requirements.
WAC 296-307-60805 Provide effective training.

You must:
• Train employees, based on their duties, if they do any of the following:
  – Use respirators
  – Supervise respirator users
  – Issue, repair, or adjust respirators
• Present effective training in a way that employees understand.

Note: • Training may be provided using audiovisuals, slide presentations, formal classroom instruction, informal discussions during safety meetings, training programs conducted by outside sources, or a combination of these methods.
• You may want to have instructors available when using video or automated training methods to:
  – Encourage and provide responses to questions for the benefit of employees
  – Evaluate employees' understanding of the material
  – Provide other instructional interaction to employees.

You must:
• Make sure a qualified instructor provides training
• Provide training, at no cost to the employee, at these times:
  – Initially, before worksite respirator use begins
  – Periodically, within twelve months of the previous training
• Additionally, when the following occur:
  ■ The employee has not retained knowledge or skills
  OR
  ■ Changes in the worksite, or type of respirator make previous training incomplete or obsolete.

Note: • You may accept an employee's previous training, such as training provided by another employer, to satisfy the initial training requirement if:
  – You can demonstrate the employee received training within the past twelve months
AND
  – The employee can demonstrate the knowledge and skills to use required respirators effectively.
• If you accept an employee's previous training to satisfy the initial training requirement, you are still responsible for providing periodic, and additional training when needed. Periodic training would need to be provided within twelve months of the employee's previous training.

You must:
• Make sure employees can demonstrate the following knowledge and skills as required by their duties:
  – Why the respirator is necessary. Include, for example, information identifying respiratory hazards such as hazardous chemicals, the extent of the employee’s exposure, and potential health effects and symptoms
  – The respirator’s capabilities and limitations. Include, for example, how the respirator provides protection and why air-purifying respirators cannot be used in oxygen-deficient conditions
  – How improper fit, use, or maintenance can compromise the respirator’s effectiveness and reliability
  – How to properly inspect, put on, seal check, use, and remove the respirator
  – How to clean, disinfect, repair, and store the respirator, or how to get this done by someone else
  – How to use the respirator effectively in emergency situations; including what to do when a respirator fails and where emergency respirators are stored
  – Medical signs and symptoms that may limit or prevent the effective use of respirators such as shortness of breath or dizziness
  – The employer’s general obligations under this part. For example, developing a written program, selecting appropriate respirators, and providing medical evaluations.

WAC 296-307-610 Maintenance.

Your responsibility:
To make sure respirators are maintained so they will function properly and not create health hazards such as skin irritation.

You must:
Maintain respirators in a clean and reliable condition
WAC 296-307-61005
Store respirators properly
WAC 296-307-61010
Inspect and repair respirators
WAC 296-307-61015

IMPORTANT:
This section applies to employees who voluntarily use respirators only when maintenance is necessary to prevent the respirator from creating a hazard. See WAC 296-307-598 for voluntary use requirements.

WAC 296-307-61005 Maintain respirators in a clean and reliable condition.

You must:
• Make sure respirators are kept, at no cost to the employee, clean, sanitary and in good working order. Do at least the following:
  – Clean and disinfect respirators as often as specified in Table 8 of this section.

Note: • Use required cleaning and disinfecting procedures in WAC 296-307-62015, or the manufacturer’s procedures that:
  – Result in a clean and sanitary respirator
  – Do not damage the respirator
  – Do not harm the user
• Automated cleaning and disinfecting are permitted
• Cleaning and disinfecting may be done by a central facility as long as you make sure respirators provided are clean, sanitary, and function properly.

You must:
• Make sure respirators are assembled properly after cleaning or disinfecting.

Use Table 8 to determine how often to clean and disinfect respirators.
Table 8
Required Frequencies for Cleaning and Disinfecting Respirators

<table>
<thead>
<tr>
<th>If, the respirator will be . . .</th>
<th>Then, clean and disinfect the respirator . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Used exclusively by one employee</td>
<td>• As often as needed to:</td>
</tr>
<tr>
<td></td>
<td>– Keep it clean and functional AND</td>
</tr>
<tr>
<td></td>
<td>– To prevent health hazards such as skin irritation</td>
</tr>
<tr>
<td>• Shared for nonemergency use OR • Used for fit-testing or training</td>
<td>• Before it is worn by another employee</td>
</tr>
<tr>
<td>• Shared for emergency use</td>
<td>• After each use so the respirator is immediately ready for use at all times</td>
</tr>
</tbody>
</table>

Note: Use coffee cans, sealable plastic bags, or other suitable means of protection.

WAC 296-307-61010 Store respirators properly.
You must:
• Store respirators to protect them from ALL of the following:
  – Deformation of the facepiece or exhalation valve
  – Sunlight or extreme temperatures or other conditions
  – Contamination such as dust or damaging chemicals
  – Excessive moisture.
Note: Use coffee cans, sealable plastic bags, or other suitable means of protection.

You must:
• Follow these additional requirements for emergency respirators:
  – Keep respirators accessible to the work area
  – Store respirators in compartments or with covers clearly marked as containing emergency respirators
  – Follow additional storage instructions from the respirator manufacturer
  – Store an adequate number of emergency respirators in each area where they may be needed.
Note: Emergency respirators include mouthpiece respirators and other respirators that are limited to escape-only use by their NIOSH certification.

WAC 296-307-61015 Inspect and repair respirators.
You must:
• Conduct respirator inspections as often as specified in Table 9.
• Make sure respirator inspections cover ALL of the following:
  – Respirator function
  – Tightness of connections
  – The condition of the facepiece, head straps, valves, connecting tubes, and cartridge, canisters or filters
  – Pliability and deterioration of elastomeric parts
  – Maintenance of air or oxygen cylinders
  – Making sure SCBA air cylinders are at ninety percent of the manufacturer's recommended pressure level
  – Proper functioning of SCBA regulators when air-flow is activated
  – Proper functioning of SCBA low-pressure warning devices when activated
• Certify inspections for emergency respirators by documenting the following:
  – Inspection date
  – Serial number of each respirator or other identifying information
  – Inspector’s name or signature
  – Inspection findings
• Required action, if problems are found.

You must:
• Repair or replace any respirator that is not functioning properly before the employee returns to a situation where respirators are required.
  – If respirators fail inspection or are not functioning properly during use due to problems such as leakage, vapor or gas breakthrough, or increased breathing resistance, ALL of the following apply:
    ■ Do NOT permit such respirators to be used until properly repaired or adjusted
    ■ Use only NIOSH-certified parts
    ■ Make sure repairs and adjustments are made by appropriately trained individuals
  – Use the manufacturer or a technician trained by the manufacturer to repair or adjust reducing and admission valves, regulators, and warning devices on SCBAs or air-line respirators.
  – Follow the manufacturer's recommendations and specifications for the type and extent of repairs.
  – Use Table 9 to determine how often to inspect respirators.

Table 9
Required Frequencies for Respirator Inspections

<table>
<thead>
<tr>
<th>If the respirator is . . .</th>
<th>Then inspect . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>A SCBA in any use</td>
<td>• Before each use AND • During cleaning OR • Monthly if NOT used</td>
</tr>
</tbody>
</table>

Used for nonemergencies, including day-to-day or infrequent use
• Inspect before each use AND • During cleaning

Used only for emergencies
• Check for proper function before and after each use AND • Inspect at least monthly as instructed by the manufacturer

(2005 Ed.)
If the respirator is . . .  Then inspect . . .

| Used for escape-only purposes | • Before carrying into a work place for use |

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-61015, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-612 Safe use and removal of respirators.**

**Your responsibility:**
To make sure respirator use and removal is safe.

**Exemption:** These sections do NOT apply to employees who voluntarily use any type of respirator. See WAC 296-307-598 for voluntary use requirements.

**You must:**
Prevent sealing problems with tight-fitting respirators WAC 296-307-61205

Make sure employees leave the use area before removing respirators WAC 296-307-61210.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-612, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-61205 Prevent sealing problems with tight-fitting respirators.**

**You must:**
• Make sure employees use the procedure in WAC 296-307-62020 to perform a user seal check each time they put on their tight-fitting respirator.
• Make sure you do NOT permit respirator use if employees have a characteristic that interferes with the respirator facepiece seal or valve function. For example, stubble, moustaches, sideburns, bangs, hairlines, or scars between the face and the sealing surface of the respirator will affect the seal.
• Make sure corrective glasses or personal protective equipment (PPE) do NOT interfere with the facepiece seal. Examples of PPE include safety glasses, goggles, faceshields, clothing, and hard hats.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-61205, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-61210 Make sure employees leave the use area before removing respirators.**

**You must:**
• Make sure employees leave the use area for any of these reasons:
  – To replace air-purifying filters, cartridges, or canisters
  – When they smell or taste (detect) vapor or gas leakage from, for example, cartridges, canister, or the facepiece seal
  – When they detect changes in breathing resistance
  – To readjust their respirators
  – To wash their faces and respirators as necessary to prevent skin or eye irritation
  – If they become ill
  – If they experience sensations of dizziness, nausea, weakness, breathing difficulty, coughing, sneezing, vomiting, fever, or chills.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-61210, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-614 Standby requirements for immediately dangerous to life or health (IDLH) conditions.**

**Your responsibility:**
To provide adequate assistance to employees using respirators in conditions immediately dangerous to life or health (IDLH).

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-614, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-61405 Provide standby assistance in immediately dangerous to life or health (IDLH) conditions.**

**IMPORTANT:**
WISHA currently uses the IDLH values in the 1990 NIOSH Pocket Guide to Chemical Hazards to determine the existence of IDLH conditions. You may use more recent editions of this guide. Visit www.cdc.gov/niosh for more information.

**You must:**
• Provide at least two standby employees outside the IDLH area.

**Note:** You need only one standby employee if the IDLH condition is well characterized, will remain stable and you can show one employee can adequately do ALL of the following:
• Monitor employees in the IDLH area
• Implement communication
• Initiate rescue duties.
• Train and equip standby employees to provide effective emergency rescue. Equip them with:
  – A pressure-demand SCBA or a pressure-demand airline respirator with an auxiliary SCBA, for each standby employee
  – Appropriate retrieval equipment, when it would help with the effective rescue of the entrant, or an equivalent means of rescue
  • Make sure standby employees maintain visual, voice, or signal line communication with employees in the IDLH area
  • Make sure that in the event of an emergency:
    – Standby employees notify you or your designee before they enter the IDLH area to provide emergency rescue
    – You provide necessary assistance when notified.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-61405, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-616 Air quality for self-contained breathing apparatus (SCBA) and air-line respirators.**

**Your responsibility:**
To provide employees who use SCBAs or air-line respirators with an acceptable air supply.

**You must:**
Make sure breathing air and oxygen meet established specifications

WAC 296-307-61605

Prevent conditions that could create a hazardous breathing air supply
WAC 296-307-61610

Make sure compressors do not create a hazardous breathing air supply
WAC 296-307-61615.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-616, filed 12/21/04, effective 4/2/05.]

[Title 296 WAC—p. 2646] (2005 Ed.)
WAC 296-307-61605 Make sure breathing air and oxygen meet established specifications.

You must:

- Make sure that all SCBAs and air-line respirators are provided with safe breathing air and oxygen according to the following:
  - Compressed breathing air must meet the following specifications for Grade D air:
    - Oxygen (volume/volume) within 19.5-23.5%
    - Hydrocarbon (condensed): NO MORE than five milligrams per cubic meter of air
    - Carbon monoxide (CO): NO MORE than ten parts per million (ppm)
    - Carbon dioxide (CO2): NO MORE than 1,000 ppm
    - No noticeable odor

Reference: See the American National Standards Institute - Compressed Gas Association Commodity Specification for Air (G-7.1, 1989) for more information. Contact your local library to access a copy.

You must:

- Make sure the moisture content of the air supplied meets the following:
  - Air supplied to respirators from cylinders must NOT exceed a dew point of -50°F (-45.6°C) at 1 atmospheric pressure.
  - Compressor supplied air must NOT exceed a dew point of 10°F (5.56°C) BELOW the use temperature at 1 atmospheric pressure.
  - Cylinders obtained from a supplier of breathing air must have a certificate of analysis that verifies each cylinder's contents meet Grade D and dew point standards.
  - Compressed and liquid oxygen must meet the United States Pharmacopoeia requirements for medical or breathing oxygen.

You must:

- Use SCBA and air-line respirators safely:
  - Do NOT supply compressed oxygen to SCBAs or airline respirators that previously used compressed air.

Note: Compressed air leaves residues containing hydrocarbons such as oil or grease. Fire or explosion can occur if compressed oxygen makes contact with these residues.

You must:

- Use breathing air couplings on air-line respirators that are NOT compatible with couplings for nonrespirable air or other gas systems, for example, utility air used for manufacturing purposes.
  - Do NOT allow asphyxiating substances to enter breathing air lines; for example, do not flush nitrogen through worksite air lines also used for breathing air.
  - Use equipment specifically designed for oxygen service or distribution if oxygen concentrations greater than 23.5% are used.

Note: Respiratory equipment NOT designed for oxygen service or distribution can create fire or explosion hazards in oxygen concentrations higher than 23.5%.

You must:

- Make sure cylinders used to supply breathing air for SCBAs or air-line respirators are tested and maintained as described in the federal Department of Transportation's (DOT) Shipping Container Specification Regulations, Title 49 CFR Parts 173 and 178.

Note: Use only cylinders marked (with serial number, cylinder pressure, DOT exemption number, and test dates) according to these DOT regulations

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-61605, filed 12/21/04, effective 4/2/05.]

WAC 296-307-61610 Prevent conditions that could create a hazardous breathing air supply.

You must:

- Use SCBA and air-line respirators safely:
  - Do NOT supply compressed oxygen to SCBAs or airline respirators that previously used compressed air.

Note: Compressed air leaves residues containing hydrocarbons such as oil or grease. Fire or explosion can occur if compressed oxygen makes contact with these residues.

You must:

- Use breathing air couplings on air-line respirators that are NOT compatible with couplings for nonrespirable air or other gas systems, for example, utility air used for manufacturing purposes.
  - Do NOT allow asphyxiating substances to enter breathing air lines; for example, do not flush nitrogen through worksite air lines also used for breathing air.
  - Use equipment specifically designed for oxygen service or distribution if oxygen concentrations greater than 23.5% are used.

Note: Respiratory equipment NOT designed for oxygen service or distribution can create fire or explosion hazards in oxygen concentrations higher than 23.5%.

You must:

- Make sure cylinders used to supply breathing air for SCBAs or air-line respirators are tested and maintained as described in the federal Department of Transportation's (DOT) Shipping Container Specification Regulations, Title 49 CFR Parts 173 and 178.

Note: Use only cylinders marked (with serial number, cylinder pressure, DOT exemption number, and test dates) according to these DOT regulations

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-61610, filed 12/21/04, effective 4/2/05.]

WAC 296-307-61615 Make sure compressors do not create a hazardous breathing air supply.

IMPORTANT:

- Ambient-air movers (or pumps) used to supply air to respirators must be used according to the manufacturer's instructions.

You must:

1. Locate or modify compressor intakes so they will not pick up contaminated air OR exhaust gases such as carbon monoxide from:
   - Fuel-powered vehicles
   - The internal combustion motor of the compressor
   - Other contaminant sources in the area, for example, a ventilation system discharge.

Note: You may need to reposition or extend the compressor's intake or engine exhaust pipe or outlet, especially if they are located near each other.

- Be aware that exhaust gases may not adequately disperse when the compressor is operated in:
  - An enclosed space such as a small room, a corner, or near a wall
  - In turbulent wind conditions.

You must:

2. Equip compressors with suitable air-purifying filters, water traps, and sorbents (such as charcoal beds) and maintain them as follows:
   - Periodically change or clean them according to the manufacturer or supplier's instructions
   - Keep a tag at the compressor with the following information:
     - When the sorbent and filters were last replaced or cleaned
     - The date of the most recent changes or cleaning
     - The signature of the person authorized by the employer to perform changes or cleaning.

Note: To be sure you are providing the recommended operating pressure for respirators, you may need to install a delivery pressure gauge at the point where the manifold respirator hose is attached.

You must:

3. Make sure the carbon monoxide (CO) level in breathing air from compressors does NOT exceed ten parts per million (ppm).
WAC 296-307-618 Labeling of air-purifying respirator filters, cartridges, and canisters.

Your responsibility:
To make sure employees, their supervisors, and program administrators can easily check for the correct air-purifying filters, cartridges, and canisters on respirators.

Exemption: This section does NOT apply to filtering-facepiece respirators when used voluntarily. See WAC 296-307-598 for voluntary use requirements.

WAC 296-307-61805 Keep labels readable on respirator filters, cartridges, and canisters during use.

You must:
- Make sure the NIOSH certification labeling and color-coding on air-purifying respirator filters, cartridges, and canisters remains readable and intact during use.

WAC 296-307-620 Required procedures for respiratory protection program.

Your responsibility:
To use the procedures and questionnaire provided in this section when implementing your respiratory protection program.

You must:
- Use this medical questionnaire for medical evaluations
- WAC 296-307-62005
- Follow these fit-testing procedures for tight-fitting respirators

WAC 296-307-62005 Use this medical questionnaire for medical evaluations.

You must:
- Use the medical questionnaire in Table 10 when conducting medical evaluations.

WISHA Medical Evaluation Questionnaire

Employer instructions:
- You may use on-line questionnaires if the requirements in WAC 296-307-60405 are met.
- You must tell your employee how to deliver or send the completed questionnaire to the healthcare provider you have selected.
- You must NOT review employees’ questionnaires.

Healthcare provider’s instructions:
- Review the information in this questionnaire and any additional information provided to you by the employer.
- You may add questions to this questionnaire at your discretion; HOWEVER, questions in Parts 1-3 may not be deleted or substantially altered.
- Follow-up evaluation is required for any positive response to questions 1-8 in Part 2, or questions 1-6 in Part 3. This might include: Phone consultations to evaluate positive responses, medical tests, and diagnostic procedures.
- When your evaluation is complete, send a copy of your written recommendation to the employer AND employee.

Employee information and instructions:
- Your employer must allow you to answer this questionnaire during normal working hours, or at a time and place that’s convenient to you.
- Your employer or supervisor must not look at or review your answers at any time.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-618, filed 12/21/04, effective 4/2/05.]

### Part 1 - Employee Background Information
All employees must complete this part
Please print

1. Today's date: 
2. Your name: 
3. Your age (to nearest year): 
4. Sex (circle one): Male / Female
5. Your height: ___ ft. ___ in.
7. Your job title: 
8. A phone number where you can be reached by the healthcare professional who reviews this questionnaire (include Area Code): 
9. The best time to call you at this number: 
10. Has your employer told you how to contact the healthcare professional who will review this questionnaire? Yes / No
11. Check the type of respirator(s) you will be using:
   a. ___ N, R, or P filtering-facepiece respirator (for example, a dust mask, or an N95 filtering-facepiece respirator).
   b. Check all that apply:
      ❏ Half mask ❏ Full facepiece mask ❏ Helmet hood ❏ Escape
      ❏ Nonpowered cartridge or canister ❏ Powered air-purifying cartridge respirator (PAPR)
      ❏ Supplied-air or Air-line
   Self-contained breathing apparatus (SCBA): ❏ Demand or ❏ Pressure demand
   Other: 
12. Have you previously worn a respirator? Yes / No
   If "yes," describe what type(s): 

### Part 2 - General Health Information
All employees must complete this part
Please circle "Yes" or "No"

1. Do you currently smoke tobacco, or have you smoked tobacco in the last month? Yes / No
2. Have you ever had any of the following conditions?
   a. Seizures (fits): Yes / No
   b. Diabetes (sugar disease): Yes / No
   c. Allergic reactions that interfere with your breathing: Yes / No
   d. Claustrophobia (fear of closed-in places): Yes / No
   e. Trouble smelling odors: Yes / No
3. Have you ever had any of the following pulmonary or lung problems?
   a. Asbestosis: Yes / No
   b. Asthma: Yes / No
   c. Chronic bronchitis: Yes / No
   d. Emphysema: Yes / No
   e. Pneumonia: Yes / No
   f. Tuberculosis: Yes / No
   g. Silicosis: Yes / No
   h. Pneumothorax (collapsed lung): Yes / No
   i. Lung cancer: Yes / No
   j. Broken ribs: Yes / No
   k. Any chest injuries or surgeries: Yes / No
   l. Any other lung problem that you have been told about: Yes / No
4. Do you currently have any of the following symptoms of pulmonary or lung illness?
   a. Shortness of breath: Yes / No
   b. Shortness of breath when walking fast on level ground or walking up a slight hill or incline: Yes / No
   c. Shortness of breath when walking with other people at an ordinary pace on level ground: Yes / No
   d. Have to stop for breath when walking at your own pace on level ground: Yes / No
   e. Shortness of breath when washing or dressing yourself: Yes / No
   f. Shortness of breath that interferes with your job: Yes / No
   g. Coughing that produces phlegm (thick sputum): Yes / No
   h. Coughing that wakes you early in the morning: Yes / No
   i. Coughing that occurs mostly when you are lying down: Yes / No
   j. Coughing up blood in the last month: Yes / No
   k. Wheezing: Yes / No
   l. Wheezing that interferes with your job: Yes / No
m. Chest pain when you breathe deeply:  
   Yes / No
n. Any other symptoms that you think may be related to lung problems:  
   Yes / No
5. Have you ever had any of the following cardiovascular or heart problems?  
   Yes / No
   a. Heart attack:  
      Yes / No
   b. Stroke:  
      Yes / No
   c. Angina:  
      Yes / No
d. Heart failure:  
   Yes / No
e. Swelling in your legs or feet (not caused by walking):  
   Yes / No
f. Heart arrhythmia (heart beating irregularly):  
   Yes / No
g. High blood pressure:  
   Yes / No
h. Any other heart problem that you have been told about:  
   Yes / No
6. Have you ever had any of the following cardiovascular or heart symptoms?  
   Yes / No
   a. Frequent pain or tightness in your chest:  
      Yes / No
   b. Pain or tightness in your chest during physical activity:  
      Yes / No
c. Pain or tightness in your chest that interferes with your job:  
   Yes / No
d. In the past 2 years, have you noticed your heart skipping or missing a beat:  
   Yes / No
e. Heartburn or indigestion that's not related to eating:  
   Yes / No
f. Any other symptoms that you think may be related to heart or circulation problems:  
   Yes / No
7. Do you currently take medication for any of the following problems?  
   Yes / No
   a. Breathing or lung problems:  
      Yes / No
   b. Heart trouble:  
      Yes / No
c. Blood pressure:  
   Yes / No
d. Seizures (fits):  
   Yes / No
8. If you have used a respirator, have you ever had any of the following problems? (If you have never used a respirator, check the following space and go to question 9):  
   Yes / No
   a. Eye irritation:  
      Yes / No
   b. Skin allergies or rashes:  
      Yes / No
c. Anxiety:  
   Yes / No
d. General weakness or fatigue:  
   Yes / No
e. Any other problem that interferes with your use of a respirator?  
   Yes / No
9. Would you like to talk to the healthcare professional who will review this questionnaire about your answers?  
   Yes / No

Part 3 - Additional Questions for Users of Full-Facepiece Respirators or SCBAs

Please circle "Yes" or "No"

1. Have you ever lost vision in either eye (temporarily or permanently)?  
   Yes / No
2. Do you currently have any of these vision problems?  
   Yes / No
   a. Need to wear contact lenses:  
      Yes / No
   b. Need to wear glasses:  
      Yes / No
c. Color blindness:  
   Yes / No
d. Any other eye or vision problem:  
   Yes / No
3. Have you ever had an injury to your ears, including a broken ear drum?  
   Yes / No
4. Do you currently have any of these hearing problems?  
   Yes / No
   a. Difficulty hearing:  
      Yes / No
   b. Need to wear a hearing aid:  
      Yes / No
c. Any other hearing or ear problem:  
   Yes / No
5. Have you ever had a back injury?  
   Yes / No
6. Do you currently have any of the following musculoskeletal problems?  
   Yes / No
   a. Weakness in any of your arms, hands, legs, or feet:  
      Yes / No
   b. Back pain:  
   Yes / No
c. Difficulty fully moving your arms and legs:  
   Yes / No
d. Pain or stiffness when you lean forward or backward at the waist:  
   Yes / No
e. Difficulty fully moving your head up or down:  
   Yes / No
f. Difficulty fully moving your head side to side:  
   Yes / No
g. Difficulty bending at your knees:  
   Yes / No
h. Difficulty squatting to the ground:  
   Yes / No
i. Climbing a flight of stairs or a ladder carrying more than 25 lbs:  
   Yes / No
j. Any other muscle or skeletal problem that interferes with using a respirator:  
   Yes / No

Part 4 - Discretionary Questions

Complete questions in this part only if your employer's healthcare provider says they are necessary

1. In your present job, are you working at high altitudes (over 5,000 feet) or in a place that has lower than normal amounts of oxygen?  
   Yes / No
If "yes," do you have feelings of dizziness, shortness of breath, pounding in your chest, or other symptoms when you are working under these conditions: Yes / No

2. Have you ever been exposed (at work or home) to hazardous solvents, hazardous airborne chemicals (such as gases, fumes, or dust), or have you come into skin contact with hazardous chemicals? Yes / No
If "yes," name the chemicals, if you know them: ________________________________

3. Have you ever worked with any of the materials, or under any of the conditions, listed below:
   a. Asbestos? Yes / No
   b. Silica (for example, in sandblasting)? Yes / No
   c. Tungsten/cobalt (for example, grinding or welding this material)? Yes / No
d. Beryllium? Yes / No
e. Aluminum? Yes / No
f. Coal (for example, mining)? Yes / No
g. Iron? Yes / No
h. Tin? Yes / No
i. Dusty environments? Yes / No
j. Any other hazardous exposures? Yes / No
If "yes," describe these exposures: ________________________________

4. List any second jobs or side businesses you have:

5. List your previous occupations:

6. List your current and previous hobbies:

7. Have you been in the military services? Yes / No
If "yes," were you exposed to biological or chemical agents (either in training or combat)? Yes / No

8. Have you ever worked on a HAZMAT team? Yes / No

9. Other than medications for breathing and lung problems, heart trouble, blood pressure, and seizures mentioned earlier in this questionnaire, are you taking any other medications for any reason (including over-the-counter medications)? Yes / No
If "yes," name the medications if you know them: ________________________________

10. Will you be using any of the following items with your respirator(s)?
    a. HEPA filters: Yes / No
    b. Canisters (for example, gas masks): Yes / No
c. Cartridges: Yes / No

11. How often are you expected to use the respirator(s)?
    a. Escape-only (no rescue): Yes / No
d. Less than 2 hours per day: Yes / No
e. 2 to 4 hours per day: Yes / No
f. Over 4 hours per day:

12. During the period you are using the respirator(s), is your work effort:
   a. Light (less than 200 kcal per hour): Yes / No
If "yes," how long does this period last during the average shift: ___ hrs. ___ mins.
Examples of a light work effort are sitting while writing, typing, drafting, or performing light assembly work; or standing while operating a drill press (1-3 lbs.) or controlling machines.

b. Moderate (200 to 350 kcal per hour): Yes / No
If "yes," how long does this period last during the average shift: ___ hrs. ___ mins.
Examples of moderate work effort are sitting while nailing or filing; driving a truck or bus in urban traffic; standing while drilling, nailing, performing assembly work, or transferring a moderate load (about 35 lbs.) at trunk level; walking on a level surface about 2 mph or down a 5-degree grade about 3 mph; or pushing a wheelbarrow with a heavy load (about 100 lbs.) on a level surface.
c. Heavy (above 350 kcal per hour): Yes / No
If "yes," how long does this period last during the average shift: ___ hrs. ___ mins.
Examples of heavy work are lifting a heavy load (about 50 lbs.) from the floor to your waist or shoulder; working on a loading dock; shoveling; standing while bricklaying or chipping castings; walking up an 8-degree grade about 2 mph; climbing stairs with a heavy load (about 50 lbs.).

13. Will you be wearing protective clothing and/or equipment (other than the respirator) when you are using your respirator? Yes / No
If "yes," describe this protective clothing and/or equipment: ________________________________

14. Will you be working under hot conditions (temperature exceeding 77°F)? Yes / No
WAC 296-307-62010 Follow these fit-testing procedures for tight-fitting respirators.

**IMPORTANT:**
- This section contains procedural requirements that apply during actual fit testing.
- See WAC 296-307-606 of this part for fit-testing requirements that apply to your overall program.

**Exemptions:** This section does NOT apply to employees who:
- **Voluntarily use respirators**
- **Are required to use mouthpiece respirators.**

**You must:**
- Conduct fit testing according to all of the following:
  - Follow the procedure in Table 11 to choose a respirator for fit testing:
    - Prior to conducting fit tests
    - Any time your employee must select a different respirator such as when a previously selected respirator fails a test
    - Select and follow at least one of the following fit test procedures:
      - **Qualitative fit-test procedures:**
        - Isoamyl acetate vapor (IAA, banana oil) in Table 12
        - Saccharine aerosol in Table 13
        - Bitrex™ aerosol in Table 14
        - Irritant smoke in Table 15
      - **Quantitative fit-test procedures:**
        - Ambient aerosol condensation nuclei counter such as the Portacount™, in Table 16
        - Controlled negative pressure (CNP) such as the Fit-Tester 3000™, in Table 17
        - Generated aerosol in Table 18
        - Make sure employees perform the appropriate fit-test exercises listed in Table 19.
        - Clean and maintain equipment according to the manufacturer's instructions.
        - Make sure during fit testing employees wear any safety equipment that could:
          - Interfere with respirator fit

  - **Be worn in the workplace. For example, chemical splash goggles.**
    - Check, prior to fit testing, for conditions that may interfere with the respirator seal or valve functions. If you find such conditions, do NOT conduct fit testing for that individual.
    - **Examples of conditions that may interfere with the respirator seal or valve functions include:**
      - Mustache, stubble, sideburns, bangs, hairline, and other types of facial hair in areas where the respirator facepiece seals or that interfere with valve function
      - Temple bars of corrective eyewear or headgear that extend through the face seal area.

<table>
<thead>
<tr>
<th>Procedure for Choosing a Respirator for Fit Testing</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>1. Inform</strong> the employee:</td>
</tr>
<tr>
<td>- To choose the most comfortable respirator that provides an adequate fit</td>
</tr>
<tr>
<td>- That each respirator sample represents a different size and, if more than one model is supplied, a different shape</td>
</tr>
<tr>
<td>- That if fitted and used properly, the respirator chosen will provide adequate protection</td>
</tr>
<tr>
<td><strong>2. Provide</strong> a mirror and show the employee how to:</td>
</tr>
<tr>
<td>- Put on the respirator</td>
</tr>
<tr>
<td>- Position the respirator on the face</td>
</tr>
<tr>
<td>- Set strap tension.</td>
</tr>
</tbody>
</table>

**Note:**
This instruction does NOT take the place of the employee’s formal training since it is only a review.

**3. Review** with the employee how to check for a comfortable fit around the nose, cheeks and other areas on the face.
- Tell the employee the respirator should be comfortable while talking or wearing eye protection.

**4. Have the employee** hold each facepiece against the face, taking enough time to compare the fit of each. The employee can then either:
- Reject any facepiece that clearly does not feel comfortable or fit adequately

---

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-62005, filed 12/21/04, effective 4/2/05.]

[Title 296 WAC—p. 2652] (2005 Ed.)
**Procedure for Choosing a Respirator for Fit Testing**

- Choose which facepiece is most acceptable and which is less acceptable, if any.

**Note:**
- Supply as many respirator models and sizes as needed to make sure the employee finds a respirator that's acceptable and fits correctly.
- To save time later, during this step note the more acceptable facepieces in case the one chosen fails the fit test or proves unacceptable later.

5. **Have the employee wear** the most acceptable respirator for **AT LEAST** 5 minutes to evaluate comfort and fit. Do **ALL** of the following during this time:
   - Ask the employee to observe and comment about the comfort and fit:
     - Around the nose, cheeks, and other areas on the face
     - When talking or wearing eye protection
   - Have the employee put on the respirator and adjust the straps until they show proficiency
   - Evaluate the respirator's general fit by checking:
     - Proper chin placement
     - Properly tightened straps (do **NOT** over tighten)
     - Acceptable fit across the nose bridge
     - Respirator size; it must span the distance from nose to chin
     - To see if the respirator stays in position
   - Have the employee complete a successful seal check as specified in WAC 296-307-62020 of this chapter.
   - Prior to the seal check they must settle the respirator on their face by taking a few slow deep breaths **WHILE SLOWLY:**
     - Moving their head from side-to-side
     - Up and down.

6. **If the employee finds the respirator unacceptable,** allow the employee to select another one and return to Step 5. Otherwise, proceed to Step 7.

7. **Before starting the fit test,** you must:
   - Describe the fit test including screening procedures, employee responsibilities, and test exercises **AND**
   - Make sure the employee wears the respirator **AT LEAST** five minutes.

---

**Table 12**

<table>
<thead>
<tr>
<th>Isoamyl Acetate (Banana Oil) Vapor Test Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Important:</strong></td>
</tr>
<tr>
<td>• This is a qualitative fit-test (QLFT) procedure</td>
</tr>
<tr>
<td>• The success of this test depends on preserving the employee's odor sensitivity to isoamyl acetate (IAA) vapor</td>
</tr>
<tr>
<td>• Vapor accumulations in ambient air can decrease odor sensitivity. To prevent this:</td>
</tr>
<tr>
<td>■ Prepare <strong>ALL</strong> solutions in a location separate from screening and test areas</td>
</tr>
<tr>
<td>■ Conduct screening and tests in separate well-ventilated rooms. For example, use an exhaust fan or laboratory hood to prevent IAA vapor from accumulating in the room air</td>
</tr>
</tbody>
</table>

---

**Isoamyl Acetate (Banana Oil) Vapor Test Procedure**

- Always use odor-free water, for example, distilled or spring water that's 25°C (77°F).
- Isoamyl acetate is also known as isopentyl acetate.

**Screening Preparations**

**Important:**
- Odor threshold screening determines if the employee can detect weak concentrations of IAA vapor.

1. Choose an appropriate location to conduct screening.
   - Conduct screening and tests in separate well-ventilated rooms.

2. Prepare a stock solution **AT LEAST** weekly as follows:
   - Add one milliliter (ml) of pure IAA to 800 ml of odor-free water in a one-liter glass jar with a metal lid using a measuring dropper or pipette
   - Seal the jar with the lid and shake it for 30 seconds
   - Clean the dropper or pipette.

3. Prepare the odor test solution daily as follows:
   - Add 0.4 ml from the stock solution to 500 ml of water in a one-liter glass jar with a metal lid using a clean pipette or dropper
   - Seal the jar with the lid and shake it for 30 seconds
   - Let this solution stand for 2-3 minutes so the IAA concentration above the liquid reaches equilibrium
   - Label this jar so you know the contents but the employee cannot know its contents, for example, "1."

**Note:**
- To maintain the integrity of the test, use labels that peel off easily AND periodically switch the labels.

4. Prepare a "test blank" solution as follows:
   - Add 500 ml of odor-free water to a one liter glass jar with a metal lid
   - Seal the jar
   - Label the jar so you know the contents but the employee cannot know its contents.

5. Type or neatly print the following instructions on a card and place it on the table in front of the two test jars:

   "The purpose of this test is to find out if you can smell banana oil at a low concentration. While both jars contain water, one **ALSO** contains a small amount of banana oil. Make sure the lid is secure then pick up a jar and shake it for two seconds. Open the jar and sniff at the opening. Repeat this for the second jar. Tell the individual conducting the fit test which jar contains banana oil."

6. Choose an appropriate location to conduct fit testing.
   - Conduct screening and tests in separate well-ventilated rooms.

7. Assemble the fit test enclosure in the room.
   - Invert a clear 55-gallon drum liner over a circular 2-foot diameter frame made of plywood or other lightweight rigid material or construct a similar enclosure using plastic sheeting
   - Hang the frame with the plastic covering so the top of the enclosure is about six inches above the employee's head
   - Attach a small hook inside top center of the enclosure
Isoamyl Acetate (Banana Oil) Vapor Test Procedure

• Tape a copy of the test exercises (see Table 28) to the inside of the test enclosure where the employee can read it.
8. Have organic vapor cartridges or equivalent on hand for each employee's chosen respirator.
9. Have ready a 6 x 5-inch piece of paper towel or other porous absorbent single-ply material AND 0.75 ml of pure IAA. Do NOT apply IAA yet.

Note:
As an alternative to using the paper towel, you may use an IAA test swab OR ampoule if it has been demonstrated to generate an equivalent test concentration.

Screening

10. Have the employee, while NOT wearing a respirator, follow the instructions on the card provided.
• If the employee correctly identifies the jar containing IAA, proceed to conduct testing (Step 11)
• If the employee is NOT able to correctly identify the jar containing IAA, you must STOP and use a different fit test protocol.
11. BEFORE entering the fit test room, have the employee attach cartridges, put on, properly adjust, and seal check the respirator. Have the employee enter the test enclosure.
12. Wet the paper towel with 0.75 ml of pure IAA AND fold it in half.
13. Pass the paper towel to the employee inside the enclosure AND instruct the employee to hang it on the hook at the top of the enclosure.
14. Wait two minutes for the IAA vapor to fill the enclosure.

• While waiting, explain the fit test, including the purpose of the test exercises, the importance of cooperation, and that you must be informed if a banana-like odor is detected during the test

• You may also demonstrate the test exercises.
15. Have the employee perform the appropriate fit-test exercises in Table 19.
• If the employee does NOT detect IAA while performing test exercises, the fit test has been PASSED. Proceed as follows:
  • BEFORE leaving the enclosure, have the employee break the respirator seal and inhale. If they detect IAA, the test is valid
  • When exiting the employee must remove the paper towel and give it to the individual conducting the fit test. This prevents IAA vapor from building up in the enclosure during subsequent tests
  • The individual conducting the fit test must keep used paper towels in a self-sealing plastic bag to prevent area contamination
  • If the employee detects IAA during any test exercise, the fit test has FAILED. STOP and have the employee do the following:
  • Quickly return to the selection room to remove the respirator. This avoids decreasing the employee's odor sensitivity
  • Select another respirator
  • Repeat screening and testing

 Isoamyl Acetate (Banana Oil) Vapor Test Procedure

■ At this stage, if the employee fails the screening part of this procedure, the employee can repeat it AFTER waiting at least five minutes for odor sensitivity to return.

Table 13

Saccharin Aerosol Test Procedure

Screening Preparations

Important:
• This is a qualitative fit-test (QLFT) procedure
• Taste threshold screening determines whether the employee being tested can detect the taste of saccharin
  – The employee must NOT eat, smoke, chew gum or drink anything but plain water for at least fifteen minutes BEFORE the fit test. Sweet foods or drink consumed before the test may make the employee unable to detect saccharin during screening
  – Nebulizers must be thoroughly rinsed in water and shaken dry:
    ■ Each morning and afternoon
    OR
    ■ At least every four hours.
• You may use commercially prepared solutions if they meet the requirements in this procedure.

1. Obtain a test enclosure (hood) that meets the following specifications:
• Twelve inches in diameter by fourteen inches tall
• A clear front portion
• Enough space inside to allow free movement of the head when a respirator is worn
• A 3/4 inch (or 1.9 centimeter) hole to accommodate the nebulizer nozzle. The hole must line up in front of the wearer's nose and mouth.

Note:
• An enclosure similar to the 3M hood assembly, parts #FT 14 and #FT 15 combined, meets these specifications
• This enclosure can also be used for testing.
2. Obtain and assemble two clean DeVilbiss Model 40 Inhalation Medication Nebulizers OR equivalent.
3. Prepare the screening solution as follows:
  • Dissolve 83.0 milligrams of sodium saccharin USP in 100 ml of warm distilled water
  OR
  • IF you have already prepared the fit-test solution, you can make the screening solution by adding 1 ml of this solution to 100 ml of distilled water.
4. Add about 1 ml of the screening solution to one of the nebulizers.
  • Mark this nebulizer to distinguish it from the one to be used for fit testing.

Test Preparations

5. Prepare the fit-test solution as follows:
  • Add 83.0 grams of sodium saccharin to 100 ml of warm water.
6. Add about 1 ml of the test solution to the second nebulizer.
  • Mark this nebulizer to distinguish it from the one used for screening
Saccharin Aerosol Test Procedure

7. Have particulate filters ready for the employee's chosen respirator or have filtering-facepiece respirators ready.

8. Have the employee, while NOT wearing a respirator, put on the test enclosure.

9. Instruct the employee to:
   - Breath through a slightly open mouth with tongue extended during screening AND testing
   - Immediately report when a sweet taste is detected.

10. Insert the nebulizer into the front hole of the test enclosure AND administer saccharin as follows:
    - Direct the nozzle away from the employee's nose and mouth
    - Complete 10 squeezes in rapid succession
    - Each time firmly squeeze the bulb so it collapses completely, then release and allow it to fully expand.

11. Ask the employee if a sweet taste is detected.
    - If YES, screening is completed. Proceed to conduct testing, Step 14, AFTER you:
      - Ask the employee to remember the taste for reference during the fit test
      - Note the employee's taste threshold as "10" regardless of the number of squeezes actually completed
    - If NO, screening must continue. Proceed to Step 12.

12. Repeat with 10 more squeezes. Then follow Step 11 again; EXCEPT this time note the employee's taste threshold as "20" IF a sweet taste is reported.
    - If a sweet taste is still NOT detected, repeat with 10 more squeezes and follow Step 11 one last time; EXCEPT this time note "30" for the taste threshold IF a sweet taste is reported.

13. If NO sweet taste is reported after 30 squeezes, you must STOP and choose a different fit-test protocol for the employee.

Important!
- Periodically check nebulizers to make sure they do not clog during use. A test is NOT valid if the nebulizer is clogged at the end of the test.

Screening

Test

Important!
- Taste threshold screening determines whether the employee being tested can detect the taste of Bitrex™
- Nebulizers must be thoroughly rinsed in water and shaken dry:
  - Each morning and afternoon
  - At least every four hours.
- You may use commercially prepared solutions if they meet the requirements in this procedure.

Test Preparations

Important!
- This is a qualitative fit-test (QLFT) procedure
- Bitrex™ (denatonium benzoate) is routinely used as a taste aversion agent in household liquids that children shouldn't drink and is endorsed by the American Medical Association, the National Safety Council, and the American Association of Poison Control Centers
- The employee must NOT eat, smoke, chew gum or drink anything but plain water for at least fifteen minutes BEFORE the fit test.

Table 14

</tbody>
</table>

Solutions

1. Obtain a test enclosure that meets the following specifications:
   - Twelve inches in diameter by fourteen inches tall
   - A clear front portion
   - Enough space inside the front to allow free movement of the head when a respirator is worn
   - 3/4 inch (or 1.9 centimeter) hole to accommodate the nebulizer nozzle. The hole must line up in front of the wearer's nose and mouth.

Note:
- An enclosure similar to the 3M hood assembly, parts #FT 14 and #FT 15 combined, meets these specifications
- This enclosure can also be used for testing.

2. Obtain and assemble two clean DeVilbiss Model 40 Inhalation Medication Nebulizers or equivalent:

3. Prepare the screening solution as follows:
   - Make up a 5% salt solution by dissolving 5.0 grams of salt (sodium chloride) into 100 ml of distilled water
   - Dissolve 13.5 milligrams of Bitrex™ in the salt solution.

4. Add about 1 ml of the screening solution to one of the nebulizers.

5. Prepare the fit test solution:
   - Dissolve 10.0 grams of salt (sodium chloride) into 200 ml of distilled water
   - Add 337.5 milligrams of Bitrex™ to the warmed salt solution.

6. Add about 1 ml of the test solution to the second nebulizer.
Bitrex™ Aerosol Test Procedure

• Mark this nebulizer to distinguish it from the one used for screening.
7. Have particulate filters ready for the employee's chosen respirator or have filtering-facepiece respirators ready.

Screening

Important:
The employee must NOT eat, smoke, chew gum or drink anything but plain water for at least fifteen minutes BEFORE the screening and test. Have the employee, while NOT wearing a respirator, put on the test enclosure.
9. Instruct the employee to:
• Breath through a slightly opened mouth with tongue extended during screening AND testing
• Immediately report when a bitter taste is detected.
10. Insert the nebulizer into the front hole of the test enclosure AND administer Bitrex™ as follows:
• Direct the nozzle away from the employee's nose and mouth
• Complete 10 squeezes in rapid succession
• Each time firmly squeeze the bulb so it collapses completely, then release and allow it to fully expand.
11. Ask the employee whether a bitter taste is detected.
• IF YES, screening is completed. Proceed to conduct fitting, Step 14, AFTER you:
  – Ask the employee to remember the taste for reference during the fit test
  – Note the employee's taste threshold as "10," regardless of the number of squeezes actually completed
• IF NO, screening must continue. Proceed to Step 12.
12. Repeat with 10 more squeezes. Then follow Step 11 again; EXCEPT this time note the employee's taste threshold as "20" IF a bitter taste is reported.
  • If a bitter taste is still NOT detected repeat with 10 more squeezes and follow Step 11 one last time; EXCEPT this time note "30" for the taste threshold IF a bitter taste is reported.
13. IF NO bitter taste is reported after 30 squeezes, you must STOP and choose a different fit-test protocol for the employee.

Test

14. Have the employee attach particulate filters, put on, properly adjust, and seal check the respirator. Have the employee put on the test enclosure.
15. Instruct the employee to:
• Breathe through a slightly opened mouth with tongue extended during screening AND testing
• Immediately report when a bitter taste is detected.
16. Insert the nebulizer into the front hole of the test enclosure AND administer the same number of squeezes, either 10, 20, or 30, as noted during screening.
17. Have the employee perform the appropriate fit-test exercises as described in Table 19. During this step:
• Replenish the aerosol in the hood EVERY 30 seconds using 1/2 the number of squeezes used in Step 16, either 5, 10, or 15
• The employee must report if a bitter taste is detected:
  – IF NO Bitrex™ is tasted, the test has been PASSED

Bitrex™ Aerosol Test Procedure

– IF Bitrex™ is tasted the test has FAILED. Have the employee:
  ■ Select another respirator
  AND
  ■ Repeat all screening and testing steps.

Table 15

Irritant Smoke (Stannic Chloride) Test Procedure

Important:

• DO NOT USE A TEST ENCLOSURE OR HOOD FOR THIS FIT TEST!
• This is a qualitative fit-test (QLFT) procedure
• During this test an employee is exposed to irritating smoke containing hydrochloric acid produced by a stannic chloride ventilation smoke tube to detect leakage. The smoke will irritate eyes, lungs, and nasal passages
• Employee sensitivity varies, and certain employees may respond more intensely than others exposed to irritant smoke. The individual conducting the fit test must take precautions to minimize the employees' exposure to irritant smoke
• Conduct fit testing in an area with adequate ventilation to prevent exposure of the individual conducting the fit test and build-up of irritant smoke in the ambient air.

Screening AND Test Preparations

Important:

Sensitivity screening is necessary to determine whether the employee can detect a weak concentration of irritant smoke AND whether any gross facepiece leakage is detected.

1. Obtain only stannic chloride (ventilation) smoke tubes, AND an aspirator squeeze bulb OR use a low-flow air pump set to deliver 200 milliliters of air flow per minute.
2. Equip the employee's chosen respirator with P100 series filters if a negative pressure air-purifying respirator will be tested. If a powered air-purifying respirator (PAPR) will be tested equip the respirator with high-efficiency particulate air (HEPA) filters.

Screening

Important!

When performing sensitivity screening checks use only the MINIMUM amount of smoke necessary to elicit a response from the employee.
3. Advise the employee that the smoke can be irritating to eyes, lungs, and nasal passages AND instruct the employee to keep eyes closed while exposed.
4. Break both ends of the ventilation smoke tube AND fit a short piece of plastic tubing, for example, two-to-six inches of tygon tubing, over one end to prevent exposure to the sharp end of the tube. Connect the other end to an aspirator bulb or a low-flow air pump set to deliver a flow of 200 ml per minute.
5. While the employee is NOT wearing a respirator, have the employee smell a weak concentration of irritant smoke to become familiar with its irritating properties.
   • Carefully direct a small amount of irritant smoke toward the employee.
Irritant Smoke (Stannic Chloride) Test Procedure

Test 6. Have the employee attach respirator filters, put on, adjust, and seal check the respirator without assistance. The employee must be proficient at these tasks.

7. Remind the employee to keep eyes closed during testing.

8. Direct a stream of irritant smoke toward the respirator's face seal area as follows:
   - Begin at least 12 inches from the facepiece AND move the smoke around the whole perimeter of the mask
   - Gradually make two more passes around the perimeter of the facepiece, moving to within 6 inches of the respirator
   - STOP at any time the employee detects smoke in the facepiece. If this occurs a different respirator will need to be chosen and tested, beginning with sensitivity screening.

9. Have the employee perform appropriate fit-test exercises in Table 19 IF the employee has NOT had an involuntary response such as evidence of coughing, flinching, or other response, OR detected smoke in the facepiece.
   - Continue to direct smoke from a distance of 6 inches around the facepiece perimeter
     - If smoke is detected at any time the test has FAILED. A different respirator must be chosen and tested, starting with sensitivity screening
     - If NO smoke is detected proceed to Step 10.

10. Have the employee remove the respirator AND perform another sensitivity screening check as follows:
    - Continue to use the smoke tube used for fit testing
    - Carefully direct a SMALL amount of irritant smoke toward the employee
      - The test has been PASSED IF the employee responds to the smoke
      - The fit test is VOIDED IF the employee does NOT respond to the smoke.

<table>
<thead>
<tr>
<th>Table 16</th>
</tr>
</thead>
</table>

Ambient Aerosol Condensation Nuclei Counter (Portacount™) Test Procedure

Important:
- This is a quantitative (QNFT) fit-test procedure
- This method uses a particle counting instrument that measures and compares the particle concentration both inside and outside the respirator facepiece while the employee performs a series of test exercises
- Particles in the ambient air are used as the test aerosol.

Test Preparations
1. Obtain a test instrument such as a Portacount™.
2. Have probed respirators available for each respirator model and size the employer uses, OR have a sampling adapter available if the employee's actual or chosen respirator will be tested.

Note:
- A probed respirator has a special fitting installed on the facepiece designed to connect with the end of the test instrument's plastic sampling tube so that air samples can be taken inside the facepiece. Probed respirators can be obtained from the respirator manufacturer, or distributor, AND can only be used for fit-testing purposes
- Contact TSI Inc., OR the respirator's manufacturer to obtain probed respirators or facepiece sampling adapters.

3. Follow the test instrument manufacturer's instructions for test preparation, including particle, zero, and system checks. Make sure the instrument's pass OR fail criterion is programmed to the following MINIMUM performance levels:
   - For half-facepiece respirators, an overall minimum fit factor of 100 as a passing level
   - For full-facepiece respirators, an overall minimum fit factor of 500 as a passing level

4. Have high-efficiency particulate air (HEPA) filters, OR other respirator filters available that are capable of preventing significant penetration by particles generated by the test instrument such as, P100 or N95 series filters.
   - If you'll use a sampling adapter instead of probed respirators be sure to have the correct type for the respirators chosen.

5. Properly attach the sampling line to the facepiece probe or sampling adapter.

6. Have the employee attach respirator filters, put on, properly adjust, and wear the respirator five minutes BEFORE the fit test. During this time you and the employee must evaluate the respirator's general fit by checking:
   - Proper chin placement
   - Properly tightened straps (do NOT over tighten)
   - Acceptable fit across the nose bridge
   - Respirator size. It must span the distance from nose to chin
   - To see if the respirator stays in position.

Note:
Wearing the respirator for five minutes permits the employee to make certain the respirator is comfortable AND allows for purging of ambient particles trapped inside the facepiece.

7. Have the employee perform a seal check. Make sure the sampling line is crimped to avoid leakage during the seal check. IF NO leakage is detected, proceed to Step 8. If leakage is detected:
   - Determine the cause
   - If leakage is due to a poorly fitting facepiece, have the employee:
     - Choose another respirator size or model AND
     - Start again at Step 6.

8. Start the fit test cycle.
   - Follow the manufacturer's instructions for operating the test instrument
   - Have the employee perform the appropriate fit-test exercises in Table 19
     - The test instrument will automatically stop and calculate the overall fit factor. Use this result to determine whether or not the test is passed.
**Controlled Negative Pressure (CNP) Test Procedure**

**Table 17**

**Important!**
- This is a quantitative fit-test (QNFT) procedure
- This method determines respirator fit by measuring how much the facepiece leaks when it is subject to a slight negative pressure **AFTER** various premeasure- ment activities
- Measurements occur while employees remain still **AND** hold their breath for 10 seconds
- No test aerosols are used. Respirator cartridges aren’t needed for this test.

**Test Preparations**
1. Make sure the individual conducting the fit test is thoroughly trained to perform this test.
2. Obtain a CNP test instrument such as a FitTester 3000™. Make sure:
   - Defaults are set at:
     - -15mm (-0.58 inches) of water test pressure **AND**
     - A modeled inspiratory flow rate of 53.8 liters per minute
   - It has an effective audio warning device that signals when employees fail to hold their breath.
**Note:**
- You are not required to obtain test recording and printing equipment such as computers or printers. Hand recording results is acceptable
- To see default settings, check the instrument’s "REDON protocol."
3. Obtain facepiece adapters appropriate for each test respirator.
**Note:**
- Adapters are either a one-piece (for SCBA facepieces), or two-piece (for dual cartridge facepieces) device providing a manifold and breathing valve system. For positive pressure respirators, you will need to obtain an additional fitting, available from the respirator manufacturer, to convert the facepiece to negative pressure
- To obtain adapters, contact the CNP instrument’s distributor, Occupational Health Dynamics, OR the respirator manufacturer.

---

**Important!**
After the test, you must ask the employee about the comfort of the respirator **AND** if the respirator has become unacceptable, another size or model must be chosen and tested.
4. Explain the test procedure to the employee.
5. Train the employee on how to hold a breath for at least 20 seconds.
6. Prepare the respirator for the fit test as follows:
   - Remove or prop open the inhalation valves. If a breathing tube is present, disconnect it
   - Replace cartridges, if present, with the manifold and breathing valve adapter
     - For positive pressure facepieces, mount the manufacturer's additional fitting followed by the manifold-breathing valve adapter
   - Connect the respirator to the CNP device according to the CNP instrument manufacturer's directions.
7. Have the employee put on, adjust, and seal check the respirator.
8. Turn on the instrument **AND** have the employee stand and perform the fit-test exercises in Table 19.
9. Interpret the test results:
   - The test is **PASSED** IF the overall fit factor obtained is at least 100 for a half facepiece, or at least 500 for a full facepiece
   - The test has **FAILED** IF the fit factor is less than 100 for a half facepiece; 500 for a full facepiece
     - If the test has **FAILED** you must have the employee select another respirator model or size following the steps in Table 11 **AND** repeat this procedure, starting at Step 6.
Table 18

Generated Aerosol Test Procedure

Important:
- This is a quantitative (QNFT) fit-test procedure
- In this method, a test aerosol is used to challenge the facepiece seal while aerosol concentrations inside and outside the facepiece are measured during test exercises
- Special equipment is needed to generate, disperse, detect, and measure test aerosols.

Test Preparations

1. Test aerosol.
   - Use a particulate, for example, corn oil, polyethylene glycol 400, di-2-ethyl hexyl sebacate, or sodium chloride.

2. Instrumentation.
   - Do ALL the following:
     - Obtain and use aerosol generation, dilution, and measurement systems appropriate for particulates
     - Use an aerosol-generating instrument that will maintain test concentrations within a 10% variation
     - Select a sampling instrument that allows for a computer record or strip chart record to be created
       - The record must show the rise and fall of test agent concentration during each inhalation and exhalation at fit factors of at least 2000.
       - Note: Integrators, or computers that integrate the amount of test agent penetration leakage into the respirator for each exercise, may be used if a record of the readings is made.
     - Minimize the time interval between the activity and the recording of the activity so you can clearly connect what you see to what is being recorded. For example, use a small diameter and length of sampling line.

3. Test enclosure.
   - Do ALL the following:
     - Make sure the enclosure is equipped and constructed to effectively:
       - Maintain a uniform concentration of the test agent inside the enclosure. For example, the enclosure must be large enough to allow ALL employees freedom of movement during testing WITHOUT disturbing the test concentration or measurement instrument
       - Keep the test agent from contaminating the air outside the enclosure. For example, use a HEPA filter to purify exhausted air
       - Allow the individual conducting the fit test to view the employee during the test
     - Make sure the tubing used to collect samples from the enclosure AND respirator is the same material, diameter, AND length. This makes the effect of aerosol loss caused by deposition in each sample line equal
     - If sodium chloride is used, relative humidity inside the enclosure must be kept below 50%.

4. Prepare test respirators.
   - Do ALL the following:
     - Inspect test respirators regularly for missing parts AND damage
     - Keep test respirators in proper working order
     - Make sure in-mask sampling probes are:
       - Designed and installed so the air sample will be drawn from the employee's breathing zone; midway between the nose and mouth
       - The probe extends inside the facepiece at least 1/4 inch
     - Make sure sampling ports such as probes, or adapters on respirators are constructed and installed so they do NOT:
       - Block air flow into the sampling line
       - Leak
       - Interfere with the respirator's fit or performance
     - Have high efficiency particulate air (HEPA) filters OR P100 series filter available
       - Replace filters when increased breathing resistance is detected OR when the test agent has altered the filter material's integrity.

Test

Important!
- Throughout the test, maintain the employee's exposure to any test agent below the established exposure limit. Exposures allowed must be based on exposure time and exposure limit duration
- If a single peak penetration exceeds 5% for half facepieces OR 1% for full facepieces:
  - STOP the test
  - Have the employee select another respirator for testing.

5. Have the employee attach filters, put on, adjust, and seal check the respirator.
   - Be sure to crimp the sampling line to avoid pressure leaks during the seal check
   - Have the employee adjust the respirator straps, without assistance, so the fit is comfortable. Do NOT over tighten.
6. **OPTIONAL Step.** To save time conduct a screening test to quickly identify poorly fitting respirators.  
   **Note:**
   You may use a qualitative screening test **OR** an ambient aerosol condensation nuclei counter instrument in the count mode.

7. Make sure test aerosol concentration is reasonably stable.
   - If a canopy or shower curtain enclosure is used, determine stability of the test aerosol concentration **AFTER** the employee enters the enclosure.

8. Have the employee enter the test enclosure and connect the respirator to the sample lines.

9. Immediately after entering the enclosure measure test aerosol concentration inside the respirator.
   - Make sure the peak penetration does **NOT** exceed 5% for half facepieces, **OR** 1% for full facepieces.

10. Have employee perform the appropriate fit-test exercises in Table 19.
   - **Do NOT** adjust the respirator once exercises begin.

11. Calculate the overall fit factor as specified in Steps 12-13. The fit test is:
   - **PASSED** if the minimum fit factor of 100 for half facepieces **OR** 500 for full facepieces is obtained
   - **OR**
   - **IF** a passing fit factor is **NOT** obtained, the test has **FAILED** and you must have the employee select and test another respirator.

### Calculations

**Important!**
- **Do NOT** count the grimace exercise measurements during these calculations
- **Take into account the limitations of instrument detection when determining fit factors.

12. Calculate individual fit factors for **EACH** exercise by applying the following:

   Exercise fit factor \( (f_{FE}) \) = Average test enclosure concentration

   Test aerosol concentration inside the respirator
   - To determine the average test enclosure concentration use one of the following methods:
     - Arithmetic average of the concentration before and after each **test** (an average of two values per entire test)
     - Arithmetic average of concentration before and after each **exercise** (an average of two values per exercise)
     - True average measured continuously during the respirator sample
   - Determine the test aerosol concentration inside the respirator in one of the following ways:
     - Average peak penetration values. Determine aerosol penetration for each exercise by:
       - Using integrators or computers that calculate the actual test agent penetration
       **OR**
       - Average the peak heights shown on the strip chart recording, graph, or by computer integration
     - Maximum peak penetration. Use strip chart recordings to determine the highest peak penetration for each exercise and use this value
     - Area under the peaks. Use computerized integration or other appropriate calculations to integrate the area under individual peaks for each exercise.

13. Using individual exercise fit factors \( (f_{FE}) \) calculate the **overall fit factor** by doing **ALL** of the following:
   - Convert each exercise fit factor to a penetration value
   - Determine the average penetration value
   - Convert the average penetration value back to a fit factor
   **OR**
   - Use this equation to calculate the **overall fit factor**:
     \[
     \text{Overall fit factor} = \frac{1}{f_{FE1} + 1/f_{FE2} + 1/f_{FE3} + \ldots + 1/f_{FE_n}}
     \]

### Table 19

**Fit-Test Exercises**

**Important:**
- This list applies when you use any fit test
- Employees tested must perform **ALL** exercises marked with an "X" as described for the fit-test procedure used
  - Once exercises begin, any adjustments made void the test AND you must begin again
  - After test exercises are completed, you must ask the employee about the comfort of the respirator. If it has become unacceptable, have the employee choose another one for testing
- **When the controlled negative pressure procedure is used, STOP and repeat** the test if the employee adjusts the respirator **OR** takes a breath and fails to hold it for 10 seconds
### Fit-Test Exercises

Controlled negative pressure tests conducted according to the method published in 29 CFR 1910.134, Appendix A are an acceptable alternative to the method outlined below.

</table>

¹ Rainbow Passage is a prepared text that can be easily accessed for fit testing purposes.
The Rainbow Passage:

“When the sunlight strikes raindrops in the air, they act like a prism and form a rainbow. The rainbow is a division of white light into many beautiful colors. These take the shape of a long round arch, with its path high above, and its two ends apparently beyond the horizon. There is, according to legend, a boiling pot of gold at one end. People look, but no one ever finds it. When a man looks for something beyond reach, his friends say he is looking for the pot of gold at the end of the rainbow.”

WAC 296-307-62015 Follow procedures established for cleaning and disinfecting respirators.
You must:
• Follow the procedure in Table 20 for cleaning and disinfecting respirators.

Table 20
Respirator Cleaning Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
</tr>
</thead>
</table>
| 1. | Remove filters, cartridges, canisters, speaking diaphragms, demand and pressure valve assemblies, hoses, or any components recommended by the manufacturer.  
• Discard or repair any defective parts. |
| 2. | Wash components in warm (43°C (110°F) maximum) water with a mild detergent or with a cleaner recommended by the manufacturer  
• A stiff bristle (not wire) brush may be used to help remove the dirt  
• If the detergent or cleaner does not contain a disinfecting agent, respirator components should be immersed for two minutes in one of the following:  
  – A bleach solution (concentration of 50 parts per million of chlorine). Make this by adding approximately one milliliter of laundry bleach to one liter of water at 43°C (110°F)  
  – A solution of iodine (50 parts per million iodine). Make this in two steps:  
    ■ First, make a tincture of iodine by adding 6-8 grams of solid ammonium iodide and/or potassium iodide to 100 cc of 45% alcohol approximately  
    ■ Second, add 0.8 milliliters of the tincture to one liter of water at 43°C (110°F) to get the final solution  
  – Other commercially available cleansers of equivalent disinfectant quality when used as directed, if their use is recommended or approved by the respirator manufacturer. |
| 3. | Rinse components thoroughly in clean, warm (43°C (110°F) maximum), preferably, running water.  
**Note:** The importance of thorough rinsing cannot be overemphasized. Detergents or disinfectants that dry on facepieces could cause dermatitis. In addition, some disinfectants may cause deterioration of rubber or corrosion of metal parts, if not completely removed. |
| 4. | Drain components. |
| 5. | Air-dry components or hand dry components with a clean, lint-free cloth. |
| 6. | Reassemble the facepiece components.  
• Replace filters, cartridges, and canisters, if necessary (for testing). |
| 7. | Test the respirator to make sure all components work properly. |

WAC 296-307-62020 Follow procedures established for seal checking respirators.
**IMPORTANT:**
• User seal checks are **NOT** a substitute for fit tests. See WAC 296-307-62010 for fit test procedures.
• You may use a seal check procedure recommended by the respirator manufacturer **INSTEAD** of the procedure outlined in Table 21 if you can demonstrate the procedure is based on a scientific study that, for example, demonstrates the procedure effectively identifies respirators that fit poorly when put on or adjusted.

Note: Redon-2

– Repeat the premeasurement activity and measurement position described in Redon-1

X
The element or filtering facepiece is designed to remove specific contaminants, such as particles, vapors, or gases, from air that passes through it.

**Air-line respirator**
An atmosphere-supplying respirator for which breathing air is drawn from a source separate from and not worn by the user, such as:
- A cylinder or a tank
- A compressor
- An uncontaminated environment.

**Air supplied respirator (see air-line respirator)**

**Assigned protection factor (APF)**
Indicates the expected level of workplace respiratory protection WHEN the respirator is:
- Functioning properly
- Fitted to the user
- Worn by trained individuals
- Used with the limitations specified on the NIOSH approval label.

**Atmosphere-supplying respirator**
A respirator that supplies the user with breathing air from sources, such as:
- A cylinder or a tank
- A compressor
- An uncontaminated environment.

**Breathing air**
Air supplied to an atmosphere-supplying respirator. This air meets the specifications found in WAC 296-307-616.

**Canister or cartridge (air-purifying)**
Part of an air-purifying respirator that consists of a container holding materials such as fiber, treated charcoal, or a combination of the two, that removes contaminants from the air passing through the cartridge or canister.

**Cartridge respirator (see also air-purifying respirator)**
An air-purifying respirator equipped with one or more cartridges. These respirators have a facepiece made from silicone, rubber or other plastic-like materials.

**Demand respirator**
An atmosphere-supplying respirator that sends breathing air to the facepiece only when suction (negative pressure) is created inside the facepiece by inhalation. Demand respirators are "negative pressure" respirators.

**Dust mask**
A name used to refer to filtering-facepiece respirators. Dust masks may or may not be NIOSH certified. See filtering facepiece.

**Emergency respirator**
Respirators suitable for rescue, escape, or other activities during emergency situations.

**Emergency situation**
Any occurrence that could OR does result in a significant uncontrolled release of an airborne contaminant. Causes of emergency situations include, but are not limited to, equipment failure, rupture of containers, or failure of control equipment.
End-of-service-life indicator (ESLI)
A system that warns the air-purifying respirator user that cartridges or canisters must be changed. An example of an ESLI is a dot on the respirator cartridge that changes color.

Escape-only respirator
A respirator that can only be used to exit during emergencies. Look for this use limitation on the respirator's NIOSH approval label.

Exposed, or exposure
The contact an employee has with a toxic substance, harmful physical agent, or oxygen deficient condition. Exposure can occur through various routes of entry, such as inhalation, ingestion, skin contact, or skin absorption.

Filter
Fibrous material that removes dust, spray, mist, fume, fog, smoke particles, OR other aerosols from the air.

Filtering-facepiece respirator
A tight-fitting, half-facepiece, negative-pressure, particulate air-purifying respirator with the facepiece MAINLY composed of filter material. These respirators do not use cartridges or canisters and may have sealing surfaces composed of rubber, silicone or other plastic-like materials. They are sometimes referred to as "dust masks."

Fit factor
A number providing an estimate of fit for a particular respiratory inlet covering to a specific individual during quantitative fit testing.

Fit test (see also qualitative fit test and quantitative fit test)
Fit testing is an activity where the facepiece seal of a respirator is challenged, using a WISHA accepted procedure, to determine if the respirator provides an adequate seal.

Full-facepiece respirator
A tight-fitting respirator that covers the wearer's nose, mouth, and eyes.

Gas mask
An air-purifying respirator equipped with one or more canisters. These respirators have a facepiece made from silicone, rubber OR other plastic-like materials.

Half-facepiece respirator
A tight-fitting respirator that only covers the wearer's nose and mouth.

Helmet
The rigid part of a respirator that covers the wearer's head AND also provides head protection against impact or penetration.

High-efficiency particulate air filter (HEPA)
A powered air purifying respirator (PAPR) filter that removes at least 99.97% of monodisperse dioctyl phthalate (DOP) particles with a mean particle diameter of 0.3 micrometer from contaminated air.

Note: Filters designated, under 42 CFR Part 84, as an "N100," "R100," or "P100" provide the same filter efficiency (99.97%) as HEPA filters.

Hood
The part of a respirator that completely covers the wearer's head and neck AND may also cover some or all of the shoulders and torso.

Immediately dangerous to life or health (IDLH)
An atmospheric condition that would:
- Cause an immediate threat to life
- Cause permanent or delayed adverse health effects
- Interfere with an employee's ability to escape.

Licensed healthcare professional (LHCP)
An individual whose legally permitted scope of medical practice allows him or her to provide SOME OR ALL of the healthcare services required for respirator users' medical evaluations.

Loose-fitting facepiece
A respiratory inlet covering that is designed to form a partial seal with the face.

Negative-pressure respirator
Any tight-fitting respirator in which the air pressure inside the facepiece is less than the air pressure outside the respirator during inhalation.

NIOSH
The National Institute for Occupational Safety and Health. NIOSH is the federal agency that certifies respirators for occupational use.

Oxygen deficient
An atmosphere with an oxygen content below 19.5% by volume.

Permissible exposure limit (PEL)
Permissible exposure limits (PELs) are employee exposures to toxic substances or harmful agents that must not be exceeded. PELs are specified in applicable WISHA chapters.

Positive-pressure respirator
A respirator in which the air pressure inside the respiratory-inlet covering is greater than the air pressure outside the respirator.

Powered air-purifying respirators (PAPRs)
An air-purifying respirator equipped with a blower that draws ambient air through cartridges or canisters. These respirators, as a group, are NOT classified as positive pressure respirators and must not be used as such.

Pressure-demand respirator
A positive-pressure atmosphere-supplying respirator that sends breathing air to the respiratory inlet covering when the positive pressure is reduced inside the facepiece by inhalation or leakage.

Qualitative fit test (QLFT)
A test that determines the adequacy of respirator fit for an individual. The test relies on the employee's ability to detect a test substance. Test results are either "pass" or "fail."

Quantitative fit test (QNFT)
A test that determines the adequacy of respirator fit for an individual. The test relies on specialized equipment that performs numeric measurements of leakage into the respiratory inlet covering. Test results are used to calculate a "fit factor."

Respiratory hazard
Harmful airborne hazards and oxygen deficiency that are addressed in WAC 296-307-624. Identifying and controlling airborne hazards and oxygen deficiency.

Required use
Respirator use:
- That is necessary to protect employees from respiratory hazards
- OR
• That the employer decides to require for his or her own reasons. For example, the employer decides to follow more rigorous exposure limits
• The employer for his or her own reasons. For example, the employer decides to follow more rigorous exposure limits, OR the employer is required to follow a medical recommendation.

**Respirator**
A type of personal protective equipment designed to protect the wearer from harmful airborne hazards, oxygen deficiency, or both.

**Respiratory inlet covering**
The part of a respirator that forms the protective barrier between the user's respiratory tract and an air-purifying device or breathing air source or both. The respiratory inlet covering may be a facepiece, helmet, hood, suit, or mouthpiece respirator with nose clamp.

**Seal check**
Actions conducted by the respirator user each time the respirator is put on, to determine if the respirator is properly seated on the face.

**Self-contained breathing apparatus (SCBA)**
An atmosphere-supplying respirator designed for the breathing air source, to be carried by the user.

**Service-life**
The period of time that a respirator, filter or sorbent, or other respiratory equipment provides adequate protection to the wearer. For example, the period of time that sorbent cartridge is effective for removing a harmful substance from the air.

**Sorbent**
Rigid, porous material, such as charcoal, used to remove vapor or gas from the air.

**Supplied-air respirator (see air-line respirator)**

**Tight-fitting facepiece**
A respiratory inlet covering forming a complete seal with the face or neck. Mouthpiece respirators aren't tight-fitting facepieces.

**Voluntary use**
Respirator use that is requested by the employee AND permitted by the employer when NO respiratory hazard exists.

**Part Y-6 Respiratory Hazards**

**WAC 296-307-624 Scope.**
This part applies only if your employees:
• Are exposed to a respiratory hazard
OR
• Could be exposed to one of the specific hazards listed below.

This part applies to any workplace with potential or actual employee exposure to respiratory hazards. It requires you to protect employees from respiratory hazards by applying this protection strategy:
• Evaluate employee exposures to determine if controls are needed

• Use feasible controls. For example, enclose or confine the operation, use ventilation systems, or substitute with less toxic material
• Use respirators if controls are not feasible or if they cannot completely remove the hazard.

**Definition:**

**Exposed or exposure:**
The contact an employee has with a toxic substance, harmful physical agent or oxygen deficient condition, whether or not protection is provided by respirators or other personal protective equipment (PPE). Exposure can occur through various routes of entry, such as inhalation, ingestion, skin contact, or skin absorption.

**Note:** Examples of substances that may be respiratory hazards when airborne include:
• Chemicals listed in Table 3
• Any substance
  – Listed in the latest edition of the NIOSH Registry of Toxic Effects of Chemical Substances
  – For which positive evidence of an acute or chronic health hazard exists through tests conducted by, or known to, the employer
  – That may pose a hazard to human health as stated on a material safety data sheet kept by, or known to, the employer
• Atmospheres considered oxygen deficient
• Biological agents such as harmful bacteria, viruses or fungi
  – Examples include airborne TB aerosols and anthrax
• Pesticides with a label requirement for respirator use
• Chemicals used as crowd control agents such as pepper spray
• Chemicals present at clandestine drug labs.
These substances can be airborne as dusts, fibers, fogs, fumes, mists, gases, smoke, sprays, vapors, or aerosols.

**Reference:**
• Substances in Table 3 that are marked with an X in the "skin" column may require personal protective equipment (PPE). See WAC 296-307-100, Personal protective equipment, for additional information and requirements.
• If any of the following hazards are present in your workplace, you will need both this part and any of the following specific rules that apply:

**Hazard**

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-624, filed 12/21/04, effective 4/2/05.]
WAC 296-307-626 Evaluate and control employee exposures.

Summary:
Your responsibility:
To protect your employees from exposure to respiratory hazards in the workplace by identifying and controlling the hazards.

You must:
Identify and evaluate employee exposures
WAC 296-307-62605
Control employee exposures
WAC 296-307-62610
Use respirators
WAC 296-307-62615
Notify employees
WAC 296-307-62620
Permissible exposure limits of air contaminants
WAC 296-307-62625.

WAC 296-307-62605 Identify and evaluate respiratory hazards.

You must:
• Make sure employees are protected from potentially hazardous exposure while you perform your evaluation
• Perform your evaluation without considering the protection provided to employees by a respirator
• Determine the form of the hazard, such as dust, mist, gas, oxygen deficiency, or biological agent
• Make sure you consider:
  – Potential emergency and rescue situations that may occur, such as equipment or power failures, uncontrolled chemical reactions, fire, explosion, or human error
  – Workplace conditions such as work processes, types of material, control methods, work practices and environmental conditions.
• Determine or reasonably estimate whether any employee is or could be exposed to any of the following:
  – Any airborne substance above a permissible exposure limit (PEL) listed in Table 3
  – A substance at or above the action level (AL) specified in the rule for that substance
  – Any other respiratory hazard.
• Use any of the following to determine employee exposure:
  – Information that would allow an estimate of the level of employee exposure, such as MSDSs or pesticide labels, observations, measurements or calculations
  – Data demonstrating that a particular product, material or activity cannot result in employee exposure at or above the AL or PEL
  – Personal air samples that represent an employee’s usual or worst case exposure for the entire shift.

Note:
• Rules for specific substances may contain additional requirements for determining employee exposure.
• Use methods of sampling and analysis that have been validated by the laboratory performing the analysis.
• Samples from a representative group of employees may be used for other employees performing the same work activities when the duration and level of exposure are similar.

You must:
• Consider the atmosphere to be immediately dangerous to life or health (IDLH) when you cannot determine or reasonably estimate employee exposure
• Make sure employee exposure, to 2 or more substances with additive health effects, is evaluated using this formula:

\[ E_m = \frac{C_1}{L_1} + \frac{C_2}{L_2} + \ldots + \frac{C_n}{L_n} \]

The symbol Is the . . .

| E | Equivalent exposure for the mixture. When the value of E is greater than 1, a respiratory hazard is present. |
| C | Concentration of a particular substance. |
| L | TWA, STEL, or ceiling for that substance from Table 3. |

WAC 296-307-62610 Control employee exposures.

You must:
• Use feasible controls to protect employees from exposure to respiratory hazards by:
  – Reducing employee exposure to a level that removes the respiratory hazard, such as to a level below the permissible exposure limit (PEL) in Table 3;
  OR
  – Reducing the exposure to the lowest achievable level, when the respiratory hazard cannot be removed.
Note: The following table gives you examples of control methods.

Table 1 Examples of Possible Controls

<table>
<thead>
<tr>
<th>Control:</th>
<th>For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using a different chemical (substitution)</td>
<td>• Choose a chemical with a lower evaporation rate or vapor pressure.  • Choose a chemical without hazardous ingredients.</td>
</tr>
<tr>
<td>Changing a process to lessen emissions</td>
<td>• Use hand rolling or paint dipping instead of paint spraying.  • Bolt items instead of welding them.</td>
</tr>
<tr>
<td>Separating employees from emissions areas and sources</td>
<td>• Use control rooms.  • Build an enclosure around process machinery or other emissions sources.  • Automate a process.</td>
</tr>
<tr>
<td>Removing emissions at or near the source (local exhaust ventilation)</td>
<td>• Install exhaust hoods or slots to capture emissions.  • Use an exhausted enclosure (like a blasting cabinet or laboratory hood).</td>
</tr>
<tr>
<td>Diluting and removing emissions in the work area (general exhaust ventilation)</td>
<td>• Allow natural air movement to create an adequate airflow through an area.  • Use mechanical fans.</td>
</tr>
</tbody>
</table>
296-307-62615  Use respirators.
You must:
• Require employees to use respiratory protection when respirator hazards have not been removed using feasible controls. For example, use respirators at any of the following times:
  – While controls are being evaluated or put in place
  – When the respiratory hazard is not completely removed
  – When controls are not feasible.
Reference: See WAC 296-307-594, Respirators, for respirator program requirements.

296-307-62620  Notify employees.
You must:
• Notify employees who are or may be exposed to respiratory hazards, as specified in Table 2.
Note: • The notification may be provided either individually, to a group, or by posting of results in an appropriate location that's accessible to affected employees.

Table 2

<table>
<thead>
<tr>
<th>Notify employees of:</th>
<th>As follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any exposure result above a permissible exposure limit (PEL)</td>
<td>Within five business days, after the employee's exposure result is known to the employer</td>
</tr>
<tr>
<td>The corrective action being taken to reduce employee exposure to or below the PEL</td>
<td>Within fifteen business days, after the employee's exposure result is known to the employer</td>
</tr>
<tr>
<td>AND The schedule for completion of the corrective action and any reasons why exposures cannot be lowered to below the PEL</td>
<td>In writing, as specified in the rule specific to the substance</td>
</tr>
</tbody>
</table>

WAC 296-307-62625  Permissible exposure limits of air contaminants.

IMPORTANT:
The following information applies to Table 3, Permissible Exposure Limits for Air Contaminants.
• Exposure needs to be determined from personal air samples taken in the breathing zone or from monitoring representative of the employee's breathing zone.
• Ppm refers to parts of vapor or gas per million parts of air by volume, at 25 degrees C and 760 mm Hg pressure.
• Mg/m³ refers to milligrams of substance per cubic meter of air.
• For a metal that is measured as the metal itself, only the CAS number for the metal is given. The CAS numbers for individual compounds of the metal are not provided. For more information about CAS registry numbers see the website: http://www.cas.org.
• Time weighted averages (TWA₈) represent the maximum allowed average exposure for any 8-hour time period. For work periods longer than 8 hours the TWA₈ needs to be determined using the 8 continuous hours with the highest average concentration.
• Short-term exposure limits (STEL) represent maximum allowed average exposure for any fifteen-minute period, unless another time period is noted in Table 3.
  • The ceiling represents the maximum allowed exposure for the shortest time period that can feasibly be measured.
  • An "X" in the "skin" column indicates the substance can be absorbed through the skin, either by airborne or direct contact.
  • Requirements for the use of gloves, coveralls, goggles, and other personal protective equipment can be found in WAC 296-307-100.
• The respirable fraction of particulate is measured by sampling with a size-selector having the following characteristics:

<table>
<thead>
<tr>
<th>Mean aerodynamic diameter in micrometers</th>
<th>Percent passing the selector</th>
</tr>

</table>
WAC 296-307-628 Definitions.

Ceiling - An exposure limit, measured over the shortest time period feasible, that must not be exceeded during any part of the employee's workday.

Dust - Solid particles suspended in air. Dusts are generated by handling, drilling, crushing, grinding, rapid impact, detonation, or decrepitation of organic or inorganic materials such as rock, ore, metal, coal, wood, grain, etc.

Exposed or exposure - The contact an employee has with a toxic substance, harmful physical agent or oxygen deficient condition. Exposure can occur through various routes of entry, such as inhalation, ingestion, skin contact, or skin absorption.

Fume - Solid particles suspended in air, generated by condensation from the gaseous state, generally after volatilization from molten metals, etc.

Gas - A normally formless fluid which can be changed to the liquid or solid state by the effect of increased pressure or decreased temperature or both.

Mist - Liquid droplets suspended in air, generated by condensation from the gaseous to the liquid state or by breaking up a liquid into a dispersed state, such as by splashing, foaming, spraying or atomizing.

Oxygen deficient - An atmosphere with an oxygen content below 19.5% by volume.

Permissible exposure limits (PEL) - Permissible exposure limits (PELs) are employee exposures to toxic substances or harmful agents that must not be exceeded. PELs are specified in applicable WISHA rules.

Short-term exposure limit (STEL) - An exposure limit averaged over a short time period (usually measured for 15 minutes) that must not be exceeded during any part of an employee's workday.

Time weighted average (TWA₈) - An exposure limit averaged over 8 hours that must not be exceeded during an employee's workday.

Toxic substance - Any chemical substance or biological agent, such as bacteria, virus, and fungus, which is any of the following:

- Listed in the latest edition of the National Institute for Occupational Safety and Health (NIOSH) Registry of Toxic Effects of Chemical Substances (RTECS)
- Shows positive evidence of an acute or chronic health hazard in testing conducted by, or known to, the employer.

The subject of a material safety data sheet kept by or known to the employer showing the material may pose a hazard to human health.

Vapor - The gaseous form of a substance that is normally in the solid or liquid state.

Reference: Table 1 will help you determine the hearing loss prevention requirements for your workplace. For the specific requirements associated with Noise Evaluation Criteria, see WAC 296-307-63410 of this part.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-630, filed 12/21/04, effective 4/2/05.]

**Hearing Loss Prevention Program**

**WAC 296-307-632 Summary.**

**Your responsibility:**
To prevent employee hearing loss by minimizing, and providing protection from, noise exposures.

**You must:**
- Conduct employee noise exposure monitoring
- WAC 296-307-63205
- Control employee noise exposures that equal or exceed 90 dBA TWA<sub>8</sub>
  - WAC 296-307-63210
  - Make sure employees use hearing protection when their noise exposure equals or exceed 85 dBA TWA<sub>8</sub>
    - WAC 296-307-63215
    - Make sure exposed employees receive training about noise and hearing protection
    - WAC 296-307-63220
    - Make sure warning signs are posted for areas with noise levels that equal or exceed 115 dBA
      - WAC 296-307-63225
      - Arrange for oversight of audiometric testing
        - WAC 296-307-63230
        - Identify and correct deficiencies in your hearing loss prevention program
        - WAC 296-307-63235

**WAC 296-307-63205 Conduct employee noise exposure monitoring.**

**You must:**
- Conduct employee noise exposure monitoring to determine the employee's actual exposure when reasonable information indicates that any employee's exposure may equal or exceed 85 dBA TWA<sub>8</sub>.

  **Note:**
  - Representative monitoring may be used where several employees perform the same tasks in substantially similar conditions
  - Examples of information or situations that can indicate exposures which equal or exceed 85 dBA TWA<sub>8</sub>, include:
    - Noise in the workplace that interferes with people speaking, even at close range
    - Information from the manufacturer of equipment you use in the workplace that indicates high noise levels for machines in use
    - Reports from employees of ringing in their ears or temporary hearing loss
    - Warning signals or alarms that are difficult to hear
    - Work near abrasive blasting or jack hammering operations
    - Use of tools and equipment such as the following:
      - Heavy equipment or machinery
      - Fuel-powered hand tools
      - Compressed air-driven tools or equipment in frequent use
      - Power saws, grinders or chippers
      - Powder-actuated tools.

**You must:**
- Follow applicable guidance in WAC 296-307-634 when conducting noise exposure monitoring
- Make sure your sampling for noise exposure monitoring identifies:
  - All employees whose exposure equals or exceeds the following:
    - 85 dBA TWA<sub>8</sub> (noise dosimetry, providing an average exposure over an eight-hour time period)
    - 115 dBA (slow response sound level meter, identifying short-term noise exposures)
    - 140 dBC (fast response sound level meter, identifying almost instantaneous noise exposures).
  - Exposure levels for selection of hearing protection.
  - Provide exposed employees and their representatives with an opportunity to observe any measurements of employee noise exposure that are conducted
  - Notify each employee whose exposure equals or exceeds 85 dBA TWA<sub>8</sub> of the monitoring results within five working days of when you receive the results
  - Conduct additional noise monitoring whenever a change in production, process, equipment or controls, may reasonably be expected to result in:
    - Additional employees whose exposure equals or exceeds 85 dBA TWA<sub>8</sub>
    - Employees exposed to higher level of noise requiring more effective hearing protection.

**Note:**
Conditions that may be expected to increase exposure include:
- Adding machinery to the work area
- Increasing production rates
- Removal or deterioration of noise control devices

(2005 Ed.)
WAC 296-307-63210 Control employee noise exposures that equal or exceed 90 dBA TWA$_8$.

**IMPORTANT:**
Hearing protection provides a barrier to noise and protects employees but is not considered a control of the noise hazard. Separate requirements apply to hearing protection and are found in WAC 296-307-63215.

**You must:**
- Reduce employee noise exposure, using feasible controls, wherever exposure equals or exceeds 90 dBA TWA$_8$.

**Note:**
- Once noise exposures are brought below 90 dBA TWA$_8$, no further reduction is required. However, further reduction of noise may reduce the need for other hearing loss prevention requirements.
- Controls that eliminate noise at the source or establish a permanent barrier to noise are typically more reliable. For example:
  - Replacing noisy equipment with quiet equipment
  - Using silencers and mufflers
  - Installing enclosures
  - Damping noisy equipment and parts.
- Other controls and work practices may also be useful for reducing noise exposures. Examples include:
  - Employee rotation
  - Limiting use of noisy equipment
  - Rescheduling work.

WAC 296-307-63215 Make sure employees use hearing protection when their noise exposure equals or exceeds 85 dBA TWA$_8$.

**You must:**
- Make sure employees wear hearing protectors that will provide sufficient protection when exposure equals or exceeds:
  - 85 dBA TWA$_8$ (noise dosimetry, providing an average exposure over an eight-hour time period)
  - 115 dBA (slow response sound level meter, identifying short-term noise exposures)
  - 140 dBC (fast response sound level meter, identifying almost instantaneous noise exposures).
- Provide employees with an appropriate selection of hearing protectors:
  - The selection must include at least two distinct types (such as molded earplugs, foam earplugs, custom-molded earplugs, earcaps, or earmuffs) for each exposed employee and must be sufficient to cover:
    - Different levels of hearing protection needed in order to reduce all employee exposures to a level below 85 dBA TWA$_8$.
    - Different sizes
    - Different working conditions.
    - Consider requests of the employees regarding:
      - Physical comfort
      - Environmental conditions
      - Medical needs
      - Communication requirements.

**Note:** Hearing protector selection should include earplugs, earcaps and earmuffs.

**You must:**
- Provide hearing protection at no cost to employees.
- Supervise employees to make sure that hearing protection is used correctly.
- Make sure hearing protectors are:
  - Properly chosen for fit
  - Replaced as necessary.
- Make sure all hearing protection is sufficient to reduce the employee's equivalent eight-hour noise exposure to 85 dBA or less. When using the A-weighted exposure measurements, reported as "dBA TWA$_8$," the reduction in noise exposure by hearing protectors is given by Table 2:

<table>
<thead>
<tr>
<th>Type of hearing protection</th>
<th>Effective protection</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single hearing protection (earplugs, earcaps or earmuffs)</td>
<td>7 dB less than the manufacturer assigned noise reduction rating (NRR); for example, earplugs with an NRR of 20 dB are considered to reduce employee exposures of 95 dBA TWA$_8$ to 82 dBA TWA$_8$</td>
</tr>
<tr>
<td>Dual hearing protection (earplug and earmuff worn together)</td>
<td>2 dB less than the higher NRR of the two protectors; for example, earplugs with an NRR of 20 dB and earmuffs with an NRR of 12 dB are considered to reduce employee exposures of 100 dBA TWA$_8$ to 82 dBA TWA$_8$</td>
</tr>
</tbody>
</table>

In addition to protection based on daily noise dose, make sure hearing protection has an NRR of at least 20 dB when exposures involve noise that equals or exceeds 115 dBA (slow response sound level meter) or 140 dBC (fast response sound level meter).

**Note:** You may also evaluate hearing protection by using the other methods given in the NIOSH Compendium of Hearing Protection (DHHS (NIOSH)) Publication No. 95-105 or online at http://www.cdc.gov/niosh/topics/noise/hpcomp.html. These methods require additional monitoring and are more complex, but provide a more thorough evaluation of protection. This may be useful in cases where communication is critical or for evaluating hearing protection for employees with hearing impairment.

WAC 296-307-63220 Make sure exposed employees receive training about noise and hearing protection.

**You must:**
- Train all employees whose noise exposure equals or exceeds 85 dBA TWA$_8$:
  - Provide training when an employee is first assigned to a position involving noise exposure that equals or exceeds 85 dBA TWA$_8$ and at least annually after that.
  - Update information provided in the training program to be consistent with changes in controls, hearing protectors and work processes.
• Make sure your noise and hearing protection training includes:
  – The effects of noise on hearing (including both occupational and nonoccupational exposures)
  – Noise controls used in your workplace
  – The purpose of hearing protectors: The advantages, disadvantages, and attenuation of various types
  – Instructions about selecting, fitting, using, and caring for hearing protection
  – The purpose and procedures for program evaluation including audiometric testing and hearing protection auditing when you choose to rely upon auditing (see WAC 296-307-638)
  – The employees’ right to access records kept by the employer.
  • Maintain a written program describing initial and refresher training.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63220, filed 12/21/04, effective 4/2/05.]

WAC 296-307-63225 Make sure warning signs are posted for areas where noise levels equal or exceed 115 dBA.

You must:
• Make sure warning signs are posted at the entrances or boundaries of all well-defined work areas where employees may be exposed to noise that equals or exceeds 115 dBA (measured using a sound level meter with slow response).
  – Warning signs must clearly indicate that the area is a high noise area and that hearing protectors are required.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63225, filed 12/21/04, effective 4/2/05.]

WAC 296-307-63230 Arrange for oversight of audiometric testing.

You must:
• Make sure audiometric testing as described by WAC 296-307-636 is supervised and reviewed by one of the following licensed or certified individuals:
  – An audiologist
  – An otolaryngologist
  – Another qualified physician.
  • Make sure audiograms are conducted by one of the above individuals or by a technician certified by the Council of Accreditation in Occupational Hearing Conservation (CAOHC) and responsible to a qualified reviewer.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63230, filed 12/21/04, effective 4/2/05.]

WAC 296-307-63235 Identify and correct deficiencies in your hearing loss prevention program.

You must:
• Use audiometric testing to identify hearing loss, which may indicate program deficiencies
• Take appropriate actions when deficiencies are found with your program.
  – A deficiency may be indicated when:
    ■ Any employee isn’t wearing appropriate hearing protection during an audit when auditing is used in place of baseline audiograms for short term employees (see WAC 296-307-638, Option to audiometric testing).

Note: A standard threshold shift or audit deficiency does not necessarily indicate that a significant hearing loss has occurred. These criteria are intended to help identify where there may be flaws in your hearing loss prevention program that can be fixed before permanent hearing loss occurs. There are additional statistical tools and tests that may be used to improve the effectiveness of your program. Staff conducting audiometric testing and auditing may be able to suggest additional ways to improve your hearing loss prevention program and tailor it to your worksite.

You must:
• Evaluate the following, at a minimum, when responding to a standard threshold shift:
  – Employee noise exposure measurements
  – Noise controls in the work area
  – The selection of hearing protection available and refit employees as necessary
  – Employee training on noise and the use of hearing protection and conduct additional training as necessary.

Reference: You may use the option of auditing hearing protection (see WAC 296-307-638) for employees hired or transferred to jobs with noise exposure for less than one year. You may also use audiograms provided by a third-party hearing loss prevention program in some circumstances. Details of these program options are found in WAC 296-307-638, Options to audiometric testing.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63235, filed 12/21/04, effective 4/2/05.]

WAC 296-307-63240 Document your hearing loss prevention activities.

You must:
• Create and retain records documenting noise exposures. Include, at a minimum:
  – Exposure measurements required by this part for at least two years and for as long as you rely upon them to determine employee exposure
  – Audiometric test records for the duration of employment for the affected employees
  – Hearing protection audits, if you choose to rely upon them, for the duration of employment of the affected employees.

Note: • You need to keep as complete a record as possible. Records developed under previous rules or in other jurisdictions need to be kept, even when they do not fulfill the full requirements of this part. Similarly, records found to have errors in collection or processing need to be kept if they provide an indication of employee exposure or medical condition not found in other records
• You may want to consider your other business needs, such as worker’s compensation claims management, before discarding these records.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63240, filed 12/21/04, effective 4/2/05.]

Noise Measurement and Computation

WAC 296-307-634 Summary.
Your responsibility:
Conduct noise monitoring or measurement to evaluate employee exposures in your workplace.

[Title 296 WAC—p. 2687]
You must:
Make sure that noise-measuring equipment meets recognized standards
WAC 296-307-63405
Measure employee noise exposure
WAC 296-307-63410
Use these equations when estimating full-day noise exposure from sound level measurements
WAC 296-307-63415.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-634, filed 12/21/04, effective 4/2/05.]

WAC 296-307-63405  Make sure that noise-measuring equipment meets recognized standards.

You must:
• Make sure that noise dosimetry equipment meets these specifications:
  – Dosimeters must be equipment class 2AS-90/80-5 of the American National Rule Specification for Personal Noise Dosimeters, ANSI S1.25-1991, such dosimeters are normally marked "Type 2."

Note: Make sure any dosimeter you use is Type 2 equipment that:
• Uses slow integration and A-weighting of sound levels.
• Has the criterion level set to 90 dB, so the dosimeter will report a constant 8-hour exposure at 90 dBA as a 100% dose.
• Has the threshold level set at 80 dB, so the dosimeter will register all noise above 80 dB.
• Uses a 5 dB exchange rate for averaging of noise levels over the sample period.

You must:
• Make sure that sound level meters meet these specifications:
  – American National Standard Specification for Sound Level Meters, S1.4-1984, Type 2 requirements for sound level meters, such sound level meters are normally marked "Type 2."
  ■ For continuous noise measurements, the meter must be capable of measuring A-weighted sound levels with slow response
  ■ For impulse or impact noise measurements, the meter must be capable of indicating maximum C-weighted sound level measurements with fast response.
  • Calibrate dosimeters and sound level meters used to monitor employee noise exposure:
    – Before and after each day's use
    AND
    – Following the instrument manufacturer's calibration instructions.

Note: Make sure any dosimeter you use is Type 2 equipment that:
• Uses slow integration and A-weighting of sound levels.
• Has the criterion level set to 90 dB, so the dosimeter will report a constant 8-hour exposure at 90 dBA as a 100% dose.
• Has the threshold level set at 80 dB, so the dosimeter will register all noise above 80 dB.
• Uses a 5 dB exchange rate for averaging of noise levels over the sample period.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63405, filed 12/21/04, effective 4/2/05.]

WAC 296-307-63410  Measure employee noise exposure.

IMPORTANT:
[Title 296 WAC—p. 2688]

A noise dosimeter is the basis for determining total daily noise exposure for employees. However, where you have constant noise levels, you may estimate employee noise exposure using measurements from a sound level meter. Calculation of the employee noise exposure must be consistent with WAC 296-307-63415.

You must:
• Include all:
  – Workplace noise from equipment and machinery in use
  – Other noise from sources necessary to perform the work
  – Noise outside the control of the exposed employees.
• Use a noise dosimeter when necessary to measure employee noise dose
• Use a sound level meter to evaluate continuous and impulse noise levels
• Identify all employees whose exposures equal or exceed the Noise Evaluation Criteria as follows:

Noise Evaluation Criteria

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Description</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>85 dBA TWA&lt;sub&gt;8&lt;/sub&gt;</td>
<td>Full-day employee noise exposure dose. If you have one or more employees whose exposure equals or exceeds this level, you must have a hearing loss prevention program</td>
<td>– Hearing protection&lt;br&gt;– Training&lt;br&gt;– Audiometric testing</td>
</tr>
<tr>
<td>90 dBA TWA&lt;sub&gt;8&lt;/sub&gt;</td>
<td>Full-day employee noise exposure dose. If you have one or more employees whose exposure equals or exceeds this level, you must reduce employee noise exposures in the workplace</td>
<td>Noise controls (in addition to the requirements for 85 dBA TWA&lt;sub&gt;8&lt;/sub&gt;)</td>
</tr>
<tr>
<td>115 dBA measured using slow response</td>
<td>Extreme noise level (greater than one second in duration)</td>
<td>– Hearing protection&lt;br&gt;– Signs posted in work areas warning of exposure</td>
</tr>
<tr>
<td>140 dBC measured using fast response</td>
<td>Extreme impulse or impact noise (less than one second in duration)</td>
<td>Hearing protection</td>
</tr>
</tbody>
</table>

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63410, filed 12/21/04, effective 4/2/05.]

WAC 296-307-63415  Use these equations when estimating full-day noise exposure from sound level measurements.

You must:
• Compute employee's full-day noise exposure by using the appropriate equations from Table 3 "Noise Dose Computation" when using a sound level meter to estimate noise dose.

(2005 Ed.)
WAC 296-307-636  Summary.

Your responsibility:
To conduct audiometric testing of employees exposed to noise to make sure that their hearing protection is effective.

You must:
- Provide audiometric testing at no cost to employees
- WAC 296-307-63605
- Establish a baseline audiogram for each exposed employee
- WAC 296-307-63610
- Conduct annual audiograms
- WAC 296-307-63615
- Review audiograms that indicate a standard threshold shift
WAC 296-307-63620
- Keep the baseline audiogram without revision, unless annual audiograms indicate a persistent threshold shift or a significant improvement in hearing
- WAC 296-307-63625
- Make sure a record is kept of audiometric tests
- WAC 296-307-63630
- Make sure audiometric testing equipment meets these requirements
- WAC 296-307-63635.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63605, filed 12/21/04, effective 4/2/05.]

Audiometric Testing

WAC 296-307-636

Table 3  Noise Dose Computation

<table>
<thead>
<tr>
<th>Description</th>
<th>Equation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compute the noise dose based on several time periods of constant noise during the shift</td>
<td>The total noise dose over the work day, as a percentage, is given by the following equation where C_n indicates the total time of exposure at a specific noise level, and T_n indicates the reference duration for that level. D = 100 * [(C_n/T_n) + (C_2/T_2) + (C_3/T_3) + ... + (C_n/T_n)]</td>
</tr>
<tr>
<td>The reference duration is equal to the time of exposure to continuous noise at a specific sound level that will result in a one hundred percent dose</td>
<td>The reference duration, T, for sound level, L, is given in hours by the equation: T = 8 / (2^((L - 90)/5))</td>
</tr>
<tr>
<td>Given a noise dose as a percentage, compute the equivalent eight-hour time weighted average noise level</td>
<td>The equivalent eight-hour time weighted average, TWA_8, is computed from the dose, D, by the equation: TWA_8 = 16.61 * Log_{10}((D/100) + 90)</td>
</tr>
</tbody>
</table>

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63415, filed 12/21/04, effective 4/2/05.]

WAC 296-307-63605  Provide audiometric testing at no cost to employees.

You must:
- Provide audiograms, including any required travel or necessary additional examinations or testing, at no cost to exposed employees.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63605, filed 12/21/04, effective 4/2/05.]

WAC 296-307-63610  Establish a baseline audiogram for each exposed employee.

You must:
- Conduct a baseline audiogram when an employee is first assigned to work involving noise exposures that equal or exceed 85 dBA TWA_8.
  - Make sure this audiogram is completed no more than one hundred eighty days after the employee is first assigned
  - Make sure employee is covered by a hearing protection audit program (as described by WAC 296-307-638 and available as an alternative only for employees hired for less than one year).

Note: Employers who utilize mobile test units are allowed up to one year to obtain a valid baseline audiogram for each exposed employee. The employees must still be given training and hearing protection as required by this part.

You must:
- Make sure employees are not exposed to workplace noise at least fourteen hours before testing to establish a baseline audiogram.
  - Hearing protectors may be used to accomplish this.
  - Notify employees of the need to avoid high levels of nonoccupational noise exposure (such as loud music, headphones, guns, power tools, motorcycles, etc.) during the fourteen-hour period immediately preceding the baseline audiometric examination.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63610, filed 12/21/04, effective 4/2/05.]

WAC 296-307-63615  Conduct annual audiograms.

You must:
- Conduct annual audiograms for employees as long as they continue to be exposed to noise that equals or exceeds 85 dBA TWA_8.

Note: Annual audiometric testing may be conducted at any time during the work shift. By conducting the annual audiogram during the work shift with the employee exposed to typical noise for their job, the test may record a temporary threshold shift. This makes the test more sensitive to potential hearing loss and may help you improve employee protection before a permanent threshold shift occurs. A suspected temporary shift is one reason an employer may choose to retest employee hearing.

You must:
- Make sure each employee is informed of the results of his or her audiometric test.
  - Include whether or not there has been a hearing level decrease or improvement since their previous test.
  - Make sure each employee’s annual audiogram is compared to his or her baseline audiogram by an audiologist, otorhinolaryngologist, another qualified physician, or the technician conducting the test to determine if a standard threshold shift has occurred.

[Title 296 WAC—p. 2689]
WAC 296-307-63620 Review audiograms that indicate a standard threshold shift.

You must:
• Make sure the healthcare professional supervising audiograms has:
  – A copy of this part
  – The baseline audiogram and most recent audiogram of the employee to be evaluated
  – Background noise level records for the testing room
  – Calibration records for the audiometer.
• Obtain an opinion from the healthcare professional supervising audiograms as to whether the audiograms indicate possible occupational hearing loss and any recommendations for changes in hearing protection.
  – Pay for any clinical audiological evaluation or otological examination required by the reviewer, if:
    – Additional review is necessary to evaluate the cause of hearing loss
  OR
  – If there is indication of a medical condition of the ear caused or aggravated by the wearing of hearing protectors.
  – Inform the employee in writing of the existence of a standard threshold shift within twenty-one calendar days of the determination.
  – Make arrangements for the reviewer to communicate to the employee any suspected medical conditions that are found unrelated to your workplace. This information is confidential and must be handled appropriately.

WAC 296-307-63625 Keep the baseline audiogram without revision, unless annual audiograms indicate a persistent threshold shift or a significant improvement in hearing.

You must:
• Keep the baseline audiogram without revision, unless a qualified reviewer determines:
  – The standard threshold shift revealed by the audiogram is persistent
  OR
  – The hearing threshold shown in the annual audiogram indicates significant improvement over the baseline audiogram.

WAC 296-307-63630 Make sure a record is kept of audimetric tests.

You must:
• Retain a legible copy of all employee audiograms conducted under this part.
  – Make sure the record includes:
    ■ Name and job classification of the employee
    ■ Date of the audiogram
    ■ The examiner's name
    ■ Date of the last acoustic or exhaustive calibration of the audiometer
    ■ Employee's most recent noise exposure assessment
    ■ The background sound pressure levels in audimetric test rooms.

WAC 296-307-63635 Make sure audimetric testing equipment meets these requirements.

You must:
• Use pure tone, air conduction, hearing threshold examinations, with test frequencies including as a minimum 500, 1000, 2000, 3000, 4000, and 6000 Hz
  – Tests at each frequency must be taken separately for each ear
  – Supra-aural headphones must be used.
• Conduct audimetric tests with audiometers (including microprocessor audiometers) that meet the specifications of, and are maintained and used according to, American National Standard Specification for Audiometers, S3.6-1996
  • Check the functional operation of the audiometer each day before use by doing all of the following:
    – Make sure the audiometer's output is free from distorted or unwanted sound
    – Test either a person with known, stable hearing thresholds or a bio-acoustic simulator
    – Perform acoustic calibration for deviations of 10 dB or greater.
  • Audiometer calibration must be checked acoustically at least annually to verify continued conformance with ANSI S3.6-1996. Test frequencies below 500 Hz and above 6000 Hz may be omitted from this check
  • An exhaustive calibration must be performed at least every two years according to the American National Standard Specification for Audiometers, S3.6-1996. Test frequencies below 500 Hz and above 6000 Hz may be omitted from the calibration
• Provide audimetric test rooms that meet the requirements of ANSI S3.1-1999 American National Standard Maximum Permissible Ambient Noise Levels for Audimetric Test Rooms using the following table of Maximum Ambient Sound Pressure Levels:

<table>
<thead>
<tr>
<th>Frequency (Hz)</th>
<th>500</th>
<th>1000</th>
<th>2000</th>
<th>4000</th>
<th>8000</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sound Pressure Level (dB)</td>
<td>40</td>
<td>40</td>
<td>47</td>
<td>57</td>
<td>62</td>
</tr>
</tbody>
</table>

Table 4

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-6360, filed 12/21/04, effective 4/2/05.]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63620, filed 12/21/04, effective 4/2/05.]

[Title 296 WAC—p. 2690]
Although you remain responsible for the program, third-party programs can have at least two benefits over running your own program:

- The audiometric testing is portable between the participating employers so new testing will not be needed when an employee changes employers
- Employees who only work for short periods for any one employer can be monitored under the group program over a longer period of time increasing the effectiveness of the audiometric testing in preventing hearing loss for these employees.

**Options to Audiometric Testing**

**WAC 296-307-638 Summary.**

**Your responsibility:**

This section provides options to baseline audiometric testing for employees assigned to duties with noise exposures for **less than one year**. These program options may also be used to provide added assessment of longer-term employees in addition to audiometric testing.

The requirements of this section apply only if you decide to use auditing or a third-party hearing loss prevention program and do not conduct baseline audiometric testing for those employees.

**Hearing Protection Audits**

You must:

- Conduct hearing protection audits at least quarterly
  - WAC 296-307-63805
- Make sure staff conducting audits are properly trained
  - WAC 296-307-63810
- Assess the hearing protection used by each employee during audits
  - WAC 296-307-63815
- Document your hearing protection audits
  - WAC 296-307-63820

**Third-Party Audiometric Testing**

You must:

- Make sure third-party hearing loss prevention programs meet the following requirements
  - WAC 296-307-63825

**IMPORTANT:**

Hearing protection audits are a tool for use in evaluating your hearing loss prevention program in cases where audiometric testing does not provide a useful measure. For example, if most of your employees are hired on a temporary basis for a few months at a time, audiometric testing may not identify the small changes in hearing acuity that could occur. Auditing provides an alternative to audiometric testing in these cases.

Auditing is not required unless you use it in place of baseline audiometric testing for employees hired for a period of **less than one year** and is permitted as a substitute for audiometric testing only for these employees.

Third-party hearing loss prevention programs are full hearing loss prevention programs and are distinct from audiometric testing provided by third parties as part of your own hearing loss prevention program. These programs may be organized by labor groups, trade associations, labor-management cooperatives, or other organizations to:

- Cover a specific group of employees
  - OR
- Combine efforts for several employers with common employees.

(2005 Ed.)

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63635, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-63805 Conduct hearing protection audits at least quarterly.**

You must:

- Conduct audits at least quarterly to provide a representative assessment of your workplace
  - The assessment is representative if it:
    - Covers all processes and work activities in your business at full production levels
    - AND
    - Covers all employees present on the audit day.
    - IF your business is mobile or involves variable processes, auditing may need to be repeated more often than quarterly
    - Auditing does not need to be repeated more than monthly as long as a reasonable effort is made to cover:
      - The activities with greatest exposure
      - AND
      - As many employees as possible.
      - Assess exposures and hearing protection for the full shift for each employee covered at the time of the audit.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63805, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-63810 Make sure staff conducting audits are properly trained.**

You must:

- Make sure staff conducting hearing protection audits:
  - Can demonstrate competence in:
    - Evaluating hearing protection attenuation
    - Evaluating hearing protector choices
    - Assessing the correct use of hearing protectors.
  - Are certified by the Council for Accreditation in Occupational Hearing Conservation (CAOHC) or have training in the following areas:
    - Noise and hearing loss prevention
    - Washington state noise regulations
    - Hearing protectors
    - Fitting of hearing protectors
    - Basic noise measurement
    - Hearing loss prevention recordkeeping.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63810, filed 12/21/04, effective 4/2/05.]

[Title 296 WAC—p. 2691]
WAC 296-307-63815  Assess the hearing protection used by each employee during audits.

You must:
• Confirm that:
  – Current site conditions during audits are consistent with conditions existing during noise monitoring
  – The hearing protection used by the employee is sufficient and appropriate for the conditions
  – The hearing protection is worn properly
  – The employees are satisfied with the performance and comfort of the hearing protection.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63815, filed 12/21/04, effective 4/2/05.]

You must:
• Keep a record of audit results for each employee assessed for the length of their employment and for the length of time you rely upon the audit results
• Include the following information in the record:
  – The make and model of the hearing protectors
  – The size of the protectors
  – Average noise exposure of the employee
  – Any problems found with use of the hearing protection
  – Any comments or complaints from the employee regarding the hearing protection.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63820, filed 12/21/04, effective 4/2/05.]

Third-party Audiometric Tests

WAC 296-307-63825  Make sure third-party hearing loss prevention programs meet the following requirements.

IMPORTANT:
Third-party hearing loss prevention programs are intended:
• For short-term employees hired or assigned to duties having noise exposures for less than one year
  AND
• For seasonal employees.
However, other employees may be included as long as you meet all requirements for hearing loss follow-ups and recordkeeping.

You must:
• Make sure that the third-party program is:
  – Equivalent to an employer program as required by this part
  AND
  – Uses audiometric testing to evaluate hearing loss.
• Make sure a licensed or certified audiologist, otolaryngologist, or other qualified physician administers the third-party program.
  • Make sure the third-party program has written procedures for:
    – Communicating with participating employers of program requirements
    – Follow-up procedures for detected hearing loss
    – Annual review of participating employer programs.
  • Make sure the following program elements are corrected by you or the third-party program when deficiencies are found:
    – Noise exposures
    – Hearing protection
    – Employee training
    – Noise controls.
  • Obtain a review of your hearing loss prevention program at least once per year, conducted by the third-party program administrator or their representative, in order to:
    – Identify any tasks needing a revised selection of hearing protection
    AND
    – Provide an overall assessment of the employers' hearing loss prevention activities.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-63825, filed 12/21/04, effective 4/2/05.]

WAC 296-307-640  Noise definitions.

A-weighted - An adjustment to sound level measurements that reflects the sensitivity of the human ear. Used for evaluating continuous or average noise levels.

Audiogram - A chart, graph, or table resulting from an audiometric test showing an individual's hearing threshold levels as a function of frequency.

Audiologist - A professional, specializing in the study and rehabilitation of hearing, who is certified by the American Speech, Hearing, and Language Association, or the American Academy of Audiology, and is licensed by the state board of examiners.

Baseline audiogram - The audiogram against which future audiograms are compared. The baseline audiogram is collected when an employee is first assigned to work with noise exposure. The baseline audiogram may be revised if persistent standard threshold shift (STS) of improvement is found.

Continuous noise - Noise with peaks spaced no more than one second apart. Continuous noise is measured using sound level meters and noise dosimeters with the slow response setting.

Criterion sound level - A sound level of ninety dBA noise is a one hundred percent noise dose exposure.

C-weighted - An adjustment to sound level measurements that evenly represents frequencies within the range of human hearing. Used for evaluating impact or impulse noise.

Decibel (dB) - Unit of measurement of sound level. A-weighting, adjusting for the sensitivity of the human ear, is indicated as "dBA." C-weighting, an even reading across the frequencies of human hearing, is indicated as "dBC."

Fast response - A setting for a sound level meter that will allow the meter to respond to noise events of less than one second. Used for evaluating impulse and impact noise levels.

Hertz (Hz) - Unit of measurement of frequency, numerically equal to cycles per second.

Impulsive or impact noise - Noise levels which involve maxima at intervals greater than one second. Impulse and impact noise are measured using the fast response setting on a sound level meter.
Noise dose - The total noise exposure received by an employee during their shift. It can be expressed as a percentage indicating the ratio of exposure received to the noise exposure received in an eight-hour exposure to constant noise at 90 dBA. It may also be expressed as the sound level that would produce the equivalent exposure during an eight-hour period (TWA).

Noise dosimeter - An instrument that integrates a function of sound pressure over a period of time in such a manner that it directly indicates a noise dose.

Occupational hearing loss - A reduction in the ability of an individual to hear either caused or contributed to by exposure in the work environment.

Otolaryngologist - A physician specializing in diagnosis and treatment of disorders of the ear, nose and throat.

Permanent threshold shift - A hearing level change that has become persistent and is not expected to improve.

Qualified reviewer - An audiologist, otolaryngologist, or other qualified physician who has experience and training in evaluating occupational audiograms.

Slow response - A setting for sound level meters and dosimeters in which the meter does not register events of less than about one second. Used for evaluating continuous and average noise levels.

Sound level - The intensity of noise as indicated by a sound level meter.

Sound level meter - An instrument that measures sound levels.

Standard threshold shift (STS) - A hearing level change, relative to the baseline audiogram, of an average of 10 dB or more at 2000, 3000, and 4000 Hz in either ear.

Temporary threshold shift - A hearing level change that improves. A temporary threshold shift may occur with exposure to noise and hearing will return to normal within a few days. Temporary threshold shifts can be indicators of exposures that lead to permanent hearing loss.

TWA - Equivalent eight-hour time-weighted average sound level - That sound level, which if constant over an eight-hour period, would result in the same noise dose measured in an environment where the noise level varies.

Part Y-8 Confined Spaces

WAC 296-307-642 Scope. This part applies to all confined spaces and provides requirements to protect employees from the hazards of entering and working in confined spaces. This part applies in any of the following circumstances:

- You have confined spaces in your workplace.
- Your employees will enter another employer's confined spaces.
- A contractor will enter your confined spaces.
- You provide confined space rescue services.
- You can use Table 1 to help you decide which requirements to follow for confined spaces.

Table 1 Requirements for Confined Spaces

<table>

<td>X</td>
</tr>
</tbody>
</table>

Definition:
A confined space is a space that is all of the following:
- Large enough and arranged so an employee could fully enter the space and work.
- Has limited or restricted entry or exit. Examples of spaces with limited or restricted entry are tanks, vessels, silos, storage bins, hoppers, vaults, excavations, and pits.
- Not primarily designed for human occupancy.

Note:
- Requirements in other chapters may apply to your work. You will find some safety and health requirements are addressed on a broad level in this part, while being addressed for a specific application in another rule. When this happens, both requirements apply and should not conflict. When a conflict does occur, you need to follow the more specific requirement.
- If you are uncertain which requirements to follow, contact your local labor and industries (L&I) office.

Your responsibility:
To identify your permit-required confined spaces and control employee entry.

You must:
- Identify permit-required confined spaces.
- Inform employees and control entry to permit-required confined spaces.

WAC 296-307-64402 Follow these requirements when you contract with another employer to enter your confined space.

(2005 Ed.)
WAC 296-307-64402 Identify permit-required confined spaces.

IMPORTANT:
If your workplace contains only nonpermit confined spaces and your employees do not enter another employer’s confined space, you may follow only the requirements in:
- WAC 296-307-644, Identifying and controlling permit-required confined spaces; and
- WAC 296-307-654, Nonpermit confined space requirements.

You must:
- Identify all permit-required confined spaces in your workplace.
- Assume any confined space is a permit-required confined space, unless you determine the space to be a nonpermit confined space.
  - If you enter the space to determine the hazards, follow the requirements in WAC 296-307-650, Permit entry procedures.
  - If you evaluate the confined space and there are no potential or actual hazards, you can consider it to be a nonpermit confined space.
- Document your determination that the space is nonpermit, as required by WAC 296-307-654.

Definitions:
A permit-required confined space or permit space is a confined space that has one or more of the following characteristics capable of causing death or serious physical harm:
- Contains or has a potential to contain a hazardous atmosphere.
- Contains a material with the potential for engulfing someone who enters the space.
- Has an internal configuration that could allow someone entering to be trapped or asphyxiated by inwardly converging walls or by a floor, which slopes downward and tapers to a smaller cross-section.
- Contains any physical hazard. This includes any recognized health or safety hazards including engulfment in solid or liquid material, electrical shock, or moving parts.
- Contains any other recognized safety or health hazard that could either:
  - Impair the ability to self rescue;
  - Result in a situation that presents an immediate danger to life or health.

A nonpermit confined space is a confined space that does NOT contain actual hazards or potential hazards capable of causing death or serious physical harm.

WAC 296-307-64404 Inform employees and control entry to permit-required confined spaces.

You must:
1. Provide information about confined spaces as follows:
   - Make available to affected employees and their authorized representatives all information and documents required by this part.
   - Inform affected employees about the existence, location, and danger of any permit-required confined spaces in your workplace by:
     - Posting danger signs; or
     - Using any other equally effective means to inform employees.

Note: A sign reading “Danger-Permit Required Confined Space, DO NOT ENTER” or using pictures or other similar wording employees can understand would satisfy the requirement for a sign.

You must:
2. Take effective measures to prevent unauthorized employees from entering permit-required confined spaces.

Note: Examples of measures to prevent employee entry include padlocks, bolted covers, special tools to remove covers, and providing employee training.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-64404, filed 12/21/04, effective 4/2/05.]

WAC 296-307-64406 Follow these requirements when you contract with another employer to enter your confined space.

IMPORTANT:
The contractor is responsible for following all confined space requirements in this part and in other rules that apply.

You must:
- Do all of the following if you arrange to have another employer (contractor) perform work that involves entry into your permit-required confined space:
  - Inform the contractor:
    - That the workplace contains permit-required confined spaces and entry is allowed only if the applicable requirements of this part are met.
    - Of the identified hazards and your experience with each permit-required confined space.
  - Of any precautions or procedures you require for the protection of employees in or near spaces where the contractor will be working.
    - Coordinate entry operations with the contractor, when either employees or employers from the different companies will be working in or near permit-required confined spaces.
    - Discuss entry operations with the contractor when they are complete. Include the following in your discussion:
      - The program followed during confined space entry; and
      - Any hazards confronted or created.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-64406, filed 12/21/04, effective 4/2/05.]

Permit-required Confined Space Program

WAC 296-307-646 Summary.
Your responsibility:
To develop your permit-required confined space program and practices.

IMPORTANT:
This section applies if employees will enter a permit-required confined space.

You must:
- Develop a written permit-required confined space program.
  WAC 296-307-64602

[Title 296 WAC—p. 2694]
Meet these additional requirements if your employees enter another employer's confined space.

**WAC 296-307-64604**

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-64604, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-64602 Develop a written permit-required confined space program.**

**IMPORTANT:**
- Identify and evaluate the hazards of permit-required confined spaces and the work performed, to assist you in developing your entry program.
- **You must:**
  - Develop a written program, before employees enter, that describes the means, procedures, and practices you use for the safe entry of permit-required confined spaces as required by this part. Include the following when applicable to your confined space entry program:
    - Documentation of permit entry procedures.
    - Documentation used for alternate entry procedures.
    - How to reclassify permit-required confined spaces to nonpermit spaces.
    - Designation of employee roles, such as entrants, attendants, entry supervisors, rescuers, or those who test or monitor the atmosphere in a permit-required space.
    - Identification of designated employee duties.
    - Training employees on their designated roles.
    - How to identify and evaluate hazards.
    - Use and maintenance of equipment.
    - How to prevent unauthorized entry.
    - How to coordinate entry with another employer.
    - How to rescue entrants.

**Note:** For alternate entry, your written program only needs to meet the requirements of WAC 296-307-648, Employee training, and WAC 296-307-652, Alternate entry procedures, of this part.

**You must:**
- Consult with affected employees and their authorized representatives when developing and implementing all aspects of your permit-required confined space program.
- Make the written program available to employees and their authorized representatives.
- Update your written program as necessary.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-64602, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-64604 Meet these additional requirements if your employees enter another employer's confined space.**

**You must:**
- Obtain any available information about permit-required confined space hazards and entry operations from the host employer.
- Coordinate entry operations with any other employers whose employees will be working in or near the permit-required confined space.
- Inform the host employer, either through a debriefing or during entry operations, about:
  - The entry program you will follow; and
  - Any hazards you confronted or created in the space during entry operations.

(2005 Ed.)
Permit Entry Procedures

WAC 296-307-650 Summary.
Your responsibility:
To establish procedures for the safe permit-required entry of confined spaces.
Implement procedures for entry permits.

WAC 296-307-65002 Use an entry permit that contains all required information.

WAC 296-307-65004 Keep and review your entry permits.

WAC 296-307-65006 Prevent unauthorized entry.

WAC 296-307-65008 Provide, maintain, and use proper equipment.

WAC 296-307-65010 Evaluate and control hazards for safe entry.

WAC 296-307-65012 Make sure you have adequate rescue and emergency services available.

WAC 296-307-65014 Use nonentry rescue systems or methods whenever possible.

WAC 296-307-65016 Make sure entry supervisors perform their responsibilities and duties.

WAC 296-307-65018 Provide an attendant outside the permit-required confined space.

WAC 296-307-65020 Make sure entrants know the hazardous conditions and their duties.

WAC 296-307-65022 Implement procedures for ending entry.

WAC 296-307-65024 [Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-65024, filed 12/21/04, effective 4/2/05.]

WAC 296-307-65002 Implement procedures for entry permits.
You must:
• Identify and evaluate, before employees enter, potential hazards from:
  – The permit-required confined space; and
  – The work to be performed.
• Complete an entry permit before entry is authorized, documenting that you have completed the means, procedures and practices necessary for safe entry and work.
• Make sure that entrants or their representatives have an opportunity to observe any monitoring or testing, or any actions to eliminate or control hazards, performed to complete the permit.
• Identify the entry supervisor.
  – Make sure the entry supervisor signs the entry permit, authorizing entry, before the space is entered.
• Make the completed permit available to entrants or their authorized representatives at the time of entry.
  – Do this by either posting the completed permit at the entry location, or by any other equally effective means.

WAC 296-307-65004 Use an entry permit that contains all required information.
You must:
• Make sure your entry permit identifies all of the following that apply to your entry operation:
  – The space to be entered.
  – Purpose of the entry.
  – Date and the authorized duration of the entry permit.
  – Hazards of the space to be entered.
  – Acceptable entry conditions.
  – Results of initial and periodic tests performed to evaluate and identify the hazards and conditions of the space, accompanied by the names or initials of the testers and by an indication of when the tests were performed.
  – Appropriate measures used before entry to isolate the space, and eliminate or control hazards.
  • Examples of appropriate measures include the lockout or tagging of equipment and procedures for purging, inerting, ventilating, and flushing permit-required confined spaces.
    – Names of entrants and current attendants.
  • Other means include the use of rosters or tracking systems as long as the attendant can determine quickly and accurately, for the duration of the permit, which entrants are inside the space.
    – The current entry supervisor.
    – A space for the signature or initials of the original supervisor authorizing entry.
    – Communication procedures for entrants and attendants to maintain contact during the entry.
    – Equipment provided for safe entry, such as:
      • Personal protective equipment (PPE).
      • Testing equipment.
      • Communications equipment.
      • Alarm systems.
      • Rescue equipment.
    – Rescue and emergency services available, and how to contact them. Include equipment to use, and names and contact information.
    – Other information needed for safety in the particular confined space.
    – Additional permits issued for work in the space, such as for hot work.

WAC 296-307-65006 Keep and review your entry permits.
You must:
• Keep entry permits for at least one year.
Keep entry permits or other atmospheric monitoring records that show the actual atmosphere an employee entered or worked in, as employee exposure records.

Review your permit-required confined space entry program as follows:

– Conduct a review when you have any reason to believe your entry program may not protect employees, and revise your program before allowing subsequent entries.

Note: Examples of circumstances requiring the review of your program include the following:

• There is unauthorized entry of a permit space.
• A permit space hazard not covered by the permit is found.
• A condition prohibited by the permit occurs.
• An injury or near-miss occurs during entry.
• There is a change in the use or configuration of a permit space.
• An employee complains about the effectiveness of the program.

You must:

• Review canceled entry permits within one year following each entry to evaluate:
  – Your permit-required confined space program.
  – The protection provided to employees entering permit-required confined spaces.
• Update your written permit-required confined space entry program as necessary.

Note: Employers may perform a single annual review covering all entries performed during a twelve-month period. If no entry is performed during a twelve-month period, no review is necessary.

Table 2

</tr>
</thead>
<tbody>
<tr>
<td>Testing and monitoring equipment</td>
<td>Evaluating permit-required confined space conditions</td>
</tr>
<tr>
<td>Ventilating equipment</td>
<td>Obtaining and maintaining acceptable entry conditions</td>
</tr>
</tbody>
</table>

You must:

• Implement measures necessary to prevent unauthorized entry into permit-required confined spaces, when conducting authorized entry.

Note: When removing entrance covers to open the confined space, protect entrants and those outside the confined space from hazards.

Examples of measures to prevent unauthorized entry are signs, barricades, warning tape, and an attendant.

You must:

• Provide the equipment in Table 2, when needed and at no cost to employees.
• Make sure that employees use provided equipment properly.
• Maintain the provided equipment.

WAC 296-307-65008 Prevent unauthorized entry.

WAC 296-307-65010 Provide, maintain, and use proper equipment.

WAC 296-307-65012 Evaluate and control hazards for safe entry.

</tbody>
</table>

WAC 296-307-65012 Evaluate and control hazards for safe entry.

• Evaluate and control hazards for safe entry into permit-required confined spaces by doing all the following:
  – Test for atmospheric hazards, in this order:
    ■ Oxygen.
    ■ Combustible gases and vapors.
    ■ Toxic gases and vapors.
  – Provide each entrant or their authorized representative an opportunity to observe any of the following:
    ■ Preentry testing.
    ■ Subsequent testing.
    ■ Monitoring of permit-required spaces.
  – Reevaluate the permit-required space in the presence of any entrant, or their authorized representative, who requests this to be done because they have reason to believe that the evaluation of that space may not have been adequate.
  – Upon request, immediately provide each entrant or their authorized representative, with the results of any testing required by this rule.
  – Continuously monitor conditions in areas where entrants are working, when isolation of the space is not feasible.

• Examples would be a large space or space that is part of a continuous system, such as a sewer.
• Evaluate space conditions during entry as follows:
Table 3
Evaluating Space Conditions

<table>
<thead>
<tr>

<td>Determine that acceptable entry conditions are being maintained during entry operations</td>
</tr>
<tr>
<td>Evaluate entry operations</td>
<td>Make sure entrants of more than one employer working at the same time in or around a permit-required confined space, do not endanger each other</td>
</tr>
</tbody>
</table>

IMPORTANT:
This section applies to both:
  • Employers whose employees use permit entry procedures; and
  • Employers who provide rescue services.

WAC 296-307-65014 Make sure you have adequate rescue and emergency services available.

You must:
1. Make sure you have adequate rescue and emergency services available during your permit-required confined space entry operations.
   • Evaluate and select rescue teams or services who can:
     – Respond to a rescue call in a timely manner. Timeliness is based on the identified hazards. Rescuers must have the capability to reach potential victims within an appropriate time frame based on the identified permit space hazards.
     – Proficiently rescue employees from a permit-required confined space in your workplace. Rescuers must have the appropriate equipment for the type of rescue.
   • Make sure that at least one member of the rescue team or service holds a current certification in first aid and cardiopulmonary resuscitation (CPR).
   • Inform each rescue team or service about the hazards they may confront when called to perform rescue.
   • Provide the rescue team or service with access to all permit spaces from which rescue may be necessary.
   – This will allow them to develop appropriate rescue plans and to practice rescue operations.

Note: What will be considered timely will vary according to the specific hazards involved in each entry. For example, WAC 296-307-594, Respirators, requires that employers provide a standby person or persons capable of immediate action to rescue employee(s) for work areas considered to contain an IDLH atmosphere.

You must:
2. Provide employees, assigned to provide permit-required confined space rescue and emergency services, with:
   • Personal protective equipment (PPE) needed for safe entry.
   • Other equipment required to conduct rescues safely.
   • Training so they are:
     – Proficient in the use of the PPE and other equipment.
     – Proficient as an entrant of permit-required confined spaces.
     – Able to safely perform assigned rescue and emergency duties.
     – Knowledgeable in basic first aid and cardiopulmonary resuscitation (CPR).
   – Practice sessions for permit-required confined space rescues at least once every twelve months where dummies, manikins, or actual persons are removed from either:
     – The actual permit spaces; or
     – Representative permit spaces that simulate the opening size, configuration, and accessibility, of permit spaces where rescue will be performed.
   – Establish procedures for:
     • Contacting rescue and emergency services.
     • Rescuing entrants from permit-required confined spaces.
     • Providing necessary emergency services to rescued entrants.
     • Preventing unauthorized persons from attempting a rescue.

WAC 296-307-65016 Use nonentry rescue systems or methods whenever possible.

You must:
1. Use nonentry retrieval systems or methods to rescue entrants in a permit-required confined space unless this:
   – Would increase the overall risk of injury to entrants; or
   – Would not contribute to the rescue of the entrant.
   – Make sure each entrant uses a chest or full-body harness, with a retrieval line attached to the harness at one of the following locations:
     – At the center of the employee’s back, near shoulder level.
     – Above the employee’s head.
     – At another point which presents a profile small enough for the successful removal of the employee.
   – Attach the retrieval line to a mechanical device or fixed point outside the space, so rescue can begin as soon as necessary.
   – Make sure a mechanical device is available to retrieve entrants from vertical spaces more than five feet (1.52 m) deep.

Note: When you can demonstrate that the use of a chest or full-body harness is not feasible or creates a greater hazard, then you may use wristlets or another method shown to be the safest and most effective alternative.

WAC 296-307-65018 Make sure entry supervisors perform their responsibilities and duties.

You must:
1. Make sure that an entry supervisor:
   – Authorizes the entry into a permit-required confined space by signing the entry permit.
   – Oversees entry operations.
Make sure entry supervisors have the required knowledge and proficiency to perform the job duties and responsibilities required by this part.

The entry supervisor may also perform other duties under this part, such as attendant or entrant, if they are trained and proficient in those duties.

The responsibility of the entry supervisor may be passed from one supervisor to another during an entry operation.

Note: • Make sure entry supervisors have the required knowledge and proficiency to perform the job duties and responsibilities required by this part.

The entry supervisor may also perform other duties under this part, such as attendant or entrant, if they are trained and proficient in those duties.

The responsibility of the entry supervisor may be passed from one supervisor to another during an entry operation.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-65018, filed 12/21/04, effective 4/2/05.]

WAC 296-307-65020 Provide an attendant outside the permit-required confined space.

IMPORTANT:

The number of attendants assigned should be tailored to the requirements of the space and the work performed.

You need to assess if it is appropriate or possible to have multiple permit spaces monitored by a single attendant, or have an attendant stationed at a location outside each space. Video cameras and radios are examples of tools that may assist an attendant monitoring more than one space.

Attendants may be stationed at any location outside the permit-required confined space if the duties described in this section can be effectively performed for each space that is monitored.

You must:

• Provide at least one attendant outside the permit-required confined space during entry operations.

• Make sure each permit-required confined space attendant:
  – Understands the hazards that may be faced during entry, including the mode, signs or symptoms, and results of exposure to the hazards.
  – Is aware of the behavioral effects of exposure to the hazard.
  – Continuously maintains an accurate count of entrants in the space.

• Maintains an accurate record of who is in the permit-required confined space.

• Communicates with entrants as necessary to monitor their status or alert them of the need to evacuate the space.

• Monitors activities inside and outside the space to determine if it is safe for entrants to remain in the space.

• Orders entrants to evacuate the space immediately if any of the following conditions occur:
  ■ A prohibited condition.
  ■ The behavioral effects of hazardous exposure on an entrant.
  ■ A situation outside the space that could endanger entrants.
  ■ The attendant cannot effectively and safely perform all the duties required in this part.

• Takes the following actions when unauthorized persons approach or enter a space:
  ■ Warns unauthorized persons to stay away from the space.
  ■ Tells the unauthorized persons to exit immediately if they have entered the space.
  ■ Informs entrants and the entry supervisor if unauthorized persons have entered the space.

• Monitors entry operations until relieved by another attendant or all entrants are out of the space.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-65020, filed 12/21/04, effective 4/2/05.]

WAC 296-307-65022 Make sure entrants know the hazardous conditions and their duties.

You must:

• Make sure that all entrants:
  – Know the hazards they may face during entry, including the mode, signs or symptoms, and results of exposure to the hazards.
  – Use equipment properly.
  – Communicate with the attendant as necessary so the attendant can:
    ■ Monitor entrant status.
    ■ Alert entrants of the need to evacuate.
    ■ Alert the attendant whenever either of these situations exist:
      ■ A warning sign or symptom of exposure to a dangerous situation such as, behavioral changes, euphoria, giddiness potentially from lack of oxygen or exposure to solvents.
      ■ A prohibited condition.
      ■ Exit from the permit-required confined space as quickly as possible when one of the following occurs:
        ■ The attendant or entry supervisor gives an order to evacuate.

(2005 Ed.)
The entrant recognizes any warning sign or symptom of exposure to a dangerous situation.

■ The entrant detects a prohibited condition.

■ An evacuation alarm is activated.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-65022, filed 12/21/04, effective 4/2/05.]

WAC 296-307-65024 Implement procedures for ending entry.

You must:

• Make sure you terminate the entry when entry operations are completed, including securing an entrance cover and canceling the permit.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-65024, filed 12/21/04, effective 4/2/05.]

WAC 296-307-652 Alternate entry procedures.

Summary:

Your responsibility:

To choose alternate entry procedures for spaces where the only hazard is a hazardous atmosphere.

IMPORTANT:

In addition to this section, you also need to meet the requirements in the following sections of this part:

– WAC 296-307-646, Permit-required confined space program.

You must:

Make sure the following conditions are met if using alternate entry procedures.

WAC 296-307-65202 Follow these alternate entry procedures for permit-required confined spaces.

WAC 296-307-65204

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-65204, filed 12/21/04, effective 4/2/05.]

WAC 296-307-65202 Make sure the following conditions are met if using alternate entry procedures.

You must:

• Make sure, when using alternate entry procedures, instead of permit entry procedures, that you have monitoring and inspection data that supports the following:

  – That the only hazard of the permit-required confined space is an actual or potentially hazardous atmosphere.

  – That continuous forced air ventilation alone is all that is needed to maintain the permit-required confined space for safe entry.

• Make sure an entry to obtain monitoring and inspection data or to eliminate hazards is performed according to WAC 296-307-500, Permit entry procedures.

• Make sure all documentation produced is available to each affected employee and their authorized representative.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-65202, filed 12/21/04, effective 4/2/05.]

WAC 296-307-65204 Follow these alternate entry procedures for permit-required confined spaces.

You must:

• Use the following alternate entry procedures:

  – Eliminate any unsafe conditions before removing an entrance cover.

  ■ When entrance covers are removed, promptly guard the opening with a railing, temporary cover, or other temporary barrier to prevent accidental falls through the opening and protect entrants from objects falling into the space.

  ■ Certify that preentry measures have been taken (such as safe removal of the cover and having protection needed to gather preentry data), with the date, location of the space, and signature of the person certifying.

  • Make the preentry certification available before entry to each entrant.

    – Before an employee enters the confined space, test the internal atmosphere with a calibrated, direct-reading instrument for all of the following, in this order:

      ■ Oxygen content.

      ■ Flammable gases and vapors.

      ■ Potential toxic air contaminants.

    – Provide entrants, or their authorized representatives, with an opportunity to observe the preentry and periodic testing.

    – Make sure the atmosphere within the space is not hazardous when entrants are present.

    – Use continuous forced air ventilation, as follows:

      ■ Wait until the forced air ventilation has removed any hazardous atmosphere before allowing entrants into the space.

      ■ Direct forced air ventilation toward the immediate areas where employees are, or will be, and continue ventilation until all employees have left the space.

      ■ Provide the air supply from a clean source and make sure it does not increase hazards in the space.

      ■ Test the atmosphere within the space as needed to make sure hazards do not accumulate.

      ■ If a hazardous atmosphere is detected during entry, do all of the following:

        ■ Evacuate employees from the space immediately.

        ■ Evaluate the space to determine how the hazardous atmosphere developed.

        ■ Implement measures to protect employees from the hazardous atmosphere before continuing the entry operation.

        ■ Verify the space is safe for entry before continuing the entry operation.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-65204, filed 12/21/04, effective 4/2/05.]

WAC 296-307-654 Nonpermit confined spaces requirements.

Summary:

IMPORTANT:

A confined space may be classified as a nonpermit confined space for as long as the hazards remain eliminated. Once a hazard is present, you must follow all requirements of this part that apply.
Your responsibility:
To make sure any space you classify as nonpermit does not have the potential to contain serious health or safety hazards.

You must:
Follow these requirements when classifying a confined space as a nonpermit confined space.

WAC 296-307-65402
Reevaluate nonpermit confined spaces if hazards develop.

WAC 296-307-65404
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-65404, filed 12/21/04, effective 4/2/05.]

WAC 296-307-65402 Follow these requirements when classifying a confined space as a nonpermit confined space.

You must:
• Make sure the confined space meets these conditions to be classified as nonpermit confined spaces:
  – The confined space does not contain an actual or potential hazardous atmosphere.
  – The confined space does not contain hazards capable of causing death or serious physical harm. This includes any recognized health or safety hazards including engulfment in solid or liquid material, electrical shock, or moving parts.
  – If you must enter to remove hazards, the space must be treated as a permit-required confined space until hazards have been eliminated.

Note: • Controlling atmospheric hazards through forced air ventilation does not eliminate the hazards.
  • You should evaluate the use of lockout-tagout, as covered in WAC 296-307-320, to determine if using it fully eliminates the hazard.
  • You are allowed to use alternate entry procedures covered in WAC 296-307-652, if you can demonstrate that forced air ventilation alone will control all hazards in the space.

You must:
• Document how you determined the confined space contained no permit-required confined space hazards. Certify this documentation with the following:
  – Date.
  – Location of the space.
  – Signature of the person making the determination.
  • Make the certification available to each entrant, or their authorized representative.

Note: This certification must be completed every time a permit-required confined space is reclassified as a nonpermit space.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-65404, filed 12/21/04, effective 4/2/05.]

WAC 296-307-65404 Reevaluate nonpermit confined spaces if hazards develop.

You must:
• Reclassify a nonpermit confined space to a permit-required confined space, if necessary, when changes in the use or configuration of the space increase the hazards to entrants.
• Make sure all employees exit the space if hazards develop. You must then reevaluate the space and determine whether it must be reclassified as a permit-required confined space.

WAC 296-307-656 Definitions.
Acceptable entry conditions:
The conditions that must exist in a permit-required confined space to allow safe entry and work.

Attendant:
An individual stationed outside one or more permit-required confined spaces to monitor the entrants.

Blanking or bleeding:
The absolute closure of a pipe, line, or duct by fastening a solid plate (such as a spectacle blind or a skillet blind) that completely covers the bore. It is capable of withstanding the maximum pressure of the pipe, line, or duct with no leakage beyond the plate.

Confined space:
A space that is all of the following:
• Large enough and arranged so an employee could fully enter the space and work.
  • Has limited or restricted entry or exit. Examples of spaces with limited or restricted entry are tanks, vessels, silos, storage bins, hoppers, vaults, excavations, and pits.
  • Not primarily designed for human occupancy.

Double block and bleed:
The closure of a line, duct, or pipe by closing and locking or tagging two in-line valves and by opening and locking or tagging a drain or vent valve in the line between the two closed valves.

Emergency:
Any occurrence (including any failure of hazard control or monitoring equipment) or event internal or external to the permit-required confined space that could endanger authorized entrants.

Engulfment:
The surrounding capture of a person by a liquid or finely divided (flowable) solid substance that can be inhaled to cause death by filling or plugging the respiratory system or that can exert enough force on the body to cause death by strangulation, constriction, or crushing.

Enter (entry):
The action by which a person passes through an opening into a permit-required confined space and includes work activities in that space. Entry is considered to have occurred as soon as any part of the entrant’s body breaks the plane of an opening into the space.

Note: If the opening is large enough for the worker to fully enter the space, a permit is required even for partial body entry. Permits are not required for partial body entry where the opening is not large enough for full entry, although other rules such as lockout-tagout, WAC 296-307-320 or respiratory hazards, WAC 296-307-624 may apply.

Entrant:
An employee who is authorized by the employer to enter a permit-required confined space.

Entry permit (permit):
The written or printed document that is provided by you to allow and control entry into a permit-required confined space and that contains the information required in WAC 296-307-650, Permit entry procedures.

(2005 Ed.)
Entry supervisor:
The person (such as the employer, crew leader, or crew chief) responsible for:
• Determining if acceptable entry conditions are present at a permit-required confined space where entry is planned;
• Authorizing entry and overseeing entry operations; and
• Terminating entry as required.

Hazardous atmosphere:
An atmosphere that may expose employees to the risk of death, incapacitation, impairment of ability to self-rescue (that is, escape unaided from a permit-required confined space), injury, or acute illness caused by one or more of the following:
• Flammable gas, vapor, or mist in excess of ten percent of its lower flammable limit (LFL).
• Airborne combustible dust at a concentration that meets or exceeds its LFL.

Note: This concentration may be approximated as a condition in which the dust obscures vision at a distance of five feet (1.52 m) or less.

• Atmospheric oxygen concentration below 19.5 percent or above 23.5 percent.
• Atmospheric concentration of any substance which may exceed a permissible exposure limit. For additional information about atmospheric concentration, see chapter 296-62 WAC, Parts F, G, and I, General occupational health standards and WAC 296-307-624, Respiratory hazards.

Note: An airborne concentration of a substance that is not capable of causing death, incapacitation, impairment of ability to self-rescue, injury, or acute illness due to its health effects is not covered by this definition.

• Any other atmospheric condition that is immediately dangerous to life or health.

Note: You can find guidance on establishing acceptable atmospheric conditions for air contaminants, which have no WISHA-determined doses or permissible exposure limits using other sources of information, such as:
• Material safety data sheets required by WAC 296-307-550, Employer chemical hazard communication.
• Published information.
• Internal documents.

Hot work permit:
A written authorization to perform operations, for example, riveting, welding, cutting, burning, and heating, that can provide a source of ignition.

Immediately dangerous to life or health (IDLH):
Any of the following conditions:
• An immediate or delayed threat to life.
• Anything that would cause irreversible adverse health effects.
• Anything that would interfere with an individual's ability to escape unaided from a permit-required confined space.

Note: Some materials - hydrogen fluoride gas and cadmium vapor, for example - may produce immediate transient effects that, even if severe, may pass without medical attention, but are followed by sudden, possibly fatal collapse twelve to seventy-two hours after exposure. The victim "feels normal" after recovery from transient effects until collapse. Such materials in hazardous quantities are considered to be "immediately" dangerous to life or health (IDLH).

Inerting:
The displacement of the atmosphere in a permit-required confined space by a noncombustible gas (such as nitrogen) to such an extent that the resulting atmosphere is noncombustible.

Note: This procedure produces an IDLH oxygen-deficient atmosphere.

Isolation:
The process by which a permit-required confined space is removed from service and completely protected against the release of energy and material into the space by such means as: Blanking or blinding; misaligning or removing sections of lines, pipes, or ducts; a double block and bleed system; lockout or tagout of all sources of energy; or blocking or disconnecting all mechanical linkages.

Line breaking:
The intentional opening of a pipe, line, or duct that is or has been carrying flammable, corrosive, or toxic material, an inert gas, or any fluid at a volume, pressure, or temperature capable of causing injury.

Nonpermit confined space:
A confined space that does NOT contain actual hazards or potential hazards capable of causing death or serious physical harm.

Oxygen deficient atmosphere:
An atmosphere containing less than 19.5 percent oxygen by volume.

Oxygen enriched atmosphere:
An atmosphere containing more than 23.5 percent oxygen by volume.

Permit-required confined space or permit space:
A confined space that has one or more of the following characteristics capable of causing death or serious physical harm:
• Contains or has a potential to contain a hazardous atmosphere.
• Contains a material with the potential for engulfing someone who enters.
• Has an internal configuration that could allow someone entering to be trapped or asphyxiated by inwardly converging walls or by a floor, which slopes downward and tapers to a smaller cross section.
• Contains any physical hazard. This includes any recognized health or safety hazards including engulfment in solid or liquid material, electrical shock, or moving parts.
• Contains any other recognized serious safety or health hazard that could either:
  – Impair the ability to self-rescue; or
  – Result in a situation that presents an immediate danger to life or health.

Permit-required confined space program:
An overall program for:
• Controlling and appropriately protecting employees from permit-required confined space hazards; and
• Regulating employee entry into permit-required confined spaces.

Prohibited condition:
Any condition in a permit-required confined space that is not allowed by the permit during the authorized entry period.

Rescue service:
The personnel designated to rescue employees from permit-required confined spaces.

Retrieval system:
The equipment used for nonentry rescue of persons from permit-required confined spaces, such as a retrieval line, full-body harness or wristlets, and a lifting device or anchor.
Testing:
The process of identifying and evaluating the hazards that entrants may be exposed to in a permit-required confined space. Testing includes specifying the tests that are to be performed in the permit-required confined space.

Note: Testing allows employers to devise and implement adequate controls to protect entrants during entry, and to determine if acceptable entry conditions are present.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060, 05-01-166, § 296-307-656, filed 12/21/04, effective 4/2/05.]

Part Y-10
Emergency Response

To state the minimum requirements that help you protect the safety and health of your employees during a response to hazardous substance releases in your workplace or any other location.

Do the requirements of this rule apply to your workplace?
This section applies if your employees are, or could become, involved in responding to uncontrolled releases of hazardous substances in your workplace or any other location. Use the scope flow chart, and definitions that follow, to determine if this section applies to your workplace(s). Defined words are italicized in the flow chart.

307 - FLOWCHART

* The flow chart references other rules applicable to your workplace depending on conditions and hazards. Examples include:
  • WAC 296-62-400, Hazardous chemicals in laboratories
  • WAC 296-307-594, Respiratory protection.
Definitions applicable to the flow chart (see WAC 296-307-70480 for additional definitions used in this section):

**Danger area**
Areas where conditions pose a serious danger to employees, such as areas where:
- Immediately dangerous to life or health (IDLH) conditions could exist
  OR
  - High levels of exposure to toxic substances could exist
  OR
  - There is a potential for exceeding the lower explosive limit (LEL), also known as the lower flammability limit (LFL), of a substance.

**Emergency response**
A response to an anticipated release of a hazardous substance that is, or could become, an *uncontrolled release*.

**Hazardous substance**
Any biological, radiological, or chemical substance that can have adverse effects on humans. (See WAC 296-307-70480 for a more specific definition.)

**Immediately dangerous to life or health (IDLH)**
Any atmospheric condition that would:
- Cause an immediate threat to life
- Cause permanent or delayed adverse health effects
- Interfere with an employee’s ability to escape.

**Incidental release**
A release that can be safely controlled at the time of the release and does not have the potential to become an *uncontrolled release*.

Example of a situation that results in an incidental release:

A tanker truck is receiving a load of hazardous liquid when a leak occurs. The driver knows the only hazard from the liquid is minor skin irritation. The employer has trained the driver on procedures and provided equipment to use for a release of this quantity. The driver puts on skin protection and stops the leak. A spill kit is used to contain, absorb, and pick up the spilled material for disposal.

**Limited action**
Action necessary to:
- Secure an operation during emergency responses,
  OR
- Prevent an incident from increasing in severity.
Examples include shutting down processes and closing emergency valves.

**Release**
A spill, leak, or other type of hazardous substance discharge.

**Uncontrolled release**
A release where significant safety and health risks could be created. Releases of hazardous substances that are either incidental or could not create a safety or health hazard (i.e., fire, explosion or chemical exposure) are not considered to be uncontrolled releases.

Examples of conditions that could create a significant safety and health risk:
- Large-quantity releases
- Small-releases that could be highly toxic
- Airborne exposures that could exceed a WISHA permissible exposure limit or a published exposure limit and employees are not adequately trained or equipped to control the release.

Example of an uncontrolled release:
A forklift driver knocks over a container of a solvent-based liquid, releasing the contents onto the warehouse floor. The driver has been trained to recognize the vapor is flammable and moderately toxic when inhaled. The driver has not been trained or provided appropriate equipment to address this type of spill. In this situation, it is not safe for the driver to attempt a response. The driver needs to notify someone of the release so an emergency response can be initiated.

**Workplace**
- A fixed facility
  OR
  - A temporary location (such as a traffic corridor)
  OR
  - Locations where employees respond to emergencies.

**Summary:**
**Your responsibility:**
To anticipate, plan for, and manage emergency response operations so employees are protected from hazardous substances and conditions.

**Note:** Other chapters may apply to your workplace, such as:
- Chapter 296-62 WAC, General occupational health standards.
- Other regulations that could affect your workplace, such as:
  - These rules apply to your workplace but do not relieve you of your responsibility to comply with other rules.
  - These rules do not relieve you of your responsibility to comply with other rules.

You will find some safety and health requirements (for example, personal protective equipment) are addressed on a general level in the core rules, while being addressed for a specific application in this section. When this happens, both requirements apply and should not conflict.

If you are uncertain which requirements to follow, you must comply with the more protective requirement. Contact your local L&I office if you need assistance in making this determination.

**You must:**
- WAC 296-307-70410 Planning
- WAC 296-307-70415 Training
- WAC 296-307-70420 Medical surveillance
- WAC 296-307-70425 Keep records
- WAC 296-307-70430 Incident requirements
- WAC 296-307-70435 Implement and maintain an incident command system (ICS) (incident command system)
- WAC 296-307-70440 Prepare skilled support personnel
- WAC 296-307-70445 Make sure the incident commander oversees activities during the response
- WAC 296-307-70450 Use the buddy system in danger areas
- WAC 296-307-70455 Provide rescue and medical assistance
- WAC 296-307-70460 Personal protective equipment

[Title 296 WAC—p. 2704]
WAC 296-307-70465 Control hazards created by personal protective equipment (PPE)
WAC 296-307-70470 Use personal protective equipment (PPE) properly
WAC 296-307-70475 Postemergency response
WAC 296-307-70480 Definitions.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-704, filed 12/21/04, effective 4/2/05.]

Note: • You may already have an emergency response plan, such as required by chapter 296-843 WAC. Hazardous waste operations or by state and locally coordinated response efforts (Section 303 of Superfund Amendments and Reauthorization Act (SARA), Title III). You may use these plans to comply with this section, if they include the items listed below:
• Before a written emergency response plan can be developed, you will need to anticipate the types of uncontrolled releases that employees could encounter in your workplace(s).

You must:
(1) Make sure your plan is written and adequately addresses, as a minimum, all of the following:
• Preemergency planning and coordination with additional responders (including personnel from other employers such as: Fire departments, law enforcement agencies, emergency medical services, and state or federal agencies).
• Personnel roles, (see Table 1) and lines of authority and communications for all affected parties including responders.
• Employee training (see WAC 296-307-70415, train your employees), for more detail:
  Note: • Responders' level of training depends on the duties and roles the employer assigns.
  • Training for the employees' role should address the competencies specified in Tables 3 through 6.
  • Training on specific substances may be appropriate depending on the number and characteristics of hazardous substances expected to be encountered. For example, if employees may only respond to one substance, you could provide training (covering the knowledge and skills specified in Tables 3 through 6) relevant to that single substance. If employees might respond to a range of hazardous substances, training may be required to cover categories of hazardous substances.

You must:
• Videos and automated training methods (for example: Interactive computer based programs) may be used in training; however, instructors must be readily available to:
  • Encourage and provide responses to questions for the benefit of the group
  • Evaluate employees' understanding of the material
  • Provide instructional interaction to the group.
• Emergency recognition
• Immediate emergency procedures including:
  • Methods of alerting employees (see WAC 296-307-345, Employee alarm systems) and outside responders
  • Procedures for limited action (emergency prevention).

Note: Limited action includes shutting down processes, closing emergency valves and other critical actions to secure the operation, or prevent the incident from increasing in severity.

### Limited Action and Employee Roles

<table>
<thead>
<tr>
<th>If...</th>
<th>Then employees involved would be:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Limited action could be conducted in the danger area</td>
<td>Considered emergency responders</td>
</tr>
<tr>
<td>Limited action will not be conducted in IDLH conditions</td>
<td>Considered evacuees, not emergency responders</td>
</tr>
</tbody>
</table>

- Details of who will evacuate immediately and who will remain behind for limited action
- Evacuation routes and procedures
- How to establish safe distances and places of refuge
  (for example, during emergency response the incident commander (IC) decides to make changes based on new developments, i.e., changes in the wind direction).

You must:
• Methods of securing and controlling access to the site
• Emergency medical treatment and first aid
• A complete personal protective equipment (PPE) program that addresses:
  • Selection of PPE including selection criteria to be used and the identification, specified use and limitations of the PPE selected
  • Training on proper use of PPE (including maintenance)
  • Hazards created by wearing PPE including heat stress during temperature extremes, and/or other appropriate medical considerations
  • Criteria used for determining the proper fit of PPE
  • Procedures covering proper use of PPE including procedures for inspection, putting it on (donning) and removing it (doffing)
  • Maintenance of PPE including procedures for decontamination, disposal and storage
  • Methods used to evaluate the effectiveness of your PPE program.

Note: • If a manufacturer's printed information or WISHA rule adequately addresses procedural requirements (such as donning or doffing for PPE), it is not necessary to rewrite this into your program; simply attach the printed information.
• You may use written procedures provided by the equipment manufacturer when they meet the requirements of other chapters, including chapter 296-307 WAC, Part Y-5, Respirators.

- Emergency equipment
- Emergency response procedures
- Decontamination procedures determined by a hazardous materials specialist or other qualified individual
- Methods to critically assess the response and conduct appropriate follow-up.

You must:
(2) Make your written emergency response plan available to employees, their representatives, and WISHA personnel for inspecting or copying.

Note: In situations where multiple employers could respond to an incident, all plans should consistently address:
• Who will be designated as the incident commander (IC) AND
• If, when, and how transfer of the incident commander (IC) position will take place.

(2005 Ed.)
### Table 1: Roles and Duties of Emergency Responders

<table>
<thead>
<tr>
<th>If the employee's role is:</th>
<th>Then all the following apply. They:</th>
</tr>
</thead>
<tbody>
<tr>
<td>First responder at the awareness level</td>
<td>* Are likely to witness or discover a hazardous substance release</td>
</tr>
<tr>
<td></td>
<td>* Are trained to initiate an emergency response by notifying the proper authorities of the release</td>
</tr>
<tr>
<td></td>
<td>* Take no further action beyond notifying the authorities</td>
</tr>
<tr>
<td>First responder at the operations level</td>
<td>* Respond to actual or potential releases in order to protect nearby persons, property, and/or the environment from the effects of the release</td>
</tr>
<tr>
<td></td>
<td>* Are trained to respond defensively, without trying to stop the release</td>
</tr>
<tr>
<td></td>
<td>* May try to:</td>
</tr>
<tr>
<td></td>
<td>- Confine the release from a safe distance</td>
</tr>
<tr>
<td></td>
<td>- Keep it from spreading</td>
</tr>
<tr>
<td></td>
<td>- Protect others from hazardous exposures</td>
</tr>
<tr>
<td>Hazardous materials technician</td>
<td>* Respond to releases or potential releases, with the intent of stopping the release</td>
</tr>
<tr>
<td></td>
<td>* Are trained to approach the point of release offensively in order to, either:</td>
</tr>
<tr>
<td></td>
<td>- Plug</td>
</tr>
<tr>
<td></td>
<td>- Patch</td>
</tr>
<tr>
<td></td>
<td>- Stop the release using other methods</td>
</tr>
<tr>
<td>Hazardous materials specialist</td>
<td>* Respond along with, and provide support to, hazardous materials technicians</td>
</tr>
<tr>
<td></td>
<td>* Are required to have more specific knowledge of hazardous substances than a hazardous materials technician</td>
</tr>
<tr>
<td></td>
<td>* Act as the site activity liaison when federal, state, local, and other government authorities participate</td>
</tr>
<tr>
<td>Incident commander</td>
<td>* Have ultimate responsibility for:</td>
</tr>
<tr>
<td></td>
<td>- Direction</td>
</tr>
<tr>
<td></td>
<td>- Control</td>
</tr>
<tr>
<td></td>
<td>- Coordination of the response effort</td>
</tr>
<tr>
<td></td>
<td>- Will assume control of the incident beyond the first responder awareness level</td>
</tr>
<tr>
<td>Specialist employee</td>
<td>* Are a technical, medical, environmental, or other type of expert</td>
</tr>
<tr>
<td></td>
<td>* May represent a hazardous substance manufacturer, shipper, or a government agency</td>
</tr>
<tr>
<td></td>
<td>* May be present at the scene or may assist from an off-site location</td>
</tr>
<tr>
<td></td>
<td>* Regularly work with specific hazardous substances</td>
</tr>
<tr>
<td></td>
<td>* Are trained in the hazards of specific substances</td>
</tr>
<tr>
<td></td>
<td>* Are expected to give technical advice or assistance to the incident commander or incident safety officer, when requested</td>
</tr>
<tr>
<td>Skilled support personnel</td>
<td>* Are needed to perform an immediate, specific emergency support task at the site</td>
</tr>
<tr>
<td></td>
<td>* Are skilled in the operation of equipment including:</td>
</tr>
<tr>
<td></td>
<td>- Earth moving equipment</td>
</tr>
<tr>
<td></td>
<td>- Cranes</td>
</tr>
<tr>
<td></td>
<td>- Hoisting equipment</td>
</tr>
<tr>
<td>Incident safety officer</td>
<td>* Are designated by the incident commander</td>
</tr>
<tr>
<td></td>
<td>* Are knowledgeable in operations being implemented at the site</td>
</tr>
<tr>
<td></td>
<td>* Have specific responsibility to</td>
</tr>
<tr>
<td></td>
<td>- Identify and evaluate hazards</td>
</tr>
<tr>
<td></td>
<td>- Provide direction on employee safety matters</td>
</tr>
</tbody>
</table>

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-70410, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-70415 Training.**

**Train your employees**

**Note:**
- Use Tables 3 through 6 to identify your employees' training competencies.
- You may conduct training internally, or use outside training services to comply with this section.
  - When outside trainers are hired, you are still responsible for making sure the requirements of this section are met. For example, employers may compare the course outline to the competencies listed in Tables 3 through 6.

**You must:**
- Make sure employees are appropriately trained for their assigned roles and duties as follows:

**Exemption:** Skilled support employees are not covered by the training requirements of this section (see WAC 296-307-70440).

**Initial training:**
- Provide initial training before the employee is allowed to participate in an actual emergency response operation.

**Note:** When first responders at the awareness or operations level have sufficient experience to objectively demonstrate competencies specified in Table 3, you may accept experience instead of training.

- Make sure initial training adequately addresses the competencies in Tables 3 through 6 and the minimum training durations in Table 2.

[Title 296 WAC—p. 2706] (2005 Ed.)
Certify that employees objectively demonstrate competencies specified in Tables 3 through 6 (except for employees trained as first responders at the awareness level).

**You must:**

**Retraining (refresher) training:**
- Provide retraining annually.
- Make sure retraining covers necessary content.
- Document training or demonstrated competency.

**Note:** Retraining is not required when employees demonstrate competencies annually and a record is kept of the demonstration methodology used.

**You must:**

**Trainer qualifications:**
- Verify trainers have satisfactorily completed an instructors’ training course for the subjects they teach. For example, courses offered by the United States National Academy, or equivalent courses are acceptable.
- OR
  - Have the educational and instructional experience necessary for training.

**Specialist employees:**
- Specialist employees who have been sent to the scene to advise or assist must receive training or demonstrate competency in their specialty, annually.

</table>

### Table 5
**Competencies for Incident Commanders**

Employees designated as Incident Commanders must be able to show they:

- Have competencies specified for the First Responder Operations Level. (See Table 3.)
- Know of the state emergency response plan and the Federal Regional Response Team.
- Can implement the local emergency response plan.
- Can implement the employer's emergency response plan.
- Have knowledge of the incident command system (ICS) and understand how they relate to it.
- Can implement the employer's ICS.
- Understand the hazards and risks associated with employees working in chemical protective clothing.
- Understand the importance of decontamination procedures.

**Note:** If the first employee arriving at the scene is not trained as an IC, they may take control of the incident within their designated role and training level.

### Table 6
**Competencies for Specialist Employees**

Employees designated as Specialist Employees must be able to show they:

- Have current knowledge in their field regarding safety and health practices relating to the specific hazardous substances.
- Have the knowledge of the ICS and understand how they relate to it.
- Understand the care and use of personal protective equipment (PPE).

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-70415, filed 12/21/04, effective 4/2/05.]

---

**WAC 296-307-70420  Medical surveillance. Provide medical surveillance to employees.**

**You must:**

(1) Provide medical surveillance for employees to comply with Tables 7 and 8, and the following:

- Make medical surveillance available at:
  - Reasonable times and places.
  - No cost to employees, including travel associated costs such as mileage, gas or bus fare if the employee is required to travel off site

  **AND**

  - Wages for additional time spent outside of employees' normal work hours.
  - Make sure a licensed physician performs or supervises exams and procedures.
  - Give complete information to the examining physician including:
    - A copy of this section.
    - A description of the employee's duties that relate to hazardous substance exposure.
    - The hazardous substance exposure levels anticipated for the employee.

[Title 296 WAC—p. 2708]  
(2005 Ed.)
– A description of the personal protective equipment (PPE) the employee could use.
– Information available from previous medical examinations.
– The medical evaluation information required by chapter 296-307 WAC, Part Y-5, Respirators.
• Medical exams must include, at a minimum:
  – A medical history.
  – A work history (or updated history if on file).
  – A special emphasis on:
    ■ Assessment of symptoms related to handling hazardous substances.
    ■ Health hazards.
    ■ Evaluation of fitness for duty (including the ability to wear any personal protective equipment (PPE) or other conditions that may be expected at the workplace).
  – Other content as determined by the examining physician.

You must:
(2) Obtain the physician's written opinion and give a copy to the employee that includes:
• A statement of whether or not medical conditions were found which would increase the employee's risk for impairment during emergency response work or respirator use.
  – Do not include specific findings or diagnoses unrelated to occupational exposures.
• Limitations recommended to the employee's assigned work, if any.
• Exam and test results if the employee requests this information.
• A statement that affirms the employee has been confidentially informed of medical exam results (including medical conditions requiring follow-up).

Table 7
Medical Surveillance for Employee Categories

<table>
<thead>
<tr>
<th>If the employee is covered by this section and is:</th>
<th>Then you must:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Exposed for at least 30 days a year to health hazards or hazardous substances at or above the permissible exposure limit or published exposure levels (even when respirators are used), OR • Required to wear a respirator for at least 30 days a year.*</td>
<td>• Offer standard medical surveillance as specified in Table 8.*</td>
</tr>
<tr>
<td>• A hazardous materials (HAZMAT) team member. • A hazardous materials specialist.</td>
<td>• Provide standard medical surveillance as specified in Table 8.</td>
</tr>
<tr>
<td>• An emergency responder who shows immediate or delayed signs or symptoms possibly resulting from exposure to hazardous substances during an incident.</td>
<td>• Provide incident-specific medical surveillance as specified in Table 8.</td>
</tr>
<tr>
<td>• Not an emergency responder and: – May be injured. – Shows immediate or delayed signs or symptoms possibly resulting from exposure to hazardous substances. – May have been exposed to hazardous substances at concentrations above the permissible exposure limits (PELs) or the published exposure levels without appropriate PPE.</td>
<td>• Offer incident-specific medical surveillance as specified in Table 8.</td>
</tr>
</tbody>
</table>

*Note: A medical evaluation for respirator use is required by chapter 296-307 WAC, Part Y-5, Respiratory protection, for those employees who have not been cleared for respirator use during medical surveillance activities.

Table 8
Frequency of Exams and Consultations

<table>
<thead>
<tr>
<th>If the employee is covered by:</th>
<th>Then medical surveillance must include:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Standard medical surveillance</td>
<td>Exams and consultations: • Before assignment. Note: If the employee is a hazardous materials (HAZMAT) team member or a hazardous materials specialist, the employee must receive a baseline physical examination. • At least once every 12 months after their initial assignment unless the physician believes a shorter, or longer interval (but no more than 24 months) is appropriate. • Whenever employees are reassigned to an area where they will no longer be covered by medical surveillance and they have not been examined within the past 6 months.</td>
</tr>
</tbody>
</table>
WAC 296-307-70425 Keep records.
You must:
• Keep a record of:
  – Name and Social Security number of the employee receiving medical surveillance
  – Physicians’ written opinions, recommended limitations, and results of examinations and tests
  – Any employee medical complaints regarding hazardous substance exposures
  – A copy of all information given to the examining physician (except a copy of this section).

WAC 296-307-70430 Incident requirements. Recognize emergencies and initiate a response.
You must:
• Make sure employees follow procedures in your emergency response plan to:
  – Recognize when an emergency response must be initiated
  – Notify employees, and others designated in your plan, of the release
  – Follow immediate emergency procedures
  – Prevent the incident from increasing in severity or to secure the operation.

WAC 296-307-70435 Implement and maintain an incident command system (ICS).
You must:
(1) Make sure a single individual, acting as the incident commander (IC), is in charge of the site-specific incident command system (ICS) and acts within their designated role and training level.

You must:
(2) Make sure all employers’ emergency responders and their communications are coordinated and controlled by the IC.

WAC 296-307-70440 Prepare skilled support personnel.
You must:
(1) Make sure that your skilled support personnel (including those employees who are not regularly employed by you) who could be exposed to on-scene hazards are given an initial briefing at the site before they participate in any emergency response. The initial briefing must include:
  • What chemical hazards are involved
  • What duties are to be performed
  • Instruction in the wearing of appropriate personal protective equipment.

You must:
(2) Make sure the safety and health precautions given to your employees are also given to skilled support personnel.

WAC 296-307-70445 Make sure the incident commander oversees activities during the response. The employer of the incident commander (IC) must:
(1) Identify all hazardous substances and conditions present, within their training level, using site analysis and maximum exposure limits, when appropriate.

<table>
<thead>
<tr>
<th>Table 8</th>
<th>Frequency of Exams and Consultations</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• As soon as possible after an employee reports:</td>

[Title 296 WAC—p. 2710] (2005 Ed.)
(2) Implement emergency response procedures appropriate to the hazardous substances and conditions present, such as:

- Procedures that address the use of engineering controls, hazardous substance handling, and new technologies
- Procedures that address decontamination
- Procedures that address PPE
- Procedures that limit the number of personnel to those who are actively performing emergency response operations, in areas where exposure could exist.

(3) Designate an incident safety officer (ISO).

- Make sure the ISO demonstrates knowledge about operations being implemented at the emergency response site. They must:
  - Identify and evaluate hazards
  - Communicate with the IC about hazards, immediately informing the IC of corrective actions that must be taken when conditions are judged to be:
    ■ An imminent danger
    OR
    ■ Immediately dangerous to life or health (IDLH).
  - Provide direction about the safety of operations.

WAC 296-307-70450 Use the buddy system in danger areas.

You must:
- Make sure operations and tasks (including limited actions) in danger areas are conducted using the buddy system in teams of two or more.

Definition:
Danger areas are areas where conditions pose a serious danger to employees, such as areas where:
- Immediately dangerous to life or health (IDLH) conditions could exist.
  OR
  - High levels of exposure to toxic substances could exist.
  OR
  - There is a potential for exceeding the lower explosive limit (LEL), also known as the lower flammability limit (LFL) of a hazardous substance.

WAC 296-307-70455 Provide rescue and medical assistance.

You must:

<table>
<thead>
<tr>
<th>Table 9</th>
<th>Selecting PPE for Specific Hazards</th>
</tr>
</thead>
<tbody>
<tr>
<td>If:</td>
<td>Then use:</td>
</tr>
<tr>
<td>Inhalation hazards could be present.</td>
<td>• Positive-pressure (pressure-demand) self-contained breathing apparatus (SCBA) OR • A decreased level of respiratory protection only when the incident commander determines, from air monitoring results, that employees will be adequately protected.</td>
</tr>
</tbody>
</table>

WAC 296-307-70460 Personal protective equipment.

You must:
- Provide employees with appropriate PPE and make sure it is used if hazards could be present.
  - Select PPE (such as respirators, gloves, protective suits and other PPE) based on:
    - An evaluation of the performance characteristics (such as breakthrough time and hazardous substance-specificity of the material or item) relevant to the requirements and limitations of the site.
    - Task-specific conditions and durations.
    - The hazards and potential hazards of the site (see Table 9, Selecting PPE for Specific Hazards).
- Select totally encapsulating chemical protective (TECP) suits, as specified in Table 9, that:
  - Maintain positive air pressure.
  - Prevent inward test gas leakage of more than 0.5 percent.

Note:
- Employers who require their employees to provide first aid must comply with the bloodborne pathogen rule, chapter 296-823 WAC.

WAC 296-307-70450 Personal protective equipment.

You must:
- Provide stand-by employees equipped with the same level of personal protective equipment (PPE) as the entrants, for assistance or rescue.

Note:
- The buddy system applies to stand-by employees (WAC 296-307-70450).
  - One of the two stand-by employees can be assigned to another task provided it does not interfere with the performance of the stand-by role.
  - Rescue equipment should be selected and provided based on the types of rescue situations that could occur.

You must:
- Make sure employees trained in first aid are readily available with necessary medical equipment and have a way to transport the injured.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-70455, filed 12/21/04, effective 4/2/05.]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-70445, filed 12/21/04, effective 4/2/05.]

[Title 296 WAC—p. 2711]
Chemical exposure levels will create a substantial possibility of:
- Immediate death.
- Immediate serious illness or injury.
- Reduced ability to escape.

<table>
<thead>
<tr>
<th>Chemical exposure levels will create a substantial possibility of:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Immediate death.</td>
</tr>
<tr>
<td>• Immediate serious illness or injury.</td>
</tr>
<tr>
<td>• Reduced ability to escape.</td>
</tr>
</tbody>
</table>

Skin absorption of a hazardous substance may result in a substantial possibility of:
- Immediate death.
- Immediate serious illness or injury.
- Reduced ability to escape.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-70460, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-70465 Control hazards created by personal protective equipment (PPE).**

**You must:**
- Control hazards created by the use of PPE, including:
  - Heat stress due to extremely high temperatures.
  - Any other employee health hazard and consideration.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-70465, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-70470 Use personal protective equipment (PPE) properly.**

**You must:**
(1) Make sure employees inspect PPE before, during and after use, following your plan's procedures.
(2) Make sure employees put on (don) and remove (doff) PPE following your plan's procedures.
(3) Make sure employees do not interchange self-contained breathing apparatus (SCBA) air cylinders from different manufacturers, unless all of the following apply:
- There is a life-saving emergency
- You need a supplemental air supply
- The cylinders are of the same capacity and pressure rating.
(4) Make sure compressed air cylinders used with SCBAs meet the testing and service life requirements of the United States Department of Transportation (USDOT). Search at: [http://www.dot.gov](http://www.dot.gov).

**Note:** You can also check with the cylinder manufacturers to obtain USDOT test and service life specifications.

**You must:**
(5) Make sure PPE is maintained in a safe and reliable condition using your plan's procedures. PPE maintenance includes:
- Decontamination
- Cleaning
- Inspection
- Identification of damage or defects
- Parts repair or replacement
- Storage or disposal.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-166, § 296-307-70470, filed 12/21/04, effective 4/2/05.]

**WAC 296-307-70475 Postemergency response.**

**IMPORTANT:**
Postemergency response is the stage of the emergency response where the immediate threat from the release has been stabilized or eliminated, and cleanup of the site has started.

When cleanup is done by the employees who were part of the initial emergency response, the employees are not covered by this section (however, training, PPE and other requirements in WAC 296-307-70460 through 296-307-70470 apply to these employees).

**You must:**
(1) Follow Table 10 to determine which requirements apply to your postemergency response activities.
(2) Maintain clean-up equipment as specified in Table 10.

**Table 10**

WAC 296-307-70480 Definitions. The following definitions are specific to this section:

**Annually**
Any twelve-month cycle.

**Buddy system**
A system of organizing employees (who enter or stand by danger areas) into work groups, so each employee can be observed by at least one other member of the group. The purpose of this system is to provide rapid assistance to employees in an emergency.

**Clean-up operation(s)**
An operation where hazardous substances are removed, contained, incinerated, neutralized, stabilized, cleared up or, in any other manner, processed or handled with the goal of making the site safer for people or the environment.

**Danger area**
Areas where conditions pose a serious danger to employees, such as areas where:
- Immediately dangerous to life or health (IDLH) conditions could exist
- OR
  - High levels of exposure to toxic substances could exist
  - OR
  - There is a potential for exceeding the lower explosive limit (LEL), also known as the lower flammability limit (LFL), of a substance.

**Decontamination**
Removing hazardous substances from employees and their equipment so potential adverse health effects will not occur.

**Emergency response**
An organized response to an anticipated release of a hazardous substance that is, or could become, an uncontrolled release.

**Emergency response plan**
A written plan that requires coordination between emergency response participants, and contains procedures, criteria, and other information that will be applied to emergency response operations. Each employer's plan should be compatible with local and state plans.

**Engineering controls**
Methods of controlling employee exposures by modifying the source or reducing the quantity of contaminants.

**Hazardous materials team (HAZMAT team)**
A group of employees who are expected to perform responses to releases, or possible releases, of hazardous substances for the purpose of control and stabilization. As a result of their duties, HAZMAT team members may have close contact with hazardous substances.

**Hazardous substance**
Any of the following substances that could adversely affect an exposed employee's health or safety:
- Substances defined under section 101(14) of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA) or "Superfund" Act (visit: http://www.epa.gov)
- Biological or other disease-causing agents released that could reasonably be expected to cause death, disease, behavioral abnormalities, cancer, genetic mutation, physiological malfunctions (including malfunctions in reproduction) or physical deformations in a person or their offspring when the person:
  - Is directly exposed to the agent in the environment
  - Directly ingests, inhales, or assimilates the agent from the environment
  - Indirectly ingests the agent through a food chain
- Substances listed by the United States Department of Transportation as hazardous materials under Title 49 (Transportation) in the Code of Federal Regulations (CFR), Part 172, section 101 and appendices (visit: http://www.wn.nara.gov and search for "List of CFR subjects")
- Hazardous wastes as defined in this section.

**Health hazard**
A chemical, a mixture of chemicals, or a pathogen for which there is statistically significant evidence, based on at least one study conducted according to established scientific principles, that acute or chronic health effects may occur in exposed employees.

The term "health hazard" includes stress due to temperature extremes and chemicals that are:
- Carcinogens
- Toxic or highly toxic agents
- Reproductive toxins, irritants, corrosives, sensitizers, hepatotoxins, nephrotoxins, or neurotoxins
- Agents acting on the hematopoietic system agents that damage lungs, skin, eyes, or mucous membranes. (Detailed definitions of these chemical terms can be found in the Safety and health core rules, WAC 296-307-550, chemical hazard communication.)

**Immediately dangerous to life or health (IDLH)**
Any atmospheric condition that would:
- Cause an immediate threat to life
- OR
- Cause permanent or delayed adverse health effects
- OR
- Interfere with an employee's ability to escape.

**Incident command system (ICS)**
An organized approach to control and manage operations at an emergency response incident.

**Incidental release**
A release that can be safely controlled at the time of the release and does not have the potential to become an uncontrolled release.

**Note:** Example of a situation that results in an incidental release:
A tanker truck is receiving a load of hazardous liquid when a leak occurs. The driver knows the only hazard from the liquid is minor skin irritation. The employer has trained the driver on procedures and provided equipment to use for a release of this quantity. The driver puts on skin protection and stops the leak. A spill kit is used to contain, absorb, and pick up the spilled material for disposal.
Chapter 296-310  
Title 296 WAC: Labor and Industries, Department of

Limited action  
Action necessary to:  
• Secure an operation during emergency responses,  
OR  
• Prevent an incident from increasing in severity.  
Examples include shutting down processes and closing emergency valves.  

Lines of authority  
A preestablished ranking of individuals, qualified to assume a commanding role during an emergency response, noted in an emergency response plan and implemented during a response. This is most important when responders from multiple employers could participate in an emergency response.  

Lower explosive limit (LEL)  
See lower flammable limit (LFL).  

Lower flammable limit (LFL)  
The lowest concentration of a material that will propagate a flame. The LFL is usually expressed as a percent (by volume) of the material in air (or other oxidant).  

Must  
Must means mandatory.  

Permissible exposure limit (PEL)  
Means the established time-weighted-average (TWA) concentration or ceiling concentration of a contaminant that must not be exceeded.  
The exposure, inhalation, or dermal permissible limit specified in chapter 296-307 WAC, Part Y-6, Respiratory hazards.  

Personal protective equipment (PPE)  
Protective items designed to be worn by the user to protect them against airborne, skin contact and other hazards. This includes items such as respiratory protection, protective suits, gloves, eye protection, etc.  

Postemergency response  
The stage of the emergency response where the immediate threat from the release has been stabilized or eliminated, and cleanup of the site has started.  

Published exposure level  
Exposure limits published in "National Institute for Occupational Safety and Health (NIOSH) Recommendations for Occupational Safety and Health" (DHHS publication #92-100, 1992).  

If an exposure limit is not published by NIOSH, then "published exposure level" means the exposure limits published by the American Conference of Governmental Industrial Hygienists (ACGIH) in "TLVs and BEIs-Threshold Limit Values for Chemical Substances and Physical Agents" (1999 edition).  

Note: Additional exposure levels published by recognized organizations such as the American Industrial Hygiene Association are not required to be observed by this rule; however, they may be a useful resource when a hazardous substance is not covered by NIOSH and ACGIH publications.  

Release  
A spill, leak, or other type of hazardous substance discharge.  

Uncontrolled release  
A release where significant safety and health risks could be created. Releases of hazardous substances that are either incidental or could not create a safety or health hazard (i.e., fire, explosion or chemical exposure) are not considered to be uncontrolled releases.  

Examples of conditions that could create a significant safety and health risk:  
Large-quantity releases  
Small releases that could be highly toxic  
Airborne exposures that could exceed a WISHA permissible exposure limit or a published exposure limit and employees are not adequately trained or equipped to control the release.  

Example of an uncontrolled release:  
A forklift driver knocks over a container of a solvent-based liquid, releasing the contents onto the warehouse floor. The driver has been trained to recognize the vapor is flammable and moderately toxic when inhaled. The driver has not been trained or provided appropriate equipment to address this type of spill. In this situation, it is not safe for the driver to attempt a response. The driver needs to notify someone of the release so an emergency response can be initiated.  

Workplace  
• A fixed facility  
• A temporary location (such as a traffic corridor)  
• Locations where employees respond to emergencies.

[Title 296 WAC—p. 2714]  
(2005 Ed.)
WAC 296-310-010 Definitions. For the purposes of this chapter:

(1) "Agricultural employee" means any person who renders personal services to, or under the direction of, an agricultural employer in connection with the employer's agricultural activity.

(2) "Agricultural employer" means any person engaged in agricultural activity, including the growing, producing, or harvesting of farm or nursery products, or engaged in the forestation or reforestation of lands, which includes but is not limited to the planting, transplanting, tubing, precommercial thinning, and thinning of trees and seedlings, the clearing, piling, and disposal of brush and slash, the harvest of Christmas trees, and other related activities.

(3) "Bonded contractor" means a contractor who obtained a surety bond in order to comply with RCW 19.30.030(5).

(4) "Contractor" means a farm labor contractor.

(5) "Department" means the department of labor and industries.

(6) "Director" means the director of the department of labor and industries.

(7) "Employee" means an agricultural employee.

(8) "Farm labor contractor" means any person, or his or her agent or subcontractor, who, for a fee, performs any farm labor contracting activity.

(9) "License" means a farm labor contractor license.

(10) "Secured contractor" means a contractor who assigned a savings account to, or deposited cash or other security with, the department in order to comply with RCW 19.30.030(5).

(11) "Security" means a savings account assigned to, or cash or other security deposited with, the department.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-010, filed 12/11/85.]

WAC 296-310-020 Application for initial and renewed licenses. (1) To obtain a license, a contractor must:

(a) Complete an application for a license;

(b) Provide the information required by RCW 19.30.030 (1), (6), and (7);

(c) Obtain a surety bond or provide other acceptable security to the department. If the contractor obtains a bond, it must submit the original bond to the department;

(d) Obtain insurance and supply the information required by WAC 296-310-040(2) if the contractor seeks a license to transport workers; and

(e) Pay the fee set by WAC 296-310-060.

(2) The department shall send a renewal notice to the contractor's last recorded address at least forty-five days before the contractor's license expires. The contractor may renew its license if it submits the renewal notice and provides the materials required in subsection (1)(b), (c), (d) if appropriate, and (e) of this section.

(3) The contractor must submit all materials to the department in one package. Each of the materials must name the contractor exactly as it is named on the application for license or the renewal notice. If the contractor is renewing its license, each of the materials must include the contractor's license number. If any of the materials are missing, do not properly name the contractor, or do not include the license number, the department shall refuse to license or renew the license of the contractor.

(4) The bond and the insurance policy must expire no sooner than the expiration date of the license for which the contractor has applied.

(5) Applications for issuance or renewal of a license must be sent to:

Department of Labor and Industries
ESAC Division
General Administration Building
Olympia WA 98504

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-020, filed 12/11/85.]

WAC 296-310-030 Denial of license. (1) The department may refuse to issue or renew a license for the reasons listed in RCW 19.30.050 and 19.30.060. If the department refuses a license for any of these reasons, it shall serve on the contractor a notice of denial of license. The notice of denial of license shall:

(a) Describe concisely the ground for denial of the license; and

(b) Specify the statutory authority for the denial.

The notice of denial shall inform the contractor that it may request a hearing pursuant to WAC 296-310-160 on the denial. The notice shall specify that if no hearing is requested within thirty days of the date of issuance of the notice the director shall issue a final, unappealable order denying the license.

(2) The department also shall refuse to issue a license to or renew the license of a contractor who fails to comply with WAC 296-310-020. The department shall inform the contractor of the problem either in writing or, if appropriate, orally. Because compliance with WAC 296-310-020 involves technical requirements that are entirely within the control of the contractor, no hearing shall be granted on a failure to comply.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-030, filed 12/11/85.]

WAC 296-310-040 Requirements for a license to transport employees. (1) A contractor who intends to transport employees must obtain liability insurance. The department shall require public liability and property damage insurance that provides coverage, for each single occurrence and for each vehicle used to transport employees, in the following minimum amounts:

(a) $50,000 for injury or damage to property;

(b) $100,000 for injury or damage, including death, to any one person; and

(c) $500,000 for injury or damage, including death, to more than one person.

(2) The contractor must also provide to the department evidence of the insurance policy or policies.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-040, filed 12/11/85.]

WAC 296-310-050 Amount of bond or security. (1) A contractor must provide a bond or security in the following minimum amount:

(a) If the contractor employs or intends to employ: [Title 296 WAC—p. 2715]
(i) From one to ten employees: $5,000  
(ii) From eleven to fifty employees: $10,000  
(iii) From fifty-one to one hundred employees: $15,000  
(iv) Over one hundred employees: $20,000

(b) If the contractor does not employ agricultural employees, but only recruits, solicits, supplies, transports, or hires employees for another person, and that person takes complete responsibility for payment of wages to the employees, the contractor shall obtain a $5,000 bond or other security.

(2) If the contractor obtains a two-year license, the bond or security shall be twice the minimum amounts stated in subsection (1) of this section.

(3) The department may order the contractor to obtain a bond or security for an amount greater than the minimums set by subsections (1) and (2) of this section if the security or bond is insufficient to satisfy the contractor's potential liability for the license period. If the department determines that an increased bond is necessary, it shall serve on the contractor a notice to increase bond or security. The notice shall:

(a) Describe concisely the reasons an increase in the bond or security is necessary;
(b) Specify the statutory authority for the required increase; and
(c) Grant the contractor thirty days from the date of issuance of the notice to obtain and provide to the department the increased bond or security.

The notice shall inform the contractor that it may request a hearing pursuant to WAC 296-310-160 on the order to increase the bond or security. The notice shall specify that if no hearing is requested within thirty days of the date of issuance of the notice the director shall issue a final, unappealable order requiring the contractor to submit the increased bond or security. The notice shall also specify that, if the contractor neither appeals nor obtains the increased bond or security within the thirty days, the department shall suspend the contractor's license.

(4) If the director issues a final, unappealed decision raising the amount of the bond or security, the raised amount shall be required for all license periods after the date of issuance of the final decision unless the decision specifically states otherwise. A contractor may, if the circumstances that led to the increased amount change, file with the department a written petition to lower the amount. The petition shall specify the grounds that justify a lowering of the bond or security. The department shall investigate the petition and shall issue a new notice stating its decision on the bond amount. The contractor, if aggrieved, may appeal this new notice as provided in subsection (3) of this section.

(a) For a contractor engaged in forestation or reforestation: $200.00  
(b) For all other contractors: $70.00

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-060, filed 12/11/85.]

WAC 296-310-070 Duplicate licenses. If a contractor loses its license, or if the license is stolen or destroyed, the contractor may obtain a duplicate license upon application to the department. The application must specify the reason a duplicate is necessary.

The duplicate license shall be stamped prominently with the word "duplicate." A new contractor license number shall be supplied to the contractor.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-070, filed 12/11/85.]

WAC 296-310-080 Length of license period. A contractor who is obtaining its initial license shall be licensed for one year only. A contractor who is renewing its license may choose to obtain either a one-year or two-year license, unless the department informs the contractor that it may obtain only a one-year license.

All one-year licenses shall expire on December 31 of the year of issuance. All two-year licenses shall expire on December 31 of the year following the year of issuance.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-080, filed 12/11/85.]

WAC 296-310-090 Change in business structure, name, address, or number of employees. (1) If a contractor changes its business structure (for example, if it changes from a partnership to a corporation, or if the partners in a partnership change), the contractor must apply for a new license in the manner required by WAC 296-310-020. If a contractor does not obtain a new license after a change in its business structure, its previous license may be invalid.

(2) If a contractor changes its name or address, it must notify the department within ten days.

(3) If a contractor begins employing agricultural employees, or increases the number of its employees, so that the bond or security is insufficient for that number of employees, the contractor must obtain a new bond or security in the amount required by WAC 296-310-050 and submit it to the department. The department need not issue a notice to increase the amount of bond or security in this situation.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-090, filed 12/11/85.]

WAC 296-310-100 Cancellation of insurance or bond. (1) No surety company may cancel any bond issued to a contractor pursuant to RCW 19.30.040, unless the contractor previously submits another bond or other security, for the same amount, that covers the contractor’s liability for the same period as that for the bond that is to be cancelled.

(2) A cancellation of a surety bond or insurance policy is effective thirty days after the department receives the cancellation notice, if the cancellation notice contains the following information:
(a) The name of the contractor, exactly as it appears on the contractor's license;
(b) The contractor's license number;
(c) The contractor's business address;
(d) The number of the bond or insurance policy that is to be cancelled;
(e) The effective date of the bond or insurance policy that is to be cancelled; and
(f) If the cancellation is of a surety bond, a certification that the contractor has previously obtained and submitted to the department a new bond or other security as required by subsection (1) of this section.

(3) To help the department process cancellations, the information in subsection (2) of this section should be provided in the order shown.

(4) The insurance and bonding companies should send cancellation notices to the department by certified or registered mail.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-100, filed 12/11/85.]

WAC 296-310-110 Refund of security deposited with the department. (1) If a contractor is secured, the department shall release its interest in the security three years after the contractor's last license expired. The department shall not release its interest, however, if an unsatisfied judgment or claim is outstanding against the contractor.

(2) The department shall in any case release its interest in the security if the contractor provides a surety bond in the same amount that covers all of the periods in which the contractor was licensed for the previous three years, plus for the contractor's current license period if applicable.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-110, filed 12/11/85.]

WAC 296-310-120 Revocation or suspension of license. (1) The department may revoke a contractor's license for the reasons listed in RCW 19.30.050(1) and 19.30.060. If the department revokes a license, it shall serve on the contractor a notice of revocation. The notice of revocation shall:

(a) Describe concisely the ground for the revocation; and
(b) Specify which statutory authority for the revocation.

The notice of revocation shall inform the contractor that it may request a hearing on the revocation. The notice shall specify that if no hearing is requested within thirty days after the date of issuance of the notice, the director shall issue a final, unappealable order revoking the contractor's license. The hearing may be requested pursuant to WAC 296-310-160.

(2) A contractor is entitled to retain its license only if it remains in compliance with the bonding and insurance requirements of RCW 19.30.030 and 19.30.040. If a contractor's surety bond or other security is impaired or becomes insufficient, the contractor's insurance policy is cancelled, or the contractor transports employees without insurance, the department shall suspend the contractor's license until the contractor obtains a new bond, other security, or insurance policy, eliminates the impairment to the bond or security, or ceases to transport workers. The contractor may not do business while its license is suspended.

The department shall inform the contractor in writing of the suspension and of the steps the contractor must take to remove the suspension. The contractor may not appeal a suspension of licensing.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-120, filed 12/11/85.]

WAC 296-310-130 Submission of complaint. Any person may submit to the department a complaint alleging a violation of chapter 19.30 RCW or challenging an application for a license. The complaint must describe the alleged violation or ground for denying a license, and must identify the alleged violator or applicant. It would aid the department's investigation if the complaint also specifies:

(1) The name and address of the complainant; and
(2) The address of the alleged violator or applicant.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-130, filed 12/11/85.]

WAC 296-310-140 Investigation of complaint. The department shall investigate a complaint unless the complaint was submitted more than three years after the date of the alleged violation. The department shall not investigate any complaint filed more than three years after the date of the violation.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-140, filed 12/11/85.]

WAC 296-310-150 Notice of violation. (1) If the department determines that there is reasonable cause to believe that chapter 19.30 RCW has been violated, the department shall serve on the violator a notice of violation. The notice of violation shall:

(a) Describe concisely the violation;
(b) Specify which statute was violated;
(c) If known, identify the employees who were affected by the violation;
(d) If known and applicable, state the amount of unpaid wages or damages the violator owes;
(e) State the penalty, if any, the department will assess for the violation; and
(f) State whether the contractor's license is being revoked as a result of the violation.

(2) If the notice alleges that the contractor owes unpaid wages or damages, the department shall serve a copy of the notice of violation on the violator's surety bond company.

(3) The notice of violation shall inform the violator and, if applicable, its surety that they may request a hearing on the violation, the amount of unpaid wages or damages owed, or the penalty assessed. The notice shall specify that if no hearing is requested within thirty days after the date the notice was issued the director shall issue a final, unappealable order finding that the violation did occur, ordering the violator to pay any unpaid wages or damages, and assessing penalties.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-150, filed 12/11/85.]

WAC 296-310-160 Appeal of notices. (1) The contractor or violator, or the violator's surety if the surety has an interest in the matter, may request a hearing on the matter
asserted in a notice of denial of license, a notice of revocation, a notice of increased bond amount, or a notice of violation. One original and four copies of the request must be filed with the director within thirty days after the date the department issued the notice. A party requesting a hearing on a notice of violation must also serve a copy of the request on the surety or the violator as appropriate.

(2) The request for hearing must be in writing and must specify:
   (a) The name and address of the party requesting the hearing;
   (b) The name and date of issuance of the notice that is being appealed;
   (c) The matters contained in the notice that the requestor believes are erroneous;
   (d) The reasons the notice is erroneous; and
   (e) If a surety is appealing a notice of violation, the name and address of the violating contractor.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-160, filed 12/11/85.]

WAC 296-310-170 Hearing on appeal of notice. (1) The director may hear an appeal personally or may delegate the authority to hold the hearing and draft a proposed decision to an administrative law judge pursuant to chapter 34.12 RCW. The plaintiff at the hearing shall be the department and the defendants shall be the contractor or the violator and its surety. The department shall have the burden of proving, by a preponderance of the evidence, that the matters stated in the notice occurred.

(2) Any person who has standing may, upon motion, be allowed to intervene as a plaintiff in a hearing on a notice of violation. Any interested person, whether or not admitted as a plaintiff, may submit written arguments and affidavits in any hearing.

(3) The hearing shall be conducted in accordance with the uniform procedure rules, chapter 1-08 WAC.

(4) If the director presides over the hearing, the director shall issue a final decision that includes findings of fact and conclusions of law and, if appropriate for a violation, an order to pay unpaid wages, damages, or a penalty.

(5) If an administrative law judge presides over the hearing, she or he shall issue a proposed decision that includes findings of fact and conclusions of law and, if appropriate for a violation, an order to pay unpaid wages, damages, or a penalty. The proposed decision shall be served on the contractor or the violator and its surety, the department, and any persons who have intervened as plaintiffs. Any of these parties, if aggrieved by the proposed decision, may appeal to the director within thirty days after the date of issuance of the proposed decision. If none of the parties appeals within thirty days, the proposed decision may not be appealed either to the director or the courts. A copy of the proposed decision shall also be mailed to all persons who submitted written arguments or affidavits at the hearing.

(6) An appellant must file with the director an original and four copies of its notice of appeal. The notice of appeal must specify which findings and conclusions are erroneous. The appellant must attach to the notice the written arguments supporting its appeal.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-180, filed 12/11/85.]

WAC 296-310-180 Effect of final decision. If the director issues a final decision that includes a finding that a violator owes unpaid wages or damages, and the finding is not appealed or is affirmed by the courts, the finding and the decision are res judicata in any action by the department, or by any other person who was a plaintiff at the hearing, against the violator and its surety to recover the unpaid wages or damages. The finding and decision are not res judicata in any action by a person who was not a party at the hearing.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-180, filed 12/11/85.]

WAC 296-310-190 Suit by department for unpaid wages or damages. (1) RCW 19.30.160(4) authorizes the department to sue a violator and its surety on behalf of an employee to recover unpaid wages and other damages. The department is not required to bring suit and, in its sole discretion, may decide not to do so in any case. The department also shall not sue on behalf of any employee who has already brought a suit against the violator and its surety in the matter.

(2) The department may file a suit against the violator and its surety at any time and without regard to whether administrative proceedings have been exhausted.

(3) The department may include in any suit a request for an injunction against the violator.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-190, filed 12/11/85.]

WAC 296-310-200 Procedures for filing suit against a contractor. (1) A suit against a contractor and its bond or security for unpaid wages or damages may be brought in any
court with jurisdiction. The venue may be in the county in which the claim arose, or in which either the damaged person or the defendant resides.

(2) When a contractor is sued, the plaintiff must serve the summons and complaint on the contractor and its surety by serving three copies of the summons and complaint by certified or registered mail on the department. The department shall not accept personal service of the summons and complaint.

(3) The department may be unable to process a summons and complaint if the summons and complaint do not contain the following information:
(a) The contractor's name exactly as it appears on the contractor's license;
(b) The contractor's business address;
(c) The names of the owners, partners, or officers of the contractor; and
(d) The contractor's license number.
If the suit names a surety as a defendant, the summons and complaint should also include:
(e) The name and address of the surety that issued the contractor's bond;
(f) The bond number; and
(g) The effective date of the bond.
If the information is insufficient for the department to identify the contractor or surety that is being sued, the department shall not attempt to serve the summons and complaint and shall return them to the plaintiff.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-210, filed 12/11/85.]

WAC 296-310-210 Collection of judgments. (1) If a contractor is secured, a plaintiff who has received a final judgment against a contractor may satisfy the judgment out of the security held by the department.

(2) The department shall satisfy a final judgment if the plaintiff serves on the department three certified copies of the judgment against a contractor. If the information is insufficient for the department to identify the contractor or surety that is being sued, the department shall not attempt to serve the summons and complaint and shall return them to the plaintiff.

(3) If a contractor is bonded, a plaintiff can satisfy a final judgment out of the bond that remains unimpaired. No claim in a lesser category may be satisfied until all pending claims in the preceding categories are satisfied, unless the total amount of all pending claims in the preceding categories is less than the amount of the bond that remains unimpaired.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-220, filed 12/11/85.]

WAC 296-310-220 Priority for payment of judgments. RCW 19.30.170 contains two different provisions for priority in paying judgments from the contractor's bond or security.

(1) If a contractor is secured, the department shall satisfy final judgments against the contractor in the order the department receives the judgments.

(2) If a contractor is bonded, claims for unpaid wages and benefits are satisfied first, claims for damages are satisfied second, and claims for costs and attorney's fees are satisfied last. No claim in a lesser category may be satisfied until all pending claims in the preceding categories are satisfied, unless the total amount of all pending claims in the preceding categories is less than the amount of the bond that remains unimpaired.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-220, filed 12/11/85.]

WAC 296-310-230 Civil penalties. (1) In determining the amount of any civil penalty to be imposed under RCW 19.30.160 the department shall consider the following factors:
(a) Previous violations by the violator;
(b) The history of the violator in taking all necessary measures to prevent or correct violations;
(c) The magnitude and seriousness of the violation;
(d) The remedial purpose of chapter 19.30 RCW;
(e) Any mitigating circumstances; and
(f) Any other factors the department considers relevant.
(2) It is the violator's responsibility to inform the department of mitigating evidence.
(3) The penalties for acting as a contractor without a license, or for transporting employees without an endorsement to do so, are:
(a) Up to $500 for the first violation;
(b) Up to $750 for the second violation; and
(c) Up to $1000 for the third and any further violations.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-230, filed 12/11/85.]

WAC 296-310-240 Adjustment of controversies. (1) Upon receipt of a complaint or on its own motion, the department shall attempt to adjust equitably a controversy between a contractor and its employees.

(2) No particular form of proceeding is necessary for resolving disputes. The supervisor of employment standards shall, in each case, use his or her best judgment in designing a procedure. However, in every case in which the supervisor determines that a hearing should be held, the supervisor shall notify the affected persons, or their representatives, of the time, date, place, and purpose of the hearing.

(3) A hearing shall be informal and shall not be subject to chapter 34.04 RCW. The supervisor's suggestions for resolution are advisory and not binding, and may not be appealed to any person or court.

(4) The director may delegate the resolution of any particular case to a person other than the supervisor of employment standards. That person shall have the same authority as the supervisor to determine the form of the proceeding.

[Statutory Authority: RCW 19.30.130. 86-01-027 (Order 85-34), § 296-310-240, filed 12/11/85.]

WAC 296-310-260 Liability of person who uses services of unlicensed contractor. (1) A person who knowingly
uses the services of an unlicensed contractor is liable for
unpaid wages, damages, and civil and criminal penalties to
the same extent as the unlicensed contractor.
(2) Pursuant to RCW 19.30.200, a person may prove lack
of knowledge by proving that she or he relied on a license
issued by the department under chapter 19.30 RCW, or upon
the department's representation that the contractor was
licensed. The department shall not make oral representations
that a contractor is or is not licensed. All representations by
the department that a contractor is licensed shall be made in
writing and shall be signed by the director or the employment
standards supervisor or the assistant director. The department
shall not accept reliance on a supposed oral representation as
proof in any administrative enforcement proceeding.

296-350-600
WISHA appeals. [Statutory Authority: RCW 49.17-010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-600, filed 5/17/00, effective 8/1/00.] Repealed by 01-11-038, filed 5/9/01, effective 9/1/01. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050.

Filing an appeal—Who, when and where. [Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-600, filed 5/17/00, effective 8/1/00.] Repealed by 01-11-038, filed 5/9/01, effective 9/1/01. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050.

Why we reassemble jurisdiction. [Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-600, filed 5/17/00, effective 8/1/00.] Repealed by 01-11-038, filed 5/9/01, effective 9/1/01. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050.

296-350-60025
Reassuming jurisdiction or forwarding an appeal to the board. [Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-600, filed 5/17/00, effective 8/1/00.] Repealed by 01-11-038, filed 5/9/01, effective 9/1/01. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050.

296-350-60030
Reviewing appeals and extending review time. [Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-600, filed 5/17/00, effective 8/1/00.] Repealed by 01-11-038, filed 5/9/01, effective 9/1/01. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050.

296-350-60040
Issuing and appealing corrective notices. [Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-600, filed 5/17/00, effective 8/1/00.] Repealed by 01-11-038, filed 5/9/01, effective 9/1/01. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050.

296-350-60045
Notifying employees. [Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-600, filed 5/17/00, effective 8/1/00.] Repealed by 01-11-038, filed 5/9/01, effective 9/1/01. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050.
WAC 296-350-010 Definitions. The following definitions apply to terms used in chapter 296-350 WAC.

Abatement date means the date on the citation when you must comply with specific safety and health standards listed on the citation and notice of assessment or the corrective notice of redetermination.

Board means the board of industrial insurance appeals.

Citation and notice refers to the citation issued to an employer under RCW 49.140.120 for any violations of WISHA safety and health rules, also known as a citation and notice of assessment.

Corrective notice refers to a corrective notice of redetermination issued after we have reassumed jurisdiction over a citation and notice.

Interim order is an order we grant allowing you to vary from WISHA requirements until we have determined whether to grant either a permanent or temporary variance.

Our refers to the department of labor and industries.

Permanent variance is an order we grant allowing you to vary from WISHA requirements when you use an alternate means that provides equal worker protection. It is in effect until we modify or revoke it.

Temporary variance is an order we grant allowing you to vary from WISHA requirements under certain circumstances (see WAC 296-350-70020).

Us refers to the department of labor and industries.

Variance refers to any order granted by us allowing you to vary from WISHA safety and health rules, including a permanent variance, temporary variance, or interim order.

We means the WISHA services division of the department of labor and industries and any other divisions charged with enforcing chapter 49.17 RCW, Washington Industrial Safety and Health Act.

Working days mean weekdays that do not fall on state holidays (see RCW 1.16.050 for a complete description of state holidays). State holidays include:

- January 1—New Year's Day;
- Martin Luther King, Jr. Day;
- Presidents' Day;
- Memorial Day;
- July 4—Independence Day;
- Labor Day;
- November 11—Veterans' Day;
- Thanksgiving Day;
- The day after Thanksgiving Day; and
- December 25—Christmas Day.

You means the employer as defined in RCW 49.17.020.

Your refers to the employer as defined in RCW 49.17.-020.

WAC 296-350-015 Purpose of variances. In certain circumstances, we allow you to deviate from a specific WISHA safety and health standard when you use agency-approved substitute measures to protect workers.

You may request the following as described in WAC 296-350-70015 through 296-350-70025:

- Permanent variances.
- Temporary variances.
- Interim orders.

WAC 296-350-70020 Temporary variances—Description. (1) You may request a temporary variance if you cannot meet one or more new WISHA requirements because:

- Professional or technical people are not available;
- Materials or equipment are not available; or
- You cannot complete construction or alteration of facilities by the effective date of a standard.

If you request a temporary variance, you must have an effective plan for coming into compliance with the applicable safety and health standards as quickly as possible.

(2) We review permanent variances periodically to determine whether they are still needed or need to be changed (see WAC 296-350-70065(1)).

(3) A permanent variance remains in effect unless we modify or revoke it.

WAC 296-350-70025 Interim orders—Description and requesting. (1) You may request an interim order when requesting a permanent or temporary variance, or anytime after. Interim orders allow you to vary from existing WISHA requirements until we make a final decision on your variance request.
(2) We may choose to issue an interim order in response to a variance request, even when the interim order was not specifically requested.

(3) Our decision to grant or deny an interim order will not restrict our decision on a permanent or temporary variance request.

(4) Interim orders will be effective until revoked or until we approve or deny your variance request.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-70025, filed 5/17/00, effective 8/1/00.]

WAC 296-350-70030 Requesting a permanent variance. (1) Request for a permanent variance must be in writing and signed by you or your representative. You must include the following items in your variance request:

- Employer name and address;
- What work locations and situations that you want the variance to apply to;
- The requirements from which you want the variance (be specific and include WAC numbers);
- A specific description of your proposed alternate means of protecting employees from hazards;
- How the proposed alternative means will protect employees;
- How you have notified your employees you are applying for a variance as required in WAC 296-350-70050; and
- How you have notified your employees that they may request a hearing. All applications for variances must contain the following notice on the first page, written large enough and clearly enough to be read easily:

"Attention Employees: Your employer is applying to the department of Labor and Industries for a variance from safety and health standards. You have a right to ask the Department to have a hearing on this application, but you must ask for the hearing in writing by (date**), or the Department may act on this application without a hearing."

** This date must be at least twenty-one calendar days but not more than one month after submitting your variance request.

(2) Department forms for requesting variances are available from any labor and industries office in the state.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-70025, filed 5/17/00, effective 8/1/00.]

WAC 296-350-70035 Requesting a temporary variance. Requests for a temporary variance must be in writing and signed by you or your representative. You must include:

- All items listed in WAC 296-350-70030, Requesting a permanent variance.
- A specific explanation of why you cannot comply with the requirements, including documentation that supports your belief.
- What steps you will take to protect your employees until you can comply:
- What you are doing to come into compliance.
- When you will be able to come into compliance.
- A statement that this request is from a qualified person having first hand knowledge of the facts represented.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-70035, filed 5/17/00, effective 8/1/00.]

WAC 296-350-70040 Renewing temporary variances. You must apply for a renewal at least ninety days before the expiration date of the order. To apply for renewal, write to us, explaining why you need more time to come into compliance.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-70040, filed 5/17/00, effective 8/1/00.]

WAC 296-350-70045 Submitting variance requests. Submit permanent variance, temporary variance, or interim order requests using one of the following:

- Mail to:
  Assistant Director, WISHA Services Division
  P.O. Box 44625
  Olympia, Washington 98504-4625

- Fax to: (360) 902-5459
- Bring to any labor and industries office in the state.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-70045, filed 5/17/00, effective 8/1/00.]

WAC 296-350-70050 Notifying employees about variance requests. You must notify your employees before requesting a permanent variance, temporary variance, or interim order by:

- Posting a copy of the application on your safety bulletin board; and
- Using other appropriate means for employees who cannot be expected to receive notices posted on the safety bulletin board (such as, providing a copy to an authorized representative or the safety committee).

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 00-11-098, § 296-350-70050, filed 5/17/00, effective 8/1/00.]

WAC 296-350-70055 Department review and decision. (1) Review. We will review your request to determine whether to grant a variance to WISHA safety and health rules.

- If we need more information, we may contact you or others who may have relevant information.
- If we need to visit your workplace, we will contact you to make arrangements.
- If you do not provide us with the information we need or do not let us visit your workplace, we will deny your request.

(2) Decision. After reviewing your request, we will issue a written order either granting or denying it.

- We will not make a decision before the date for requesting a hearing that is listed on the variance request.
- If you have appealed a citation and notice that relates to the subject of the variance request, we may choose not to make a decision until after your appeal is resolved.
- If granted, the order will include where it applies, what rules it covers, what you must do instead of following the existing rules, an effective date, and any expiration dates, if applicable. Variances will not be retroactive. The effective date will be on or after the day we issue the order granting the variance.
- If denied, the order will include a brief statement with reason(s) supporting our decision.

[Title 296 WAC—p. 2724] (2005 Ed.)
WAC 296-350-70060 Your responsibilities once we make a decision. When you receive a written decision regarding a variance request or interim order, you must:
- Immediately notify affected employees using the same means used for the variance application (see WAC 296-350-70050); and
- Abide by the requirements specified in any variance. We can issue citations for violations of any variance.

WAC 296-350-70065 Changing a variance. (1) Permanent variances. We cannot change the terms of a permanent variance for the first six months it is in effect. Any time after six months, we will consider changing the terms of a variance when:
- You or your employees request changes; or
- We decide that changes may be warranted.
(2) Temporary variances. We will only consider changing a temporary variance as part of the renewal process.
(3) Interim orders. We will not change an interim order.
(4) Hearings. You, your employees, or employee representatives may request a hearing on variance changes as with variance applications (see WAC 296-350-70070).

WAC 296-350-70070 Variance hearings. (1) Requesting a hearing. You, any affected employee, or an employee representative may request a hearing on a variance request, temporary variance request, or changes to existing variances. All requests must be received in writing, signed by the applicant(s), and must be received by the assistant director within twenty-one calendar days of the date of the application for the variance.
(2) Department notice. We will issue a notice of the hearing ten days after receiving your request advising all interested parties that they will have the opportunity to participate. We will schedule the hearing so that you will receive notice at least twenty calendar days in advance of the hearing date.
(3) Notifying employees. Upon receiving notice of the hearing, you must immediately post copies of the notice, give copies to affected employees and employee representatives, and use any other appropriate means (see WAC 296-350-70050).
(4) Description of hearing. At the hearing, our representative will explain our view of your request for a variance or any proposed change to a variance. You, your employees, or employee representatives will then have an opportunity to explain your views and provide any relevant documents or information. Information gathered at the hearing will be used in making a decision about whether to grant or deny the request.
(5) We may tape or record a variance hearing. You, your employees, or employee representatives may request copies at cost.
APPENDIX A

APPLICATION FOR COPIES OF CITATION AND NOTICES

ISSUED PURSUANT TO THE WASHINGTON INDUSTRIAL SAFETY AND HEALTH ACT

Any employee of an employer who has been selected by the employer to act as their representative as defined in WAC 296-350-500 may apply for copies of CITATION AND NOTICES issued to said employer.

DEFINITION:

WAC 296-350-500(2) - "Employee representative" means:

(a) Any officer of the recognized bargaining unit of employees, acting on behalf of the employees of the employer.

(b) Any employee representative of an employer-employee safety committee within an establishment of the firm of the employer.

(c) Any employee of an employer who has been selected by the employees of that employer to act as their representative for the purposes indicated in subsection (1) of this section. Such selection shall be evidenced by a letter or other written communication to the Division of Industrial Safety and Health stating the name of the employee so selected and signed by not less than one-half of the employees of the employer.

Applicant certifies he/she is an employee representative by virtue of WAC 296-350-500(2)

CERTIFICATION:  I HEREBY CERTIFY UNDER PENALTY OF PERJURY THAT THE ABOVE STATEMENT IS TRUE TO THE BEST OF MY KNOWLEDGE.

| Signature | position | date |

Name and address of applicant to which copies of CITATION AND NOTICES should be sent:

Name, address and Labor & Industries account I.D. and/or Unified Business Identifier of EMPLOYER HAVING EMPLOYEES WHO ARE REPRESENTED by the applicant (please give full information for each employer you represent - use extra paper if required):

The director or his/her authorized representative may deny this application if more than one employee representative has applied or if the applicant does not qualify as an employee representative.

[Statutory Authority: Chapter 49.17 RCW. 87-24-051 (Order 87-24), § 296-350-990, filed 11/30/87. Statutory Authority: RCW 49.17.040, 49.17.050, 49.17.240, chapters 42.30 and 43.22 RCW. 80-17-014 (Order 80-20), § 296-350-990, filed 11/13/80; Order 75-14, Appendix A—Form 300 (codified as WAC 296-350-990), filed 4/14/75.]

Chapter 296-360 WAC

DISCRIMINATION, PURSUANT TO RCW 49.17.160

WAC 296-360-005 Definitions. For the purposes of this chapter.

(1) "Assistant director" - the assistant director for the division of consultation and compliance.

(2) "Division" - the division of consultation and compliance of the department of labor and industries.

WAC 296-360-010 Introduction. (1) Chapter 49.17 RCW, the Washington Industrial Safety and Health Act (WISHA), is designed to regulate employment conditions affecting industrial safety and health and to achieve safer and healthier work places throughout the state. WISHA requires every person who has employees to furnish each of his or her employees employment and a place of employment free from recognized hazards that are causing or likely to cause death or serious physical harm, and to comply with industrial safety and health standards promulgated under WISHA.

(2) Employees and representatives of employees are afforded a wide range of substantive and procedural rights under WISHA. Effective implementation of WISHA and achievement of its goals depend in large part upon the active but orderly participation of employees, individually and through their representatives.

(3) This chapter deals essentially with the rights of employees afforded under RCW 49.17.160. RCW 49.17.160 prohibits reprisals, in any form, against employees who exercise rights under WISHA. The purpose of this chapter is to make available in one place interpretations of the various provisions of section 16 of WISHA that will guide the assistant director in the performance of his or her duties thereunder.

WAC 296-360-020 General requirements of RCW 49.17.160 of WISHA. RCW 49.17.160 provides that no person shall discharge or in any manner discriminate against any employee because the employee has filed any complaint under or related to WISHA, instituted or caused to be instituted any proceeding under or related to WISHA, testified or is about to testify in any proceeding under or related to WISHA, or exercised on his or her own behalf or on behalf of others any right afforded by WISHA. Any employee who believes that he/she has been discriminated against in violation of section 16 of WISHA may, within thirty days after the violation occurs, file a complaint with the assistant director alleging the violation. The division shall investigate the complaint and, if the assistant director determines that section 16 of WISHA has been violated, the division may bring a civil action against the violator in superior court. The suit may ask the court to restrain violations of RCW 49.17.160 and to grant other appropriate relief, including rehiring or reinstating the employee to his or her former position with back pay.

[Statutory Authority: RCW 49.17.040, 49.17.050, 49.17.240, chapters 43.22 and 42.30 RCW. 80-17-015 (Order 80-21), § 296-360-020, filed 11/13/80.]

WAC 296-360-030 Filing a complaint of discrimination. (1) Who may file. A complaint of RCW 49.17.160 discrimination may be filed by the employee him- or herself, or by a representative authorized to do so on his or her behalf.

(2) Nature of filing. No particular form of complaint is required.

(3) Place of filing. The complaint should be filed with the division.

(4) Time for filing. RCW 49.17.160(3) provides that an employee who believes that he or she has been discriminated against in violation of RCW 49.17.160 "may, within thirty days after such violation occurs" file a complaint with the assistant director. A major purpose of the thirty-day period is to allow the assistant director to decline to entertain complaints that have become stale. Accordingly, the division will presume that complaints not filed within thirty days of an alleged violation are untimely. There may be circumstances, however, that justify tolling the thirty-day period on recognized equitable principles or because strongly extenuating circumstances exist, e.g., where the employer has concealed, or misled the employee regarding the grounds for, discharge or other adverse action. In the absence of circumstances justifying a tolling of the thirty-day period, the division shall not accept untimely complaints.

[Statutory Authority: RCW 49.17.040 and 49.17.050, 49.17.240, chapters 43.22 and 42.30 RCW. 80-17-015 (Order 80-21), § 296-360-030, filed 11/13/80.]

WAC 296-360-040 Notification of assistant director's determination. (1) RCW 49.17.160(3) provides that the assistant director is to notify a complainant within ninety days of the complaint of his determination whether prohibited discrimination has occurred. This ninety-day provision is directory, not mandatory. Although every effort will be made to notify complainants of the assistant director's determination within ninety days, there may be instances when it is not possible to do so.

(2) If a complaint receives a determination from the assistant director that prohibited discrimination has not occurred, the complainant may file a written request for [Title 296 WAC—p. 2727]
review by the director within fifteen working days of receipt of the determination. The request for review must set forth the basis for the request. The request shall be filed by mailing or delivering the request to the Director of Labor and Industries, P.O. Box 44000, Olympia, Washington 98504-4000. Upon review the director may set aside the assistant director's determination, remand the matter for further investigation, or affirm the determination of the assistant director. The director shall notify the complainant of the decision after review.

WAC 296-360-050 Withdrawal of complaint. Enforcing the provisions of RCW 49.17.160 is not only a matter of protecting rights of individual employees, but also of protecting the public interest. Attempts by an employee to withdraw a filed complaint will not necessarily result in termination of the division's investigation. The division's jurisdiction cannot be foreclosed as a matter of law by unilateral action of the employee. However, a voluntary and uncoerced request from a complainant to withdraw his/her complaint shall generally be accepted.

WAC 296-360-060 Arbitration or other agency proceedings. (1) General.

(a) An employee who files a complaint under RCW 49.17.160 may pursue remedies under grievance arbitration proceedings in collective bargaining agreements, and may also resort to other agencies, such as the National Labor Relations Board, for relief. The division's jurisdiction to entertain RCW 49.17.160 complaints, to investigate, and to determine whether discrimination has occurred, is independent of the jurisdiction of other agencies or bodies. The division may file an action in superior court regardless of the pendency of other proceedings.

(b) Where it is possible, however, the division favors voluntary resolution of disputes under procedures in collective bargaining agreements. Also, the division should defer to the jurisdiction of other forums established to resolve disputes that may also be related to RCW 49.17.160 complaints. Thus, where a complainant is pursuing remedies other than those provided by RCW 49.17.160 it may be proper to postpone the assistant director's determination whether discrimination has occurred, and defer to the results of such proceedings.

(2) Postponement of determination. Postponement of determination is justified where the rights asserted in other proceedings are substantially the same as rights under RCW 49.17.160 and those proceedings are not likely to violate the rights guaranteed by RCW 49.17.160. The factual issues in the such proceedings must be substantially the same as those raised by the RCW 49.17.160 complaint, and the forum hearing the matter must have the power to determine the ultimate issue of discrimination.

WAC 296-360-070 Persons prohibited from discriminating. RCW 49.17.160 specifically states that "no person shall discharge or in any manner discriminate against any employee" because the employee has exercised rights under WISHA. RCW 49.17.020(5), defines "person" as "one or more individuals, partnerships, associations, corporations, business trusts, legal representatives, or any organized group of persons." Consequently, the prohibitions of RCW 49.17.160 are not limited to actions taken by employers against their own employees. A person may be charged with discriminating against an employee of another person. RCW 49.17.160 extends to such entities as organizations representing employees in collective bargaining, employment agencies, or any other person in a position to discriminate against an employee. See Meek v. United States, 136 F.2d 679 (6th Cir., 1943); Bowe v. Judson C. Burns, 137 F.2d 37 (3rd Cir., 1943).

WAC 296-360-080 Persons protected by RCW 49.17.160. (1) All employees are afforded the full protection of RCW 49.17.160. WISHA defines an employee as "an employee of an employer who is employed in a business of his/her employer which affects commerce." RCW 49.17.020(4). WISHA does not define "employment"; however, the broad remedial nature of WISHA demonstrates a clear intent that the existence of an employment relationship, for purposes of RCW 49.17.160, is to be based upon economic realities rather than upon common law doctrines and concepts. See U.S. v. Silk, 331 U.S. 704 (1947); Rutherford Food Corporation v. McComb, 331 U.S. 722 (1947).

(2) For purposes of RCW 49.17.160, an applicant for employment could be considered an employee. See NLRB v. Lamar Creamery, 246 F.2d 8 (5th Cir., 1957).

WAC 296-360-090 Unprotected activities distinguished. (1) An employer or others may base actions that adversely affect an employee upon nondiscriminatory grounds. An employee's engagement in activities protected by WISHA does not automatically render him/her immune from discharge or discipline for legitimate reasons, or from adverse action dictated by nonprohibited considerations. See
Discrimination, Pursuant to RCW 49.17.160  

(2) An employee need not directly institute a proceeding. It is sufficient if he or she sets into motion acts of others that result in proceedings under or related to WISHA.

[Statutory Authority: RCW 49.17.040, 49.17.050, 49.17.240, chapters 43.22 and 43.30 RCW, 80-17-015 (Order 80-21), § 296-360-110, filed 11/13/80.]

WAC 296-360-120 Discrimination because of testimony. RCW 49.17.160 prohibits discharge of, or discrimination against, any employee because the employee "has testified or is about to testify" in proceedings under or related to WISHA. This protection is not limited to testimony in proceedings instituted or caused to be instituted by the employee, but extends to any statements given in the course of judicial, quasijudicial, and administrative proceedings, including inspections, investigations, administrative adjudications, and rules hearings.

[Statutory Authority: RCW 49.17.040, 49.17.050, 49.17.240, chapters 43.22 and 43.30 RCW, 80-17-015 (Order 80-21), § 296-360-120, filed 11/13/80.]

WAC 296-360-130 Discrimination because of exercise of any right afforded by WISHA—In general. In addition to protecting employees who file complaints, institute proceedings, or testify in proceedings under or related to WISHA, RCW 49.17.160 also protects employees from discrimination occurring because of the exercise "of any right afforded by this chapter." Certain rights are explicitly stated in WISHA. Other rights exist by necessary implication. For example, employees may request information from the occupational safety and health administration or the department of labor and industries. Also, employees interviewed by agents of the division in the course of inspections or investigations cannot subsequently be discriminated against because of their cooperation.

[Statutory Authority: RCW 49.17.040, 49.17.050, 49.17.240, chapters 43.22 and 43.30 RCW, 80-17-015 (Order 80-21), § 296-360-130, filed 11/13/80.]

WAC 296-360-140 Discrimination because of exercise of right afforded by WISHA—Walkaround pay. Employee participation in walkaround inspections under RCW 49.17.100 is essential. Employees are a vital source of information to the division about work place hazards. Employees must be able freely to exercise their statutory right to participate in walkarounds without fear of economic loss, such as the denial of pay for the time spent helping WISHA inspectors during the walkaround. To ensure the unimpeded flow of information to the inspectors, and the unfettered statutory right of employees to participate in walkaround inspections, an employer's failure to pay employees for time they spend in walkaround inspections is discrimination under RCW 49.17.160. In addition, an employer's failure to pay employees for time spent in other inspection-related activities, such as answering questions of inspectors or participating in the opening and closing conferences, is discrimination under RCW 49.17.160.

[Statutory Authority: Chapter 49.17 RCW, 94-15-096 (Order 94-07), § 296-360-140, filed 7/20/94, effective 9/20/94. Statutory Authority: RCW 49.17.040, 49.17.050, 49.17.240, chapters 43.22 and 43.30 RCW, 80-17-015 (Order 80-21), § 296-360-140, filed 11/13/80.]
WAC 296-360-150 Discrimination because of exercise of right afforded by WISHA—Refusal to work in an unsafe condition. (1) Review of WISHA and examination of the legislative history discloses that, as a general matter, WISHA grants no specific right to employees to walk off the job because of potential unsafe conditions at the work place. A hazardous condition that may violate WISHA will ordinarily be corrected by the employer, once brought to its attention. If the employer does not correct a hazard, or if there is a dispute about the existence of a hazard, the employee normally can ask the division to inspect the work place pursuant to RCW 49.17.110, or can seek help from other public agencies that have responsibility for safety and health. Under such circumstances, an employer would not violate RCW 49.17.160 by disciplining an employee who refuses to work because of an alleged safety or health hazard.

(2) Occasions arise, however, when an employee is confronted with a choice between not performing assigned tasks or subjecting him- or herself to serious injury or death arising from a hazard at the work place. If the employee, with no reasonable alternative, refuses in good faith to expose him- or herself to the dangerous condition, he or she is protected against subsequent discrimination.

(3) An employee's refusal to work is protected if he or she meets the following requirements:
   (a) The refusal to work must be in good faith, and must not be a disguised attempt to harass the employer or disrupt the employer's business;
   (b) The hazard causing the employee's apprehension of death or injury must be such that a reasonable person, under the circumstances then confronting the employee, would conclude that there is a real danger of death or serious injury; and
   (c) There must be insufficient time, due to the urgency of the situation, to eliminate the danger through resort to regular statutory enforcement channels.

(4) As indicated in subsection (3), an employee's refusal to work is not protected unless it is a good faith response to a hazardous condition. To determine whether an employee has acted in good faith, the division will consider, among other factors, whether the employee:
   (a) Asked the employer to correct the hazard;
   (b) Asked for other work;
   (c) Remained on the job until ordered to leave by the employer; or
   (d) Informed the employer that, if the hazard was not corrected, the employee would refuse to work.

The lack of one or more of these factors shall not necessarily preclude a finding of good faith if other factors do establish good faith. The division will also consider whether the employer knew that the hazard could cause serious injury or death, or that the hazard was prescribed by a specific safety standard promulgated under WISHA or any other law that relates to the safety and health of a place of employment.

[Statutory Authority: RCW 49.17.040, 49.17.050, 49.17.240, chapters 43.22 and 42.30 RCW. 80-17-015 (Order 80-21), § 296-360-150, filed 11/13/80.]

WAC 296-360-160 Payment of damages to employee discriminated against. (1) If an employer discriminates against an employee such that the employee earns less than he or she would have earned absent the discrimination, the employer shall pay the employee the difference between the wages that the employee would have earned absent the discrimination and the wages the employee actually earned after the discrimination.

(2) If an employer discriminates against an employee for a refusal to work that is protected under WAC 296-360-150, the employer need not pay the employee's wages for the time spent fixing the hazard, or that would have been spent fixing the hazard, if the employer (a) had to or would have had to shut down the job to make the repair and (b) had not other work the employee could have done.

[Statutory Authority: RCW 49.17.040, 49.17.050, 49.17.240, chapters 43.22 and 42.30 RCW. 80-17-015 (Order 80-21), § 296-360-160, filed 11/13/80.]

Chapter 296-400A WAC

PLUMBER CERTIFICATION RULES

(Formerly chapter 296-400 WAC)

WAC
296-400A-005 What definitions do I need to know to understand these rules?

296-400A-121 What do I need to know about trainee experience and plumber examination requirements for the journeyman and specialty plumber (excluding the backflow assembly maintenance and repair specialty)?

[Title 296 WAC—p. 2730]
WAC 296-400A-005 What definitions do I need to know to understand these rules? Unless a different meaning is clearly required by the context, the following terms and definitions are important:

"Advisory board" is the state advisory board of plumbers.

"Audit" means an assessment, evaluation, examination or investigation of, contractor's accounts, books and records for the purpose of verifying the contractor's compliance with RCW 18.106.320.

"Backflow assembly" or "backflow prevention assembly" or "backflow preventer" is a device as described in the Uniform Plumbing Code used to prevent the undesired reversal of flow of water or other substances through a cross-connection into the public water system or consumer's potable water system.

"Backflow assembly tester" is an individual certified by the department of health to perform tests to backflow assemblies.

"Continuing education" is approved plumbing and electrical courses for journeyman and residential specialty plumbers, to meet the requirements to maintain their plumbing certification and for trainees or individuals to become certified plumbers in Washington.

"Continuing education course provider" is an entity approved by the department, in consultation with the state advisory board of plumbers, to provide continuing education training for journeyman, specialty residential plumbers and trainees. All training course providers must comply with the requirements in WAC 296-400A-028.

"Continuity affidavit" is a form developed by the department that is used to verify whether medical gas pipe installation work has been performed. This form is provided to the department annually by the person holding the medical gas piping installer endorsement and requires the signature of the employer of the medical gas piping installer.

"Contractor" means any person, corporate or otherwise, who engages in, or offers or advertises to engage in, any work covered by the provisions of chapter 18.106 RCW by way of trade or business, or any person, corporate or otherwise, who employs anyone, or offers or advertises to employ anyone, to engage in any work covered by the provisions of chapter 18.106 RCW and is registered as a contractor under chapter 18.27 RCW.

"Dispatcher" means the contractor's employee who authorized the work assignment of the person employed in violation of chapter 18.106 RCW.

"Department" is the department of labor and industries.

"Director" is the director of the department of labor and industries.

"Journeyman plumber" is anyone who has learned the commercial plumbing trade and has been issued a journeyman certificate of competency by the department. A journeyman plumber may work on plumbing projects including residential, commercial and industrial worksite locations.

"Medical gas piping installer" is anyone who has been issued a medical gas piping installer endorsement of competency by the department.

"Medical gas piping systems" are piping systems that convey or involve oxygen, nitrous oxide, high pressure nitrogen, medical compressed air and medical vacuum systems.

"Plumbing" is that craft involved in installing, altering, repairing and renovating potable water systems, liquid waste systems and medical gas piping systems within a building. The installation of water softening or water treatment equipment into a water system is not considered plumbing.

"Records" include, but are not limited to, all bids, invoices, billing receipts, time cards and payroll records that show the work was performed, advertised, or bid.

"Specialty plumber" is anyone who has been issued a specialty plumbers certificate of competency by the department limited to:

(a) Installation, maintenance and repair of plumbing for single-family dwellings, duplexes and apartment buildings which do not exceed three stories; or

(b) Maintenance and repair of backflow assemblies located within a residential or commercial building or structure. For the purposes of this subsection, "maintenance and repair" includes cleaning and replacing internal parts of an assembly, but does not include installing or replacing backflow assemblies.

"Supervision" for the purpose of these rules means within sight or sound. Supervision requirements are met when the supervising plumber is on the premises and within sight or sound of the individual who is being trained.

"Training course provider" is an entity approved by the department, in consultation with the state advisory board of plumbers, to provide medical gas piping installer training. All training course providers must comply with the requirements in WAC 296-400A-026.

"Trainee plumber" is anyone who has been issued a trainee certificate and is learning or being trained in the plumbing trade with direct supervision of either a journeyman plumber or specialty plumber working in their specialty.

WAC 296-400A-020 How do I obtain a certificate of competency? You can obtain a certificate of competency by completing the following requirements for:
WAC 296-400A-021 How do I obtain a medical gas piping installer endorsement? (Only journeyman plumbers holding active state of Washington certification may apply for this endorsement.)

You can obtain a medical gas piping installer endorsement by following the requirements:

1. Submit an application to the department; and
2. Pay the examination application fee shown in WAC 296-400A-045; and
3. Submit the required evidence of approved training to the department; and
4. Pass the written and practical competency examination; and
5. Pay the endorsement issuance fee shown in WAC 296-400A-045 to the department.

At the effective date of these medical gas piping installer rules, you may apply for the state of Washington medical gas piping installer endorsement in lieu of taking the medical gas piping installer examination, if you hold a current medical gas piping installers certificate issued by a department recognized training course provider. This opportunity to obtain your endorsement without taking the examination will expire one year from the effective date of these medical gas piping installer rules.

*The written and practical competency examination is performed under contract with a nationally recognized testing agency. The results of the competency examination will be forwarded to the department for processing.

WAC 296-400A-023 What process is required for renewal of journeyman and residential specialty plumber certificates of competency? (1) An individual must apply for renewal of their plumbing certificate before the expiration date of the certificate. The individual may not apply for renewal more than ninety days prior to the expiration date. Renewed certificates are valid for two years.

2. An individual may renew their certificate within ninety days after the expiration date without reexamination if the individual pays the late renewal fee listed in WAC 296-400A-045.

3. All applications for renewal received more than ninety days after the expiration date of the plumbing certificate require that the plumber pass the appropriate competency examination before being recertified.

4. All applicants for plumbing certificate renewal must:
   a. Submit a complete renewal application;
   b. Pay all appropriate fees; and
   c. Provide accurate evidence on the renewal form that the individual has completed the continuing education requirements described in WAC 296-400A-028.

If an individual files inaccurate or false evidence of continuing education information when renewing a plumbing certificate, the individual’s plumbing certificate may be suspended or revoked.

5. A journeyman or residential specialty plumber certificate holder who has not completed the required hours of continuing education prior to the renewal date must pay a doubled fee according to RCW 18.106.070. Also, if the required hours of continuing education are not completed within ninety days after the expiration date the applicant will be required to retake the examination and pay the appropriate fees prior to being placed in active status.

6. An individual may renew a suspended plumbing certificate by submitting a complete renewal application including obtaining and submitting the continuing education required for renewal. However, the certificate will remain in a suspended status for the duration of the suspension period.

7. An individual may not renew a revoked plumbing certificate.

WAC 296-400A-025 Who approves medical gas piping installer endorsement training courses? RCW 18.106.-050 authorizes the department to:

1. Approve training courses for the medical gas piping installer endorsement; and
2. Set training course fees.

WAC 296-400A-026 What training course approval procedures for medical gas will the department follow? (1) The department will review and approve courses submitted by training course providers that offer medical gas piping systems training. Course approvals will be decided in consultation with the state advisory board of plumbers.

2. All providers seeking course approval, must submit the required information (see subsection (5) of this section) to the department at least thirty days before a regularly sched-
uled advisory board meeting. No course can be offered as meeting the requirements of a medical gas endorsement until it has been approved.

(3) All material required for approval will be reviewed without testimony and the review will be based solely upon the information submitted. Once reviewed, the department has five working days to give a provider written notification of acceptance or rejection. In the case of rejection, the department must specify its reasons.

(4) If a provider has a course rejected, it may request a hearing before the advisory board at the next regularly scheduled meeting. Any information supporting the provider’s position, which was not included with the original approval request, must be submitted to the board at least twenty days before the meeting at which the hearing will be held.

At the hearing, the department and the provider may produce witnesses and give testimony. The hearing must be conducted according to chapter 34.05 RCW. The board must base its decision upon the testimony and evidence presented and must notify the parties immediately upon reaching its decision. A majority of the board is necessary to render a decision.

(5) Specific course approval criteria:
(a) All training courses must conform to and be based upon current standards and requirements governing the installation of medical gas piping systems.
(b) All course approval requests must include:
(i) A general description of the course including its scope, the instructional materials to be used and the instructional methods to be followed; and
(ii) A copy of the complete medical gas piping installer training curriculum; and
(iii) A detailed course outline; and
(iv) The name and qualifications of the course instructor(s); and
(v) The locations where the course will be taught; and
(vi) The days and hours the course will be offered; and
(vii) The specific fees associated with the course, as well as, the total cost of the course.
(c) All fees for approved training courses must be reasonable and in line with fees charged for other comparable code based training courses.
(d) Training courses are approved for a three-year period.
(e) A provider, whose courses are approved, must give the department literature describing the courses so the department can share this information to prospective applicants.
(f) It is the responsibility of the provider to annually review and update its courses and to notify the department of any changes.
(g) The department may withdraw its approval of any training course if it determines the provider is no longer in compliance with the requirements of this chapter. If the department withdraws its approval of a training course, it must give the provider written notification of the withdrawal specifying the reasons for its decision. If the department withdraws its approval of a training course the provider may request a hearing before the advisory board at the next regularly scheduled meeting. Any information supporting the provider’s position must be submitted to the board at least twenty days before the meeting at which the hearing will be held. At the hearing the department and the provider may produce witnesses and give testimony. The hearing must be conducted according to chapter 34.05 RCW. The board must base its decision upon the testimony and evidence presented and must notify the parties immediately upon reaching its decision. A majority of the board is necessary to render a decision.

WAC 296-400A-027 Where can I obtain information regarding department approved training course providers? The department will produce a list of all approved training course providers and/or course contact persons. This list will be available to all applicants who request it. It will also be available at all department service locations.

WAC 296-400A-028 What are the requirements for continuing education and classroom training?

What are the general and continuing education course requirements for journeyman, residential specialty plumbers and plumber trainees?

(1) Journeyman, residential specialty plumber and plumber trainee.
(a) To be eligible for renewal of a journeyman plumber or residential specialty plumber certificate, the individual must have completed at least sixteen hours of approved continuing education for each two years of the prior certification period. Individuals will be required in the prior two-year period to have completed at least eight hours of plumbing code and at least four hours of electrical code from the currently adopted Washington state plumbing and electrical codes. The remaining four hours may be plumbing or electrical trade related classes.
(b) Plumber trainees must complete at least eight hours per year of classroom training from an approved continuing education course for each year of the prior certification period. Trainee will be required during a two-year period to complete at least eight hours of plumbing code and at least four hours of electrical code from the currently adopted Washington state plumbing and electrical codes. The remaining four hours may be plumbing or electrical trade related classes.
(c) Any portion of a year of a prior plumber certification period is equal to one year for the purposes of the required continuing education.
(2) An individual will not be given credit for the same approved continuing education course taken more than once in the two years prior to the renewal date. No credit will be granted for any course not approved by the department.
(3) Continuing education requirements do not apply to backflow specialty plumbers under chapter 18.106 RCW and this chapter.

Note: Subsections (1), (2) and (3) of this section take effect July 1, 2005.
Approval process - continuing education course.

(4) The advisory board of plumbers or plumbing board subcommittee will review each continuing education course. The advisory board of plumbers or plumbing board subcommittee will recommend approval or disapproval to the department. The department will either approve or disapprove the course.

(5) To be considered for approval, a continuing education course must consist of not less than two hours of instruction and must be open to monitoring by a representative of the department and/or the plumbing board at no charge. If the department determines that the continuing education course does not meet or exceed the minimum requirements for approval, the department may revoke the course approval or reduce the number of credited hours.

(6) Approved courses must be based on:
   (a) Currently adopted edition of the Uniform Plumbing Code and National Electrical Code;
   (b) Chapters 18.106 or 19.28 RCW or chapters 296-400A or 296-46B WAC; or
   (c) Materials and methods as they pertain to the industrial practices of plumbing or electrical construction, building management systems, plumbing or electrical maintenance, or workplace health and safety.

(7) Code-update courses must be based on the entire currently adopted Uniform Plumbing Code or National Electrical Code.

Application - for continuing education course approval.

(8) All applications for course approval must be on forms provided by the department. The plumbing board and the department will only consider the written information submitted with the application when considering approval of the continuing education training course.

(9) The department will provide continuing education application forms to sponsors upon request. The course sponsor must submit an original completed application for course approval and three copies (unless submitted electronically using department prescribed technology) to the department. The department must receive the complete course application from the sponsor in writing at least forty-five days before the first class requested for approval is offered.

(10) A complete application for course approval must include:
   (a) The appropriate course application fee;
   (b) Course title, number of classroom instruction hours, and whether the training is open to the public;
   (c) Sponsor’s name, address, contact’s name and phone number;
   (d) Course outline (general description of the training, including specific Uniform Plumbing Code or National Electrical Code articles referenced);
   (e) Lists of resources (texts, references, visual aids);
   (f) Names and qualifications of instructors. Course instructors must show prior instructor qualification and experience similar to that required by the work force training and education coordinating board under chapter 28C.10 RCW;
   (g) Any additional documentation to be considered; and
   (h) A sample copy of the completion certificate issued to the course participants.

(11) The course sponsor seeking approval of a continuing education course will be notified of the subcommittee’s decision within five days of the completed review of the application.

(12) If the application is not approved, the rejection notice will include an explanation of the reason(s) for rejection. If the course sponsor disagrees with the subcommittee’s decision, the course sponsor may request a reconsideration hearing by the full plumbing board. A request to appeal course rejection must be received by the department forty-five days before a regularly scheduled board meeting. The course sponsor must submit, to the department, any additional information to be considered during the hearing, in writing, at least thirty days before the board hearing. The course sponsor must provide at least twenty copies of any written information to be submitted to the board.

Offering - continuing education course.

(13) The course sponsor may offer an approved course for up to three years without additional approval. However, if the course is classified as code-update or code-related and a new edition of the Uniform Plumbing Code or National Electrical Code is adopted within the course approval period, the course approval will be considered automatically revoked and the course sponsor must submit a new application for review by the department and approval by the plumbing board subcommittee.

(14) A continuing education course attended or completed by an individual before final approval by the plumbing board subcommittee cannot be used to meet the plumbing certificate renewal requirements.

Documentation - Washington approved training course attendance/completion.

(15) The department is not responsible for providing verification of an individual’s continuing education history with the course sponsor.

(16) The course sponsor must provide the department with an accurate and typed course attendance/completion roster for each course given.
   (a) The attendance/completion roster must be provided within thirty days of course completion.
   (b) In addition, the course sponsor must provide the attendance/completion roster in an electronic format provided by the department.
   (c) The attendance/completion roster must show each participant’s name, Washington certificate number, course number, location of course, date of completion, and instructor’s name. The typed roster must contain the signature of the course sponsor's authorized representative.

(17) If the course sponsor fails to submit the required attendance/completion rosters within thirty days of the course completion, the department may revoke or suspend the course approval.

(18) Course sponsors must award a certificate to each participant completing the course from which the participant will be able to obtain:
   (a) Name of course sponsor;
   (b) Name of course;
   (c) Date of course;
   (d) Course approval number;
WAC 296-400A-030 Do I need a temporary permit?

You need a temporary permit if you are an active out-of-state journeyman plumber or a residential specialty plumber residing in a state that does not have a reciprocal agreement with Washington and you would like to work as a plumber in Washington. Temporary permits are not issued for installers of medical gas piping systems.

Temporary permits are not issued for the backflow assembly maintenance and repair specialty. Therefore, WAC 296-400A-030 through 296-400A-033 do not apply to this specialty.

[Statutory Authority: RCW 18.106.040, 18.106.140, 2002 c 82, and 2003 c 399. 04-12-046, § 296-400A-030, filed 5/28/04, effective 6/30/04.]
### Title 296 WAC: Labor and Industries, Department of

**296-400A-045** What fees will I have to pay?

The following are the department's plumbers fees:

1. Fees related to journeyman and specialty plumber certification:

<table>
<thead>
<tr>

* Reciprocity application is only allowed for applicants that are applying work experience toward certification that was obtained in state(s) with which the department has a reciprocity agreement.

** The trainee certificate shall expire one year from the date of issuance and must be renewed on or before the date of expiration.

*** This fee applies to either the original issuance or a renewal of a certificate. If you have passed the plumbers certificate of competency examination or the medical gas piping installer endorsement examination and paid the certificate fee, you will be issued a plumber certificate of competency or a medical gas endorsement that will expire on your birth date.

**** The annual renewal of a Medical Gas Piping Installer Endorsement shall include a continuity affidavit verifying that brazing work has been performed within the past year.

***** This fee is paid directly to a nationally recognized testing agency.

****** This fee is paid directly to a training course provider approved by the department, in consultation with the state advisory board of plumbers.

******* This fee is paid directly to a training course provider approved by the department, in consultation with the state advisory board of plumbers.

(2) If your birth year is:

(a) In an even-numbered year, your certificate will expire on your birth date in the next even-numbered year.

(b) In an odd-numbered year, your certificate will expire on your birth date in the next odd-numbered year.

**WAC 296-400A-050** When does the advisory board of plumbers meet?

The advisory board of plumbers meets October.
**WAC 296-400A-070 Can I work as a certified plumber in Washington without taking the Washington state plumbers’ competency examination?** You may be eligible to work in Washington state without taking an examination if:

1. You have a current plumbers certificate or license from another state; and
2. That state has a current reciprocal agreement with the department of labor and industries; and
3. You pay the reciprocity application fee and journeyman or specialty certificate fee shown in WAC 296-400A-045.

The director of labor and industries negotiates reciprocal agreements with states that have equivalent requirements for certification and licensing of journeyman and specialty plumbers. The agreement allows plumbers from those states to work in Washington and Washington-certified plumbers to work in the other state without taking competency examinations. To find out if your state has an agreement with the department, contact the plumber’s certification clerk at the department’s Tumwater, WA headquarters.

Reciprocity agreements cannot be used to take the Washington state competency examination instead of the examination in your home state.

(4)(a) Those actively certified by the department of health on or before July 1, 2001, as backflow assembly testers and registered as a contractor under chapter 18.27 RCW or employed by a registered contractor, may perform maintenance and repair of backflow prevention assemblies, without being a certified plumber under chapter 18.106 RCW and these rules, until January 1, 2003.

(b) After January 1, 2003, backflow assembly testers exempted under (a) of this subsection are required to meet the eligibility requirements for a specialty plumber’s certificate of competency under chapter 18.106 RCW and these rules.

**WAC 296-400A-100 For certification purposes, how are “years of employment” computed and documented?**

1. For certification purposes, 2,000 hours of employment is considered one year. See RCW 18.106.070(2).
2. When you renew your certificate, you must document your previous years’ plumbing work by accurately completing the department’s approved form and submitting it to the department.
3. If you have completed a one, two, three, four, or more years plumbing construction trainee program, you must have the necessary training hours for the year in which you are registered. See RCW 18.106.040.
4. Subsections (1) through (3) of this section do not apply to the backflow assembly maintenance and repair specialty certification as years of employment are not required for this specialty. Applicants for this specialty designation are required to have fulfilled the requirements in WAC 296-400A-122 and pay the applicable fees in WAC 296-400A-045(2).
5. Experience obtained as a backflow assembly maintenance and repair specialty may not be applied toward journeyman or specialty plumber certification.

**WAC 296-400A-110 Does previous work experience count toward my trainee certificate?** If your work experience was in plumbing construction, you will be given credit for all verifiable hours that are properly submitted on the department’s approved form. Plumber trainee hours accumulated in the state of Washington will be credited only if an active Washington state trainee card was in place when the work occurred. (Refer to the definition of “plumbing” in WAC 296-400A-005.)

**WAC 296-400A-120 What do I need to know about plumber trainee certificates (excluding backflow assembly maintenance and repair specialty certification)?**

1. **Journeyman and specialty plumber trainee certification:**
   - (a) The department issues separate trainee certificates once a year.
   - (b) The plumbing trainee may not apply for renewal more than ninety days prior to the expiration date. Renewed certificates are valid for one year.
   - (c) All applicants for trainee certificate of renewal must:
     1. Submit a complete renewal application;
     2. Pay all appropriate fees; and
     3. Provide accurate evidence on the renewal form that the individual has completed the continuing education requirements described in chapter 296-400A WAC.
   - (d) If an individual files inaccurate or false evidence of continuing education information when renewing a plumbing trainee certificate, the individual’s certificate may be suspended or revoked.
   - (e) An individual who has not completed the required hours of continuing education cannot renew a trainee certificate.
   - (f) Individuals will not be able to apply to test for journeyman or specialty residential plumber certificates until the continuing education requirements have been met.
   - (g) If continuing education hours have not been met, trainee certificates will become expired and any experience obtained by the trainee in expired status will not be credited toward plumbing certificate application.
   - (h) An individual may renew an expired certificate of competency by submitting a complete renewal application including obtaining and submitting the continuing education required for renewal. However, the certificate will remain in an expired status for the duration of the expired period.
   - (i) An individual may not renew a revoked trainee certificate.

[Title 296 WAC—p. 2737]
(j) Apprentices registered in an approved program according to chapter 49.04 RCW who are obtaining classroom training consistent with the continuing education requirements under chapter 18.106 RCW and this chapter, as approved by the department, are deemed to have met the continuing education requirements necessary to renew a trainee certificate.

(k) If you are a trainee applying for a journeyman certificate, you must complete a minimum of two of the required four years in commercial plumbing experience.

(l) A certified residential specialty plumber working on a commercial job site may work as a journeyman trainee only if they have a current trainee certificate on their person while performing commercial plumbing work.

(m) On a job site, the ratio of certified plumbers to non-certified plumbers must be:
   (i) One residential specialty plumber or journeyman working on a residential plumbing job site may supervise no more than two trainees.
   (ii) One journeyman plumber working on a commercial job site may supervise no more than one trainee or one residential specialty plumber who holds a current trainee certificate.

(n) A plumber trainee who has a current trainee certificate with the state of Washington and has successfully completed or is enrolled in an approved medical gas piping installer training course may work on medical gas piping systems. Work may only occur when there is direct supervision by an active Washington state certified journeyman plumber with an active medical gas piping installer endorsement issued by the department. Supervision must be one hundred percent of the working day on a one-to-one ratio.

(2) **Trainee work hours.** Trainees shall renew the certificate annually but not more than ninety days before the expiration date.

   (a) An annual fee shall be charged for the issuance or renewal of the certificate.
   
   (b) The trainee will not be issued a renewed or reinstated training certificate if the individual owes the department money as a result of an outstanding final judgment.
   
   (c) Trainee hours will not be credited if the trainee owes outstanding penalties for violations of this chapter.

(3) At the time of renewal, the holder shall provide the department with an accurate list of the holder's employers in the plumbing construction trade for the previous annual period. The individual must submit a completed, signed, and notarized affidavit(s) of experience. The affidavit of experience must accurately attest to:

   (a) The plumbing installation work performed for each employer the individual worked for in the plumbing trade during the previous period;
   
   (b) The correct plumbing category the individual worked in; and
   
   (c) The actual number of hours worked in each category, worked under the proper supervision of a Washington certified journeyman plumber or residential specialty plumber.

(4) The trainee should ask each employer and/or apprenticeship-training director for an accurately completed, signed, and notarized affidavit of experience for the previous certification period. The employer(s) or apprenticeship training director(s) must provide the previous period's affidavit of experience to the individual within twenty days of the request.

(5) If hours for previous period are not submitted within the thirty days after renewing a plumbing training certificate, the individual may not receive credit for these previous periods.

WAC 296-400A-121 What do I need to know about trainee experience and plumber examination requirements for the journeyman and specialty plumber (excluding the backflow assembly maintenance and repair specialty)?

(1) If you possess a trainee certificate:

   (a) You may take the residential specialty plumber examination after completing 6,000 hours of documented training.
   
   (b) You may take the journeyman examination after completing 8,000 hours of documented training which must include 4,000 hours of commercial plumbing experience.

(2) All journeyman trainees must work under the direct supervision of a journeyman plumber until they have completed 8,000 hours of training.

When 8,000 training hours have been completed, the trainee must take the journeyman examination. Any trainee who has failed the journeyman plumber examination cannot retake the examination for at least one month and must work under the direct supervision of a journeyman plumber until the examination is passed.

(3) To be eligible for the residential specialty plumber's examination, a residential specialty trainee must complete 6,000 hours of training under the direct supervision of either a certified specialty plumber or a journeyman plumber. Any residential specialty trainee who has failed the residential specialty examination, cannot retake the examination for at least one month and must work under the direct supervision of a certified plumber until the examination is passed.

(4) Effective January 1, 2005, all plumber trainees will be required to meet the current hour requirements to test.

(5) **Apprentice/trade school endorsement requirements.** An individual who has a current journeyman or residential specialty plumber trainee certificate and who has successfully completed or is currently enrolled in an approved apprenticeship program or in a technical school program in the plumbing construction trade in a school approved by the work force training and education coordinating board, may work without direct on-site supervision during the last six months of meeting the practical experience requirements of this chapter. In order to work without direct on-site supervision applicable to the type (residential or journeyman) of training hours for which certification is being sought by the individual. This individual must obtain an apprentice/trade school trainee endorsement by submitting the applicable forms provided by the department and paying the applicable fees. This individual may work without direct on-site supervision until he or she receives the remaining hours required to
be eligible to take the applicable examination. This individual may not supervise trainees. (See RCW 18.106.070.)

(6) Any applicant (trainee, specialty plumber or journeyman) who fails an examination, will be required to wait at least until the next scheduled examination date and location. Examinations are held the first Thursday of every month, unless that date falls on a holiday. Applications shall be submitted and received by the plumbing certification program office two weeks before the next scheduled date.

WAC 296-400A-122 What do I need to know about trainee experience and the backflow assembly maintenance and repair specialty examination requirements? (1) A trainee certificate must be obtained by an individual performing backflow assembly maintenance and repair work who is not a certified plumber. The individual must work under the direct supervision of a certified backflow assembly maintenance and repair specialty, journeyman plumber, or residential specialty plumber for a minimum of one hundred percent of each working day while the backflow assembly maintenance and repair work is being performed.

(2) Each applicant for a backflow assembly maintenance and repair specialty certificate must furnish written evidence that he or she has a valid backflow assembly tester certification administered and enforced by the department of health.

(3) Any applicant who fails an examination will be required to wait at least until the next scheduled examination date and location. Examinations are held the first Thursday of every month, unless that date falls on a holiday. In the event of a holiday, the examination will be held on the second Thursday of the month. Applications shall be submitted and received by the plumbing certification program office two weeks before the next scheduled examination date.

WAC 296-400A-130 What if I make a false statement or a material misrepresentation on an application, an employment report or a trainee certificate? (1) All required applications and annual statements of employment hours are made under oath. Making false statements and/or material misrepresentations carry serious consequences. Any person who knowingly makes a false statement or material misrepresentation on an application, an affidavit of experience or a trainee certificate may have their certificate suspended, revoked, and/or be referred to the county prosecutor for criminal prosecution. In addition, the department may issue an infraction for a violation of this chapter.

(2) The annual statements of employment described in subsection (1) of this section do not apply to the backflow assembly maintenance and repair specialty certification.

WAC 296-400A-135 How does the department enforce trainee supervision? (1) A journeyman plumber on each and every commercial job site shall supervise either a residential specialty plumber with a current plumber trainee card or trainee with a current plumber trainee card.

(a) The ratio on each commercial site shall be not more than one residential plumber or one plumber trainee working on any one job site for every certified journeyman plumber working as a journeyman plumber on that site.

(b) The time of supervision shall be a minimum of seventy-five percent of the time spent on each and every job site.

(2) A journeyman plumber or residential specialty plumber on each and every residential specialty job site shall supervise a plumber trainee with a current plumber trainee card.

(a) The ratio on each residential specialty job site shall be not more than two trainees with current plumber trainee cards on any one residential specialty job site for every certified journeyman plumber or residential specialty plumber on that site.

(b) The time of supervision shall be a minimum of seventy-five percent of the time spent on each and every job site.

(3) A journeyman plumber with current medical gas endorsement may supervise either a residential specialty plumber with a current trainee card or a plumber trainee with a current trainee card.

(a) The residential specialty plumber or the plumber trainee has to successfully completed or is currently enrolled in an approved medical gas piping installer training course approved by the department.

(b) The residential specialty plumber or other plumber trainee is under the direct supervision of a certified medical gas journeyman plumber on one-to-one ratio for one hundred percent of the time on each and every medical gas site.

(4) A backflow assembly plumber, a journeyman plumber or a residential specialty plumber shall supervise a backflow trainee to do maintenance and repair work on every backflow assembly on potable water systems, inside every commercial or residential building. The ratio shall be one-to-one for one hundred percent of the time on every job site.

[Statutory Authority: RCW 18.106.040, 18.106.140, 2002 c 82, and 2003 c 399, 04-12-046, § 296-400A-135, filed 5/28/04, effective 6/30/04.]

WAC 296-400A-140 How does the department enforce plumbers certification requirements? The department enforces plumber certification requirements by means of job-site inspections conducted by an authorized representative of the department. The representative must determine whether:

(1) Each person doing plumbing work has a proper certificate on their person; and

(2) The ratio of certified specialty and/or journeyman plumbers to certified trainees is correct; and

(3) Each certified trainee is directly supervised by either a certified specialty plumber or a certified journeyman; and

[Title 296 WAC—p. 2739]
(4) Persons who are installing medical gas piping systems have active medical gas piping installer endorsements in addition to their active plumber certification.

(5) Persons who are certified as backflow assembly maintenance and repair specialties must have an active backflow assembly tester certification from the department of health.

WAC 296-400A-150 May the department audit the records of a contractor? Yes, for any reason such as: Dispatching, ratio, supervision, excessive hours, and certification. The department may audit the records of contractors as authorized under RCW 18.106.320 when the department has reason to believe that a violation of the plumbing certification laws has occurred.

WAC 296-400A-155 Audit of trainee hours. (1) The department, under RCW 18.106.320, may audit the employment records of the plumbing contractor or employer who verified the plumbing trainee hours.

(2) Every contractor must keep a record of trainee employment so the department may obtain the necessary information to verify plumbing trainee work experience.

(a) The contractor must keep the records of jobs performed for at least five years.

(b) Upon request, these records must be made available to the department for inspection within seven business days.

(3) The contractor must maintain time cards or similar records to verify:

(a) The number of hours the trainee worked as a supervised trainee by category.

(b) The type of plumbing work the trainee performed (e.g., commercial or residential).

(4) Any information obtained from the trainee’s contractor or employer during the audit of the records of RCW 18.106.320 is confidential and is not open to public inspection under chapter 42.17 RCW.

(5) The department's audit may include, but will not be limited to, the following:

(a) An audit to determine whether the trainee was employed by the contractor or employer during the period for which the hours were submitted, the actual number of hours the trainee worked, and the category of plumbing work performed; and

(b) An audit covering a specific time period and examination of a contractor's or employer's books and records which may include their reporting of the trainee's payroll hours required for industrial insurance, employment security or prevailing wage purposes.

WAC 296-400A-300 What procedures does the department follow when issuing a notice of infraction? (1) If an authorized representative of the department determines that an individual has violated plumber certification requirements, including medical gas piping installer endorsement requirements, the department must issue a notice of infraction describing the reasons for the infraction.

(2) For plumber certification violations, the department may issue a notice of infraction to either:

(a) An individual who is plumbing without a current plumber certificate; or

(b) The employer of the individual who is plumbing without a current plumber certificate; or

(c) The employer's authorizing agent or foreman that made the work assignment to the individual who is plumbing without a current plumber certificate.

(3) For medical gas piping installer endorsement violations, the department may issue a notice of infraction to either:

(a) An individual who is installing medical gas piping systems without a current plumber certificate and a current medical gas piping installer endorsement; or

(b) The employer of the individual who is installing medical gas piping systems without a current plumber certificate and a current medical gas piping installer endorsement; or

(c) The employer's authorizing agent or foreman that made the work assignment to the individual who is installing medical gas piping systems without a current plumber certificate and a current medical gas piping installer endorsement.

(4) The department may issue an infraction to a contractor advertising or performing work under this chapter or chapter 18.27 RCW who is not properly registered under chapter 18.27 RCW.

(5) An individual may appeal a notice of infraction by complying with the appropriate provisions of RCW 18.106-220.

(6) If good cause is shown, an administrative law judge may waive, reduce or suspend any monetary penalties resulting from the infraction.

(7) Any monetary penalties collected under this chapter must be deposited in the plumbing certificate fund.

WAC 296-400A-400 What are the monetary penalties for violating certification requirements? (1) A person cited for an infraction under RCW 18.106.020 or 18.106.320 shall be assessed a monetary penalty based upon the following schedule:

(2005 Ed.)
WAC 296-400A-425 What if I owe outstanding penalties related to a department issued plumber infraction? The department may deny your application or renewal of your certificate or endorsement if you owe outstanding penalties. The department must notify you of their denial by registered mail, return receipt requested. This notice of denial will be mailed to the address on your application.

Upon receipt of the notice, you have twenty days to file a notice of appeal with the department. Your notice of appeal must be accompanied by a certified check for two hundred dollars. This amount will be returned to you if the department’s decision is not upheld by the hearings officer. If the hearings officer upholds the department’s decision, the two hundred dollars will be applied to the cost of the hearing.

The office of administrative hearings shall conduct the hearing under chapter 34.05 RCW.

WAC 296-400A-430 If I am a certified backflow assembly maintenance and repair, journeyman, or specialty plumber do I need to be a registered contractor under chapter 18.27 RCW? Anyone who advertises, offers to do work, submits a bid, or performs any work under chapter 18.106 RCW and these rules must be a registered contractor as required under chapter 18.27 RCW, or an employee of such a registered contractor, with wages as their sole compensation.

WAC 296-403A-100 Definitions. Definitions as found in ASTM F 747-97 Standard Terminology Related to Amusement Rides and Devices are adopted in addition to the following:

(1) "Air supported" structure or device means an amusement device that incorporates a structural and mechanical system and employs a high-strength fabric or film that achieves its strength, shape and stability by pretensioning with internal air pressure (inflation).

(2) "Amusement ride" means any vehicle, boat, or other mechanical or air supported device moving upon or within a structure, along cables or rails, through the air by centrifugal force or otherwise, or across water, that is used to convey one or more individuals for amusement, entertainment, diversion, or recreation. For purposes of this chapter, "boats" does not refer to personal watercraft or vessels operated on the waters of this state according to chapter 79A.60 RCW. Examples of an amusement ride include, but are not limited to, devices commonly known as skyrides, ferris wheels, carousels, parachute towers, tunnels of love, roller coasters, mechanical bulls, gyrotron, space balls, bungee operated, simulators and similar devices.

Conveyances for persons in recreational winter sports activities such as: Ski lifts, ski tows, j-bars, t-bars, and similar devices subject to regulation under chapter 70.88 RCW are not amusement rides. Any single-passenger coin-operated ride that is manually, mechanically, or electrically operated and customarily placed in a public location that does not normally require the supervision or services of an operator is not an amusement ride. Nonmechanized playground equipment including, but not limited to, swings, seesaws, stationary spring-mounted animal features, rider-propelled merry-go-rounds, climbers, slides, trampolines, and physical fitness devices are not amusement rides. Permanent water slides are not amusement rides. Animal rides such as: Pony rides, riding stables, hay rides and elephant rides are not amusement rides.

(a) "Portable amusement ride" means an amusement ride which is relocated at least once per year with or without disassembly.
(b) "Permanent amusement ride" means an amusement ride which is erected to remain a lasting part of the premises.

(3) "Amusement structure" means any electrical, mechanical, nonmechanical, or air-supported device or any combinations thereof operated for revenue and to provide amusement or entertainment to viewers or audiences at carnivals, fairs, or amusement parks. A game or concession where a member of the public performs an act or makes a purchase is not an amusement structure. Examples of an amusement structure include, but are not limited to, structures commonly known as permanent steel or wooden roller coasters, a permanent dark ride or fun house, a permanent drop tower, or a permanent building enclosing a portable amusement device.

(4) "ASTM" means the American Society for Testing and Materials (F-24 committee) as it relates to amusement rides and devices. Copies of the ASTM are available from ASTM International, 100 Barr Harbor Drive, P.O. Box C700, West Conshohocken, Pennsylvania 19428-2959.

(5) "Authority having jurisdiction" means the department.

(6) "Carnival" means a mobile enterprise principally devoted to offering amusement or entertainment to patrons in, upon, or by means of portable amusement rides or structures.

(7) "Certificate of inspection" means a document given under oath or affirmation from an insurer or a person with whom the insurer has contracted to make a safety inspection of the amusement ride or structure. The certificate must contain: the name, address and signature of the inspector, the complete description of the amusement ride or structure and the name and address of the owner or operator.

(8) "Certificate of insurance" means a document certifying that the insurance required by chapter 67.42 RCW is in effect. Copies of this document/form are available from the department upon request.

(9) "Department" means the department of labor and industries.

(10) "Insurance policy" means an insurance policy written by an insurer authorized to do business in this state under Title 48 RCW.

(11) "Major modification" means any change to the original configuration or layout of components or replacement of components that are not like-for-like.

(13) "Operating permit" means a permit that is issued by the department.

(14) "Operating permit decal" is a decal issued by the department that must be affixed on or adjacent to the control panel of the amusement ride or structure in a location visible to the patrons of the ride or structure.

(15) "RCW" means the Revised Code of Washington. Copies of RCWs are available from the office of the code reviser.

(16) "Safety inspection" means a procedure to be conducted by a safety inspector to determine whether an amusement ride or device is assembled, maintained, tested, operated, and inspected in accordance with the current ASTM standards, the manufacturer's or insurer's standards, and this chapter, whichever is the most stringent, and that determines the current operational safety of the ride or device.

(17) "Safety inspector" and "amusement ride inspector" both mean a third-party inspector authorized by the department to conduct safety inspections of amusement rides or devices in compliance with this chapter. The inspector must be an independent, third party with no organizational, managerial, financial, design, or promotional affiliation with the amusement ride or amusement structure being inspected. The inspector must not be a principal, owner, or employee of any amusement company or manufacturer doing business in the state of Washington, unless authorized by the department to conduct specific inspections on a case-by-case basis.

Inspectors who have installed, modified or repaired an amusement ride or structure may not perform the initial inspection on the equipment they have installed, modified, or repaired. The inspector must have an adequate diversity of clients or activity so that the loss or award of a specific contract regarding amusement ride or amusement structure safety certification would not be a deciding factor in the financial well being of the inspector.

(18) "WAC" means the Washington Administrative Code. Copies of WACs are available from the department and the office of the code reviser.

WAC 296-403A-110 Insurance. The following are the requirements for insurance for amusement rides and structures:

(1) An original copy of the insurance policy in an amount not less than one million dollars per occurrence from an insurer authorized to do business in the state of Washington must be filed with the department.

(2) A certificate of insurance must be presented to either the sponsor, lessor, landowner or other person responsible for an amusement ride being offered for use by the public.

(3) The insurance company must notify the department at least thirty days before canceling or revoking a policy and upon the nonrenewal of the policy.

(4) If the insurance company withdraws, cancels, revokes, suspends, or excludes coverage of any ride(s) from any policy furnished to the department, such withdrawal, cancellation, revocation, suspension, or exclusion must be plainly stated in documents furnished to the department.

(5) The department must be notified within twenty-four hours of the withdrawal, cancellation, revocation, suspension, or exclusion of insurance coverage of an amusement ride or structure for which an operating permit has been issued by the department.
WAC 296-403A-120 Application for and renewal of operating permit. (1) The person(s) making application for an operating permit for an amusement structure or an amusement ride must provide the following documentation on an application form provided by the department and pay the appropriate fee:

(a) The name, address and telephone number of the owner or operator of the amusement ride or structure together with the name and signature of the applicant.

(b) Description of amusement ride or structure. Each amusement ride or structure must be individually identified:

(i) By a trade name or title and a narrative description from which the amusement structure or ride can be identified; and

(ii) A serial number which is welded onto the frame or contained on an identification plate which is permanently affixed to the amusement structure or ride.

(c) Certificate of inspection. The amusement ride inspector or insurer per RCW 67.42.020(2) must certify that the amusement ride or structure has been inspected for safety and meets the standards for compliance with all applicable requirements of the National Electrical Code and this chapter, manufacturer’s specifications, American Society of Testing and Materials (ASTM) Standards on Amusement Rides and Devices, and insurance company inspection requirements.

(d) Amusement rides or structures that undergo major modification must be recertified by an amusement ride inspector or insurer per RCW 67.42.020(2) before being placed into operation.

(2) Renewal of operating permit. An operating permit may be renewed before the expiration date by submitting an application with the proper fee and a certificate of safety inspection. The safety inspection must have been performed within thirty days before the expiration date of the operating permit.

WAC 296-403A-130 Operating permit. An amusement ride or structure must not be operated unless the owner or operator has obtained an operating permit and an operating permit decal is posted on the ride, unless a temporary operating permit has been issued as outlined in WAC 296-403A-140. The owner or operator of the amusement ride or structure must have available for inspection, at the location where the amusement ride or structure is to be operated, a copy of the operating permit for each amusement ride or structure. Each operating permit that has been issued to an owner or operator has obtained an operating permit and an operating permit has been issued as outlined in WAC 296-403A-130. The operating permit for each amusement ride or structure must be available for inspection, at the location where the amusement ride or structure is to be operated, with the name and signature of the applicant.

WAC 296-403A-140 Temporary operating permit. A temporary operating permit expires after fifteen days and will not be renewed or extended unless authorized by the chief electrical inspector. The department electrical section may issue a temporary operating permit when:

(a) An operating permit has been denied or revoked.

(b) The department has ordered the cessation of the operation of an amusement ride or structure.

(c) An amusement ride inspector application has been denied, or certificate has been suspended or revoked.

The appeal will be conducted in accordance with chapter 34.05 RCW. An appeal does not stay the decision of the department. The appeal must be filed within twenty days after notice of the decision of the department is sent by certified mail, return receipt requested, or is served upon the owner or operator.

(2) An appeal is made by filing a written notice of appeal with the department’s chief electrical inspector and must state the decision by the department that is being appealed and the relief that is desired. The formal appeal must be accompanied by a certified check for two hundred dollars which will be returned to the holder of the certificate or permit if the department's decision is overturned. If the department's decision is not overturned, the two hundred dollars will be applied to pay the costs associated with the appeal, and any balance remaining after payment of per diem and expenses will be paid into the electrical license fund.

(3) All requests for appeals must be filed with the department's chief electrical inspector, Department of Labor and Industries, 7273 Linderson Way, P.O. Box 44460, Olympia, WA 98504-4460. The filings may be submitted by ordinary mail, certified or registered mail, or by personal delivery. The date of filing is the date the paper is actually received in the office of the chief electrical inspector.

(4) See chapter 34.05 RCW and chapter 10-08 WAC for additional information on appeals.

WAC 296-403A-170 Amusement ride inspector qualifications. An amusement ride inspector must meet the following minimum qualifications:

(1) Two years experience with an insurance company as an amusement ride inspector; or

(2) Two years experience inspecting amusement rides and enforcing amusement ride codes while employed by a state or other governmental body regulating amusement rides; or

(3) Not less than five years documented field operating and maintenance experience with amusement rides and devices, including responsibility for erection, assembly, dis-assembly; personnel supervision responsibility for erection, maintenance, and operating functions; or

(4) Not less than ten years documented practical experience in the design, construction, maintenance, repair, field inspection, and operation of amusement rides and devices as an authorized representative of a recognized amusement ride manufacturer; and

(5) In addition to the above criteria an amusement ride inspector must be certified by the department after demonstrating competency by:

(a) Passing a competency examination administered by the department; or

(b) Passing a test administered by the National Association of Amusement Ride Safety Officials for NAARSO Level II or other certification organizations recognized by the department, as an amusement ride inspector.

Those individuals who are certified by the department before December 31, 2000, will have until December 31, 2003, to take and successfully pass one of the examinations in (a) or (b) of this subsection. Individuals with at least ten years as an amusement ride inspector may become certified without testing if they were certified with the department on December 31, 2000.

(6) An amusement ride inspector may work without certification, as a trainee, if directly and continually supervised during the inspection process by a certified amusement ride inspector.

(7) This section does not apply to insurers or a person with whom the insurer has contracted with per RCW 67.42.020(2).

WAC 296-403A-180 Safety and maintenance seminar. Every amusement ride inspector must annually attend at least one amusement ride safety and maintenance seminar sponsored by the Amusement Industry Manufacturers and Equipment Suppliers, Northwestern Showman’s Club, National Association of Amusement Ride Safety Officials, International Association of Amusement Parks and Attractions, or an equivalent approved by the department. All experience and schooling must be documented and verified and must be furnished to the department with an application for an amusement ride inspector certificate.

WAC 296-403A-190 Safety standards for amusement rides and amusement structures. (1) A certified amusement ride inspector will inspect amusement rides and structures for safety. Amusement rides and structures must comply with all applicable requirements of the National Electrical Code and this chapter, manufacturer’s specifications, American Society of Testing and Materials (ASTM) Standards on Amusement Rides and Devices, insurance company inspection requirements, and the requirements established by the local authority having jurisdiction.

(2) The amusement ride inspector must verify the correction of all deficiencies noted on the application for an amusement ride operating decal. The correction of any deficiencies must be completed within fifteen calendar days unless the inspector has determined that deficiencies are of a serious nature that will prohibit operation of the amusement ride or amusement structure. The period to correct deficiencies may be extended for a specific period at the discretion of the safety inspector and/or the department. The amusement ride inspector must report to the department any amusement ride or structure that is not allowed to operate because of serious safety deficiencies. Any deficiencies must be re-inspected by the amusement ride inspector/company or other qualified inspector/company authorized by the original ride inspector/company.

WAC 296-403A-195 Incident reporting. (1) Amusement structure/ride owner(s) and/or operator(s) must report to the department:

(a) Any incident or accident where evacuation of a ride results from an electrical or mechanical malfunction or when emergency personnel are required to assist in the evacuation; and

(b) Any incident/accident involving an amusement ride or structure involving personal injury that requires medical treatment, other than ordinary first aid. Medical treatment other than ordinary first aid means treatment beyond that which occurs at the location of the incident/accident and is provided by or under the supervision of a physician licensed to practice medicine, and the treatment is in response to a medical concern that is related directly to the incident/accident.

(2) Reports meeting the above criteria must be made in writing within twenty-four hours after any incident/accident. This report may be faxed to a phone number supplied by the department followed by the original report in the mail. The report must include a detailed description of all available facts regarding the incident/accident for review by the department. After review, the department may require the amusement ride or structure to be inspected by an amusement ride inspector before continuing the operation of the ride or structure. When the department revokes a ride operating permit, a complete and detailed account of the incident/accident must be provided to the department before a new operating permit will be issued following an incident/accident.

[Title 296 WAC—p. 2744]
WAC 296-403A-200 Reciprocal certificate. The department may upon proper application, issue an amusement ride inspector certificate to an individual who meets the minimum qualifications as set forth in this chapter and who possesses a current, valid amusement ride inspector certificate in a state or province which has equal or higher standards for amusement ride inspectors as those contained in this chapter. No amusement ride inspection examination will be required of those persons who qualify for a reciprocal amusement ride inspector certificate.

WAC 296-403A-210 Revocation and suspension of certification of amusement ride inspectors—Reinstatement. (1) An amusement ride inspector's certificate of competency may be suspended or revoked for cause such as: Certifying the safety of an unsafe ride, falsifying records or reports or certifying an amusement ride or structure which he or she has not personally inspected.

(2) The suspension or revocation of a certificate of competency that is not contested will be suspended or revoked immediately. If the suspension or revocation of a certificate of competency is contested, the suspension or revocation will not occur until after a hearing has been held before the department. The inspector and his or her employer are entitled to appear at such hearings and to be heard.

(3) The department must deliver to both the inspector charged and to his or her employer (if known), not less than ten days prior to the hearing, a written notice of the charges and of the time and place of such hearing.

(4) An inspector whose certificate of competency has been suspended may apply for reinstatement not less than ninety days after the time of suspension. If the certificate of competency has been revoked, the inspector will need to reapply for certification according to this chapter.

WAC 296-403A-220 Fees for examination, certification, and renewal of certification for inspectors. (1) Fee for each application for inspector's certificate of competency and examination, one hundred dollars.

(2) Application fee (nonrefundable), twenty dollars.

(3) Fee for annual renewal of certificate of competency or reciprocal inspector certificate, twenty dollars.

WAC 296-403A-230 Electrical requirements for amusement rides and amusement structures. (1) Electrical distribution system. Service equipment, separately derived systems, feeders and circuits for each amusement ride, amusement structure or concession must comply with all applicable requirements of the National Electrical Code and chapter 296-46A WAC, as amended.

(2) Flexible multiconductor cords must be connected to equipment by approved connectors designed for the purpose or by listed cord caps. Individual conductors of multiconductor cords in sizes #2 AWG and larger are permitted to be connected by listed and labeled connection systems in accordance with Article 520-53(k) of the National Electrical Code. Where conductors are connected individually by such connection systems, the outer jacket of multiconductor cord must be secured to the electrical equipment independent from the receptacles and plugs by approved cable grips that are installed in a manner to prevent pressure from being applied to the receptacles and plugs.

(3) Individual, single conductor, insulated, portable power cable, in addition to complying with Section 525-13 of the National Electrical Code, must comply with the following:

(a) All conductors of the feeder or circuit including the equipment grounding conductor must originate in the same electrical equipment and terminate in the same equipment.

(b) All conductors of the feeder or circuit including the ungrounded, grounded, and equipment grounding conductors must run together, except for portions installed within approved cable protection systems.

(c) The cables must be secured to the electrical equipment independent from the cable receptacles and plugs by approved cable grips that prevent pressure from being applied to the connectors.

(d) The cables must be connected to electrical equipment by approved listed and labeled connection systems in compliance with Section 520-53(k) of the National Electrical Code.

(4) Disconnecting means. A separate, enclosed, externally operable fused switch or circuit breaker must be installed on each amusement ride, structure or concession to disconnect all electrical equipment. The disconnecting means must be readily accessible and identified as the disconnecting means. The disconnecting means is not required to be readily accessible when a disconnecting means meeting the requirements of NEC 525-30 is also installed. Where more than one power supply is employed, the disconnecting means must be grouped.

(5) Rotating equipment. Components of amusement rides or structures that rotate more than three hundred sixty degrees and which have electrically operated equipment, must be supplied by approved collector rings that are totally enclosed or located so they are accessible to authorized personnel only. The collector rings must be factory produced with an equipment grounding segment having a voltage and current rating that equals or exceeds the rating of the current carrying segments. Collector rings must have an ampacity not less than one hundred twenty-five percent of the full-load current of the largest device served plus the full-load current of all other devices served. Collector rings for control and signal purposes must have an ampacity not less than one hundred twenty-five percent of the full-load current of the largest device served plus the full-load current of all other devices served.

(6) Equipment grounding. All noncurrent carrying metal parts of amusement rides and structures must be grounded by [Title 296 WAC—p. 2745]
an equipment grounding conductor routed with the feeder or circuit conductors in accordance with the National Electrical Code and these rules. The metallic structure must not be used as a current carrying conductor.

EXCEPTIVE: The metallic structure is permitted to be used as the return path for low voltage systems that do not exceed thirty volts, provided that the ungrounded conductors are protected by an overcurrent device in accordance with the National Electrical Code and the system is factory built for such use.

(7) Existing concessions or games electrical systems must comply with the National Electrical Code and must be maintained in full compliance with codes and standards in effect at the time they were manufactured. When new concessions or games are purchased, manufactured or constructed, or where existing concessions or games have major modification, the electrical system must comply with this chapter and the edition of the National Electrical Code in effect at the time. All concessions and games must be identified in or on the disconnecting means and in records furnished to the department with the edition of the National Electrical Code the electrical system is intended to comply with, or be certified and labeled by the department as a factory assembled structure.

WAC 296-403A-240 Department on-site electrical inspection. (1) Department electrical inspection will be done each time an amusement ride or structure is set up. Fees will be paid in accordance with chapter 296-46A WAC, as amended. An on-site electrical inspection permit fee and inspection fee is not required for any amusement ride or structure when all of the following conditions are met:

(a) The ride is equipped with a supply cord that does not exceed 120 volts or 20 amps.

(b) The amusement ride inspector, on the operating permit application, has documented the size and length of the supply cord.

(c) No extension cords are used to supply the equipment.

(d) The amusement ride or structure has a current amusement ride operating permit decal.

(2) Itinerary for set-up locations must be made available to the chief electrical inspector upon request.

(3) Amusement rides that are leased and set up for private use (not operated for revenue) must also comply with the following in addition to the on-site inspection and operating permit requirements established by this chapter:

(a) The lessor must provide the lessee with manufacturer's set up instructions.

(b) The lessor or their authorized agent is responsible for providing proper set up and tear down of each amusement ride or structure (authorized agents must be under written contract to the owner or operator).

(c) The lessor is responsible to maintain proper documentation assuring that each lessee has been provided with proper manufacturer's instructions for operating and setting up each individual leased amusement ride or structure.

Chapter 296-800 WAC

SAFETY AND HEALTH CORE RULES

WAC 296-800-100 Introduction.

EMPLOYER RESPONSIBILITIES: SAFE WORKPLACE

296-800-110 Employer responsibilities: Safe workplace—Summary.

296-800-11005 Provide a workplace free from recognized hazards.

296-800-11010 Provide and use means to make your workplace safe.

296-800-11015 Prohibit employees from entering, or being in, any workplace that is not safe.

296-800-11020 Construct your workplace so it is safe.

296-800-11025 Prohibit alcohol and narcotics from your workplace.

296-800-11030 Prohibit employees from using tools and equipment that are not safe.

296-800-11035 Establish, supervise, and ensure rules that lead to a safe and healthy work environment that are effective in practice.

296-800-11040 Control chemical agents.

296-800-11045 Protect employees from biological agents.

EMPLOYEE RESPONSIBILITIES

296-800-120 Rule.

296-800-12005 Employee responsibilities.

SAFETY COMMITTEES AND SAFETY MEETINGS

296-800-130 Safety committees/safety meetings—Summary.

296-800-13020 Establish and conduct safety committees.

296-800-13025 Follow these rules to conduct safety meetings.

ACCIDENT PREVENTION PROGRAM

296-800-140 Accident prevention program.

296-800-14005 Develop a formal, written accident prevention program.

296-800-14020 Develop, supervise, implement, and enforce safety and health training programs that are effective in practice.

296-800-14025 Make sure your accident prevention program is effective in practice.

FIRST-AID SUMMARY

296-800-150 Rule summary.

296-800-15005 Make sure that first-aid trained personnel are available to provide quick and effective first aid.

296-800-15020 Make sure appropriate first-aid supplies are readily available.

296-800-15030 Make sure emergency washing facilities are functional and readily accessible.

296-800-15035 Inspect and activate your emergency washing facilities.

296-800-15040 Make sure supplemental flushing equipment provides sufficient water.

PERSONAL PROTECTIVE EQUIPMENT (PPE)

296-800-160 Summary.

296-800-16005 Do a hazard assessment for PPE.

296-800-16010 Document your hazard assessment for PPE.

296-800-16015 Select appropriate PPE for your employees.

296-800-16020 Provide PPE to your employees.

296-800-16025 Train your employees to use PPE.

296-800-16030 Retrain employees to use PPE, if necessary.

296-800-16035 Document PPE training.

296-800-16040 Require your employees to use necessary PPE on the job.

296-800-16045 Keep PPE in safe and good condition.

296-800-16050 Make sure your employees use appropriate eye and face protection.

296-800-16055 Make sure your employees use appropriate head protection.

296-800-16060 Make sure your employees use appropriate foot protection.

296-800-16065 Make sure your employees use appropriate hand protection.

296-800-16070 Make sure your employees are protected from drowning.

[Title 296 WAC—p. 2746] (2005 Ed.)
EMPLOYER—CHEMICAL HAZARD COMMUNICATION

INTRODUCTION

296-800-170 Employer chemical hazard communication—Introduction.
296-800-17005 Develop, implement, maintain, and make available a written Chemical Hazard Communication Program.
296-800-17007 Include multiproject workplace(s) in your program if necessary.
296-800-17010 Identify and list all the hazardous chemicals present in your workplace.
296-800-17015 Obtain and maintain material safety data sheets (MSDSs) for each hazardous chemical used.
296-800-17020 Make sure material safety data sheets (MSDSs) are readily accessible to your employees and NIOSH.
296-800-17025 Label containers holding hazardous chemicals.
296-800-17030 Inform and train your employees about hazardous chemicals in your workplace.
296-800-17035 Follow these rules for laboratories using hazardous chemicals.
296-800-17040 Follow these rules for handling chemicals in factory-sealed containers.
296-800-17045 Translate certain chemical hazard communication documents upon request.
296-800-17050 Attempt to obtain a material safety data sheet (MSDS) upon request.
296-800-17055 Items or chemicals exempt from the rule, and exemptions from labeling.
296-800-180 Material safety data sheets (MSDSs) as exposure records.
296-800-18005 Preserve exposure records for at least 30 years.
296-800-18010 Inform current employees of exposure records.
296-800-18015 Obtain and maintain material safety data sheets (MSDSs) for each hazardous chemical used.
296-800-18020 Make sure electrical equipment that is not marked is not used.
296-800-18025 Identify disconnecting means.
296-800-18030 Maintain electrical fittings, boxes, cabinets and outlets in good condition.
296-800-18035 Maintain electrical fittings, boxes, cabinets and outlets in good condition and use safely.
296-800-18040 Make sure electrical equipment is effectively grounded.
296-800-18045 Make sure electrical equipment has overcurrent protection.
296-800-18050 Provide handrails and stair railings.
296-800-18055 Develop, implement, maintain, and make available a written Chemical Hazard Communication Program.
296-800-18060 Provide a separate lunchroom if employees are exposed to toxic substances if they are allowed to eat and drink on the job site.
296-800-18065 Provide showers when required for employees working with chemicals.
296-800-18070 Provide change rooms when required.
296-800-18075 Make sure any work clothes you provide are dry.

ENVIRONMENTAL TOBACCO SMOKE IN THE OFFICE

296-800-240 Summary.
296-800-24005 Control tobacco smoke in your building.
296-800-24010 Control tobacco smoke that comes in from the outside.

STAIRS AND STAIR RAILINGS

296-800-220 Summary.
296-800-22005 Guard or cover floor openings and floor holes.
296-800-22010 Protect open-sided floors and platforms.

BATHROOMS AND WASHING FACILITIES

296-800-230 Provide bathrooms for your employees.
296-800-23020 Provide convenient and clean washing facilities.
296-800-23025 Provide safe drinking (potable) water in your workplace.
296-800-23030 Use your portable wooden ladders safely and for their intended purpose.
296-800-23035 Store things safely.
296-800-23040 Make sure eating areas are safe and healthy.
296-800-23045 Follow these requirements if you provide food service to your employees.

EATING AREAS AND FOOD SERVICE

296-800-290 Summary.
296-800-29005 Inspect all electrical equipment your employees use to make sure the equipment is safe.
296-800-29010 Make sure all electrical equipment is used for its approved or listed purpose.
296-800-29015 Make sure electrical equipment used or located in wet or damp locations is designed for such use.
296-800-29020 Make sure electrical equipment that is not marked is not used.
296-800-29025 Maintain electrical fittings, boxes, cabinets and outlets in good condition.
296-800-29030 Maintain all flexible cords and cables in good condition and use safely.
296-800-29035 Guard electrical equipment to prevent your employees from electrical hazards.
296-800-29040 Make sure electrical equipment is effectively grounded.
296-800-29045 Make sure electrical equipment has overcurrent protection.

PORTABLE METAL LADDERS

296-800-290 Summary.
296-800-29005 Inspect your portable metal ladders periodically.
296-800-29010 Make sure your portable metal ladders are kept in good condition.
296-800-29015 Use your portable metal ladders safely.

PORTABLE WOODEN LADDERS

296-800-290 Summary.
296-800-29005 Inspect your portable wooden ladders frequently.
296-800-29010 Make sure your portable wooden ladders are kept in a good condition.
296-800-29015 Use your portable wooden ladders safely and for their intended purpose.
PORTABLE FIRE extinguishers

296-800-300 Summary—Portable fire extinguishers.
296-800-30005 Provide portable fire extinguishers in your workplace.
296-800-30010 Select and distribute portable fire extinguishers in your workplace.
296-800-30015 Make sure that portable fire extinguishers are kept fully charged, in operable condition, and left in their designated places.
296-800-30020 Inspect and test all portable fire extinguishers.
296-800-30025 Train your employees to use portable fire extinguishers.

EXit routes and employee alarm systems

296-800-310 Summary.
296-800-31005 Establish a safety committee or have safety meetings.
296-800-31010 Make sure that each meeting includes a discussion of workplace inspections.
296-800-31015 Make sure that safety committee meeting minutes are recorded and preserved.
296-800-31020 Maintain the fire retardant properties of paints or other materials.
296-800-31025 Provide adequate lighting for exit routes and signs.
296-800-31030 Exit doors must be readily opened from the inside.
296-800-31035 Provide outdoor exit routes that meet these requirements.
296-800-31040 Provide unobstructed access to exit routes.
296-800-31045 Provide side-hinged doors to connect rooms to exit routes.
296-800-31050 Make sure that exit routes meet their specific design and construction requirements.
296-800-31055 Make sure that exit routes are large enough.
296-800-31060 Maintain exit routes during construction and repair.
296-800-31065 Provide doors in freezer or refrigerated rooms that open from the inside.
296-800-31070 Install and maintain an appropriate employee alarm system.
296-800-31075 Establish procedures for sounding emergency alarms.
296-800-31080 Test the employee alarm system.

ACCIDENT REPORTING AND INVESTIGATING

296-800-320 Summary.
296-800-32005 Report the death, probable death of any employee, or the in-patient hospitalization of 2 or more employees within 8 hours.
296-800-32010 Make sure that any equipment involved in an accident is not moved.
296-800-32015 Assign people to assist the department of labor and industries.
296-800-32020 Conduct a preliminary investigation for all serious injuries.
296-800-32025 Document the preliminary investigation findings.

RELEASING ACCIDENT INVESTIGATION REPORTS

296-800-330 Releasing accident investigation reports.

PROTECTING THE IDENTITY OF THE SOURCE OF CONFIDENTIAL INFORMATION

296-800-340 Protecting the identity of the source of confidential information.

WISHA APPEALS, PENALTIES AND OTHER PROCEDURAL RULES

296-800-350 Introduction.

WISHA INSPECTIONS AND CITATIONS

296-800-35002 Types of workplace inspections.
296-800-35004 Scheduling inspections.
296-800-35006 Inspection techniques.
296-800-35008 Response to complaints submitted by employees or their representatives.
296-800-35010 Citations mailed after an inspection.
296-800-35012 Employees (or their representatives) can request a citation and notice.
296-800-35016 Posting a citation and notice and employee complaint information.

CIVIL PENALTIES FOR VIOLATING WISHA REQUIREMENTS

296-800-35018 Reasons to assess civil penalties.

HOW CIVIL PENALTIES ARE CALCULATED

296-800-35020 Minimum penalties.
296-800-35022 Base penalty calculations—Severity and probability.
296-800-35024 Severity rate determination.
296-800-35026 Probability rate determination.
296-800-35028 Determining the gravity of a violation.
296-800-35030 Base penalty adjustments.
296-800-35032 Types of base penalty adjustments.
296-800-35038 Minimum and maximum adjusted base penalty amounts.
296-800-35040 Reasons for increasing civil penalty amounts.

CERTIFY THAT VIOLATIONS HAVE BEEN ABATED

296-800-35042 Employers must certify that violations have been abated.
296-800-35044 For willful, repeated, or serious violations, submit additional documentation.
296-800-35046 Submitting the correction action plans.
296-800-35048 Submit progress reports to the department when required.
296-800-35049 WISHA determines the date by which abatement documents must be submitted.
296-800-35050 Inform affected employees and their representatives of abatement actions you have taken.
296-800-35052 Tag cited moveable equipment to warn employees of a hazard.

REQUESTING MORE TIME TO COMPLY

296-800-35056 You can request more time to comply.
296-800-35062 WISHA's response to your request for more time.
296-800-35063 Post the department's response.
296-800-35064 A hearing can be requested about the department's response.
296-800-35065 Post the department's hearing notice.
296-800-35066 Hearing procedures.
296-800-35068 Notify employees.

REQUESTING AN APPEAL OF WISHA CITATIONS AND CORRECTIVE NOTICES

296-800-35072 Post the hearing decision.
296-800-35074 Employers and employees can request an appeal of a citation and notice.
296-800-35076 Employers and employees can request an appeal of a citation and notice.
296-800-35078 Await the department's response to your appeal request.
296-800-35080 Department actions when reissuing jurisdiction over an appeal.
296-800-35082 Appealing a corrective notice.
296-800-35084 Notify employees.

USING STANDARDS FROM NATIONAL ORGANIZATIONS AND FEDERAL AGENCIES

296-800-360 Rule.
296-800-36005 Comply with standards national organizations or of federal agencies when referenced in WISHA rules.
296-800-370 Definitions.

DISPOSITION OF SECTIONS FORMERLY CODIFIED IN THIS CHAPTER

296-800-13005 Establish a safety committee or have safety meetings.
[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-13005, filed 11/2001, effective 12/1/01; 01-11-038, § 296-800-13005, filed 5/9/01, effective 9/1/01.] Repealed by 02-16-047, filed 8/1/02, effective 10/1/02. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-13005, filed 5/9/01, effective 9/1/01.] Repealed by 02-16-047, filed 8/1/02, effective 10/1/02. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050.

(2005 Ed.)
Workers’ compensation (or industrial insurance), workplace safety and health, including inspections and enforcement, apprenticeship programs and employment standards.

Many of these services are available from L&I’s twenty-two regional offices (see the resource section of this book for a list of regional offices).

In 1973, the legislature passed the Washington Industrial Safety and Health Act or WISHA (Revised Code of Washington (chapter 49.17 RCW)). WISHA requires employers to provide safe and healthful workplaces for all employees. It gives L&I the responsibility to establish and enforce workplace safety and health rules. These rules are the Washington Administrative Code (WAC).

How does WISHA work?

WISHA covers nearly all employers and employees in Washington, including employees who work for the state, counties, and cities. L&I inspectors enforce WISHA rules by inspecting workplaces without advance notice including investigations of work-related deaths, injuries, and employees’ complaints. When WISHA inspectors find a violation in a workplace, they issue a citation to the employer and a penalty may be attached. If you have questions about whether you are covered by WISHA, call 1-800-4BE SAFE (1-800-423-7233) or a local office of L&I.

What is OSHA and its relationship to WISHA?

The U.S. Congress created the Occupational Safety and Health Administration (OSHA) in 1971 to develop and enforce workplace safety and health rules throughout the country. States may choose to run their own safety and health programs as long as they are at least as effective as OSHA. Washington state has chosen to run its own program and most employers in the state, therefore, are subject to enforcement by L&I and not by federal OSHA.

In Washington state, OSHA covers workplaces with federal employees, nonfederal employees working on federal reservations and military bases, employees working on floating worksites (floating dry docks, fishing boats, construction barges), and employees working for tribal employers on tribal lands.

Does WISHA apply to you?

WISHA applies to almost every employer and employee in Washington. WISHA applies to you if:

- You hire someone to work for you as an employee, including workers from a temporary agency.
- You are hired to work for someone as their employee.
- You own your own business or you are a corporate officer and have elected industrial insurance coverage for yourself.
- You have a contract with someone else that primarily involves personal labor, even though you are not required to pay industrial insurance or unemployment insurance premiums.
- You volunteer your personal labor, or you have volunteers working for you who receive any benefit or compensation.

If you have any questions about your particular situation, call 1-800-4BE SAFE (1-800-423-7233) or contact your local office of L&I for help. See the resource section of this book for a complete list of L&I offices.

Are there other safety and health rules I need to know about?

(2005 Ed.)
In addition to the rules in the WISHA Safety and Health Core Rules book, there are other general WISHA rules that may apply to employers, depending upon the industry and workplace activities. See the resource section of this book for a complete list of WISHA rules or go to the website for all the state rules administered by L&I at http://www.wa.gov/lni/home/wacs.htm. If you have questions about these rules or would like copies of them, call 1-800-4BE SAFE (1-800-423-7233) or your local office of L&I.

How do the WISHA rules relate to fire, building and electrical codes?

Fire codes: WISHA rules contain basic requirements for portable fire extinguishers, exit routes, housekeeping, storage, stairs and electrical hazards for the protection of employees in your workplace. The rules contained in this book are the most basic requirements to make sure that as an employer you provide a safe and healthy work environment. However, these are not the only rules regarding the requirements for portable fire extinguishers, exit routes, housekeeping, storage, stairs and electrical equipment. The fire marshal and local fire authorities enforce the Uniform Fire Code (UFC).

WISHA and UFC differ in some areas, for example UFC requires exit sign lettering to be 6” or more and WISHA only states that the letters have to be clearly visible. Fire codes have more detailed and extensive requirements for the protection of the public than WISHA. Some codes overlap with WISHA requirements.

Building and electrical codes: WISHA rules are minimum requirements regardless of when the building was built or remodeled. Buildings must also comply with building and electrical codes at the time of construction. If you remodel, you must comply with the building and electrical codes applicable at that time. Building authorities and electrical inspection authorities enforce rules from the Uniform Building Code (UBC), and the National Electrical Code (NEC).

You are encouraged to call your local fire, building or electrical authority. For more information on the requirements in your area look in the government section of your phone book. Copies of these codes are available at your local library.

How can WISHA help employers and employees?

Employers can ask WISHA safety and health consultation staff for free, confidential consulting services in your workplace. WISHA safety and health professionals can examine your workplace and make recommendations about how to comply with WISHA rules. If the consultant finds hazards, the employer will be given a reasonable period of time to correct the hazard without citation or penalty.

Sometimes you might have to wait for an appointment because of the demand for these services. You still must provide a safe workplace while you wait for a consultation.

WISHA offers a wide variety of free services:
- Safety and health workshops held in locations throughout the state
- A comprehensive safety and health video lending library
- Safety and health publications geared for both employer and employee
- Website with on-line publications and learning opportunities

Note:
- By law, WISHA consultants do not have any enforcement authority.

Link:
- For more information, call 1-800-4BE SAFE (1-800-423-7233) or visit http://www.wa.gov/lni/home/training.htm.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-100, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-100, filed 5/9/01, effective 9/1/01.]

EMPLOYER RESPONSIBILITIES: SAFE WORKPLACE

WAC 296-800-110 Employer responsibilities: Safe workplace—Summary.

Your responsibility:
- To provide a safe and healthy workplace free from recognized hazards.

IMPORTANT:
- Use these rules where there are no specific rules applicable to the particular hazard.

You must:
- Provide a workplace free from recognized hazards.
  WAC 296-800-11005.
- Provide and use means to make your workplace safe.
  WAC 296-800-11010.
- Prohibit employees from entering, or being in, any workplace that is not safe.
  WAC 296-800-11015.
- Construct your workplace so it is safe.
  WAC 296-800-11020.
- Prohibit alcohol and narcotics from your workplace.
  WAC 296-800-11025.
- Prohibit employees from using tools and equipment that are not safe.
  WAC 296-800-11030.
- Establish, supervise, and enforce rules that lead to a safe and healthy work environment that are effective in practice.
  WAC 296-800-11035.
- Control chemical agents.
  WAC 296-800-11040.
- Protect employees from biological agents.
  WAC 296-800-11045.

Note:
- Employees may discuss and participate in any WISHA safety and health related practice and may refuse to perform dangerous tasks without fear of discrimination. Discrimination includes: Dismissal, demotion, loss of seniority, denial of a promotion, harassment, etc. See chapter 296-360 WAC, Discrimination pursuant to RCW 49.17.160, for a complete description of discrimination and the department’s responsibility to protect employees.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-18-090, § 296-800-110, filed 9/2/03, effective 11/1/03. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-16-047, § 296-800-110, filed 8/1/02, effective 10/1/02; 01-23-060, § 296-800-110, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-110, filed 5/9/01, effective 9/1/01.]

WAC 296-800-11005 Provide a workplace free from recognized hazards. You must:
- Provide your employees a workplace free from recognized hazards that are causing, or are likely to cause, serious injury or death.
Safety and Health Core Rules

WAC 296-800-11010 Provide and use means to make your workplace safe. You must:
- Provide and use safety devices, safeguards, and use work practices, methods, processes, and means that are reasonably adequate to make your workplace safe.
- Do not remove, displace, damage, destroy or carry off any safety device, safeguard, notice or warning, furnished for use in any employment or place of employment.
- Do not interfere with use of any of the above.
- Do not interfere with the use of any method or process adopted for the protection of any employee.
- Do everything reasonably necessary to protect the life and safety of your employees.

WAC 296-800-11015 Prohibit employees from entering, or being in, any workplace that is not safe. You must:
- Prohibit employees from entering, or being in, any workplace that is not safe.

WAC 296-800-11020 Construct your workplace so it is safe. You must:
- Not construct, or cause to be constructed, a workplace that is not safe.
- This rule applies to employers, owners, and renters of property used as a place of employment.

WAC 296-800-11025 Prohibit alcohol and narcotics from your workplace. You must:
- Prohibit alcohol and narcotics from your workplace, except in industries and businesses that produce, distribute, or sell alcohol and narcotic drugs.
- Prohibit employees under the influence of alcohol or narcotics from the worksite.

EXEMPTION: Employees who are taking prescription drugs, as directed by a physician or dentist, are exempt from this section, if the employees are not a danger to themselves or other employees.

WAC 296-800-11030 Prohibit employees from using tools and equipment that are not safe.
- Take responsibility for the safe condition of tools and equipment used by employees.

Note: This applies to all equipment, materials, tools, and machinery whether owned by the employer or another firm or individual.

WAC 296-800-11035 Establish, supervise, and enforce rules that lead to a safe and healthy work environment that are effective in practice. You must:
- Establish, supervise, and enforce rules that lead to a safe and healthy work environment that are effective in practice.

WAC 296-800-11040 Control chemical agents. You must:
- Control chemical agents in a manner that they will not present a hazard to your workers; or
- Protect workers from the hazard of contact with, or exposure to, chemical agents.

Note: Pesticides are considered to be chemical agents. As required by this rule, you must control them or provide protection to workers from exposure to pesticide hazards. Pesticide manufacturers supply precautionary statements in the information provided with the pesticide that tells you how to protect your workers from these hazards.

WAC 296-800-11045 Protect employees from biological agents.
- You must:
  1. Protect employees from exposure to hazardous concentrations of biological agents that may result from processing, handling or using materials or waste.
  2. Warn employees of biohazards.
- Use signs, tags, or labels to identify:
  - The actual or potential presence of a biohazard;
  - Equipment, containers, rooms, materials, experimental animals, or any combinations of these that contain viable hazardous agents.

Definition: Biohazard means those infectious agents presenting a risk or potential risk of death, injury or illness to employees.
- You must:
  - Make sure the sign, tag, or label includes the biohazard symbol that is designed and proportioned in the illustration that follows.
You must:
- Make sure that there is sufficient contrast for the symbol to be clearly defined, if the sign, tag, or label has a background color.

Reference: Additional requirements for biohazard signs, tags, and labels may apply. See WAC 296-823-14025 and 296-823-18040 of the Bloodborne Pathogens book.

Note: It's recommended that the sign, tag, or label have a key color of fluorescent orange or orange-red and lettering or symbols in a contrasting color.
- Appropriate wording may be used in association with the symbol to indicate:
  - The nature or identity of the hazard;
  - Name of individual responsible for its control;
  - Precautionary information;
  - Other information.

This information should not be written on the symbol.

[Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050. 04-18-080, § 296-800-11045, filed 8/31/04, effective 11/1/04; 01-11-038, § 296-800-12005, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-12005, filed 5/9/01, effective 9/1/01.]

SAFETY COMMITTEES AND SAFETY MEETINGS

WAC 296-800-130 Safety committees/safety meetings—Summary. Important:
This rule requires you to have a method of communicating and evaluating safety and health issues brought up by you or your employees in your workplace. Larger employers must establish a safety committee. Smaller employers have the choice of either establishing a safety committee or holding safety meetings with a management representative present.

There is a difference between a safety committee and a safety meeting.
- A safety committee is an organizational structure where members represent a group. This gives everyone a voice but keeps the meeting size to an effective number of participants.
- A safety meeting includes all employees and a management person is there to ensure that issues are addressed. Typically, the safety committee is an effective safety management tool for a larger employer and safety meetings are more effective for a smaller employer.

Your responsibility:
To establish a safety committee or hold safety meetings to create and maintain a safe and healthy workplace for all employees.

You must:
- Coordinate and cooperate with all other employees in the workplace to try to eliminate on-the-job injuries and illnesses.
- Apply the principles of accident prevention in their daily work and use proper safety devices and protective equipment as required by their employment or employer.
- Take care of all personal protective equipment (PPE) properly.
- Not wear torn or loose clothing while working around machinery.
  Note: Things such as clothing, hair, and jewelry can get caught in machinery and be a hazard on the job.
  Employees must:
  - Report promptly to their supervisor every industrial injury or occupational illness.
  - Not remove, displace, damage, or destroy or carry off any safeguard, notice, or warning provided to make the workplace safe.
  - Not interfere with use of any safeguard by anyone in the workplace.
  - Not interfere with the use of any work practice designed to protect them from injuries.
  - Do everything reasonably necessary to protect the life and safety of employees.

[Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050. 04-18-080, § 296-800-130, filed 8/1/02, effective 10/1/02; 01-11-038, § 296-800-130, filed 5/9/01, effective 9/1/01.]

EMPLOYEE RESPONSIBILITIES

WAC 296-800-120 Rule. Employee’s responsibility: To play an active role in creating a safe and healthy workplace and comply with all applicable safety and health rules.

Note: Employees may discuss and participate in any WISHA safety and health related practice and may refuse to perform dangerous tasks without fear of discrimination. Discrimination includes: Dismissal, demotion, loss of seniority, denial of a promotion, harassment, etc. (see chapter 296-360 WAC, Discrimination) pursuant to RCW 49.17.160 for a complete description of discrimination and the department’s responsibility to protect employees.

WAC 296-800-12005 Employee responsibilities. Employees must:
- Study and follow all safe practices that apply to their work.
Establish and conduct safety committees. You must:

<table>
<thead>
<tr>
<th>If:</th>
<th>Then:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You employ 11 or more employees on the same shift at the same location</td>
<td>You must establish a safety committee</td>
</tr>
</tbody>
</table>

(1) Establish a safety committee.
- Make sure your committee:
  - Has employee-elected and employer-selected members.
  - The number of employee-elected members must equal or exceed the number of employer-selected members.
  - The term of employee-elected members must be a maximum of one year. (There is no limit to the number of terms a representative can serve.)
  - If there is an employee-elected member vacancy, a new member must be elected prior to the next scheduled meeting.
    - Has an elected chairperson.
    - Determines how often, when, and where, the safety committee will meet.

Note: Employees selected by the employees bargaining representative or union qualify as employee-elected.

Note: Meetings should be one hour or less, unless extended by a majority vote of the committee.

Note: If the committee cannot agree on the frequency of meetings, the department of labor and industries regional safety consultation representative should be consulted for recommendations. (See the resources section of this book for contacts.)

You must:
(2) Cover these topics:
- Review safety and health inspection reports to help correct safety hazards.
- Evaluate the accident investigations conducted since the last meeting to determine if the cause(s) of the unsafe situation was identified and corrected.
- Evaluate your workplace accident and illness prevention program and discuss recommendations for improvement, if needed.
- Document attendance.
- Write down subjects discussed.

Note: There are no formal documentation requirements for safety meetings except for writing down who attended and the topics discussed.

ACCIDENT PREVENTION PROGRAM

WAC 296-800-140 Accident prevention program.

Summary.
Your responsibility: To establish, supervise and enforce an accident prevention program (APP) that is effective in practice. (You may call this your total safety and health plan.)

You must:
- Develop a formal, written accident prevention program (APP).
- Develop, supervise, implement, and enforce safety and health training programs that are effective in practice.
- Make sure your accident prevention program (APP) is effective in practice.

WAC 296-800-14005 Develop a formal, written accident prevention program. You must:
- Develop a formal accident prevention program that is outlined in writing. The program must be tailored to the
needs of your particular workplace or operation and to the types of hazards involved.

**Note:** The term "accident prevention program" refers to your written plan to prevent accidents, illnesses, and injuries on the job. Your accident prevention program may be known as your safety and health plan, injury prevention program, or by some other name.

You must:

- Make sure your Accident Prevention Program contains at least the following elements:
  - A safety orientation:
  - A description of your total safety and health program.
  - On-the-job orientation showing employees what they need to know to perform their initial job assignments safely.
  - How and when to report on-the-job injuries including instruction about the location of first-aid facilities in your workplace.
  - How to report unsafe conditions and practices.
  - The use and care of required personal protective equipment (PPE).
  - What to do in an emergency, including how to exit the workplace.
  - Identification of hazardous gases, chemicals, or materials used on-the-job and instruction about the safe use and emergency action to take after accidental exposure.
  - A safety and health committee.

(WAC 296-800-130.)

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-11-038, § 296-800-14005, filed 5/9/01, effective 9/1/01.]

**WAC 296-800-14020** Develop, supervise, implement, and enforce safety and health training programs that are effective in practice. You must:

- Develop, supervise, implement, and enforce training programs to improve the skill, awareness, and competency of all your employees in the field of occupational safety and health.
- Make sure training includes on-the-job instruction to employees prior to their job assignment about hazards such as:
  - Safe use of powered materials-handling equipment, such as forklifts, backhoes, etc.
  - Safe use of machine tool operations.
  - Use of toxic materials.
  - Operation of utility systems.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-11-038, § 296-800-14020, filed 5/9/01, effective 9/1/01.]

**WAC 296-800-14025** Make sure your accident prevention program is effective in practice. You must:

- Establish, supervise, and enforce your accident prevention program in a manner that is effective in practice.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-11-038, § 296-800-14025, filed 5/9/01, effective 9/1/01.]

**FIRST-AID SUMMARY**

**WAC 296-800-150** Rule summary. Your responsibility: Make sure first-aid trained personnel are available to provide quick and effective first aid.

You must:

- Make sure that first-aid trained personnel are available to provide quick and effective first aid.
  - WAC 296-800-15005.
- Make sure appropriate first-aid supplies are readily available.
  - WAC 296-800-15020.
- Make sure emergency washing facilities are functional and readily accessible.
  - WAC 296-800-15030.
- Inspect and activate your emergency washing facilities.
  - WAC 296-800-15035.
- Make sure supplemental flushing equipment provides sufficient water.
  - WAC 296-800-15040.

**WAC 296-800-15005** Make sure that first-aid trained personnel are available to provide quick and effective first aid.

You must:

- Comply with the first-aid training requirements of 29 CFR 1910.151(b) which states: "In the absence of an infirmary, clinic, or hospital in near proximity to the workplace, which is used for the treatment of all injured employees, a person or persons shall be adequately trained to render first aid."

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-11-038, § 296-800-15005, filed 5/9/01, effective 9/1/01.]

**WAC 296-800-15020** Make sure appropriate first-aid supplies are readily available. You must:

- Make sure first-aid supplies are readily available.
- Make sure first-aid supplies at your workplace are appropriate to:
  - Your occupational setting.
  - The response time of your emergency medical services.
WAC 296-800-15030 Make sure emergency washing facilities are functional and readily accessible. You must:

- Provide an emergency shower:
  - When there is potential for major portions of an employee's body to contact corrosives, strong irritants, or toxic chemicals.
  - That delivers water to cascade over the user's entire body at a minimum rate of 20 gallons (75 liters) per minute for fifteen minutes or more.

- Provide an emergency eyewash:
  - When there is potential for an employee's eyes to be exposed to corrosives, strong irritants, or toxic chemicals.
  - That irrigates and flushes both eyes simultaneously while the user holds their eyes open.
  - With an on-off valve that activates in one second or less and remains on without user assistance until intentionally turned off.
  - That delivers at least 0.4 gallons (1.5 liters) of water per minute for fifteen minutes or more.

Note: Chemicals that require emergency washing facilities:
- You can determine whether chemicals in your workplace require emergency washing facilities by looking at the material safety data sheet (MSDS) or similar documents. The MSDS contains information about first-aid requirements and emergency flushing of skin or eyes.
- For chemicals developed in the workplace, the following resources provide information about first-aid requirements:
  - NIOSH Pocket Guide to Chemical Hazards
  - DHHS (NIOSH) Publication No. 97-140
  - http://www.cdc.gov/niosh/npg/ggdstart.html
  - Threshold Limit Values for Chemical Substances and Physical Agents American Conference of Governmental Industrial Hygienists (ACGIH)

You must:
- Make sure emergency washing facilities:
  - Are located so that it takes no more than ten seconds to reach.
  - Are kept free of obstacles blocking their use.
  - Function correctly.
  - Provide the quality and quantity of water that is satisfactory for emergency washing purposes.

Note: If water in emergency washing facilities is allowed to freeze, they will not function correctly. Precautions need to be taken to prevent this from happening.
- The travel distance to an emergency washing facility should be no more than fifty feet (15.25 meters).
- For further information on the design, installation, and maintenance of emergency washing facilities, see American National Standards Institute (ANSI) publication Z358.1 - 1998, Emergency Eyewash and Shower Equipment. Emergency washing facilities that are designed to meet ANSI Z358.1 - 1998 also meet the requirements of this standard. The ANSI standard can be obtained from the American National Standards Institute, 1430 Broadway, New York, New York 10018.

Reference:
- Training in the location and use of your emergency washing facilities is required under the employer chemical hazard communication rule, WAC 296-800-170, and the accident prevention program rule, WAC 296-800-140.
- All emergency washing facilities using "not fit for drinking" (nonpotable) water must have signs stating the water is "not fit for drinking." See WAC 296-800-23010.

[WAC 296-800-15035 Inspect and activate your emergency washing facilities. You must:

- Make sure all plumbed emergency washing facilities are inspected once a year to make sure they function correctly.

Note: Inspections should include:
- Examination of the piping
- Making sure that water is available at the appropriate temperature and quality
- Activation to check that the valves and other hardware work properly
- Checking the water flow rate.

You must:
- Make sure plumbed emergency eyewashes and hand-held drench hoses are activated weekly to check the proper functioning of the valves, hardware, and availability of water
- Make sure all self-contained eyewash equipment and personal eyewash units are inspected and maintained according to manufacturer instructions.
- Inspections to check proper operation must be done once a year
- Sealed personal eyewashes must be replaced after the manufacturer's expiration date.

Note: Most manufacturers recommend replacing fluid in open self-contained eyewashes every six months. The period for sealed containers is typically two years.

[WAC 296-800-15040 Make sure supplemental flushing equipment provides sufficient water.

Note: Supplemental flushing equipment cannot be used in place of required emergency showers or eyewashes.

You must:
- Make sure hand-held drench hoses deliver at least 3.0 gallons (11.4 liters) of water per minute for fifteen minutes or more.

Note: Why use a drench hose? A drench hose is useful when:
- The spill is small and does not require an emergency shower
- Used with a shower for local rinsing, particularly on the lower extremities.

You must:
- Make sure personal eyewash equipment delivers only clean water or other medically approved eye flushing solutions.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 03-11-047, § 296-800-15020, filed 5/9/01, effective 9/1/01.]

(2005 Ed.)
PERSONAL PROTECTIVE EQUIPMENT (PPE)

WAC 296-800-160 Summary. Your responsibility: To make sure that your employees have, use, and care for the appropriate personal protective equipment (PPE).

PPE is an item or items used to protect the eyes, face, head, body, arms, hands, legs, and feet such as goggles, helmets, head covers, gloves, rubber slickers, disposable coveralls, safety shoes, protective shields, and barriers.

You must:
- Do a hazard assessment for PPE.
- Document your hazard assessment for PPE.
- Select appropriate PPE for your employees.
- Provide PPE to your employees.
- Train your employees to use PPE.
- Retrain employees to use PPE, if necessary.
- Document PPE training.
- Require your employees to use necessary PPE on the job.
- Keep your PPE safe and in good condition.
- Make sure your employees use appropriate face and eye protection.
- Make sure your employees use appropriate head protection.
- Make sure your employees use appropriate foot protection.
- Make sure your employees use appropriate hand protection.
- Multiply your employees are protected from drowning.
- Make sure employees are protected from drowning.
- Select appropriate PPE for each at-risk employee.
- Select PPE for each at-risk employee to use for protection from the hazards identified in your workplace hazard assessment.
- Discuss PPE choices with your employees.

WAC 296-800-1605 Do a hazard assessment for PPE. You must:
- Look for and identify hazards or potential hazards in your workplace and determine if PPE is necessary on the job.

Note: PPE alone should not be relied on to provide protection for your employees. PPE should be used after all other reasonable means of reducing hazards have been carried out. Identifying hazards in your workplace should be built into your regular routine. You should take active steps to get rid of all identified hazards. For example, you can:
  - Consider other ways to get hazardous jobs done.
  - Reduce hazardous materials or processes.

WAC 296-800-16010 Document your hazard assessment for PPE. You must:

- Verify that a hazard assessment for PPE has been done at your workplace and complete a written certification (paper or electronic format) that includes the:
  - Name of the workplace
  - Address of the workplace you inspected for hazards
  - Name of person certifying that a workplace hazard assessment was done
  - Date(s) the workplace hazard assessment was done
  - Statement identifying the document as the certification of hazard assessment for PPE for the workplace

WAC 296-800-16015 Select appropriate PPE for your employees. You must:

1. Select appropriate PPE.
   - Select appropriate PPE for your employees if hazards are present, or likely to be present.
   - Select PPE for each at-risk employee to use for protection from the hazards identified in your workplace hazard assessment.
2. Select PPE that properly fits each at-risk employee.

Note: The hazards in your workplace have special rules that apply to them. For information about PPE for specific workplaces, see these WISHA rule books:

Construction Work Chapter 296-155 WAC
Electrical Workers Chapter 296-45 WAC
Fire Fighters Chapter 296-305 WAC
General Occupational Health Standards Chapter 296-62 WAC
General Safety and Health Standards Chapter 296-24 WAC
Logging Operations Chapter 296-54 WAC
Pulp, Paper and Paper Board Mills and Converters Chapter 296-79 WAC
Ship Repairing, Ship Building and Shipbreaking Chapter 296-304 WAC
Ski Area Facilities and Operations Chapter 296-59 WAC
Telecommunication Chapter 296-32 WAC
Textile Industry Chapter 296-301 WAC

Note: For help in selecting PPE for your employees, you have several options. You may:
- Call 1-800-BE-SAFE (1-800-423-7233) for guidelines for selecting PPE.
- Consult with safety and health professionals knowledgeable in this area. See resource section for links to professional organizations.
- Discuss PPE choices with your employees.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-16005, filed 5/9/01, effective 9/1/01.]

WAC 296-800-16005 Do a hazard assessment for PPE. You must:

- Apply engineering controls to reduce or eliminate hazards.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-16005, filed 5/9/01, effective 9/1/01.]
WAC 296-800-16020 Provide PPE to your employees. You must:

- Provide PPE wherever hazards exist from:
  - Processes or the environment
  - Chemical hazards
  - Radiological hazards or
  - Mechanical irritants that could cause injury or impairment to the function of any body part through absorption, inhalation, or physical contact.
- Provide necessary PPE to employees at no cost to the employee if the PPE:
  - Will be used to protect against hazardous materials
  - Is the type that would not reasonably or normally be worn away from the workplace, such as single use or disposable PPE.

Note: Examples of PPE that the employer must provide are:
  - Boots or gloves that could become contaminated with hazardous materials in the workplace.
  - Safety glasses, goggles, and non-prescription protective eye wear.
  - Goggles that fit over prescription eye wear.
  - Hard hats.
  - Full body harnesses and lanyards.
  - Single use or disposable PPE such as plastic type gloves used in the food service or medical industries.

Examples of PPE that the employer may not have to provide are:
  - Coats to protect against inclement weather.
  - Leather boots, with or without steel toes, that will not become contaminated on the job.
  - Prescription protective eye wear (except as part of a full face piece or hooded respirator).

WAC 296-800-16025 Train your employees to use PPE. You must:

- Communicate your PPE selection decision to each at-risk employee.
- Provide training to each employee who is required to use PPE on the job. Each affected employee must be trained to know at least the following:
  - When PPE is necessary
  - What PPE is necessary
  - How to put on, take off, adjust, and wear PPE
  - Limitations of PPE
  - Proper care, maintenance, useful life, and disposal of PPE.
- Make sure before an employee is allowed to perform work requiring the use of PPE that the employee can:
  - Demonstrate an understanding of the training specified above; and
  - Demonstrate the ability to use PPE properly.

WAC 296-800-16030 Retrain employees to use PPE, if necessary. You must:

- Retrain an employee when you have reason to believe the understanding, motivation, and skills required to use the PPE has not been retained. Circumstances where retraining is required include:
  - Changes in the workplace that make previous training out of date.
  - Changes in the types of PPE to be used make previous training out of date.
  - Work habits or demonstrated knowledge indicate that the employee has not retained the necessary understanding, skill, or motivation to use PPE.

WAC 296-800-16035 Document PPE training. You must:

- Document in writing that each employee using PPE has received and understood the required training. This documentation must include:
  - Name of each employee
  - Date(s) of training
  - Subject of the training

Note: Documentation may be stored on a computer as long as it is available to safety and health personnel from the department of labor and industries.

WAC 296-800-16040 Require your employees to use necessary PPE on the job. You must:

- Require your employees to use necessary PPE on the job.

WAC 296-800-16045 Keep PPE in safe and good condition. You must:

- Make sure all PPE is safe for the work to be performed. It must:
  - Be durable.
  - Fit snugly.
  - Not interfere with the employee's movements.
- Make sure PPE is used and maintained in a clean and reliable condition.
  - Defective equipment MUST NOT be used.
  - Make sure if employees provide their own PPE, that it is adequate for the workplace hazards, and maintained in a clean and reliable condition.

WAC 296-800-16050 Make sure your employees use appropriate eye and face protection. You must:

- Make sure that employees exposed to hazards that could injure their eyes and/or face use appropriate protection. Examples of these hazards include:
  - Flying particles.
  - Molten metal.
  - Liquid chemicals.
  - Acids or caustic liquids.
  - Chemical gases or vapors.
  - Any light that could injure the eyes such as lasers, ultraviolet, or infrared light.
– Objects that puncture.

- Make sure employees exposed to hazards from flying objects have eye protection with side protection, such as safety glasses with clip-on or slide-on side shields.
- Make sure eye protection for employees who wear prescription lenses:
  – Incorporates the prescription into the design of the eye protection; or
  – Is large enough to be worn over the prescription lenses without disturbing them.
- Make sure PPE used to protect the eyes and face meet the following specific ANSI (American National Standards Institute) standards. Most commercially available PPE is marked with the specific ANSI requirements.
- If you use eye or face protection that does not meet these ANSI standards, you must show they are equally effective.

Note: ANSI is the American National Standards Institute that publishes nationally recognized safety and health requirements. Their address is:
ANSI (American National Standards Institute)
1819 L Street NW
Washington, DC 20036
Phone: (202) 293-8020
Fax: (202) 293-9287
http://www.ansi.org

WAC 296-800-16055 Make sure your employees use appropriate head protection. You must:
(1) Make sure employees wear appropriate protective helmets.
  – Where employees are exposed to hazards that could cause a head injury. Examples of this type of hazard include:
    – Flying or propelled objects.
    – Falling objects or materials.
  – Where employees are working around or under scaffolds or other overhead structures.
  – That helmets meet the following specific ANSI standards (most commercially available PPE is marked with specific ANSI requirements):
  – If you use protective helmets that do not meet these ANSI standards, you must show they are equally effective.

(2) Make sure employees working near exposed electrical conductors that could contact their head wear a protective helmet designed (that meet the above ANSI standards) to reduce electrical shock hazard.
  – Caps with metal buttons or metal visors must not be worn around electrical hazards.
  – Make sure employees working around machinery or in locations that present a hair-catching or fire hazard wear caps or head coverings that completely cover their hair.

WAC 296-800-16060 Make sure your employees use appropriate foot protection. You must:
(1) Use appropriate foot protection.
  – Where employees are exposed to hazards that could injure their feet. Examples of these hazards are:
    – Falling objects
    – Rolling objects
    – Piercing/cutting injuries
    – Electrical hazards
  – That meets specific ANSI requirements. (Most commercially available PPE is marked with specific ANSI requirements.)
    – If you use foot protection that does not meet these ANSI standards, you must show it is equally effective.

(2) Make sure your employees wear clogs or other suitable footwear to protect against slipping while they are working on top of logs.

WAC 296-800-16065 Make sure your employees use appropriate hand protection. You must:
  – Make sure employees exposed to hazards that could injure their hands use appropriate hand protection. Examples of these hazards include:
    – Absorbing harmful substances
    – Severe cuts, lacerations or abrasions
    – Punctures
    – Chemical burns and/or thermal burns
    – Harmful temperature extremes
  – Make sure when choosing hand protection, you consider how well the hand protection performs relative to the:
    – Task
    – Conditions present
    – Duration of use
    – Hazards
    – Potential hazards

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-16055, filed 5/9/01, effective 9/1/01.]

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-16060, filed 5/9/01, effective 9/1/01.]

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-16065, filed 5/9/01, effective 9/1/01.]

(2005 Ed.)
WAC 296-800-16070 Make sure your employees are protected from drowning. You must:

1) Provide and make sure your employees wear personal flotation devices (PFD).
   • When they work in areas where the danger of drowning exists, such as:
     – On the water.
     – Over the water.
     – Alongside the water.

Note: Employees are not exposed to the danger of drowning when:
   – Employees are working behind standard height and strength guardrails.
   – Employees are working inside operating cabs or stations that eliminate the possibility of accidentally falling into the water.
   – Employees are wearing an approved safety belt with a lifeline attached that prevents the possibility of accidentally falling into the water.

You must:
• Provide your employees with PFDs approved by the United States Coast Guard for use on commercial or merchant vessels. The following are appropriate or allowable United States Coast Guard-approved PFDs:

<table>
<thead>
<tr>
<th>Type of PFD</th>
<th>General Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type I Off-shore life jacket - effective for all waters or where rescue may be delayed.</td>
<td></td>
</tr>
<tr>
<td>Type II Near-shore buoyant vest - intended for calm, inland water or where there is a good chance of quick rescue.</td>
<td></td>
</tr>
<tr>
<td>Type III Flotation aid - good for calm, inland water, or where there is a good chance of rescue.</td>
<td></td>
</tr>
<tr>
<td>Type V Flotation aids such as boardsailing vests, deck suits, work vests and inflatable PFDs marked for commercial use.</td>
<td></td>
</tr>
</tbody>
</table>

Note: • Commercially available PFDs are marked or imprinted with the type of PFD.
• Type IV PFDs are throwable devices. They are used to aid persons who have fallen into the water.

You must:
• Inspect PFDs before and after each use for defects and make sure that defective PFDs are not used.

2) Provide approved life rings with an attached line on all docks, walkways, and fixed installations on or adjacent to water more than five feet deep.
• Life rings must:
  – Be United States Coast Guard approved 30 inch size.
  – Have attached lines that are at least 90 feet in length.
  – Have attached lines at least 1/4 inch in diameter.
  – Have attached lines with a minimum breaking strength of 500 pounds.
  – Be spaced no more than 200 feet apart.
  – Be kept in easily visible and readily accessible locations.
• Life rings and attached lines must:
  – Be maintained to retain at least 75 percent of their designed buoyancy and strength.
  – Be provided in the immediate vicinity when employees are assigned work at other casual locations where the risk of drowning exists.
  – Work assigned over water where the vertical drop from an accidental fall would be more than 50 feet, must be subject to specific procedures as approved by the department.

[Statutory Authority: RCW 49.17.010. [49.17].040, and [49.17].050. 02-16-047, § 296-800-16070, filed 8/1/02, effective 10/1/02; 01-11-038, § 296-800-16070, filed 5/9/01, effective 9/1/01.]

EMPLOYER—CHEMICAL HAZARD COMMUNICATION INTRODUCTION

WAC 296-800-170 Employer chemical hazard communication—Introduction.

IMPORTANT:
Thousands of chemicals can be found in today's workplaces. These chemicals may have the capacity to cause health problems, from minor skin irritations to serious injuries or diseases like cancer. You should review the type of chemicals you use and consider using less hazardous chemicals (such as less toxic and nonflammable chemicals).

The Employer Chemical Hazard Communication rule was developed to make sure employers and employees are informed about chemical hazards in the workplace.

This rule applies to:
• Employers engaged in businesses where chemicals are used, distributed, or produced for use or distribution.
• Contractors or subcontractors that work for employers engaged in businesses where chemicals are used, distributed, or produced for use or distribution.

Exemptions: • Certain products, chemicals, or items are exempt from this rule. Below is a summarized list of these exemptions. See WAC 296-800-17055 at the end of this rule to get complete information about these exemptions:
  – Any hazardous waste or substance
  – Tobacco or tobacco products
  – Wood or wood products that are not chemically treated and will not be processed, for example, by sawing and sanding
  – Food or alcoholic beverages
  – Some drugs, such as retail or prescription medications
  – Retail cosmetics
  – Ionizing and nonionizing radiation
  – Biological hazards
  – Any consumer product or hazardous substance when workplace exposure is the same as that of a consumer

Retail products used in offices in the same manner and frequency used by consumers can be termed “consumer products”, and include things such as: Correction fluid, glass cleaner, and dishwashing liquid.

Example: If you use a household cleaner in your workplace in the same manner and frequency that a consumer would use it when cleaning their house, your exposure should be the same as the consumer’s, you are exempt. A janitor using a household cleaner, such as bleach, throughout the day, is not considered to be a consumer, and is not exempt.
• Manufactured items that remain intact are exempt from this rule.
• Manufactured items that are fluids or in the form of particles are not exempt from this rule.

[Title 296 WAC—p. 2759]
The following are examples:

<table>
<thead>
<tr>
<th>Item</th>
<th>Covered by this rule</th>
<th>Not covered by this rule</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brick</td>
<td>Sawed or cut in half</td>
<td>Used whole or intact</td>
</tr>
<tr>
<td>Pipe</td>
<td>Cut by a torch</td>
<td>Bent with a tube bender</td>
</tr>
<tr>
<td>Nylon Rope</td>
<td>Burning the ends</td>
<td>Tying a knot</td>
</tr>
</tbody>
</table>

Reference:
- If you produce, import, distribute and/or repackage chemicals, or choose not to rely on labels or material safety data sheets provided by the manufacturer or importer, you must comply with chemical hazard communication for manufacturers, importers and distributors, WAC 296-62-054.
- You may withhold trade secret information under certain circumstances. See trade secrets, WAC 296-62-053, to find out what information may be withheld as a trade secret and what information must be released.

Your responsibility:
To inform and train your employees about the hazards of chemicals they may be exposed to during normal working conditions, or in foreseeable emergencies by:
- Making a list of the hazardous chemicals present in your workplace
- Preparing a written Chemical Hazard Communication Program for your workplace
- Informing your employees about this rule and your program
- Providing training to your employees about working in the presence of hazardous chemicals
- Getting and keeping the material safety data sheets (MSDSs) for the hazardous chemicals
- Making sure that labels on containers of hazardous chemicals are in place and easy to read.

You must:
Develop, implement, maintain, and make available a written Chemical Hazard Communication Program.

WAC 296-800-17005
Include multiemployer workplaces in your program if necessary.

WAC 296-800-17007
Identify and list all the hazardous chemicals present in your workplace.

WAC 296-800-17010
Obtain and maintain material safety data sheets (MSDS) for each hazardous chemical used.

WAC 296-800-17015
Make sure that material safety data sheets (MSDS) are readily accessible to your employees and NIOSH.

WAC 296-800-17020
Label containers holding hazardous chemicals.

WAC 296-800-17025
Inform and train your employees about hazardous chemicals in your workplace.

WAC 296-800-17030
Follow these rules for laboratories using hazardous chemicals.

WAC 296-800-17035
Follow these rules for handling chemicals in factory-sealed containers.

WAC 296-800-17040
The department must:
Translating certain chemical hazard communication documents upon request.

WAC 296-800-17045

Attempt to obtain a material safety data sheet (MSDS) upon request.
WAC 296-800-17050.

Exemption:
Items or chemicals exempt from the rule, and exemptions from labeling.

WAC 296-800-17055.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-18-090, § 296-800-170, filed 9/2/03, effective 11/1/03. Statutory Authority: RCW 49.17.010, [49.17]040, and [49.17]050. 02-16-047, § 296-800-170, filed 8/1/02, effective 10/1/02; 01-23-060, § 296-800-170, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-170, filed 5/9/01, effective 9/1/01.]

WAC 296-800-17005 Develop, implement, maintain, and make available a written Chemical Hazard Communication Program.

You must:
- Develop, implement, maintain, and make available a written Chemical Hazard Communication Program specific to your workplace. The Chemical Hazard Communication Program must, at a minimum, include:
  - A list of hazardous chemicals known to be present in your workplace.
  - Procedures for making sure all containers are properly labeled.
  - A description of how you are going to obtain and maintain your material safety data sheets (MSDSs).
  - A description of how you are going to train and inform your employees about hazardous chemicals in their workplace.
  - A description of how you are going to inform your employees about:
    - Chemical hazards used during nonroutine tasks.
    - The hazards associated with chemicals contained in unlabeled pipes in employee work areas.

You must:
- Make your Chemical Hazard Communication Program available to your employees.

Note:
- You must make the written Chemical Hazard Communication Program available, upon request, to employees, their designated representatives, the department and NIOSH, in accordance with the requirements of chapter 296-802 WAC, Employee medical and exposure records.
- Where employees must travel between workplaces during a workshift, that is, if their work is carried out at more than one geographical location, the written Chemical Hazard Communication Program may be kept at the primary workplace facility.

WAC 296-800-17007 Include multiemployer workplaces in your program if necessary.

IMPORTANT:
- Sharing chemical hazard information at multiemployer workplaces is required for the success of your hazard communication program and the success of other employers’ programs.
- This section applies to a site where you or your employees work if:

[Title 296 WAC—p. 2760]
You must:

- Your employees may be exposed to hazardous chemicals used by another employer;

**OR**

- Another employer’s employees may be exposed to hazardous chemicals you or your employees use.

Examples include employees of construction companies, cleaning services, or maintenance contractors visiting or working on-site.

**You must:**

- Include, in your written Chemical Hazard Communication Program, the methods you will use to share the following hazard information with other employers when their employees share a workplace with you and are potentially exposed to chemicals you produce, use, or store:
  - How you will provide other employers with a copy of the relevant material safety data sheets (MSDSs), or provide access to the MSDSs in a specified location.
  - How you will inform the other employers of any precautionary measures needed to protect employees during normal operating conditions and in foreseeable emergencies.
  - A description of how you will inform other employers of the labeling system you use.

**Note:** You may rely on another employer’s Chemical Hazard Communication Program to share the information required if the program meets the requirements of this rule.

**WAC 296-800-17010 Identify and list all the hazardous chemicals present in your workplace.** You must:

- Identify all hazardous chemicals at your workplace.

  - This includes any chemical that is known to be present in your workplace in such a way that employees may be exposed to it under normal conditions of use or in a foreseeable emergency.
  
  - Create a list of these chemicals using the chemical or common name on the material safety data sheet (MSDS).
  
  - This list:
    - Must be compiled for the workplace as a whole, or for individual work areas.
    - Is necessary to make sure that all hazardous chemicals are identified and that MSDS, and labeling rules are met.
    - Must be current.

**Note:** The following are some ways to determine whether a product is hazardous:

- Look for words on the label, such as “CAUTION,” “WARNING,” or “DANGER.”
- Look for words or “hazard coding” that indicate that the chemical is flammable, an irritant, corrosive, carcinogenic, etc. “Hazard coding” refers to words, numbers, or colors that tell you a chemical is dangerous.
- The product’s MSDS for hazard information.

WAC 296-800-17015 Obtain and maintain material safety data sheets (MSDSs) for each hazardous chemical used.

**Note:** MSDSs are a type of employee exposure record. Therefore, you must comply with the material safety data sheets (MSDSs) as exposure records, WAC 296-800-180, located in this book.

**You must:**

- Obtain a MSDS for each hazardous chemical used as soon as possible if the MSDS is not provided with the shipment of a hazardous chemical, from the chemical manufacturer or importer.

**Note:**

- To obtain a MSDS, you may try calling the manufacturer or checking their website.
- If you have a commercial account with a retailer or wholesaler, you have the right to request and receive a MSDS about hazardous chemicals you purchase.
- If a chemical is purchased from a retailer with no commercial accounts, you have the right to request and receive the manufacturer’s name and address so that you can contact them and request a MSDS for the chemical.
- Whoever prepares the MSDS is required to mark all blocks on the form, even if there is no relevant information for that section.
- If you have problems getting a MSDS within 30 calendar days after making a written request to the chemical manufacturer, importer, or distributor, you can get help from WISHA. You may contact your local regional office for assistance or make a written request for assistance to the: Department of Labor and Industries Right-to-Know Program P.O. Box 44610 Olympia, Washington 98504-4610.

**Include in your request:**

- A copy of the purchaser's written request to the chemical manufacturer, importer, or distributor.
- The name of the product suspected of containing a hazardous chemical.
- The identification number of the product, if available.
- A copy of the product label, if available.
- The name and address of the chemical manufacturer, importer, or distributor from whom the product was obtained.

**You must:**

- Maintain a MSDS for each hazardous chemical:
  
  - Keep copies of the required MSDSs for each hazardous chemical present in your workplace.
  
  - Each MSDS must be in English. You may also keep copies in other languages.

**Reference:** See material safety data sheets and label preparation, chapter 296-839 WAC, if you choose to create your own MSDS or label.

**WAC 296-800-17020 Make sure material safety data sheets (MSDSs) are readily accessible to your employees and NIOSH.**

**You must:**

- Make sure that MSDSs are readily accessible, easily obtained without delay during each work shift by employees when they are in their work area(s).

- Make sure that employees, who must travel between workplaces during a work shift, such as when their work is carried out at more than one geographical location, can immediately obtain the required MSDS information in an emergency. (MSDSs may be kept at a central location at the...
primary workplace facility and accessed by means such as voice communication or laptop computer.)

Note: • Electronic access (such as computer or fax), microfiche, and other alternatives to maintaining paper copies of the MSDSs are permitted as long as they do not create barriers to immediate employee access in each workplace.
• Barriers to immediate access of electronic MSDSs may include:
  – Power outages
  – Equipment failure
  – System delays
  – Deficient user knowledge to operate equipment
  – Location of equipment outside the work area.

Solutions to eliminating these and other possible barriers to access may require the availability of back-up systems, employee training, and providing access equipment in the work areas.

You must:
• Make MSDSs readily available, when requested, to representatives of the National Institute for Occupational Safety and Health (NIOSH).

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-18-090, § 296-800-17020, filed 9/2/03, effective 11/1/03. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 02-16-047, § 296-800-17020, filed 8/1/02, effective 10/1/02; 01-23-060, § 296-800-17020, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-17020, filed 5/9/01, effective 9/1/01.]

WAC 296-800-17025 Label containers holding hazardous chemicals.

Exemptions: • The following is a summary of items that are exempt from this rule:
  – Pesticides, when labeled as required by the Environmental Protection Agency (EPA).
  – Food, food additives, color additives, drugs, cosmetics, or medical/veterinary devices or products.
  – Alcoholic beverages not intended for industrial use.
  – Consumer products labeled as required by the Consumer Product Safety Commission.
  – Agriculture or vegetable seeds treated and labeled as required by the Federal Seed Act.
For complete information about each of these, see WAC 296-800-17055.

Note: You are not required to label portable containers into which hazardous chemicals are transferred from labeled containers, if the chemical is used and controlled by the same employee who performed the transfer within the same shift.

You must:
• Make sure that each container of hazardous chemicals in the workplace is labeled, tagged, or marked with the following information:
  – The identity of the hazardous chemical(s) using either the chemical or common name.
  – Appropriate hazard warnings which give general information about the relevant health and physical hazards of the chemicals. This includes health effects information, such as information about organs most likely to be affected by the chemicals.
  – For individual stationary process containers, you may use alternate labeling methods such as:
    ✦ Signs
    ✦ Placards
    ✦ Process sheets
    ✦ Batch tickets
    ✦ Operating procedures or
    ✦ Other such written materials,
as long as the alternate method identifies the containers and conveys the required label information.

Note: • You do not need to put on new labels if existing labels already provide the required information.
• You are not required to list each component in a hazardous mixture on the label. If a mixture is referred to on an MSDS by a product name, then the product name should be used as the identifier.
• You may use words, pictures, symbols, or any combination of these, to communicate the hazards of the chemical.

Sample Container Labels

This is an example of a labeled container. You may use a laminated or coated label, affixed to the container with a wire, to avoid deterioration of labels due to a solvent, such as acetone.

You must:
• Not remove or deface existing labels on incoming containers of hazardous chemicals unless the container is immediately labeled with the required information.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-16-047, § 296-800-17025, filed 8/1/02, effective 10/1/02; 01-23-060, § 296-800-17025, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-17025, filed 5/9/01, effective 9/1/01.]
WAC 296-800-17030 Inform and train your employees about hazardous chemicals in your workplace. You must:

- Provide employees with effective information on hazardous chemicals in their work area at the time of their initial job assignment. Whenever a new physical or health hazard related to chemical exposure is introduced into their employees' work areas, information must be provided.
  - Inform employees of:
    - The requirements of this rule
    - Any operations in their work area where hazardous chemicals are present
    - The location and availability of your written Chemical Hazard Communication Program, including the list(s) of hazardous chemicals and material safety data sheets (MSDSs) required by this rule.
- Provide employees with effective training about hazardous chemicals in their work area at the time of their initial job assignment. Whenever a new physical or health hazard related to chemical exposure is introduced, the employees must be trained.
- Make sure employee training includes:
  - Methods and observations that may be used to detect the presence or release of a hazardous chemical in the work area. Examples of these methods and observations may include:
    - Monitoring conducted by you
    - Continuous monitoring devices
    - Visual appearance or odor of hazardous chemicals when being released
  - Physical and health hazards of the chemicals in the work area, including the likely physical symptoms or effects of overexposure
  - Steps employees can take to protect themselves from the chemical hazards in your workplace, including specific procedures implemented by you to protect employees from exposure to hazardous chemicals. Specific procedures may include:
    - Appropriate work practices
    - Engineering controls
    - Emergency procedures
    - Personal protective equipment to be used
    - Details of the chemical hazard communication program developed by you, including an explanation of the labeling system and the MSDS, and how employees can obtain and use the appropriate hazard information.
  - Tailor information and training to the types of hazards to which employees will be exposed. The information and training may be designed to cover categories of hazards, such as flammability or cancer-causing potential, or it may address specific chemicals. Chemical-specific information must always be available through labels and MSDSs.
- Make reasonable efforts to post notices in your employees' native languages (as provided by the department) if those employees have trouble communicating in English.

Note:
- Interactive computer-based training or training videos can be used provided they are effective.
- Your MSDSs may not have WISHA permissible exposure limits (PELs) listed. In some cases, WISHA PELs are stricter than the OSHA PELs and other exposure limits listed on the MSDSs you receive. If this is the case, you must refer to the WISHA PEL table, WAC 296-62-075, for the appropriate exposure limits to be covered during training.

WAC 296-800-17035 Follow these rules for laboratories using hazardous chemicals.

Note:
- Laboratories are required to have a written Chemical hygiene plan under WAC 296-62-400, if applicable. They are not required to have a written Chemical Hazard Communication Program.
- You may combine your accident prevention program and chemical hazard communication program to assist you in developing a chemical hygiene plan for your laboratory.

You must:

1. Make sure that labels on incoming containers of hazardous chemicals are in place and readable.
2. Maintain material safety data sheets (MSDSs) received with incoming shipments of hazardous chemicals and make them readily accessible to laboratory employees when they are in their work areas.
3. Provide laboratory employees with information and training as described in: "Inform and train your employees about hazardous chemicals in your workplace," WAC 296-800-17030. You do not have to cover the location and the availability of the Hazard Communication Program.

WAC 296-800-17040 Follow these rules for handling chemicals in factory-sealed containers. This applies to situations where employees only handle chemicals in factory-sealed containers that are not opened under normal use (such as those found in marine cargo handling, trucking, warehousing, or retail sales).

You must:

1. Make sure that labels on incoming containers of hazardous chemicals are in place and readable.
2. Keep or obtain material safety data sheets (MSDSs).
   - Keep any MSDSs that are received with incoming shipments of the sealed containers of hazardous chemicals.
   - If a factory-sealed container of hazardous chemicals comes without a MSDS, obtain one as soon as possible, if an employee requests it.
3. Make sure that the MSDSs are readily accessible during each work shift to employees when they are in their work area(s).
4. Inform and train your employees about hazardous chemicals in your workplace, to protect them in case of a hazardous chemical spill or leak from a factory-sealed container. You do not have to cover the location and availability of the written Chemical Hazard Communication Program.

(2005 Ed.)

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-16-047, § 296-800-17030, filed 8/1/02, effective 10/1/02; 01-23-060, § 296-800-17030, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-17030, filed 5/9/01, effective 9/1/01.]

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-17035, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-17035, filed 5/9/01, effective 9/1/01.]

[Title 296 WAC—p. 2763]
WAC 296-800-17045 Translate certain chemical hazard communication documents upon request. The department must:

• Upon receipt of a written or verbal request, prepare and make available (within available resources) to employers or the public, a translation into Cambodian, Chinese, Korean, Spanish, or Vietnamese of any of the following:
  – An employer’s written Chemical Hazard Communication Program.
  – A material safety data sheet or
  – Written materials prepared by the department to inform employees of their rights described in this rule, regarding chemical hazard communication.

Note: Written requests for translations should be directed to:
Department of Labor and Industries
Right-to-Know Program
P.O. Box 44610
Olympia, Washington 98504-4610.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-17045, filed 5/9/01, effective 9/1/01.]

WAC 296-800-17050 Attempt to obtain a material safety data sheet (MSDS) upon request. The department must:

• Upon receipt of an employer’s written request for a material safety data sheet, attempt to obtain the MSDS from the chemical manufacturer, importer, or distributor. When the department receives the MSDS, the department must forward a copy of it to the purchaser at no cost. Small business employers will be given priority for this service.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-17050, filed 5/9/01, effective 9/1/01.]

WAC 296-800-17055 Items or chemicals exempt from the rule, and exemptions from labeling.

• Listed below are the full descriptions of the items or chemicals that are exempt, or not covered, by this rule:
  – Any consumer product or hazardous substance, defined in the Consumer Product Safety Act (15 U.S.C. 2051 et seq.) and Federal Hazardous Substance Act (15 U.S.C. 1261 et seq.) respectively, where you can show that it is used in the workplace for the purpose intended by the chemical manufacturer or importer of the product, and the use results in a duration and frequency of exposure that is not greater than the range of exposures that could reasonably be experienced by consumers when used for the purpose intended.
  – Any hazardous waste defined by the Hazardous Waste Management Act chapter 70.105 RCW, when subject to regulations issued under that act by the department of ecology that describes specific safety, labeling, personnel training, and other rules for the accumulation, handling and management of hazardous waste.
  – Any hazardous waste defined by the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act of 1976, as amended (42 U.S.C. 6901 et seq.), when subject to regulations issued under that act by the Environmental Protection Agency.
  – Any hazardous substance defined by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. 9601 et seq.), when the hazardous substance is the focus of remedial or removal action being conducted under CERCLA in accordance with Environmental Protection Agency regulations.
  – Tobacco or tobacco products.
  – Wood or wood products, including lumber that will not be processed, where the chemical manufacturer or importer can establish that the only hazard they pose to the employees is the potential for flammability or combustibility. Wood or wood products that have been treated with hazardous chemicals covered by this rule, and wood that may be subsequently sawed or cut, generating dust, are not exempted.
  – Articles, meaning manufactured items other than a fluid or particle that:
    ♦ Are formed to a specific shape or design during manufacture:
      ♦ Have end use function(s) dependent in whole or in part upon their shape or design during end use; and
    ♦ Under normal conditions of use, do not release more than very small quantities, for example, minute or trace amounts of a hazardous chemical such as, emissions from a marking pen or a newly varnished wood chair, and do not pose a physical hazard or health risk to employees.
  – Food or alcoholic beverages that are sold, used, or prepared in a retail establishment such as a grocery store, restaurant, or drinking place, and foods intended for personal consumption by employees while in the workplace.
  – Any drug, defined in the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 301 et seq.), when it is in solid, final form for direct administration to the patient (for example, tablets or pills); drugs that are packaged by the chemical manufacturer for sale to consumers in a retail establishment (for example, over-the-counter drugs); and drugs intended for personal consumption by employees while in the workplace (for example, first-aid supplies). Aerosolized or cytotoxic drugs administered by a health care worker are not excluded.
  – Cosmetics packaged for sale to consumers in a retail establishment, and cosmetics intended for personal consumption by employees while in the workplace.
  – Ionizing and nonionizing radiation.
  – Biological hazards.
  • This rule does not require labeling of the following chemicals:
    – Any pesticide defined in the Federal Insecticide, Fungicide, and Rodenticide Act (7 U.S.C. 136 et seq.), when subject to the labeling requirements of that act and labeling regulations issued under that act by the Environmental Protection Agency.
    – Any chemical substance or mixture defined in the Toxic Substance Control Act (15 U.S.C. 2601 et seq.), when subject to the labeling requirements of that act, and labeling requirements issued under that act by the Environmental Protection Agency.
    – Any food, food additive, color additive, drug, cosmetic, or medical/ veterinary device or product, including materials intended for use as ingredients in such products (for example, flavors and fragrances), are defined in the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 301 et seq.) or the Virus-Serum Toxin Act of 1913 (21 U.S.C. 151 et seq.) and regulations issued under those acts, when they are subject to the labeling requirements under those acts by either the Food and Drug Administration or the Department of Agriculture.

[Title 296 WAC—p. 2764]
WAC 296-800-180 Material safety data sheets (MSDSs) as exposure records. Important: Exposure records contain information about employees’ exposure to toxic substances or harmful physical agents. Material safety data sheets (MSDSs) are one type of exposure record. The preservation of and access to exposure records is necessary to improve detection, treatment, and prevention of occupational diseases.

This rule supplements the chemical hazard communication rule by extending access to MSDSs, or their alternative, after employment and after the hazardous chemical is no longer used in the workplace.

Your responsibility:

To preserve and provide access to material safety data sheets (MSDSs) or their alternative as exposure records.

You must:

Preserve exposure records for at least 30 years.

WAC 296-800-18005

Inform current employees of exposure records.

WAC 296-800-18010

Provide access to exposure records.

WAC 296-800-18015

Transfer records when ceasing to do business.

WAC 296-800-18020

Note:
- Employee medical and exposure records, chapter 296-802 WAC, requires the preservation and access to other exposure records including records such as workplace monitoring data and biological monitoring results and medical records. If you keep these other types of employee exposure records or employee medical records, you must comply with these additional requirements.
- This rule applies to every employer who maintains, makes, contracts for, or has access to MSDSs for chemicals used in their workplace.
- The specific identity of a toxic substance may be withheld from a disclosing record if it is a verifiable trade secret.
- For trade secret requirements see chapter 296-816 WAC.

WAC 296-800-18005 Preserve exposure records for at least 30 years. You must:

- Keep material safety data sheets (MSDSs) and analysis using MSDSs for at least thirty years, including current, former, and future employers receiving transferred records. Preserve MSDSs in any form, as long as the information is not altered and is retrievable. You may keep alternative records instead of MSDSs concerning the identity of a substance. The alternative record must also be kept for thirty years and contain the following information:
  - Some record of the identity (chemical name, if known) of a substance or agent
  - Where the substance or agent was used
  - When the substance or agent was used

Note: Keeping alternative records may be less work than you think. When developing your hazard communication program's list of hazardous chemicals (WAC 296-800-17010), add the "where used" and "when used" information required by this rule.

WAC 296-800-18010 Inform current employees of exposure records. You must:

- Inform current employees who are, or will be exposed to a toxic chemical of:

Note: A chemical is toxic if:

- The latest printed edition of the National Institute for Occupational Safety and Health (NIOSH) Registry of Toxic Effects of Chemical Substances (RTECS) lists the substance. This may be obtained on-line, CD-ROM, or on a computer tape.
- Testing by or known to the employer has shown positive evidence that the substance is an acute or chronic health hazard.
- A material safety data sheet (MSDS) kept by or known to the employer shows the material may be a hazard to human health.

- The existence, location, and availability of MSDSs or alternative records, and any other records covered by this rule.
- The person responsible for maintaining and providing access to records.
- Exposure records when the employee first enters into employment and then once a year thereafter.
- Existence and their rights of access to these records.

Note: Informing employees of the availability of these records may be accomplished by posting, group discussion or by individual notifications.

You must:

- Keep a copy of this rule and make copies available upon request to employees.
- Distribute to employees any informational materials about this rule that are made available to the employer by the department.

WAC 296-800-18015 Provide access to exposure records. You must:

- Provide access, whenever requested by an employee or their designated representative, to a relevant exposure record:
  - In a reasonable time, place, and manner.

(2005 Ed.)
WAC 296-800-19005 Provide a safety bulletin board in your workplace. You must:
- Install and maintain a safety bulletin board in every fixed workplace (establishment) that has eight or more employees. Make sure the safety bulletin board is large enough to post information such as the following:
  - Safety bulletins
  - Safety newsletters
  - Safety posters
  - Accident statistics
  - Other safety educational material.

Note: You may want to post your emergency phone numbers on the safety bulletin board.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-19005, filed 5/9/01, effective 9/1/01.]

WISHA POSTER

WAC 296-800-200 WISHA poster. Your responsibility: To post the WISHA poster, which informs your employees of their job safety and health protection rights.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-200, filed 5/9/01, effective 9/1/01.]

WAC 296-800-20005 Post and keep a WISHA poster in your workplace. You must:
- Post it where it can easily be seen by employees and keep it in good condition.

Note: Other programs within labor and industries may require other workplace posters. These are:
- Job safety and health protection
- Notice to employees—If a job injury occurs
- Your rights as a nonagricultural worker
- You can obtain a free copy of labor and industries posters from any labor and industries office or by printing it off our website (http://www.lni.wa.gov/ipub/101-054-000.htm). You can find the labor and industries office closest to you by:
  - Checking the resource section of this book for regional offices.
  - Calling 1-800-4BE SAFE (1-800-423-7233)
  - http://www.lni.wa.gov/wisha/question.htm#contact.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-16-047, § 296-800-20005, filed 8/1/02, effective 10/1/02; 01-23-060, § 296-800-20005, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-20005, filed 5/9/01, effective 9/1/01.]

LIGHTING

WAC 296-800-210 Lighting. Your responsibility: To provide and maintain adequate lighting in your workplace.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-210, filed 5/9/01, effective 9/1/01.]

WAC 296-800-21005 Provide and maintain adequate lighting.

Note: This section establishes minimal levels of lighting for safety purposes only. Guidelines pertaining to optimal levels of lighting and illumination may be found in Practice for Industrial Lighting, ANSI/IES RP7-1979. (See the resource section of this book on how to contact ANSI.)
You must:
- Provide and maintain adequate lighting for all work activities in your workplace. See the following table.

<table>
<thead>
<tr>
<th>Activity</th>
<th>Minimum acceptable average lighting level in an area: (Foot-candles)</th>
<th>Any one single measurement used to determine the average lighting level* cannot be less than: (Foot-candles)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indoor task</td>
<td>10</td>
<td>5</td>
</tr>
<tr>
<td>Outdoor task</td>
<td>5</td>
<td>2.5</td>
</tr>
<tr>
<td>Nontask activities for both indoor and outdoor</td>
<td>3</td>
<td>1.5</td>
</tr>
</tbody>
</table>

* Lighting levels must be measured at thirty inches above the floor/working surface at the task.

You must:
- Have adequate light for employees to see nearby objects that might be potential hazards or to see to operate emergency controls or other equipment, if general lighting is not available.

Note: You must:
- Lighting levels can be measured with a light meter.
- Conversion information: 1 foot-candle = 1 lumen incident per square foot = 10.76 lux.

[Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050. 01-11-038, § 296-800-220, filed 5/9/01, effective 9/1/01.]

**HOUSEKEEPING, DRAINAGE, AND STORAGE**

**WAC 296-800-220** Housekeeping, drainage, and storage—Summary. Your responsibility: To provide your employees with a clean, dry, pest-free workplace.

- Keep your workplace clean.
  - WAC 296-800-22005.
- Sweep and clean your workplace to minimize dust.
  - WAC 296-800-22010.
- Keep your workplace free of obstacles that interfere with cleaning.
  - WAC 296-800-22015.
- Control pests in your workplace.
  - WAC 296-800-22020.
- Make sure floors are maintained in a safe condition.
  - WAC 296-800-22022.
- Keep your workroom floors dry, when practical.
  - WAC 296-800-22025.
- Provide proper drainage.
  - WAC 296-800-22030.
- Store things safely.
  - WAC 296-800-22035.

You must:
- Keep your workplace clean.
  - WAC 296-800-22005.
- Sweep and clean your workplace to minimize dust. You must:
  - Keep all areas of your workplace, passageways, storage rooms, and service rooms in a clean, orderly and sanitary condition to the extent the nature of the work allows.
  - WAC 296-800-22010.
- Control pests in your workplace. You must:
  - Keep each building in your workplace is constructed, equipped and maintained so it restricts pests from entering or living in it. Pests include animals such as:
    - Rodents (rats, mice, and squirrels)
    - Birds (starlings, pigeons, and swallows)
    - Insects (bees, wasps, and mosquitoes)
    - Take steps to effectively control pests in your workplace, if they are detected.
    - Carry out a continuing and effective control program in the areas of your workplace where pests have been detected.
      - By handling dead or live pests including their waste products, attached parasites and other contaminated materials, your employees may be exposed to certain health risks. These risks include, but are not limited to: Hanta virus, rabies, lyme disease and psittacosis. Contact your local L&I office (see resource section of this book) or the public health department for more information about health risks and proper pest handling and disposal techniques.
  - "Workplace" includes storage areas.
  - WAC 296-800-22015.
  - WAC 296-800-22020.
- Control vegetation in your storage areas.
  - WAC 296-800-22040.

(005 Ed.)
**DRAINAGE**

**WAC 296-800-22025 Keep your workroom floors dry, when practical.** You must:
- Do the following to help keep your employees dry if wet processes are used in your work area:
  - Maintain drainage away from the work area; and
  - Provide false floors, platforms, or other dry places where employees can stand, where practical, or
  - Provide appropriate waterproof footgear.

**WAC 296-800-22030 Provide proper drainage.** You must:
- Provide all areas where employees work, such as yards, basements, or garages, with adequate drainage.

**STORAGE AREAS**

**WAC 296-800-22035 Store things safely.** You must:
- Store materials so they do not create a hazard.
- Keep workplace storage areas free from accumulation of materials that could create hazards from tripping, fire, or explosion.
- Secure stored items such as bundles, containers, and bags to prevent them from falling, sliding, or collapsing by doing one or more of the following:
  - Stacking
  - Racking
  - Blocking
  - Interlocking
  - Otherwise securing them
- Make sure stored items are limited in height so that they are stable and secure to prevent sliding or collapse.

Examples of Proper Material Storage

- Block Pattern
- Brick
- Pinwheel
- Rigid Spacer

**SANITATION AND HYGIENE FACILITIES AND PROCEDURES**

**WAC 296-800-230 Summary.**

Your responsibility:
To provide safe drinking (potable) water, bathrooms, washing facilities, eating areas and garbage and waste disposal in your workplace.

You must:
**General requirements for all workplaces.**

**Drinking water**
Provide safe drinking (potable) water in your workplace. **WAC 296-800-23005.**

Clearly mark water outlets that are not fit for drinking (nonpotable). **WAC 296-800-23010.**

Make sure systems delivering not fit for drinking (non-potable) water prevent backflow into drinking water systems. **WAC 296-800-23015.**

**Bathrooms and washing facilities**
Provide bathrooms for your employees. **WAC 296-800-23020.**

Provide convenient, clean washing facilities. **WAC 296-800-23025.**

**Eating areas and food service**
Make sure eating areas are safe and healthy. **WAC 296-800-23040.**

Follow these requirements if you provide food service to your employees. **WAC 296-800-23045.**

**Garbage and waste disposal**
Dispose of garbage and waste safely. **WAC 296-800-23050.**

Remove garbage and waste in a way that does not create a health hazard. **WAC 296-800-23055.**
Lunchrooms and personal service rooms
Provide a separate lunchroom if employees are exposed to toxic substances if they are allowed to eat and drink on the job site.
WAC 296-800-23060.
Provide showers when required for employees working with chemicals.
WAC 296-800-23065.
Provide change rooms when required.
WAC 296-800-23070.
Make sure any work clothes you provide are dry.
WAC 296-800-23075.

Note: Some industries may have additional rules on bathrooms and washing facilities. Some examples include:

Industry WAC
Agriculture; indoor sanitation and temporary labor camps WAC 296-307 WAC 296-62-07308
Carcinogens; general regulated area requirements WAC 296-115-050
Charter boats WAC 296-36-160(5)
Construction WAC 296-155-140
Temporary labor camps WAC 296-24-12507

DRINKING WATER
WAC 296-800-23005 Provide safe drinking (potable) water in your workplace.
You must:
(1) Provide safe drinking (potable) water for employees for:
• Washing themselves
• Personal service rooms
• Cooking
• Washing premises where food is prepared or processed
• Washing food, eating utensils, or clothing
(2) Make sure when providing movable or portable drinking water dispensers that they are:
• Capable of being closed
• Kept in sanitary condition
• Equipped with a tap
(3) Prohibit employees from:
• Using shared drinking cups or utensils.
• Using open containers such as barrels, pails, and tanks that require employees to dip or pour drinking water, even if the containers have covers.

Definition:
• Potable water is water that you can safely drink that meets specific safety standards prescribed by the United States Environmental Protection Agency’s National Interim Primary Drinking Water Regulations, published in 40 CFR Part 141, and 40 CFR 147.2400.
• Personal service rooms are used for activities not directly connected with a business’ production or service function such as first aid, medical services, dressing, showering, bathrooms, washing and eating.

WAC 296-800-23010 Clearly mark the water outlets that are not fit for drinking (nonpotable).
You must:
(1) Mark water outlets that are not fit for drinking (nonpotable), such as those used for industrial processes or fire fighting, so they will not be used for:
• Drinking
• Washing themselves, except in emergencies
• Cooking
• Washing food, eating utensils, or clothing.
(2) Prohibit the use of nonpotable water containing substances that could create unsafe conditions such as:
• Concentrations of chemicals, such as lead or chlorine
• Fecal coliform bacteria.

Note: As long as the nonpotable water is free of substances that could create unsafe conditions, the water can be used for cleaning both:
– Work premises used for activities other than food preparation or processing
AND
– Personal service rooms, such as bathrooms.

Reference: You may need to follow additional requirements for emergency washing facilities. See WAC 296-800-150 First aid, for more information.
BATHROOMS AND WASHING FACILITIES

WAC 296-800-23020 Provide bathrooms for your employees.

Exemption: You do not have to provide bathrooms:
For mobile crews or at work locations not normally attended by employees, if there is transportation immediately available to nearby bathrooms that meet the requirements of this section.

Exemption: You do not have to provide bathrooms:
For mobile crews or at work locations not normally attended by employees, if there is transportation immediately available to nearby bathrooms that meet the requirements of this section.

You must:
(1) Provide bathrooms with the appropriate number of toilets for your employees at every workplace based on Table 1.
• Have an appropriate number of toilets for each gender, based on the number of male and female employees at your workplace.
  – For example, if you have thirty-seven men and seventeen women, you need to have three toilets for the men and two toilets for the women, based on Table 1.
• Make sure each toilet is in a separate compartment with a door and walls or partitions for privacy.

<table>
<thead>
<tr>
<th>Maximum Number of Employees Present at Any One Time During a Shift</th>
<th>Minimum Number of Toilets Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 to 15</td>
<td>1</td>
</tr>
<tr>
<td>16 to 35</td>
<td>2</td>
</tr>
<tr>
<td>36 to 55</td>
<td>3</td>
</tr>
<tr>
<td>56 to 80</td>
<td>4</td>
</tr>
<tr>
<td>81 to 110</td>
<td>5</td>
</tr>
<tr>
<td>111 to 150</td>
<td>6</td>
</tr>
<tr>
<td>Over 150</td>
<td>One additional toilet for each additional 40 employees</td>
</tr>
</tbody>
</table>

Note: A shared bathroom (multiple toilets without enclosures) counts as one toilet no matter how many toilets it contains. In bathrooms used only by men, urinals may be substituted for up to 1/3 of the required toilets.

You must:
(2) Provide toilet paper and a toilet paper roll holder for each toilet.
(3) Make sure bathrooms are maintained in a clean and sanitary condition.
(4) Make sure the sewage disposal method does not endanger the health of employees.

Exemption: Separate bathrooms for men and women are not required if the bathroom:
• Will only be occupied by one person at a time.
• Can be locked from the inside.
• Contains at least one toilet.

Exemption: You do not have to provide washing facilities:
• Mobile crews or work locations not normally attended by employees, if there is immediately available transportation to nearby washing facilities that meet the requirements of this rule.

You must:
• Provide convenient and clean washing facilities for employees including:
  – Sinks or basins for personal washing
  – Hot and cold water, or lukewarm ( tepid), running water in each sink and basin
  – Hand soap or similar cleaning agents
  – One of the following:
    – Individual paper or cloth hand towels
    – Individual sections of clean continuous cloth toweling
    – Warm air blowers for drying hands, located near the sinks and basins.

WAC 296-800-23040 Make sure eating areas are safe and healthy.

You must:
(1) Make sure employees are not allowed to eat and drink in:
• Bathrooms.
• Areas exposed to toxic substances.
(2) Make sure food is not stored in bathrooms or areas exposed to toxic substances.

WAC 296-800-23045 Follow these requirements if you provide food service to your employees.

You must:
• Make sure all food service facilities and operations you make available follow sound hygiene principles.
• Make sure the food is:
  – Unspoiled.
  – Protected from contamination during processing, preparation, handling, and storage.

GARBAGE AND WASTE DISPOSAL

WAC 296-800-23050 Dispose of garbage and waste safely.

You must:
(1) Make sure garbage containers are:
• Kept in a clean and sanitary condition.
• Made from smooth, corrosion resistant materials.
• Easily cleaned or are disposable.
• Equipped with a solid tight-fitting cover unless you can keep them in a sanitary condition without a cover.
(2) Provide enough garbage containers to make sure they:
• Are conveniently located to encourage their use.
• Won't be overfilled.

WAC 296-800-23055  Remove garbage and waste in a way that does not create a health hazard.
You must:
• Remove all sweepings, solid and liquid wastes, refuse, and garbage as often as needed to keep the workplace in a sanitary condition.

WAC 296-800-23060  Provide a separate lunchroom if employees are exposed to toxic substances if they are allowed to eat and drink on the job site.
You must:
(1) Provide a lunchroom separate from the work area if employees are exposed to toxic substances.
(2) Use Table 2 to determine the required square footage in your lunchroom based on the number of employees using the room at any one time.

Table 2
Maximum Number of Employees Using Lunchroom at One Time
<table>
<thead>
<tr>
<th>Number of Persons</th>
<th>Square Feet per Person</th>
</tr>
</thead>
<tbody>
<tr>
<td>25 and less</td>
<td>13</td>
</tr>
<tr>
<td>26-74</td>
<td>12</td>
</tr>
<tr>
<td>75-149</td>
<td>11</td>
</tr>
<tr>
<td>150 and over</td>
<td>10</td>
</tr>
</tbody>
</table>

Note: You do not have to provide a separate lunchroom if it is convenient for employees to leave the workplace to eat and drink.

WAC 296-800-23065  Provide showers when required for employees working with chemicals.
You must:
• Provide showers for employees if:
  – They work with chemicals that could cause an occupational illness;
  AND
  – The chemicals remain on the skin between work shifts.
  • Make sure employees who work with such chemicals shower at the end of their shifts.
  – Make sure showers have:
    • Soap or other cleansing agents.
    • Hot and cold water with a common discharge line.
  – Provide individual, clean towels for each employee who is required to shower.
  • Provide at least one shower for every ten employees (or every fraction of 10) of each gender.

Note: Table 3 shows the number of showers to provide based on a "fraction of 10."

WAC 296-800-23067  Make sure any work clothes you provide are dry.
You must:
• Make sure when providing work clothes to employees that the clothing provided is dry if the clothing:
  – Gets wet during use;
  OR
  – Is washed before it is reused.

WAC 296-800-24005  Control tobacco smoke in your building.

Table 3
Number of Employees of Each Gender Number of Showers
1-10 1
11-20 2
21-30 3
31-40 4
41-50 5

Note: This rule does not preempt any federal, state, municipal, or other local authority's regulation of indoor smoking that is more protective than this section.

ENVIRONMENTAL TOBACCO SMOKE IN THE OFFICE

WAC 296-800-240 Summary. Your responsibility: To control exposure to environmental tobacco smoke in your office work environment.
You must:
Control tobacco smoke in your building
WAC 296-800-24005.
Control tobacco smoke that comes in from the outside
WAC 296-800-24010.

Note: This rule does not preempt any federal, state, municipal, or other local authority's regulation of indoor smoking that is more protective than this section.

Definition: Office work environment is an indoor or enclosed occupied space where clerical work, administration, or business is carried out. In addition, it includes:
• Other workplace spaces controlled by the employer and used by office workers, such as cafeterias, meeting rooms, and washrooms.
• Office areas of manufacturing and production facilities, not including process areas.
• Office areas of businesses such as food and beverage establishments, agricultural operations, construction, commercial trade, services, etc.

WAC 296-800-24005  Control tobacco smoke in your building. Exemption: The minimum criteria specified in this
rule do not apply to outdoor structures provided for smokers such as gazebos or lean-tos.

You must:
• Prohibit smoking in your office work environment or
• Restrict smoking inside your office work environment to designated enclosed smoking rooms that meet the following minimum criteria:
  – Identify smoking areas clearly with signs.
  – Make sure the designated smoking rooms are not in common areas, such as:
    ♦ Places where nonsmoking employees are required to work or visit
    ♦ Restrooms
    ♦ Washrooms
    ♦ Hallways
    ♦ Stairways
    ♦ Cafeterias/lunchrooms
    ♦ Meeting rooms
  – Make sure that no employee is required to enter a designated smoking room while someone is smoking there.
  – Conduct cleaning and maintenance work in designated smoking rooms when smokers are not present.
  
You must:
• Ventilate designated smoking rooms at a rate of at least 60 cubic feet per minute per smoker (calculated on the basis of the maximum number of smokers expected during the course of a normal working day), which can be supplied by transfer air from adjacent areas.
  – Maintain enough negative air pressure in designated smoking areas to prevent smoke from migrating into nonsmoking areas, at all times.
  – Operate a separate mechanical exhaust system in designated smoking rooms, to make sure exhausted air moves directly outside, and does not recirculate into nonsmoking areas.
  – Prohibit use of the designated smoking room if the mechanical exhaust system is not working properly, until repairs are completed.

Note: This ventilation rate is recommended for occupancies of no more than seven people for every 100 square feet of net occupied space in the designated smoking room.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-24010, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-24010, filed 5/9/01, effective 9/1/01.]

WAC 296-800-250  Summary.

You must:
You must:
Provide fixed stairs where required
WAC 296-800-25005
Provide stairs that minimize hazards
WAC 296-800-25010
Provide handrails and stair railings
WAC 296-800-25015.

Exemptions: This rule does not apply to:
• Stairs used exclusively for fire exit purposes
• Construction operations (See WAC 296-24-76503 for the specifications for the safe design and construction of fixed general industrial stairs.)
• Private buildings or residences
• Articulated stairs (for example, stairs used at a marina)
• Nonindustrial and monumental stairs are excluded as they are not industrial stairs; however, when public and private building steps are located at loading or receiving docks, in maintenance areas, etc., or are used exclusively by employees, the requirements of this rule must apply.

Note: The introduction has important information about building, electrical and fire codes that may apply to you in addition to WISHA rules. See “How do the WISHA rules relate to building, fire, and electrical codes” in the introduction section of this book.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-250, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-250, filed 5/9/01, effective 9/1/01.]

WAC 296-800-25005  Provide fixed stairs where required.

You must:
• Install fixed stairs where:
  – Employees travel between different levels on a predictable and regular basis.
  – Access to platforms is required to give routine attention to equipment under operation.
  – Daily movement between elevations is required to gauge, inspect, and maintain equipment where those work assignments may expose employees to acids, caustics, gases, or other harmful substances.
  – Carrying tools or equipment by hand is a normal work requirement.
• Not use spiral stairways except as secondary exit routes.

Note: You can use fixed ladders for climbing elevated structures, such as tanks, towers, and overhead traveling cranes, when their use is common practice in your industry.

You can use winding stairways on tanks and similar round structures if the structure’s diameter is at least five feet.
You could use a spiral stairway as an exit route in a restricted area that lacks room for a conventional stairway.

**Definitions:**
- A stairway or fixed stairs is a series of steps and landings:
  - Leading from one level or floor to another.
  - Leading to platforms, pits, boiler rooms, crossovers, or around machinery, tanks, and other equipment.
- A riser is the vertical part of the step at the back of a tread that rises to the front of the tread above.
- A tread is the horizontal part of the step. Tread width is the distance from the front of the tread to the back.

### WAC 296-800-25010 Provide stairs that minimize hazards

You must:
1. Make sure stairs have slip-resistant treads.
2. Make sure that stairs with four or more risers have:
   - Railings on the open sides of all exposed stairways and stair platforms
   - Handrails on at least one side of closed stairways, preferably on the right side while descending
3. Provide a platform where doors or gates open directly on a stairway. The swing of the door must not reduce the effective width of the platform to less than 20 inches.

**Note:** To see all of the rules for building fixed stairs, refer to WAC 296-24-75011 and 296-24-765 of the General safety and health standard.

### WAC 296-800-25015 Provide handrails and stair railings

**Exemption:** Vehicle service pit stairways are exempt from the rules for stairway railing and guards, if they would prevent a vehicle from moving into a position over the pit.

**Definition:**
- A handrail is a single bar or pipe on brackets from a wall or partition to provide a continuous handhold for persons using a stair.
- A stair railing is a vertical barrier attached to a stairway with an open side, to prevent falls. The top surface of the stair railing is used as a handrail.

You must:
- Make sure stairways less than forty-four inches wide have:
  - At least one handrail, preferably on your right side as you go down the stairs, if both sides are enclosed.
  OR

- Make sure stairways more than forty-four inches wide but less than eighty-eight inches wide have:
  - One handrail on each enclosed side.
  - One stair railing on each open side.

- Make sure stairways at least eighty-eight inches wide have:
  - One handrail on each enclosed side.
  - One stair railing on each open side.
  - One intermediate stair railing located approximately midway of the width.

**Reference:** Railings must consist of a top rail, intermediate rail, and posts. To see all of the rules for building handrails and stairway railings, refer to WAC 296-24-75011, of the general safety and health standard.

### FLOOR OPENINGS, FLOOR HOLES AND OPEN-SIDED FLOORS

**WAC 296-800-260 Summary**
Your responsibility: To safely guard floor openings, floor holes, and open-sided floors in your workplace.

You must:
- Guard or cover floor openings and floor holes.
WAC 296-800-26005. Protect open-sided floors and platforms.

WAC 296-800-26010.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-260, filed 5/9/01, effective 9/1/01.]

WAC 296-800-26005 Guard or cover floor openings and floor holes.

Definition: A floor opening is an opening in any floor, platform, pavement, or yard that measures at least twelve inches in its smallest dimension and through which a person can fall.

Examples of floor openings are:
• Hatchways
• Stair or ladder openings
• Pits
• Large manholes.

The following are not considered floor openings:
• Openings occupied by elevators
• Dumbwaiters
• Conveyors
• Machinery
• Containers

A floor hole is an opening in any floor, platform, pavement, or yard that measures at least one inch but less than twelve inches at its smallest dimension and through which materials and tools (but not people) can fall.

Examples of floor holes are:
• Belt holes
• Pipe openings
• Slot openings

You must:

(1) Guard stairway floor openings, temporary floor openings and floor holes.

• Protect all stairway floor openings with a railing. The railing must protect all open sides except the stairway entrance side.

• Use a hinged cover and a removable railing where traffic across an infrequently used stairway floor opening prevents the installation of a fixed railing. This removable railing must protect all open sides except the stairway entrance side.

• Protect temporary floor openings by either a railing or by a person who constantly attends the opening.

• Protect exposed floor holes into which a person can accidentally walk by either:
  – A railing with a toeboard on all open sides or
  – A floor hole cover of standard strength and construction that can be hinged in place. When a floor hole cover is not in place, the hole must be protected by a removable railing or constantly attended by someone.

• Provide covers for floor openings. Floor opening covers may be of any material that has a safety factor of four, or is strong enough to hold up to four times the intended load. Covers that do not project more than one inch above the floor level may be used providing all edges are beveled (slanted) to prevent tripping. All hinges, handles, bolts, or other parts of a cover must set flush with the floor or cover surface.

WAC 296-800-26010 Protect open-sided floors and platforms.

You must:

(1) Guard open-sided floors and platforms.

• Guard open-sided floors and platforms four feet or more above adjacent floor or ground level by a railing. The entrance to a ramp, stairway, or fixed ladder does not need a railing.

[Title 296 WAC—p. 2774] (2005 Ed.)
• Guard open-sided floors, walkways and platforms above or adjacent to dangerous equipment, pickling or galvanizing tanks, degreasing units, and other similar hazards, regardless of height with a railing and toeboard.

(2) Make sure tools and loose materials are not left on overhead platforms and scaffolds.

Note: • Where the guarding rules above do not apply because employees exposure to falls is infrequent (not on a predictable and regular basis), you must comply with the Personal Protective Equipment (PPE) rules (WAC 296-800-160) or other effective fall protection must be provided.

• You can find the minimum requirements for standard railings of various types of construction in WAC 296-24-75011.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-27010, filed 12/1/01; 01-11-038, § 296-800-26010, filed 5/9/01, effective 9/1/01.]

WORKPLACE STRUCTURAL INTEGRITY

WAC 296-800-270 Summary. Your responsibility: To make sure that the buildings, floors, and other structures in your workplace are safe, well-built, and not overloaded.

You must:
• Not overload floors or roofs WAC 296-800-27005.

Make sure that floors are safe WAC 296-800-27010.

Make sure floors can support equipment that moves or has motion WAC 296-800-27015.

Post approved load limits (weight limits) for floors WAC 296-800-27020.

Note: The introduction has important information about fire, building and electrical codes that may apply to you in addition to WISHA rules. See "How do the WISHA rules relate to fire, building and electrical codes" in the introduction section of this book.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-270, filed 5/9/01, effective 9/1/01.]

WAC 296-800-27005 Do not overload floors or roofs.

You must:
• Prohibit overloading roofs and floors of any building or other structure with more weight than is approved by the building official.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-27005, filed 5/9/01, effective 9/1/01.]

WAC 296-800-27010 Make sure that floors are safe.

You must:
• Make sure that floors including their parts and structural members are safe.

• Make sure floors are of substantial construction and kept in good repair. This includes floors of:
  – Buildings
  – Platforms
  – Walks and driveways
  – Storage yards
  – Docks
• Make sure that structures are designed, constructed, and maintained to provide a safety factor of 4 times the imposed maximum strain.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-27010, filed 5/9/01, effective 9/1/01.]

WAC 296-800-27015 Make sure floors can support equipment that moves or has motion.

You must:
• Make sure flooring of buildings, ramps, docks, trestles and other fixed structures that supports equipment that moves or has motion such as vibration, must not be less than two and one-half inch material.

Note: Where flooring is covered by steel floor plates, 2-inch material may be used.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-27015, filed 5/9/01, effective 9/1/01.]

WAC 296-800-27020 Post approved load limits (weight limits) for floors.

You must:
• Post approved load limits (weight limits) for floors used for mercantile, business, industrial or storage purposes in an obvious place.

• As the owner, or owner's agent, of a building (or other part of a workplace) post the load approved by the building official by:
  – Supplying and affixing a durable metal sign that is marked with the approved load.
  – Placing the metal sign in an obvious spot in the space to which it applies.
  – Replacing the metal sign if it is lost, defaced, damaged, or removed.

Note: This rule applies to the floor that supports shelving, but not to the shelves themselves.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-27020, filed 5/9/01, effective 9/1/01.]

BASIC ELECTRICAL RULES

WAC 296-800-280 Basic electrical rules. Summary.

Your responsibility: To protect your employees from hazards when working with electrical equipment, tools, and appliances.

You must:
• Inspect all electrical equipment your employees use to make sure the equipment is safe.

WAC 296-800-28005.

Make sure all electrical equipment is used for its approved or listed purpose.

WAC 296-800-28010.

Make sure electrical equipment located in wet or damp locations is designed for such use.

WAC 296-800-28015.

Make sure electrical equipment that is not marked by the manufacturer cannot be used.

WAC 296-800-28020.

Identify disconnecting means.

WAC 296-800-28022.
Maintain electrical fittings, boxes, cabinets, and outlets in good condition.  
WAC 296-800-28025.
Maintain all flexible cords and cables in good condition and use safely.  
WAC 296-800-28030.
Guard electrical equipment to prevent your employees from electrical hazards.  
WAC 296-800-28035.
Make sure electrical equipment is effectively grounded.  
WAC 296-800-28040.
Make sure electrical equipment has overcurrent protection.  
WAC 296-800-28045.

Exemptions:

- These rules apply to all electrical equipment used in the workplace, except for:
  - Electrical installations and equipment on ships, aircraft and all automotive vehicles other than mobile homes and recreational vehicles.
  - Electrical installations and equipment used to generate, transmit, transform or distribute power exclusively for operation of rolling stock.
  - Electrical installations used exclusively for signaling and communicating with rolling stock.
  - Installations underground in mines.
  - Installations of communication equipment located outdoors or inside buildings used and controlled exclusively by communication utilities.
  - Installations controlled and used exclusively by electric utilities for communication or metering, or for generating, controlling, transforming, transmitting and distributing electric energy in buildings used exclusively by the company located:
    ✦ Outdoors on property owned or leased by the utility; or
    ✦ Outdoors on property controlled by the utility; or
    ✦ Outdoors by established rights on private property.

Note:

- The introduction has important information about fire, building and electrical codes that may apply to you in addition to WISHA rules. See "How do the WISHA rules relate to fire, building and electrical codes" in the introduction section of this book.
- These rules guide how electrical equipment is used and maintained in your workplace. They should not be used in place of your local electrical codes if you are installing electrical wiring, electrical circuits or electrical distribution equipment.
- This rule applies to 600 volts or less. Requirements for specific equipment or special installation are found in chapter 296-24 WAC, Part L.

WAC 296-800-28005 Inspect all electrical equipment your employees use to make sure the equipment is safe.  
You must:

- Inspect electrical equipment to make sure there are no recognized hazards likely to cause your employees' death or serious physical harm. Determine the safety of the equipment by using the following list:
  - Has been approved or listed by a recognized testing laboratory, such as Underwriters Laboratories (UL) or other approving agency.
  - Is approved, or listed as approved, for the purpose it is being used.
  - Has strong and durable guards providing adequate protection including parts designed to enclose and protect other equipment.
  - Is insulated.
  - Will not overheat under conditions of use.
  - Will not produce arcs during normal use.
  - Is classified by:
    ✦ Type
    ✦ Size
    ✦ Voltage
    ✦ Current capacity
    ✦ Specific use
    ✦ Other factors

WAC 296-800-28010 Make sure all electrical equipment is used for its approved or listed purpose.  
Definitions:

- Electrical outlets are places on an electric circuit where power is supplied to equipment through receptacles, sockets and outlets for attachment plugs.
- Receptacles are outlets that accept a plug to supply electric power to equipment through a cord or cable.

You must:

- Make sure electrical outlets are rated equal or greater to the electrical load supplied.
- Make sure the proper mating configuration exists when connecting the attachment plug to a receptacle.
- Make sure when electrical outlets, cord connectors, and receptacles are joined, they accept the attachment plug with the same voltage or current rating.

<table>
<thead>
<tr>
<th>SOME COMMON ELECTRICAL OUTLET (RECEPTACLE) CONFIGURATIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>15 Ampere</strong></td>
</tr>
<tr>
<td>Two Pole</td>
</tr>
<tr>
<td>Three Pole</td>
</tr>
</tbody>
</table>

Note: A 20-ampere "T-sold" outlet or cord connector may accept a 15-ampere attachment plug of the same voltage rating.

[Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050. 01-23-060, § 296-800-28005, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-28010, filed 5/9/01, effective 9/1/01.]

[Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050. 01-23-060, § 296-800-28005, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-28010, filed 5/9/01, effective 9/1/01.]

[296-800-28005]
296-800-28015  Make sure electrical equipment used or located in wet or damp locations is designed for such use. You must:

- Make sure fixtures and receptacles located in wet or damp locations are approved for such use. They must be constructed or installed so that water cannot enter or accumulate in wireways, lampholders, or other electrical parts.

- Make sure cabinets, fittings, boxes, and other enclosures in wet or damp locations are installed to prevent moisture or water from entering and accumulating inside.

- In wet locations these enclosures must be weatherproof.

- Switches, circuit breakers, and switchboards located in wet locations must be in weatherproof enclosures.

296-800-28020  Make sure electrical equipment that is not marked is not used. You must:

- Make sure markings are durable and appropriate to the environment.

- Appropriate markings include:
  - The manufacturer's name;
  or
  - Trademark;
  or
  - The organization responsible for the product;
  and
  - Voltage, current and wattage or other ratings as necessary.

296-800-28022  Identify disconnecting means. You must:

- Make sure the disconnect means (such as on/off switches and circuit breakers) is marked to show when it is open and closed and what equipment it controls, unless located and arranged so the purpose is obvious.
• Make sure each service, feeder and branch circuit is marked, at its disconnecting means or overcurrent device, to show when the circuit is open and closed and what circuit it controls, unless located and arranged so the purpose is obvious.
• Make sure markings are durable and appropriate to the environment.

WAC 296-800-28025 Maintain electrical fittings, boxes, cabinets and outlets in good condition. You must:

(1) Do the following to covers and openings:
• Do the following when conductors enter boxes, cabinets, or fittings:
  – Protect the conductor (wires) from abrasion.
  – Effectively close the openings where conductors enter.
  – Effectively close all unused openings.
• Provide pull boxes, junction boxes, and fittings with covers approved for the purpose.

(2) Make sure the area in front of electrical panels, circuit breaker boxes and similar equipment which operates at 600 volts or less:
• Has sufficient working area at least thirty inches wide for operation and maintenance of the equipment.
• Is kept clear and free of stored materials so that employees can access this equipment for servicing, adjustments or maintenance.
• Has at least one access route to provide free and unobstructed access.
• Has at least three feet of working space in front, measured from the exposed live parts or the enclosure front. (See the work clearance table on the following page.)
• Has adequate indoor lighting.

WAC 296-800-210.
• Has at least six feet three inches of headroom.

This table shows the area you must keep clear depending on the layout of the electrical equipment.

<table>
<thead>
<tr>
<th>Conditions</th>
<th>0 - 150 volts to ground</th>
<th>151 - 600 volts to ground</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>3 ft.</td>
<td>3 ft.</td>
</tr>
<tr>
<td>b</td>
<td>3 ft.</td>
<td>3 1/2 ft.</td>
</tr>
<tr>
<td>c</td>
<td>3 ft.</td>
<td>4 ft.</td>
</tr>
</tbody>
</table>

Minimum clear distances may be 2 feet 6 inches for equipment built or installed before 3/20/82.

Conditions a, b, and c are as follows:

- a = Exposed live parts on one side and no live or grounded parts on the other side of the working space, or exposed live parts on both sides effectively guarded by suitable wood or other insulating material. Insulated wire or insulated bus bars operating at not over 300 volts are not considered live parts.
- b = Exposed live parts on one side and grounded parts on the other side.
- c = Exposed live parts on both sides of the workspace (not guarded as provided in condition (a) with the operator between the panels).

Distances are measured from live parts if they are exposed or from the enclosure front if live parts are enclosed.
WAC 296-800-28030 Maintain all flexible cords and cables in good condition and use safely.

Exemption: These rules do not apply to cords and cables that are an internal part of factory assembled appliances and equipment, like the windings on motors or wiring inside electrical panels.

Note: Flexible cords and cables are typically used to connect electrical equipment to a power source. These cords can have an electrical plug to connect to a power source or can be permanently wired into the power source. The terms flexible cords, extension cord, cables and electrical cords all refer to a type of flexible cord.

You must:
(1) Perform visual inspections.
  • On portable cord- and plug-connected equipment and extension cords before use on each work shift. Defects and damage to look for include:
    – Loose parts.
    – Deformed or missing pins.
    – External defects and damage.
    – Damage to the outer covering or insulation.
    – Pinched or crushed covering or insulation that might indicate internal damage.

Exemption: You do not need to visually inspect portable cord- and plug-connected equipment and extension cords that stay connected once in place and are not exposed to damage until they are moved.

You must:
• Remove from service any defective or damaged cord until repaired and tested.
• Make sure flexible cords and cables are used as described.
(2) Use.
  • Use flexible cords only as follows:
    – Wiring of equipment and appliances.
    – Data processing cables approved as a part of the data processing system.
    – Pendants.
    – Wiring for fixtures.
    – Connecting portable lamps or appliances to an approved outlet with an attachment plug.
    – Connecting stationary equipment that is frequently changed with an attachment plug energized from an approved outlet.
    – Elevator cables.
    – Wiring of cranes and hoists.

Common Acceptable Uses of Flexible Cords

Note: Extension cords (flexible cord sets) may be used on a temporary basis if you follow the rules described in the temporary use section, WAC 296-800-28030(3).

You must:
• Not use flexible cords in the following ways:
  – As a substitute for fixed wiring of a structure.
  – To run through holes in walls, ceilings, or floors.
  – To run through doorways, windows, or similar openings.
  – To attach to building surfaces.
  – To conceal behind building walls, ceilings, or floors.
  – To raise or lower equipment.
• Make sure flexible cords and cables are approved and suitable for:
  – The way they will be used.
  – The location where they will be used.

• Not fasten or hang cords and equipment in any way that could cause damage to the outer jacket or insulation of the cord.
• Make sure insulation on flexible cords and cables is intact.
• Make sure flexible cords and electrical cords are:
  – Connected to devices and fittings so that any pulling force on the cord is prevented from being directly transmitted to joints or terminal screws on the plug.
  – Used only in continuous lengths without splice or tap.
• Prohibit your employees from using wet hands to plug or unplug equipment or extension cords if the equipment is energized.

Note: Hard service flexible cords No. 12 or larger may be repaired or spliced if the insulation, outer sheath properties, and use characteristics of the cord are retained.

You must:
(3) Provide the following for temporary use.
• Make sure temporary electrical power and lighting installations that operate at 600 volts or less are used only:
  – During and for remodeling, maintenance, repair or demolition of buildings and similar activities.
  – Experimental or developmental work.
  – For no more than ninety days for:
    ✦ Christmas decorative lighting.
    ✦ Carnivals.
    ✦ Other similar purposes.
• Make sure flexible cords and electrical cords used on a temporary basis are protected from accidental damage:
  – By avoiding sharp corners and projections
  – If they pass through doorways or other pinchpoints.

WAC 296-800-28035 Guard electrical equipment to prevent your employees from electrical hazards. You must:
(1) Guard live parts of electric equipment operating at 50 volts or more against accidental contact by any of the following means:
  • By approved cabinets or other forms of approved enclosures.
  • By location in a room, vault, or similar enclosure that is accessible only to employees qualified to work on the equipment. Entrances to rooms and other guarded locations containing exposed live parts must be marked with conspicuous warning signs forbidding unqualified persons to enter.
  • By permanent, substantial partitions or screens so that only employees qualified to work on the equipment will have access within reach of the live parts. Any openings must prevent accidental contact with live parts by employees or objects employees carry.
  • By location on a balcony, gallery, or platform that will exclude unqualified persons.
  • By being located eight feet or more above the floor or other working surface.
(2) Make sure all electrical appliances, fixtures, lampholders, lamps, rosettes, and receptacles do not have live parts normally exposed to employee contact.
  – Rosettes and cleat type lampholders at least 8 feet above the ground may have exposed parts.
(3) In locations where electric equipment would be exposed to physical damage, enclosures or guards must be so arranged and of such strength as to prevent such damage.

Live Parts Guarded by Distance

WAC 296-800-28040 Make sure electrical equipment is effectively grounded. You must:
• Make sure the path to ground from circuits, equipment, and enclosures is permanent and continuous.
• Make sure equipment connected by cord and plug is grounded under these conditions:
  – Equipment with exposed noncurrent carrying metal parts.
  – Cord and plug connected equipment which may become energized.
  – Equipment that operates at over 150 volts to ground.
  – Equipment in hazardous locations. (WAC 296-24-95613)

Exemption: This does not apply to guarded motors and metal frames of electrically heated appliances, if the appliance frames are permanently and effectively insulated from ground.

You must:
• Ground the following type of equipment:
  – Hand-held motor-operated tools
  – Refrigerators
  – Freezers
  – Air conditioners
  – Clothes washers and dryers
  – Dishwashers
  – Electrical aquarium equipment
  – Hedge clippers
  – Electric lawn mowers
  – Electric snow blowers
You must:
- Make sure exposed metal parts of fixed equipment that do not conduct electricity, but may become energized, are grounded if the equipment is in a wet or damp location and is not isolated.
- Make sure ground wires are identified and look different than the other conductors (wires).

• Make sure grounded conductors are not attached to any terminal or lead to reverse polarity of the electrical outlet or receptacle. See illustration - Examples of wiring.
• Make sure grounding terminals or grounding-type devices on receptacles, cords, connectors, or attachments plugs are not used for purposes other than grounding.

**EXAMPLES OF WIRING**

**CORRECT WIRING**
WAC 296-800-28045  Make sure electrical equipment has overcurrent protection. You must:

- Make sure all electrical circuits that are rated at 600 volts or less have overcurrent protection.
- Protect conductors and equipment according to their ability to safely conduct electrical current.
- Make sure overcurrent devices do not interrupt the continuity of grounded conductors unless all conductors are opened at the same time, except for motor running overload protection.
  - Protect employees from electrical arcing or suddenly moving electrical parts by locating fuses and circuit breakers in safe places. If this is not possible, install shields on fuses and circuit breakers.
- Make sure the following fuses and thermo cutouts have disconnecting mechanisms:
  - All cartridge fuses accessible to nonqualified persons
  - All fuses on circuits over 150 volts to ground
  - All thermal cutouts on circuits over 150 volts to ground
  - The disconnecting mechanisms must be installed so you can disconnect the fuses or thermal cutouts without disrupting service to equipment and circuits unrelated to those protected by the overcurrent device.
- Provide easy access to overcurrent devices for each employee or authorized building management personnel.
- Protect the overcurrent devices by locating them away from easily ignitable material.
  - They must be placed to avoid exposure to physical damage.
- Make sure circuit breakers:
  - Clearly indicate when they are open (off) and closed (on)
  - That operate vertically are installed so the handle is in the "up" position when the breaker is closed (on). See WAC 296-24-95603 (2)(c) for more information
  - Used as switches in 120-volt, fluorescent lighting circuit must be approved for that purpose and marked "SWD." See WAC 296-24-95603 (2)(c) for more information
  - That have arcing or suddenly moving parts, are shielded or located so employees will not get burned or injured by the operation of the circuit breaker.
- Make sure fuses that have arcing or suddenly moving parts, are shielded or located so employees will not get burned or injured by the operation of the fuses.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-16-047, § 296-800-28040, filed 8/1/02, effective 10/1/02; 01-11-038, § 296-800-28040, filed 5/9/01, effective 9/1/01.]

[Title 296 WAC—p. 2782]
PORTABLE LADDERS: METAL AND WOODEN

WAC 296-800-290 Summary. Your responsibility: To make sure the portable ladders in your workplace are used safely and kept in good condition.

Portable metal ladders.
You must:
Inspect your portable metal ladders periodically. WAC 296-800-29005.
Make sure your portable metal ladders are kept in good condition. WAC 296-800-29010.
Use your portable metal ladders safely. WAC 296-800-29015.

Portable wooden ladders.
You must:
Inspect your portable wooden ladders frequently. WAC 296-800-29020.
Make sure your portable wooden ladders are kept in a good condition. WAC 296-800-29025.
Use your portable wooden ladders safely and for their intended purpose. WAC 296-800-29030.
Safely use a portable wooden ladder when working more than 25 feet above ground. WAC 296-800-29035.
Use wooden stepladders safely. WAC 296-800-29040.

Exemption: These rules apply to common types of portable wooden ladders except:
• Fruit picker ladders
• Industrial tripod ladders
• Combination step and extension ladders
• Stockroom step ladders
• Aisle way step ladders
• Shelf ladders
• Library ladders
• Other special ladders

Note: For design and construction requirements for wood and metal ladders, see WAC 296-24-780 and 296-24-795 of the General safety and health standard.

WAC 296-800-29005 Inspect your portable metal ladders periodically. You must:
• Immediately inspect a ladder if it:
  – Tips over.
  – Is exposed to oil or grease.
  – Is exposed to excessive heat as in the case of fire.
  – Is subjected to certain acids or alkali solutions.
• If it tips over, look at:
  – The rails for dents, bends or dented rungs.
  – All the rungs to side rail connections.
  – The hardware connections.
  – Rivets for shear damage.
• Inspect the cables and ropes on portable metal ladders and replace them if they are defective
• Check hardware fittings and accessories frequently and keep them in good condition
• Mark defective ladders and take them out of service until repaired by a maintenance department or the manufacturer.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-29005, filed 5/9/01, effective 9/1/01.]

WAC 296-800-29010 Make sure your portable metal ladders are kept in good condition. You must:
• Maintain your portable metal ladders in good, usable condition, at all times.
• Handle portable metal ladders with care and avoid dropping, jarring, or misusing them.
• Store your portable metal ladders on racks designed to protect them when not in use. The racks must have enough supporting points to prevent any possibility of excessive sagging.
• Properly support your ladder while transporting on vehicles. To prevent chafing and the effects of road shock, use supports that are made of material softer than the metal ladder, such as hardwood or rubber-covered iron pipe.
  Note: Tying the ladder to each support point will greatly reduce damage due to road shock.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-29010, filed 5/9/01, effective 9/1/01.]

WAC 296-800-29015 Use your portable metal ladders safely. You must:
(1) Use metal ladders only for their intended purpose.
(2) Make sure the base section of the portable metal ladder has secure footing.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-290, filed 5/9/01, effective 9/1/01.]

(2005 Ed.) [Title 296 WAC—p. 2783]
Examples of Securing the Ladder Base

(3) Make sure both rails are supported at the top, unless the ladder has a single support attachment.

Examples of Securing the Ladder at the Top

(4) Make sure while climbing portable metal ladders, your employees:
   • Have both hands free to hold on to the ladder.
   • Face the ladder when you are climbing up or down.
(5) Not tie or fasten ladder sections together to make longer ladders (unless the ladder manufacturer endorses this type of use, and you have hardware fittings specifically designed for this use).
(6) Make sure a nonself-supporting portable ladder is set at a safe angle. The proper angle is to place the base a distance from the vertical wall equal to one-fourth the working length of the ladder.

Note: Safe ladder angle. A simple rule for setting up a ladder at the proper angle is to place the base a distance from the wall, equal to 1/4 the working length of the ladder.

PORTABLE WOODEN LADDERS

WAC 296-800-29020 Inspect your portable wooden ladders frequently. You must:
   • Make sure ladders with defects are:
     – Withdrawn from service to be repaired or destroyed
     – Tagged as "dangerous do not use."

WAC 296-800-29025 Make sure your portable wooden ladders are kept in a good condition. You must:
   • Make sure your portable wooden ladders are maintained in good condition, and:
     – Joints between the steps or rungs and side rails are tight
Safety and Health Core Rules

WAC 296-800-29030 Use your portable wooden ladders safely and for their intended purpose. You must:

1. Use the appropriate length of ladder. 
   - Use single ladders less than or equal to 30 feet long.
   - Use 2-section extension ladders less than or equal to 60 feet long.

2. Make sure ladders meet the following rules:
   - Shorter sections cannot be spliced to make longer sections.
   - Ladders cannot be made by fastening cleats across a single rail.
   - Use ladders safely.
   - Make sure ladders are not used as guys, braces, or skids.
   - Putting ladders on boxes, barrels or other unstable bases to make the ladder taller is not allowed.
   - Make sure ladders are not used in a horizontal position.
   - Make sure that rung and cleat ladders are set up at a safe angle. (See note and illustration on safe ladder angle in WAC 296-800-29015.)

3. Make sure that where the top of the ladder rests is reasonably rigid and strong enough to support the load.

4. Place the bottom of a portable wooden ladder so it will not slip, or the bottom must be tied or held in position.

5. Not place a portable wooden ladder in front of doors that open towards the ladder, UNLESS YOU:
   - Block the door open, or
   - Lock the door, or
   - Guard the door to keep it from opening into the ladder

6. Make sure 2-section extension ladders overlap as follows:

<table>
<thead>
<tr>
<th>Length of section of extension ladders (feet)</th>
<th>Minimum overlap allowed (feet)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 36</td>
<td>3</td>
</tr>
<tr>
<td>37-48</td>
<td>4</td>
</tr>
<tr>
<td>49-60</td>
<td>5</td>
</tr>
</tbody>
</table>

7. Make sure ladders with metal reinforced rails are used with the reinforcement on the underside to avoid hazards such as tripping and electrocution.

(2005 Ed.)

(10) Not place ladders in elevator shafts and hoistways, except where used by workers assigned to that type of work. 
   - Employees must be protected from falling objects, when assigned to work on ladders in elevator shafts and hoistways.

(11) Not support more than one section of plank per ladder rung.
   - Do not allow more than 2 persons on one section of planking at a time.

(12) Brace the ladder to reduce the spring caused by weight on the ladder.

(13) Keep shoes free and clean of greasy and slippery substances when climbing.

(14) Have both hands free to hold on to the ladder when climbing.

WAC 296-800-29035 Safely use a portable wooden ladder when working more than 25 feet above ground. You must:

1. Secure the ladder at the top and bottom.

2. Not perform work that requires the use of both hands unless wearing a safety belt and lanyard secured to the ladder.

3. Not perform work requiring eye protection, respirators and/or pressure equipment if thirty feet above the ground.

PORTABLE FIRE EXTINGUISHERS

WAC 296-800-300 Summary—Portable fire extinguishers. Important:

The following WISHA rule applies to the placement, use, maintenance, and testing of portable fire extinguishers provided for the use of employees. Your local fire marshal also enforces fire codes which address fire safety that are more comprehensive and may go beyond WISHA rules.

Your responsibility: To provide readily accessible, appropriate portable fire extinguishers for employees in your workplace

You must:

Provide portable fire extinguishers in your workplace

WAC 296-800-30005

Select and distribute portable fire extinguishers in your workplace

WAC 296-800-30010
Make sure that portable fire extinguishers are kept fully charged, in good operating condition, and left in their designated places.

WAC 296-800-30015
Inspect and test all portable fire extinguishers
WAC 296-800-30020
Train your employees to use portable fire extinguishers
WAC 296-800-30025
Exemptions:
• You are exempt from the requirements of portable fire extinguishers if you have the following:
  – A written fire safety policy that requires the immediate and total evacuation of employees from the workplace when there is a fire alarm signal,
  AND
  – An emergency action plan and a fire prevention plan which meet the requirements of WAC 296-24-567
  AND
  – Portable fire extinguishers in your workplace that are not accessible for employee use
    • If another WISHA rule requires portable fire extinguishers, then you must comply with these requirements.
    • Where extinguishers are provided but are not intended for employee use and you have an emergency action plan and a fire prevention plan (which meet the requirements of WAC 296-24-567), then only the requirements of WAC 296-800-30020 apply.

Note: The introduction has important information about building, electrical and fire codes that may apply to you in addition to WISHA rules. See "How do the WISHA rules relate to building, fire and electrical codes" in the introduction section of this book.

WAC 296-800-30005 Provide portable fire extinguishers in your workplace. You must:
(1) Provide approved portable fire extinguishers for your workplace and distribute them so they are readily accessible
  • Make sure that your portable fire extinguisher does not use extinguishing agents such as carbon tetrachloride or chlorobromomethane extinguishing agents. In addition, soda-acid foam, loaded stream, antifreeze and water extinguishers of the inverting type shall not be recharged or placed into service.
  (2) Mount, locate, and identify portable fire extinguishers so employees can easily reach them, without being subjected to possible injury.

WAC 296-800-30010 Select and distribute portable fire extinguishers in your workplace. Exemption:
• This does not apply to the portable fire extinguishers provided for employees to use outside of workplace buildings or structures.
• You are exempt from the distribution requirements of this rule if you have an emergency action plan (that meets requirements of WAC 296-24-567):
  – Which designates certain employees to be the only employees authorized to use the available portable fire extinguishers; and
  – Requires all other employees in the fire area to immediately evacuate the affected work area upon the sounding of the fire alarm
You must:
• Provide the correct type of portable fire extinguishers and distribute them in your workplace, depending on the type, size, and severity of fire that could occur
• The type of portable fire extinguishers you must have in your workplace depends on the types of fire hazards that exist in your workplace

<table>
<thead>
<tr>
<th>Fire Extinguisher Distance Table</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type of fire hazard extinguisher</td>
</tr>
<tr>
<td>Type of fire hazard Wood, cloth, paper, rubber (Class A fire hazards)</td>
</tr>
<tr>
<td>Liquids, grease, gases (Class B fire hazards)</td>
</tr>
<tr>
<td>Live electrical equipment and circuits (Class C fire hazards)</td>
</tr>
<tr>
<td>Powder, flakes, and residue from combustible metals, like magnesium and titanium, that build up over a 2-week period (Class D fire hazards)</td>
</tr>
</tbody>
</table>

WAC 296-800-30015 Make sure that portable fire extinguishers are kept fully charged, in operable condition, and left in their designated places. You must:
• Make sure that fire extinguishers found with deficiencies are removed from service and replaced with a suitable fire extinguisher.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-300, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-300, filed 5/9/01, effective 9/1/01.]
WAC 296-800-30020 Inspect and test all portable fire extinguishers. You must:
- Perform inspections:
  - Make sure that portable fire extinguishers or hose systems (used instead of fire extinguishers) are visually inspected monthly
- Perform maintenance checks:
  - Make sure that all portable fire extinguishers are subjected to an annual maintenance check
  - Keep records of all annual maintenance checks and make available to the department upon request
  - For 1 year after the last maintenance check;
  - For the life of the shell, whichever is less
  - Make sure that equal protection is provided when portable fire extinguishers are removed from service for maintenance and recharging
Exemption: Most stored pressure extinguishers do not require an internal examination. Examples of those that do require an internal examination are those containing a loaded stream agent.
You must:
- Perform hydrostatic testing:
Exemption:
- Dry chemical extinguishers that have nonrefillable disposable containers are exempt from this requirement.
- Manually pressurized pumptanks are exempt from this requirement.
You must:
- Make sure that portable extinguishers are hydrostatically tested:
  - At the intervals listed in Table 1, of this section
  - Whenever they show evidence of corrosion or mechanical injury
- Not perform hydrostatic testing on fire extinguishers if:
  - The unit has been repaired by soldering, welding, brazing, or use of patching compounds
  - The cylinder or shell threads are damaged
  - Corrosion has caused pitting, including corrosion under removable name plate assemblies
  - The extinguisher has been burned in a fire
  - Calcium chloride extinguishing agents have been used in a stainless steel shell
Note: Specific rules regarding conducting hydrostatic tests are covered in WAC 296-24-59212.
You must:
- Maintain records showing that hydrostatic testing has been performed. Provide the following evidence to the department upon request:
  - Date of test
  - Test pressure used
  - The serial number, or other identifier of the fire extinguisher that was tested
  - Person or agency performing the test
- Keep records until:
  - The extinguisher is retested;
  - The extinguisher is taken out of service, whichever comes first

WAC 296-800-30025 Train your employees to use portable fire extinguishers. You must:
- Train your employees where you have provided portable fire extinguisher for their use in:
  - The hazards involved with incipient stage fire fighting (the early stage of a fire when it can be extinguished by a portable fire extinguisher)
  - The general principles of fire extinguisher use
- Provide the training when they are first hired and then annually.

Hydrostatic Test Table

<table>

</table>

Note: Due to a manufacturer's recall, stored pressure water extinguishers with fiberglass shell (pre-1976) are prohibited from hydrostatic testing.

WAC 296-800-31005 Exit routes and employee alarm systems
Make sure that each exit route leads outside.

WAC 296-800-31020.

Provide unobstructed access to exit routes.

WAC 296-800-31025.

Exit doors must be readily opened from the inside.

WAC 296-800-31030.

Use side-hinged doors to connect rooms to exit routes.

WAC 296-800-31035.

Provide outdoor exit routes that meet requirements.

WAC 296-800-31040.

Minimize danger to employees while they are using emergency exit routes.

WAC 296-800-31045.

Mark exits adequately.

WAC 296-800-31050.

Provide adequate lighting for exit routes and signs.

WAC 296-800-31053.

Maintain the fire retardant properties of paints or other coatings.

WAC 296-800-31055.

Maintain emergency safeguards.

WAC 296-800-31060.

Maintain exit routes during construction and repair.

WAC 296-800-31065.

Provide doors in freezer or refrigerated rooms that open from the inside.

WAC 296-800-31067.

Employee alarm systems:
You must:
Install and maintain an appropriate employee alarm system.

WAC 296-800-31070.

Establish procedures for sounding emergency alarms.

WAC 296-800-31075.

Test the employee alarm system.

WAC 296-800-31080.

Exemption: This rule does not apply to vehicles, vessels, or other mobile structures.

Note: The introduction has important information about building, electrical and fire codes that may apply to you in addition to WISHA rules. See "How do the WISHA rules relate to building, fire, and electrical codes" in the introduction section of this book.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-310, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-310, filed 5/9/01, effective 9/1/01.]

EXIT ROUTES

WAC 296-800-31005 Provide an adequate number of exit routes. You must:
- Provide a minimum of two exit routes to provide different ways for employees to leave the workplace safely during an emergency (at least two of the exit routes must be remote from one another so employees can safely exit if one exit route becomes blocked or unavailable).
- Provide an adequate number (at least two) of exit routes, considering the kind, number, location and capacity, appropriate to each building according to the following conditions:
  - Number of employees
  - Size of building

WAC 296-800-31010 Make sure that exit routes are large enough. You must:
- Make sure each exit route is large enough to accommodate the maximum-permitted occupant load for each floor served by the route.
- Make sure the capacity of an exit route does not decrease at any point.
- Make sure an exit route is at least 6 feet 8 inches high at all points.
- Make sure objects that stick out into the exit route, such as fans hanging from the ceilings or cabinets on walls, do not reduce the minimum height and width of the exit route.
- Make sure exit routes are at least 28 inches wide at all points between any handrails.
- If necessary, routes must be wider than 28 inches to accommodate the expected occupant load.

WAC 296-800-31015 Make sure that exit routes meet their specific design and construction requirements. You must:
- Make sure each exit is a permanent part of the workplace.
- Make sure an exit route has only those openings necessary to permit access to, or exit from, occupied areas of the workplace.
- Make sure any opening into an exit through a fire wall is protected by a self-closing fire door that remains closed.
- Make sure each fire door, its frame, and its hardware is listed or approved by a nationally recognized testing laboratory.
- Make sure construction materials, used to separate an exit route, have at least:
  - One-hour fire resistance rating if the exit connects three stories or less.
  - Two-hour fire resistance rating if the exit connects four stories or more.
- Make sure employees are provided with stairs or a ramp, if the exit route is not substantially level.

WAC 296-800-31020 Make sure that each exit route leads outside. You must:
- Make sure that building exit routes lead:
  - Directly outside or to a street, walkway; or to an open space with access to the outside.
– To streets, walkways, or open spaces large enough to accommodate all building occupants likely to use the exit.
– Make sure the exit routes clearly show the route employees use to leave the building in an emergency.
– Install a standard safeguard with a warning sign, if a door or corner of a building could allow an employee to walk in front of an engine or trolley.
– Use doors, partitions, or other effective means to show employees the correct route out of the building, if the stairs in your exit route lead anywhere but out of the building.

Note: If the stairs in your exit route lead past the exit to the basement, you might install a gate at the point they lead toward that basement. The gate could help your employees stay on the exit route taking them out of the building.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-31025, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31025 Provide unobstructed access to exit routes. You must:
(1) Provide exit routes that are always free of obstructions so all employees can safely exit the building during an emergency.
(2) Make sure employees are not required to travel to a dead end or through a room that can be locked, such as a restroom.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-31025, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31030 Exit doors must be readily opened from the inside.

Exemption: An exit door may be locked or blocked from the inside in a mental, penal, or correctional institution, if supervisory personnel are continuously on duty and a plan exists to remove employees and inmates during an emergency.

You must:
– Make sure all exit doors readily open from the inside without keys, tools, or special knowledge. A device that locks only from the outside, such as a panic bar, is permitted. An exit door must be free of any device or alarm that could restrict emergency use of an exit if the device or alarm fails.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-31030, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31035 Use side-hinged doors to connect rooms to exit routes. You must:
– Use a side-hinged exit door to connect any room to an exit route. The door must swing out when the room:
   – Is occupied by more than fifty persons or
   – Contains highly flammable or explosive materials.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-31035, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-31035, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31040 Provide outdoor exit routes that meet these requirements. You must:
– Make sure an outdoor exit route (such as an interior balcony, porch, gallery, or roof) meets all requirements for an indoor exit route. In addition, an outdoor exit route must also:
   – Have guardrails to protect unenclosed sides.
   – Be covered if snow or ice is likely to accumulate without regular removal.

– Be reasonably straight with smooth, solid, substantially level floors.
– Have no dead ends more than twenty feet long that branch off of the exit route.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-31040, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31045 Minimize danger to employees while they are using emergency exit routes. You must:
– Maintain each exit route to minimize danger to employees during an emergency.
– Keep each exit route free of explosive or highly flammable furnishings and decorations.
– Not require employees to travel toward areas where high hazard materials are stored, unless the route is protected by partitions or physical barriers. High hazard materials are materials that:
   – Burn quickly
   – Emit poisonous fumes when burned
   – Are explosive

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-31045, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31050 Mark exits adequately. You must:
– Mark each exit with a clearly visible, distinctive sign reading “exit.”
   – Make sure the letters in the word “EXIT” are at least six inches high and 3/4 inch wide.
   – Mark any doorway or passage that might be mistaken for an exit with “not an exit” or with an indication of its actual use.
– Make sure exit signs are a distinctive color.
– Make sure signs are posted and arranged along exit routes to adequately show how to get to the nearest exit and clearly indicate the direction of travel.
– Not obstruct or conceal exit signs in any way.
– Keep exit doors free of signs or decorations that obscure their visibility.

[Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050, 49.17.060. 03-18-090, § 296-800-31050, filed 9/2/03, effective 11/1/03. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-31050, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31053 Provide adequate lighting for exit routes and signs. You must:
– Illuminate each exit route adequately and reliably.
– Have at least five foot-candles illumination from a reliable light source.
– Make sure any exit signs illuminated by artificial lights and made of translucent material (other than internally illuminated types)
   – Have screens, discs or lens of at least twenty-five square inches in size; and
   – Show red or other designated color on the approach side of the exit.
– Make sure brightly lit signs, displays, or objects in or near the line of vision do not distract attention from the exit sign.
– Make sure exit signs that are self-lighting have a minimum luminance surface value of .06 footlamberts.

[Title 296 WAC—p. 2789]
WAC 296-800-31055 Maintain the fire retardant properties of paints or other coatings. You must:
- Maintain any paints or other coatings with fire retardant properties so they retain their fire retardant properties.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-31055, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31060 Maintain emergency safeguards. You must:
- Maintain each safeguard in proper working order to protect employees during an emergency. Emergency safeguards include items such as:
  - Sprinkler systems.
  - Alarm systems.
  - Fire doors.
  - Exit lighting.
- Make sure that flammable or explosive materials used during construction or repair do not expose employees to additional hazards or prevent emergency escape.
- Make sure that employees do not occupy an existing workplace unless:
  - All exits and existing fire protection are maintained; or
  - Alternate fire protection is provided that ensures an equivalent level of safety.
- Make sure that walk-in refrigerators or freezer rooms have doors with opening devices allowing them to be opened from the inside even when they are locked from the outside.
- Make sure that walk-in refrigerators or freezer rooms have doors with openings that allow employees to safely escape from the workplace, the immediate work area, or both.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-31060, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31065 Maintain exit routes during construction and repair. You must:
- Have enough exit routes that comply with these rules before letting your employees occupy a workplace under new construction.
- Make sure that employees do not occupy an existing workplace unless:
  - All exits and existing fire protection are maintained; or
  - Alternate fire protection is provided that ensures an equivalent level of safety.
- Make sure that flammable or explosive materials used during construction or repair do not expose employees to additional hazards or prevent emergency escape.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-31065, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31067 Provide doors in freezer or refrigerated rooms that open from the inside. You must:
- Make sure that walk-in refrigerators or freezer rooms have doors with opening devices allowing them to be opened from the inside even when they are locked from the outside.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-31067, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31070 Install and maintain an appropriate employee alarm system.
Exemptions:
- If you have ten or fewer employees in a particular workplace, you can use direct voice communication to sound the alarm, if all employees can hear it. For this kind of workplace, you do not need a back-up system.
- In workplaces where employees would not otherwise be able to recognize audible or visible alarms, you can use tactile devices to alert them.

You must:
- Make sure that a working employee alarm system with a distinctive signal to warn employees of fire or other emergencies is installed and maintained, unless employees can see or smell a fire or other hazard.
- Make sure that the following systems meet the requirements of this rule, if you use them as your employee alarm system:
  - Supervisory alarms
  - Discharge alarms
  - Detection systems required on fire suppression systems
  - Detection systems required on fixed extinguishing systems
- Make sure that your employee alarm systems are:
  - Providing enough warning to allow employees to safely escape from the workplace, the immediate work area, or both.
  - Noticeable above surrounding noise or light levels by all employees in the affected portions of the workplace.
  - Distinctive and recognizable as a signal, to evacuate the work area.
  - Restored to working order as soon as possible, after each test or alarm.
  - Supervised, if installed after July 1, 1982, and if it has that capacity.
  - Able to alert assigned personnel whenever a malfunction exists in the system.
  - Adequately warning employees of emergencies.
  - Serviced, maintained, and tested by a person trained in the alarm system's design and functions to keep the system operating reliably and safely.
  - In working order, except when undergoing repairs or maintenance.
  - Warning employees of fire or other emergencies with a distinctive signal, if they are not able to see or smell a fire or other hazard.
  - Manual actuation devices that, if provided, are unobstructed, easy to find, and readily accessible.
  - Using alarm devices, components, combinations of devices, or systems with approved construction and installation. This applies to steam whistles, air horns, strobe lights, or similar lighting devices, as well as tactile devices.
  - Supplied with spare alarm devices available to restore the system promptly if a component breaks, is worn, or destroyed.
  - Kept in full operating condition by maintaining and replacing power supplies as often as necessary.
  - Supplied with a back-up means of alarm, such as employee runners or telephones, when regular systems are out of service.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-31070, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31075 Establish procedures for sounding emergency alarms. You must:
- Explain to each employee how to sound the alert for emergencies. Methods of reporting emergencies can include:
  - Manual pull box alarms.
  - Public address systems.
  - Radio.
  - Telephones.
- Post emergency numbers near telephones, employee notice boards, or other conspicuous locations, if you use telephones to report emergencies.
• Require that all emergency messages have priority over all nonemergency messages if the communication system also serves as an employee alarm system.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-11-038, § 296-800-31075, filed 5/9/01, effective 9/1/01.]

WAC 296-800-31080 Test the employee alarm system. You must:
• Test the reliability and adequacy of your employee alarm system every two months.
  – Use a different activation device in each test of a multiautomation device system, so the entire alarm system gets tested.
• Make sure that supervised (monitored) employee alarm systems are tested at least once a year for reliability and adequacy.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-31080, filed 5/9/01, effective 9/1/01.]

ACCIDENT REPORTING AND INVESTIGATING

WAC 296-800-320 Summary. Your responsibility:
To report and conduct an investigation of certain types of accidents.

You must:
Report the death, or probable death, of any employee, or the in-patient hospitalization of 2 or more employees within 8 hours
WAC 296-800-32005
Make sure that any equipment involved in an accident is not moved.
WAC 296-800-32010
Assign people to assist the department of labor and industries
WAC 296-800-32015
Conduct a preliminary investigation for all serious injuries.
WAC 296-800-32020
Document the investigation findings
WAC 296-800-32025

Note: Call the nearest office of the department of labor and industries at 1-800-4BE SAFE or call Occupational Safety and Health Administration (OSHA) at 1-800-321-6742, to report the death, probable death of any employee or the in-patient hospitalization of 2 or more employees within 8 hours, after handling medical emergencies.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-11-060, § 296-800-320, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-3205, filed 5/9/01, effective 9/1/01.]

WAC 296-800-32005 Report the death, probable death of any employee, or the in-patient hospitalization of 2 or more employees within 8 hours. You must:
• Contact the nearest office of the department of labor and industries in person or by phone at 1-800-4BE SAFE to report within 8 hours of the work-related incident or accident,
  – A death
  – A probable death
  – 2 or more employees are admitted to the hospital, or
  – Contact the Occupational Safety and Health Administration (OSHA) by calling its central number at 1-800-321-6742.

(2005 Ed.)

• Provide the following information within 30 days concerning any accident involving a fatality or hospitalization of 2 or more employees:
  – Name of the work place
  – Location of the incident
  – Time and date of the incident
  – Number of fatalities or hospitalized employees
  – Contact person
  – Phone number
  – Brief description of the incident

Note: If you do not learn about the incident at the time it occurs, you must report the incident within 8 hours of the time it was reported to you, your agent, or employee.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-23-060, § 296-800-32205, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-32005, filed 5/9/01, effective 9/1/01.]

WAC 296-800-32010 Make sure that any equipment involved in an accident is not moved. You must:
• Not move equipment involved in a work or work related accident or incident if any of the following results:
  – A death
  – A probable death
  – 2 or more employees are sent to the hospital
• Not move the equipment until a representative of the department of labor and industries investigates the incident unless:
  – Moving the equipment is necessary to:
    ♦ Remove any victims
    ♦ Prevent further incidents and injuries

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-11-038, § 296-800-32010, filed 5/9/01, effective 9/1/01.]

WAC 296-800-32015 Assign people to assist the department of labor and industries. You must:
• Assign witnesses and other employees to assist department of labor and industries personnel who arrive at the scene to investigate the incident involving:
  – A death
  – Probable death
  – 2 or more employees are sent to the hospital.
Include:
  – The immediate supervisor
  – Employees who were witnesses to the incident
  – Other employees the investigator feels are necessary to complete the investigation

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-11-038, § 296-800-32015, filed 5/9/01, effective 9/1/01.]

WAC 296-800-32020 Conduct a preliminary investigation for all serious injuries. You must:
• Make sure your preliminary investigation is conducted to evaluate the facts relating to the cause of the incident by the following people:
  – A person designated by the employer
  – The immediate supervisor of the injured employee
  – Witnesses
  – An employee representative, such as a shop steward or other person chosen by the employees to represent them
  – Any other person who has the experience and skills.
• If the employee representative is the business agent of the employee bargaining unit and is unavailable to participate without delaying the investigation group, you may proceed, by using one of the following:
  – The shop steward
  – An employee representative member of your safety committee
  – A person selected by all employees to represent them

Note: A preliminary investigation includes noting information such as the following:
  – Where did the accident or incident occur?
  – What time did it occur?
  – What people were present?
  – What was the employee doing at the time of the accident or incident?
  – What happened during the accident or incident?

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-32025, filed 5/9/01, effective 9/1/01.]

WAC 296-800-32025 Document the preliminary investigation findings. You must:
• Document the preliminary investigation findings for use at any formal investigation.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-16-047, § 296-800-32025, filed 8/1/02, effective 10/1/02; 01-11-038, § 296-800-32025, filed 5/9/01, effective 9/1/01.]

WAC 296-800-330 Releasing accident investigation reports. The department must:
• Keep accident investigations and related reports confidential.
• Not freely release results of accident investigations and related reports that are confidential.
• Make available accident investigation reports, without the need of a court order, only to the following:
  – Injured workers, their legal representatives, or their labor organization representatives.
  – The legal representative or labor organization representative of a deceased worker.
  – The employer of any injured or deceased worker.
  – Any other employer or person whose actions or business operations are the subject of the report or investigation.
  – Any attorney representing a party in any pending legal action in which an investigative report constitutes material and relevant evidence.
  – Employees of governmental agencies in the performance of their official duties.
  – Any beneficiary of a deceased worker actually receiving benefits under the terms of Title 51 RCW, the Industrial Insurance Act.

Note: The records officer may provide accident investigation reports to the closest surviving member of the deceased worker's immediate family.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-330, filed 5/9/01, effective 9/1/01.]

WAC 296-800-340 Protecting the identity of the source of confidential information. The department must:
• Not reveal the source of information when a promise has been made to keep the identity of the source confidential.
• Not disclose information that would reveal the source's identity, whenever a department file contains an investigative report or information from a source under a promise of confidentiality.
  – The contents of an investigative report may be withheld only to the extent necessary to conceal the identity of the source.
  – When information is withheld, the records officer must give a general characterization of the information withheld, but must not reveal the identity of the information's source.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-340, filed 5/9/01, effective 9/1/01.]

WISHA APPEALS, PENALTIES AND OTHER PROCEDURAL RULES

WAC 296-800-350 Introduction.
This section describes actions WISHA takes during or after inspections, and your related obligation and rights.

Your responsibility: You must follow posting requirements and notify your employees of the information listed in these rules, as indicated.

You must:

WISHA INSPECTIONS AND CITATIONS

WAC 296-800-35002 Types of workplace inspections.
- WISHA conducts the following types of inspections:
  - Programmed inspections of hazardous workplaces. WISHA identifies hazardous workplaces using objective criteria and inspection-scheduling systems that may look at any of the following factors:
    - Type of industry
    - Available data of injuries and illnesses where an inspection might eliminate the hazards causing them
    - Employer’s industrial insurance experience
    - Number, type, and toxicity of contaminants in the workplace
    - Degree of exposure to hazards
    - Number of employees exposed
    - Other factors, such as history of employee complaints
  - Routine programmed inspections in the following high hazard industries:
    - Agriculture
    - Asbestos renovation and demolition
    - Construction
    - Electrical utilities and communications
    - Logging
    - Maritime
  - Unprogrammed inspections of workplaces that may be in violation of WISHA safety or health rules or chapter 49.17 RCW, the Washington Industrial Safety and Health Act. Unprogrammed inspections may result because of:
    - Complaints from employees, former employees, or employee representatives who believe they have been exposed to a hazard because of a violation
    - Referrals from anyone who reasonably believes that workers under WISHA jurisdiction are being or have been exposed to a hazard because of a violation
  - Workplace deaths and serious injuries or illnesses investigations to determine if they were caused by a violation of safety and health rules or chapter 49.17 RCW, the Washington Industrial Safety and Health Act. WISHA may also initiate comprehensive inspections based on such investigations
    - In imminent danger of serious injury or death inspections when there is a reason to believe that employees may be in imminent danger of serious injury or death
Title 296 WAC: Labor and Industries, Department of

WAC 296-800-35004 Scheduling inspections.
• WISHA distributes staff performing inspections as efficiently as possible to ensure maximum protection for workers.
[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-35004, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35006 Inspection techniques.
• During an inspection, WISHA staff may:
  – Take samples, photographs, videotapes, or audiotapes
  – Conduct tests
  – Ask employees to wear sampling devices
  – Conduct interviews
  – Privately question, on or off the worksite, any:
    ✦ Employer
    ✦ Employer representative
    ✦ Owner
    ✦ Operator
    ✦ Employee
    ✦ Employee representative
  – Employ any other reasonable investigative techniques
[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-35006, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-35012, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-35004, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35008 Response to complaints submitted by employees or their representatives.
• When an employee or their representative has filed a complaint, WISHA will:
  – Remove the name of the person submitting the complaint and the names of any employees identified in the complaint before giving a copy of the complaint to an employer, unless the person filing the complaint gives WISHA written permission to release the names involved
  – Give a copy of the citation and notice to the employee (or their representative) who submitted the complaint, or explain to them why an inspection was not conducted
  – Review any department decision refusing to inspect or cite violations alleged in a complaint, if requested in writing
  – Notify the person in writing of the review results. If the person requesting the review is not satisfied with the results, they may request a second review by the department
[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-35008, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35010 Citations mailed after an inspection.
• After an inspection or an investigation, WISHA will mail a citation to you within 6 months following the inspection or investigation
  – The citation will include
    – A description of any violations found
    – The amount and type of assessed penalties
    – The length of time given to correct the violations
  – Follow-up inspections at later dates to verify that you have corrected any hazards identified in a citation
[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-35002, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35012 Employees (or their representatives) can request a citation and notice.
• Employees or their representatives may request copies of citation and notices issued to the employer
  – Complete the Request for Copy of Citation and Notice form, and mail it to:
    DEPARTMENT OF LABOR AND INDUSTRIES

    P.O. BOX 44638
    OLYMPIA WA 98504-4638
[Note: To obtain a copy of the Request for Copy of Citation and Notice form, call 360-902-5534, or contact your local labor and industries office (see the resource section for a complete list of the offices.)
  – If you submit this form, you’ll receive all citation and notices issued to that employer for the next 12 months.
  – When the department approves the request for a copy of a citation and notice, WISHA will indicate the date the application is approved, and the date it expires. Once approved, your application is valid for one year. Once expired, a one-year extension may be requested.
  – You can waive the one-year period when you make your initial request.
  – If more than one employee representative requests a copy of the same citation and notice, the department may decide which person will receive the copy of the citation and notice.
  – The department can deny requests for copies of citation and notices if the person filing the request is not an employee representative.
[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-35012, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-35012, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35016 Posting a citation and notice and employee complaint information. You must:
• Immediately notify your employees of a citation and notice by posting them and/or any correspondence related to an employee complaint on the safety bulletin board for 3 working days, or until all violations have been corrected, whichever is longer.
• Use any other appropriate means to notify employees who cannot receive notices posted on the safety bulletin board; for example, a copy to authorized employee representatives or the safety committee, or copies sent electronically.
[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-35016, filed 5/9/01, effective 9/1/01.]

CIVIL PENALTIES FOR VIOLATING WISHA REQUIREMENTS

WAC 296-800-35018 Reasons to assess civil penalties.
(2005 Ed.)
• WISHA may assess civil penalties when a citation and notice is issued for any violation of health and safety rules, or statutes found during an inspection.
  • WISHA will assess civil penalties:
    – When a citation for a serious violation is issued.
    – Under other circumstances specified by statute (such as RCW 49.17.180, 49.26.016, 49.17.177, 49.70.190).
  • Civil penalties promote compliance, encouraging employers to correct violations before an inspection takes place and avoiding the risk of receiving a penalty assessment. Civil penalties help promote a level playing field for employers complying with the rules by assessing penalties for those who do not comply.

[Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050. 01-11-038, § 296-800-35018, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35022 Minimum penalties.
• The minimum penalty amounts assessed by WISHA are:
  – $100 for any penalty
  – $5,000 per violation for all willful violations

[Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050. 01-23-038, § 296-800-35020, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35024 Severity rate determination.
• Severity describes how serious an injury, illness, or disease might be because of a hazardous condition. Severity ratings are based on the most serious injury, illness, or disease that could be reasonably expected to occur because of a hazardous condition (see Table 1).
  • Severity ratings are expressed in whole numbers and range from 1 (lowest) to 6 (highest). A violation with a severity rating of 4, 5, or 6 is considered to be a serious violation.

<table>
<thead>
<tr>
<th>Severity</th>
<th>Most serious injury, illness, or disease likely to result in:</th>
</tr>
</thead>
<tbody>
<tr>
<td>6</td>
<td>Death from injury, illness or disease; injuries involving permanent severe disability; chronic, irreversible illness.</td>
</tr>
<tr>
<td>5</td>
<td>Permanent disability of a limited or less severe nature, injuries or reversible illnesses resulting in hospitalization.</td>
</tr>
</tbody>
</table>

(2005 Ed.)

</tbody>
</table>

WAC 296-800-35028 Determining the gravity of a violation.
• WISHA calculates most base penalties by assigning a weight to a violation. This weight is called "gravity." Gravity is calculated by multiplying a violation's severity by its probability. Expressed as a formula, gravity is:
  \[ \text{Gravity} = \text{Severity} \times \text{Probability} \]
  • Unless a particular rule establishes penalty amounts for specific violations, WISHA uses Table 2 to determine the dollar amount for each base penalty

Table 1: Severity Ratings

<td>5</td>
<td>Permanent disability of a limited or less severe nature, injuries or reversible illnesses resulting in hospitalization.</td>
</tr>
</tbody>
</table>

WAC 296-800-35026 Probability rate determination.
• Probability refers to the likelihood of an injury, illness or disease occurring, and is expressed in whole numbers ranging from 1 (lowest) to 6 (highest). Probability does not change severity.
  • When determining probability, WISHA considers the number of employees affected and other factors, depending on the situation. Other factors may include:
    – Frequency of employee exposure
    – Instances (number of times the same violation occurs in the workplace)
    – How close an employee is to the hazard
    – Weather and other working conditions
    – Employee skill level
    – Employee awareness of the hazard
    – The pace, speed, and nature of the task or work
    – Use of personal protective equipment
    – Amount of exposure (for health violations)
    – Other mitigating or contributing circumstances

[Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050. 01-11-038, § 296-800-35024, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35028 Determining the gravity of a violation.
• WISHA calculates most base penalties by assigning a weight to a violation. This weight is called "gravity." Gravity is calculated by multiplying a violation's severity by its probability. Expressed as a formula, gravity is:
  \[ \text{Gravity} = \text{Severity} \times \text{Probability} \]
  • Unless a particular rule establishes penalty amounts for specific violations, WISHA uses Table 2 to determine the dollar amount for each base penalty

[Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050. 01-23-060, § 296-800-35026, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-35026, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35030 Base penalty adjustments.

- WISHA may adjust an employer's base penalty amount because of the good faith effort, size, and compliance history. No adjustments are made to penalty amounts specified by statute.

WAC 296-800-35032 Types of base penalty adjustments. Employer's Good Faith

- An employer's good faith effort (or lack of) may justify increasing or decreasing a base penalty. No single factor determines good faith. Good faith is a reflection of an employer's:
  - Effort before an inspection to provide a safe and healthful workplace for employees
  - Effort to comply with a standard they have violated
  - Cooperation during an inspection that is measured by a desire to comply with the cited standard and immediately correct identified hazards
- WISHA uses Table 3 to adjust base penalty amounts because of good faith effort

Table 3: Good Faith Adjustments

<table>
<thead>

WAC 296-800-35038 Minimum and maximum adjusted base penalty amounts.

- The maximum penalty for a violation other than repeat, willful, egregious or failure-to-abate is $7,000.
- The minimum adjusted base penalty for any violation carrying a penalty is $100.00.

WAC 296-800-35040 Reasons for increasing civil penalty amounts.

- WISHA may increase civil penalties by applying a multiplier to an adjusted base penalty. Multipliers may be applied for the following reasons:
  
  **Repeat violations:**
  - A violation is a repeat violation if the employer has been cited one or more times previously for a substantially similar hazard.
  - WISHA cites such violations if the final order for the previous citation was dated no more than three years prior to the employer committing the violation being cited.
  - The adjusted base penalty will be multiplied by the total number of citations with violations involving similar hazards, including the current inspection.
  - The maximum penalty cannot exceed $70,000 for each violation.

  **Willful violations:**
  - A willful violation is a voluntary action done either with an intentional disregard of, or plain indifference to, the requirements of the applicable WISHA rule(s):
    - For all willful violations, the adjusted base penalty will be multiplied by 10
    - All willful violations will receive at least the statutory minimum penalty of $5,000
    - The maximum penalty cannot exceed $70,000 for each violation
For example: When management is aware that employees are resistant to following specific WAC rule(s); employee resistance results in imminent danger situation or a serious violation; and management fails to make efforts that are effective in practice to overcome the resistance, then WISHA will presume that the failure constitutes voluntary action.

Egregious violations:
An egregious violation may be issued for exceptionally flagrant cases involving willful violations. In these cases, WISHA will issue a separate penalty for each instance of an employer failing to comply with a particular rule.

Failure-to-abate violations:
A failure-to-abate violation occurs when an employer who has been cited for a WISHA violation, fails to correct the violation on time (certifying corrected violations is covered in WAC 296-800-35042 through 296-800-35052)

- Based on the facts at the time of reinspection, WISHA will:
  - Multiply the adjusted base penalty by a factor of at least 5, but up to 10, based on the employer's effort to comply
  - Multiply the adjusted base penalty by the number of calendar days past the correction date.
- The maximum penalty cannot exceed $7,000 per day for every day the violation is not corrected.

CERTIFY THAT VIOLATIONS HAVE BEEN ABATED

WAC 296-800-35042 Employers must certify that violations have been abated. You must:
- Certify within 10 calendar days following the correction date that you have abated each violation, unless the compliance officer indicates in your citation and notice that you have corrected the violations. Include the following:
  - Your name and address
  - The inspection number your written statement applies to
  - The citation and item numbers your written statement applies to
  - The date and method you used to abate each violation
  - That you informed your affected employees and their representatives that each violation was corrected
  - That the information you submitted is accurate
  - Your signature or the signature of your authorized representative

WAC 296-800-35044 For willful, repeated, or serious violations, submit additional documentation. You must:
- Submit additional documentation for each willful or repeated violation supporting that abatement is completed. This documentation may include, but is not limited to:
  - Evidence of the purchase, or repair, of equipment
  - Photographic or video evidence of corrections
  - Other written records
  - Submit additional documentation for a serious violation, when required by the citation and notice.

WAC 296-800-35046 Submitting correction action plans. You must:
- Submit a correction action plan within 25 calendar days from the final order date if the Citation and Notice requires it.
- Your plan must:
  - Identify the violation
  - List the steps you will take to correct the violation
  - Include a schedule to complete the steps
  - Describe how employees will be protected until the corrections are completed

Note: The department will notify you in writing if there is anything inadequate about your plan and will work out the problems.
- When determining if required documents are submitted on time, the department looks at the postmark date for documents sent by standard mail and the date received by other means, such as personal delivery or fax.

WAC 296-800-35048 Submit progress reports to the department when required. You must:
- Submit progress reports on the abatement if the citation and notice requires it and briefly state (a single sentence is normally adequate for each violation):
  - The action taken to abate each violation
  - The date each action was taken

Note: If progress reports are required, the citation and notice will include:
- The items for which periodic progress reports are required.
- The date when an initial progress report must be submitted (no sooner than 30 calendar days after you submit a correction plan),
- Whether additional progress reports are required.
- The date(s) on which additional progress reports must be submitted.

WAC 296-800-35049 WISHA determines the date by which abatement documents must be submitted.
- When determining if required documents are submitted on time, the department looks at:
  - Date of postmark for documents sent by mail
  - Date the department receives the documents, if transmitted by a means other than mail

WAC 296-800-35050 Inform affected employees and their representatives of abatement actions you have taken. You must:
- Post a copy of each abatement action document you submit to the department (or a summary) near the place where the violations occurred, if practical.

(2005 Ed.)
Do the following if posting near the violation site is not practical, such as with a mobile work operation:
  - Post each document (or a summary) in a location that is readily accessible by affected employees and their representatives
  - Take other steps to fully communicate abatement actions to affected employees and their representatives
  - Make sure that:
    - Notice is given to your employees and their representatives on or before the date you submit abatement information to the department
    - All abatement documents remain posted for at least 3 working days after they are submitted to the department
    - All posted abatement documents are not altered, defaced, or covered by other materials
  - Inform employees and their representatives of their right to examine and copy all abatement documents you submit to the department. If they ask to examine or copy your documents within 3 working days of receiving notice that you submitted them to the department, you have 5 days to comply with their request after receiving it.

WAC 296-800-35052 Tag cited moveable equipment to warn employees of a hazard.
You must:
  - Tag cited moveable equipment to warn employees of a hazard if it has not been abated.
    - Attach a warning tag or a copy of the citation to the equipment's operating controls or to the cited component:
    - For hand-held equipment, tag it immediately after you receive a citation
    - For other equipment, tag it before moving it within the worksite or between worksites
  - The tag should properly warn employees about the nature of the violation and tell them where the citation is posted (see the Helpful Tools Section for a sample tag that can be used to meet this requirement)
  - Make sure that the tag or copy of the citation attached to moveable equipment is not altered, defaced, or covered by other materials
  - Make sure that the tag or copy of the citation attached to moveable equipment remains attached until:
    - You have abated the violation and submitted all abatement certification documents required by the department
    - You have permanently removed the cited equipment from service
    - You no longer have control over the cited equipment
    - A final order sets aside the violation

REQUESTING MORE TIME TO COMPLY

WAC 296-800-35056 You can request more time to comply.
  - You can request more time to comply if you:
    - Have made a good faith effort to comply with a citation's abatement requirements
    - Have not completed your abatement because of factors beyond your control
    - Requests for more time must:
      - Be submitted in writing by you or your representative, and include:
        - The name of your business
        - The address of the workplace(s)
        - Identification of the citation and the abatement date(s) you want extended
        - The new abatement date and length of abatement period you are seeking
        - A description of the actions you have taken to comply with the abatement date(s) in the citation
        - Identification of the factors beyond your control that are preventing you from complying with the abatement date(s)
        - The means you will use to protect your employees during the time you are abating the violation.
    - Be received before midnight of the date you are asking to be extended
      - The department may accept late requests if they are:
        - Received within 5 days following the applicable correction date.
        - Accompanied by your written statement explaining the exceptional circumstances that caused the delay.
        - The assistant director may respond to a request received by telephone or personal conversation if the request is timely.
        - The department accepts requests by:
          - First class mail postage prepaid. Mailed to:
            Department of Labor and Industries
            WISHA Appeals
            P.O. Box 44604
            Olympia, WA 98504-4604
          - Personal delivery
          - Fax: (360) 902-5581
      - The department does not accept late requests when compliance activity related to the abatement starts before the request is received.

Note: Chapter 296-155 WAC, Safety Standards for Construction Work has information on warning tags. You can use warning tags that meet the requirements in those rules instead of the warning tags required by this rule.

WAC 296-800-35062 WISHA’s response to your request for more time.
  - Before making a decision, WISHA may conduct an investigation. Once made, the decision remains in effect unless a hearing is requested by the employee or employee representative.
  - Unless you receive a response from the department granting your request for more time, the original abatement date will remain in effect.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060, 04-18-080, § 296-800-35052, filed 8/31/04, effective 11/1/04. Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050, 01-11-038, § 296-800-35052, filed 5/9/01, effective 9/1/01.]

[Title 296 WAC—p. 2798]
WAC 296-800-35063 Post the department's response. You must:

• Post notices with the citation for which you are requesting additional abatement time immediately upon receipt. The notices must remain posted until:
  – The abatement date has passed or
  – A hearing notice is posted.

WAC 296-800-35064 A hearing can be requested about the department's response.

• The affected employees or their authorized representative may request a hearing if they disagree with the department's response to a request for more time to comply.
• All hearing requests must be sent or delivered to the assistant director and be received no later than 10 calendar days after the issue date of the notice.
• Upon receiving a hearing request, the assistant director will issue a notice of hearing to the requesting party and the employer at least 20 days before the hearing date. The hearing notice will:
  – state that all interested parties can participate in the hearing
  – set the time and date, including:
    ♦ The time, place, and nature of the proceeding
    ♦ The legal authority and jurisdiction under which the hearing will be held
    ♦ A reference to the particular sections of the statute and rules involved, and
    ♦ A short and clear explanation why a hearing was requested.
• The employer must post the department's hearing notice or a complete copy until the hearing is held. This includes the:
  – Citation containing the correction date for which more time was requested.

WAC 296-800-35065 Post the department's hearing notice. You must:

• Post the department's hearing notice or a complete copy until the hearing is held. This includes the:
  – Citation containing the correction date for which more time was requested
  – Department notices issued in response to the employer's request for more time

Note: Although the department may grant more time to correct hazards at its discretion, an employee can appeal if an extension is granted.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-35064, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-35062, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35066 Hearing procedures.

• The assistant director for WISHA services will appoint someone from the department to act as a hearings officer.
• The hearings officer must be present at, and conduct, the hearing. An assistant attorney general may be present to give legal advice to the hearings officer.
• If the hearings officer requests, the assistant attorney general may conduct the hearing.
• The hearings officer may discuss the material to be presented to determine how the hearing will proceed.
• The hearing must be conducted according to the Administrative Procedure Act. Copies of hearing transcripts will be available to the parties, at cost, upon request.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-35066, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-35062, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35072 Post the hearing decision.

• After the hearing, the assistant director will issue an order:
  – Affirming or modifying the correction date that caused the hearing
  AND
  – Complying with the provisions of the Administrative Procedure Act, chapter 34.05 RCW and the Practice and Procedure Rules, chapter 296-08 WAC.
• You must:
  – Post a complete, unedited copy of this decision, along with the citation to which it applies, as soon as it is received.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-35072, filed 5/9/01, effective 9/1/01.]

REQUESTING AN APPEAL OF WISHA CITATIONS AND CORRECTIVE NOTICES

WAC 296-800-35076 Employers and employees can request an appeal of a citation and notice.

EMPLOYER REQUESTS

• Any employer cited for a violation of WISHA safety and health rules may appeal a citation or corrective notice.
• Your request must include:
  – Business name, address, telephone number; and the name, address and telephone number of any person representing you.
  – Citation number.
  – What you think is wrong with the citation or corrective notice and any related facts.
  – What you think should be changed, and why.

EMPLOYEE REQUESTS

• Any employee or employee representative who could be affected by a citation or its correction may appeal the abatement date in the citation or corrective notice.
• Your request must include:
  – Your name, address, telephone number, and the name, address and telephone number of any person representing you.
  – Citation number.
  – What you think is wrong with the abatement date

SUBMITTING APPEAL REQUESTS
• All appeal requests must be in writing and submitted to the department within 15 working days after receiving the citation corrective notice. If you mail your request, the postmark is considered the submission date.

• All requests must be:
  – Mailed to:
    Department of Labor and Industries
    WISHA Appeals
    P.O. Box 44604
    Olympia, WA 98504-4604
  or
  – Faxed to: (360) 902-5581
  or
  – Brought to any department service location.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-047, § 296-800-35076, filed 8/1/02, effective 10/1/02; 01-11-038, § 296-800-35078 Title 296 WAC: Labor and Industries, Department of]

WAC 296-800-35078 Await the department's response to your appeal request.

• When an appeal request is received, the department decides whether to reassume jurisdiction over the citation and notice being appealed or forward the appeal to the Board of Industrial Insurance Appeals. The department will notify the person who submitted the appeal when the department reprises jurisdiction.

Definition: Reassume jurisdiction means that the department has decided to hear the appeal.

• The department may reassume jurisdiction to:
  – Provide an employer and affected employees an opportunity to present relevant information, facts, and opinions during an informal conference
  – Give an employer, affected employees and the department an opportunity to resolve appeals rapidly and without further contest, especially in routine compliance cases
  – Educate employers about the citation and notice, the WISHA appeals process, and WISHA compliance
  – Review citations, penalties, and correction dates for fairness and accuracy to ensure quality work by the department

• If the department does not reassume jurisdiction, it will send the appeal to the Board of Industrial Insurance Appeals. The board will send the person submitting the appeal a notice with the time and location of any board proceedings.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-35076, filed 8/1/02; 01-11-038, § 296-800-35076, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35080 Department actions when reassuming jurisdiction over an appeal.

• The department has 30 working days after receipt of the appeal to review it, gather more information and decide whether to make changes to the citation and notice. The 30 working days begin with the first working day after the appeal is received. For example, if an appeal is received on Friday, the 30 days will begin on the following Monday unless it is a state holiday.

• The department may extend the appeal review period up to an additional 15 working days if everyone involved agrees to the extension.

• During the review period, the department will hold an informal conference about the appeal.

• An informal conference is not an evidentiary hearing. It is an opportunity for interested parties to briefly explain their positions and provide any additional information they would like the department to consider when reviewing the citation and notice.

• Although informal, the conference is an official conference and the department may record all or part of it. The department will tell participants when the conference will be recorded.

• After the review period, the department will issue a corrective notice reflecting any changes made to the citation and notice. This notice will be sent to the employer and any employee representatives participating in the appeal process.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-35080, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35082 Appealing a corrective notice.

• Anyone who can appeal a citation and notice may appeal a corrective notice. All corrective notice appeals must be submitted within 15 working days after the notice was received.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-11-038, § 296-800-35082, filed 5/9/01, effective 9/1/01.]

WAC 296-800-35084 Notify employees. You must:

• Immediately post all correspondence from the department in a conspicuous place after submitting an appeal. This correspondence includes:
  – The notice of appeal
  – The notice explaining that the department reassumed jurisdiction over the citation and notice
  – Any extensions to the review period
  – The notice for an informal conference
  – Corrective notices
  – Post all notices and information related to the appeal in the place where WISHA citations and notices are posted (see WAC 296-800-35050). These include:
    – A notice of appeal until the appeal is resolved
    – Notices about the department reassuming jurisdiction and any extension of the review period until the end of review period
    – A notice of an informal conference until after the conference is held
    – Corrective notices for as long as citations and notices must be posted
  – Requesting alternate means of compliance with WISHA rules.

Note: If you wish to develop an alternate means of compliance with WISHA rules, you may do so by following the instructions in WAC 296-350-700, Variances from WISHA rules.

• In certain circumstances, the department allows an employer to vary from a specific WISHA safety and health standard if the employer uses department-approved substitute measures to protect employees. The substitute measure must provide at least the same protection from workplace hazards as provided by the WISHA standard.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 01-23-060, § 296-800-35084, filed 11/20/01, effective 12/1/01; 01-11-038, § 296-800-35084, filed 5/9/01, effective 9/1/01.]
USING STANDARDS FROM NATIONAL ORGANIZATIONS AND FEDERAL AGENCIES

WAC 296-800-360 Rule. Your responsibility: To use the safety and health standards from national organizations and federal agencies, when directed to by WISHA rules.
[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-11-038, § 296-800-360, filed 5/9/01, effective 9/1/01.]

WAC 296-800-36005 Comply with standards of national organizations or of federal agencies when referenced in WISHA rules. You must:

- Use the following to be in compliance with WISHA rules:
  - The edition of the standard specified in the WISHA rule or
  - Any edition published after the edition specified in the WISHA rule.

Note: The specific standards referenced in the WISHA rules are available:
- For review at your local department of labor and industries office.
- See http://www.wa.gov/lni/pa/direct.htm
- Through the local library system
- Through the issuing organization.
[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 01-11-038, § 296-800-36005, filed 5/9/01, effective 9/1/01.]

WAC 296-800-370 Definitions.

Abatement Action Plans
Refers to your written plans for correcting a WISHA violation.

Abatement date
The date on the citation when you must comply with specific safety and health standards listed on the citation and notice of assessment or the corrective notice of redetermination.

Acceptable
As used in Electrical, WAC 296-800-280 means an installation or equipment is acceptable to the director of labor and industries, and approved:
- If it is accepted, or certified, or listed, or labeled, or otherwise determined to be safe by a nationally recognized testing laboratory; or
- With respect to an installation or equipment of a kind which no nationally recognized testing laboratory accepts, certifies, lists, labels, or determines to be safe, if it is inspected or tested by another federal agency, or by a state, municipal, or other local authority responsible for enforcing occupational safety provisions of the National Electrical Code, and found in compliance with the provisions of the National Electrical Code as applied in this section;

OR
- With respect to custom-made equipment or related installations which are designed, fabricated for, and intended for use by a particular customer, if it is determined to be safe for its intended use by its manufacturer on the basis of test data which the employer keeps and makes available for inspection to the director and his/her authorized representatives. Refer to federal regulation 29 CFR 1910.7 for definition of nationally recognized testing laboratory.

Accepted
As used in Electrical, WAC 296-800-280 means an installation is accepted if it has been inspected and found by a nationally recognized testing laboratory to conform to specified plans or to procedures of applicable codes.

Access
As used in material safety data sheets (MSDSs) as Exposure Records, WAC 296-800-180 means the right and opportunity to examine and copy exposure records.

Affected employees
As used in WISHA appeals, penalties and other procedural rules, WAC 296-800-350 means employees exposed to hazards identified as violations in a citation.

Analysis using exposure or medical records
- An analysis using exposure records or medical records can be any collection of data or a statistical study. It can be based on either:
  - Partial or complete information from individual employee exposure or medical records or
  - Information collected from health insurance claims records
- The analysis is not final until it has been:
  - Reported to the employer or
  - Completed by the person responsible for the analysis

ANSI
This is an acronym for the American National Standards Institute.

Approved means:
- Approved by the director of the department of labor and industries or their authorized representative, or by an organization that is specifically named in a rule, such as Underwriters’ Laboratories (UL), Mine Safety and Health Administration (MSHA), or the National Institute for Occupational Safety and Health (NIOSH).
- As used in Electrical, WAC 296-800-280 means acceptable to the authority enforcing this section. The authority enforcing this section is the director of labor and industries. The definition of acceptable indicates what is acceptable to the director and therefore approved.

Assistant director
The assistant director for the WISHA services division at the department of labor and industries or his/her designated representative.

ASTM
This is an acronym for American Society for Testing and Materials.

Attachment plug or plug
As used in the basic electrical rules, WAC 296-800-280 means the attachment at the end of a flexible cord or cable that is part of a piece of electrical equipment. When it is inserted into an outlet or receptacle, it connects the conductors supplying electrical power from the outlet to the flexible cord.

Bare conductor
A conductor that does not have any covering or insulation.

Bathroom
A room maintained within or on the premises of any place of employment, containing toilets that flush for use by employees.

Biological agents
Organisms or their by-products.

Board
As used in WISHA appeals, penalties and other procedural rules, WAC 296-800-350 means the board of industrial insurance appeals.

Ceiling
An exposure limit that must not be exceeded during any part of the employee's workday. The ceiling must be determined over the shortest time period feasible and should not exceed fifteen minutes.

Certification
As used in WISHA appeals, penalties and other procedural rules, WAC 296-800-350 means refers to an employer's written statement describing when and how a citation violation was corrected.

CFR
This is an acronym for Code of Federal Regulations.

Chemical
Any element, chemical compound, or mixture of elements and/or compounds.

Chemical agents (airborne or contact)
A chemical agent is any of the following:
- Airborne chemical agent which is any of the following:
  - Dust - solid particles suspended in air, that are created by actions such as:
    - Handling.
    - Drilling.
    - Crushing.
    - Grinding.
    - Rapid impact.
    - Detonation.
  - Fume - solid particles suspended in air, that are created by condensation from the gaseous state.
  - Gas - a normally formless fluid, such as air, which can be changed to the liquid or solid state by the effect of increased pressure or decreased temperature or both.
  - Mist - liquid droplets suspended in air. Mist is created by:
    - Condensation from the gaseous to the liquid state;
    - OR
    - Converting a liquid into a dispersed state with actions such as splashing, foaming, spraying or atomizing.
  - Vapor - the gaseous form of a substance that is normally in the solid or liquid state.
  - Contact chemical agent which is any of the following:
    - Corrosive - a substance that, upon contact, causes destruction of living tissue by chemical action, including acids with a pH of 2.5 or below or caustics with a pH of 11.0 or above.
    - Irritant - a substance that will induce a local inflammatory reaction upon immediate, prolonged, or repeated contact with normal living tissue.
    - Toxicant - a substance that has the inherent capacity to produce personal injury or illness to individuals by absorption through any body surface.

Chemical manufacturer
An employer with a workplace where one or more chemicals are produced for use or distribution.

Chemical name
The scientific designation of a chemical in accordance with one of the following:
- The nomenclature system developed by the International Union of Pure and Applied Chemistry (IUPAC)
- The Chemical Abstracts Service (CAS) rules of nomenclature
- A name which will clearly identify the chemical for the purpose of conducting a hazard evaluation.

Circuit breaker
- Is a device used to manually open or close a circuit. This device will also open the circuit automatically and without damage to the breaker when a predetermined overcurrent is applied. (600 volts nominal or less)
  - Is a switching device capable of making, carrying, and breaking currents under normal circuit conditions, and also making, carrying for a specified time, and breaking currents under specified abnormal circuit conditions, such as those of short circuit. (Over 600 volts nominal)

Citation
Refers to the citation and notice issued to an employer for any violation of WISHA safety and health rules. A citation and notice may be referred to as a citation and notice of assessment but is more commonly referred to as a citation.

Combustible liquid
A combustible liquid has a flashpoint of at least 100°F (37.8°C) and below 200°F (93.3°C). Mixtures with at least 99% of their components having flashpoints of 200°F (93.3°C) or higher are not considered combustible liquids.

Commercial account
As used in Employer Chemical Hazard Communication, WAC 296-800-170 means any arrangement in which a retailer sells hazardous chemical(s) to an employer, generally in large quantities over time, and/or at costs that are below the regular retail price.

Common name
As used in Employer Chemical Hazard Communication, WAC 296-800-170 means any designation or identification such as:
- Code name
- Code number
- Trade name
- Brand name
- Generic name used to identify a chemical other than by its chemical name.

Compressed gas
A gas or mixture of gases that, when in a container, has an absolute pressure exceeding:
- 40 psi at 70°F (21.1°C)
- OR
- 104 psi at 130°F (54.4°C) regardless of the pressure at 70°F (21.1°C)

Compressed gas can also mean a liquid with a vapor pressure that exceeds 40 psi at 100°F (37.8°C)

Conductor
A wire that transfers electric power.

Container
As used in Employer Chemical Hazard Communication, WAC 296-800-170 means any container, except for pipes or piping systems, that contains a hazardous chemical. It can be any of the following:
• Bag
• Barrel
• Bottle
• Box
• Can
• Cylinder
• Drum
• Reaction vessel
• Storage tank

**Correction date**
The date by which a violation must be corrected. Final orders or extensions that give additional time to make corrections establish correction dates. A correction date established by an order of the board of industrial insurance appeals remains in effect during any court appeal unless the court suspends the date.

**Corrective notice**
Refers to a notice changing a citation and is issued by the department after a citation has been appealed.

**Corrosive**
A substance that, upon contact, causes destruction of living tissue by chemical action, including acids with a pH of 2.5 or below or caustics with a pH of 11.0 or above.

**Covered conductor**
A conductor that is covered by something else besides electrical insulation.

**Damp location**
As used in basic electrical rules, WAC 296-800-280 means partially protected areas that are exposed to moderate moisture. Outdoor examples include roofed open porches and marquees. Interior examples include basements and barns.

**Department**
Those portions of the department of labor and industries responsible for enforcing the Washington Industrial Safety Act (WISHA).

**Designated representative**
• Any individual or organization to which an employee gives written authorization.
• A recognized or certified collective bargaining agent without regard to written authorization.
• The legal representative of a deceased or legally incapacitated employee.

**Director**
The director means the director of the department of labor and industries or their designee.

**Distributor**
A business, other than a chemical manufacturer or importer, that supplies hazardous chemicals to other distributors or to employers.

**Documentation**
As used in WISHA appeals, penalties and other procedural rules, WAC 296-800-350 means material that you submit to prove that a correction is completed. Documentation includes, but is not limited to, photographs, receipts for materials and/or labor.

**Dry location**
As used in basic electrical rules, WAC 296-800-280 means areas not normally subjected to damp or wet conditions. Dry locations may become temporarily damp or wet, such as when constructing a building.

**Dust**
Solid particles suspended in air that are created by actions such as:
• Handling.
• Drilling.
• Crushing.
• Grinding.
• Rapid impact.
• Detonation.
• Decrepitation of organic or inorganic materials such as rock, ore, metal, coal, wood, and grain.

**Emergency washing facilities**
Emergency washing facilities are emergency showers, eyewashes, eye/face washes, hand-held drench hoses, or other similar units.

**Electrical outlets**
Places on an electric circuit where power is supplied to equipment through receptacles, sockets, and outlets for attachment plugs.

**Employee**
Based on chapter 49.17 RCW, the term employee and other terms of like meaning, unless the context of the provision containing such term indicates otherwise, means an employee of an employer who is employed in the business of his or her employer whether by way of manual labor or otherwise and every person in this state who is engaged in the employment of or who is working under an independent contract the essence of which is personal labor for an employer under this standard whether by way of manual labor or otherwise.

**Employee exposure record**
As used in material safety data sheets (MSDSs) as exposure records, WAC 296-800-180 means a record containing any of the following kinds of information:
• Environmental (workplace) monitoring or measuring of a toxic substance or harmful physical agent, including personal, area, grab, wipe, or other form of sampling, as well as related collection and analytical methodologies, calculations, and other background data relevant to interpretation of the results obtained;
• Biological monitoring results which directly assess the absorption of a toxic substance or harmful physical agent by body systems (e.g., the level of a chemical in the blood, urine, breath, hair, fingernails, etc.) but not including results which assess the biological effect of a substance or agent or which assess an employee’s use of alcohol or drugs;
• Material safety data sheets indicating that the material may pose a hazard to human health;

**OR**
• In the absence of the above, a chemical inventory or any other record which reveals where and when used and the identity (e.g., chemical, common or trade name) of a toxic substance or harmful physical agent.

**Employer**
Based on chapter 49.17 RCW, an employer is any person, firm, corporation, partnership, business trust, legal representative, or other business entity which engages in any business, industry, profession, or activity in this state and employs one or more employees or who contracts with one or more persons, the essence of which is the personal labor of such person or persons and includes the state, counties, cities,
and all municipal corporations, public corporations, political subdivisions of the state, and charitable organizations: Provided, That any persons, partnership, or business entity not having employees, and who is covered by the Industrial Insurance Act must be considered both an employer and an employee.

Exit
Provides a way of travel out of the workplace.

Exit route
A continuous and unobstructed path of exit travel from any point within a workplace to safety outside.

Explosive
A chemical that causes a sudden, almost instant release of pressure, gas, and heat when exposed to a sudden shock, pressure, or high temperature.

Exposed live parts
Electrical parts that are:
• Not suitably guarded, isolated, or insulated
AND
• Capable of being accidentally touched or approached closer than a safe distance.

Exposed wiring methods
Involve working with electrical wires that are attached to surfaces or behind panels designed to allow access to the wires.

Exposure or exposed
As used in employer chemical hazard communication, WAC 296-800-170 and material safety data sheets (MSDSs) as exposure records, WAC 296-800-180. An employee has been, or may have possibly been, subjected to a hazardous chemical, toxic substance or harmful physical agent while working. An employee could have been exposed to hazardous chemicals, toxic substances, or harmful physical agents in any of the following ways:
• Inhalation
• Ingestion
• Skin contact
• Absorption
• Related means.

The terms exposure and exposed only cover workplace exposure involving a toxic substance or harmful physical agent in the workplace different from typical nonoccupational situations in the way it is:
• Used
• Handled
• Stored
• Generated
• Present

Exposure record
See definition for employee exposure record.

Extension ladder
A portable ladder with 2 or more sections and is not self-supporting. The 2 or more sections travel in guides or brackets that let you change the length. The size of a portable ladder is determined by adding together the length of each section.

Failure-to-abate
Any violation(s) resulting from not complying with an abatement date.

Final order
Any of the following (unless an employer or other party files a timely appeal):
• Citation and notice;
• Corrective notice;
• Decision and order from the board of industrial insurance appeals;
• Denial of petition for review from the board of industrial insurance appeals; or
• Decision from a Washington State superior court, court of appeals, or the state supreme court.

Final order date
The date a final order is issued.

First aid
The extent of treatment you would expect from a person trained in basic first aid, using supplies from a first-aid kit.
Tests, such as X rays, must not be confused with treatment.

Flammable
A chemical covered by one of the following categories:
• Aerosol flammable means an aerosol that, when tested by the method described in 16 CFR 1500.45 yields either a flame projection more than 18 inches at full valve opening or a flashback (a flame extending back to the valve) at any degree of valve opening;
• Gas, flammable means:
  – A gas that, at temperature and pressure of the surrounding area, forms a flammable mixture with air at a concentration of 13% by volume or less or
  – A gas that, at temperature and pressure of the surrounding area, forms a range of flammable mixtures with air wider than 12% by volume, regardless of the lower limit.
• Liquid, flammable means any liquid having a flashpoint below 100°F (37.8°C), except any mixture having components with flashpoints of 100°F (37.8°C) or higher, the total of which make up 99% or more of the total volume of the mixture.
• Solid, flammable means a solid, other than a blasting agent or explosive as defined in 29 CFR 1910.109(a), that is likely to cause fire through friction, moisture absorption, spontaneous chemical change, or retained heat from manufacturing or processing, or which can be ignited readily. Solid, inflammable also means that when the substance is ignited, it burns so powerfully and persistently that it creates a serious hazard. A chemical must be considered to be a flammable solid if, when tested by the method described in 16 CFR 1500.44, it ignites and burns with a self-sustained flame at a rate greater than one-tenth of an inch per second along its major axis.

Flashpoint
• The minimum temperature at which a liquid gives off a vapor in sufficient concentration to ignite when tested by any of the following measurement methods:
  – Tagliabue closed tester: (See American National Standard Method of Test for Flash Point by Tag Closed Tester, Z11.24-1979 (ASTM D 56-79)) for liquids with a viscosity of less than 45 Saybolt Universal Seconds (SUS) at 100°F (37.8°C), that do not contain suspended solids and do not have a tendency to form a surface film under test; or
  – Pensky-Martens closed tester: (See American National Standard Method of Test for Flash Point by Pensky-
Martens Closed Tester, Z11.7-1979 (ASTM D 93-79)) for liquids with a viscosity equal to or greater than 45 SUS at 100°F (37.8°C), or that contain suspended solids, or that have a tendency to form a surface film under test; or 
   – Setaflash closed tester: (See American National Standard Method of Test for Flash Point by Setaflash Closed Tester (ASTM D 3278-78)).

Note: Organic peroxides, which undergo auto accelerating thermal decomposition, are excluded from any of the flashpoint measurement methods specified above.

Flexible cords and cables
Typically used to connect electrical equipment to an outlet or receptacle. These cords can have an attachment plug to connect to a power source or can be permanently wired into the power source. Flexible cords, extension cords, cables and electrical cords are all examples of flexible cord.

Floor hole
An opening in any floor, platform, pavement, or yard that measures at least one inch but less than 12 inches at its smallest dimension and through which materials and tools (but not people) can fall.
Examples of floor holes are:
- Belt holes
- Pipe openings
- Slot openings

Floor opening
An opening in any floor, platform, pavement, or yard that measures at least 12 inches in its smallest dimension and through which a person can fall.
Examples of floor openings are:
- Hatchways
- Stair or ladder openings
- Pits
- Large manholes

The following are NOT considered floor openings:
- Openings occupied by elevators
- Dumbwaiters
- Conveyors
- Machinery
- Containers

Foreseeable emergency
As used in Employer Chemical Hazard Communication, WAC 296-800-170 means any potential event that could result in an uncontrolled release of a hazardous chemical into the workplace. Examples of foreseeable emergencies include equipment failure, rupture of containers, or failure of control equipment.

Fume
Solid particles suspended in air that are created by condensation from the gaseous state.

Gas
A normally formless fluid, such as air, which can be changed to the liquid or solid state by the effect of increased pressure or decreased temperature or both.

Ground
As used in Electrical, WAC 296-800-280, a connection between an electrical circuit or equipment and the earth or other conducting body besides the earth. This connection can be intentional or accidental.

Grounded
A connection has been made between an electrical circuit or equipment and the earth or another conducting body besides the earth.

Grounded conductor
A system or circuit conductor that is intentionally grounded.

Ground-fault circuit-interrupter
A device whose function is to interrupt the electric circuit to the load when a fault current to ground exceeds some predetermined value that is less than that required to operate the overcurrent protective device of the supply circuit.

Grounding conductor
Is used to connect equipment or the grounded circuit of a wiring system to a grounding electrode or electrodes.

Grounding conductor, equipment
A conductor used to connect noncurrent-carrying metal parts of equipment, raceways, and other enclosures to the system grounded conductor and/or the grounding electrode conductor at the service equipment or at the source of a separately derived system.

Guarded
Covered, shielded, fenced, enclosed, or otherwise protected by means of suitable covers, casings, barriers, rails, screens, mats, or platforms to remove the likelihood of being accidentally touched or approached closer than a safe distance.

Hand-held drench hoses
Hand-held drench hoses are single-headed emergency washing devices connected to a flexible hose that can be used to irrigate and flush the face or other body parts.

Handrail
A single bar or pipe supported on brackets from a wall or partition to provide a continuous handhold for persons using a stair.

Harmful physical agent
Any physical stress such as noise, vibration, repetitive motion, heat, cold, ionizing and nonionizing radiation, and hypo- or hyperbaric pressure which:
- Is listed in the latest edition of the National Institute for Occupational Safety and Health (NIOSH) Registry of Toxic Effects of Chemical Substances (RTECS); or
- Has shown positive evidence of an acute or chronic health hazard in testing conducted by, or known to, the employer;

OR
- Is the subject of a material safety data sheet kept by or known to the employer showing that the material may pose a hazard to human health.

Hazard
Any condition, potential or inherent, which can cause injury, death, or occupational disease.

Hazard warning
As used in Employer Chemical Hazard Communication, WAC 296-800-170 can be a combination of words, pictures, symbols, or combination appearing on a label or other appropriate form of warning which shows the specific physical and health hazard(s), including target organ effects, of the chemical(s) in the container(s).

Note: See definition for physical hazard and health hazard to determine which hazards must be covered.
Hazardous chemical
Any chemical that is a physical or health hazard.

Health hazard
A chemical, mixture, biological agent, or physical agent that may cause health effects in short- or long-term exposed employees. Based on statistically significant evidence from at least one study conducted using established scientific principles. Health hazards include:
- Carcinogens
- Toxic or highly toxic agents
- Reproductive toxins
- Irritants
- Corrosives
- Sensitizers
- Hepatotoxins (liver toxins)
- Nephrotoxins (kidney toxins)
- Neurotoxins (nervous system toxins)
- Substances that act on the hematopoietic system (blood or blood-forming system)
- Substances that can damage the lungs, skin, eyes, or mucous membranes
- Hot or cold conditions.

Hospitalization
To be sent to, to go to, or be admitted to, a hospital or an equivalent medical facility and receive medical treatment beyond first-aid treatment, regardless of the length of stay in the hospital or medical facility.

Identity
As used in Employer Chemical Hazard Communication, WAC 296-800-170 means any chemical or common name listed on the material safety data sheet (MSDS) for the specific chemical. Each identity used must allow cross-references among the:
- Required list of hazardous chemicals
- Chemical label
- MSDSs

Imminent danger violation
Any violation(s) resulting from conditions or practices in any place of employment, which are such that a danger exists which could reasonably be expected to cause death or serious physical harm, immediately or before such danger can be eliminated through the enforcement procedures otherwise provided by the Washington Industrial Safety and Health Act.

Importer
The first business within the Customs Territory of the USA that:
- Receives hazardous chemicals produced in other countries
  AND
- Supplies them to distributors or employers within the USA

Insulated
A conductor has been completely covered by a material that is recognized as electrical insulation and is thick enough based on:
- The amount of voltage involved
  AND
- The type of covering material

Interim waiver
An order granted by the department allowing an employer to vary from WISHA requirements until the department decides to grant a permanent or temporary waiver.

Irritant
A substance that will induce a local inflammatory reaction upon immediate, prolonged, or repeated contact with normal living tissue.

Ladder
Consists of 2 side rails joined at regular intervals by crosspieces called steps, rungs, or cleats. These steps are used to climb up or down.

Listed
Equipment is listed if it:
- Is listed in a publication by a nationally recognized laboratory (such as UL, underwriters laboratory) that inspects the production of that type of equipment,
  AND
- States the equipment meets nationally recognized standards or has been tested and found safe to use in a specific manner.

Material safety data sheet (MSDS)
Written, printed, or electronic information (on paper, microfiche, or on-screen) that informs manufacturers, distributors, employers or employees about a hazardous chemical, its hazards, and protective measures as required by material safety data sheet and label preparation, chapter 296-839 WAC.

Medical treatment
Treatment provided by a physician or by registered professional personnel under the standing orders of a physician. Medical treatment does not include first-aid treatment even if provided by a physician or registered professional personnel.

Mist
Liquid droplets suspended in air. Mist is created by:
- Condensation from the gaseous to the liquid state;
  OR
- Converting a liquid into a dispersed state with actions such as splashing, foaming, spraying or atomizing.

Mixture
As used in Employer Chemical Hazard Communication, WAC 296-800-170, any combination of 2 or more chemicals (if that combination did not result from a chemical reaction).

Movable equipment
As used in WAC 296-800-35052, a hand-held or non-hand-held machine or device:
- That is powered or nonpowered;
  AND
- Can be moved within or between worksites

Must
Must means mandatory.

NEMA
These initials stand for National Electrical Manufacturing Association.

NFPA
This is an acronym for National Fire Protection Association.

Nose
The portion of the stair tread that projects over the face of the riser below it.
Occupational Safety and Health Administration (OSHA)

Created in 1970 when the U.S. Congress passed the Occupational Safety and Health Act, the Occupational Safety and Health Administration (OSHA) provides safety on the job for workers. OSHA oversees state plans (such as WISHA in Washington) that have elected to administer the safety and health program for their state. OSHA requires WISHA rules to be at least as effective as OSHA rules.

Office work environment

An indoor or enclosed occupied space where clerical work, administration, or business is carried out.

In addition, it includes:

- Other workplace spaces controlled by the employer and used by office workers, such as cafeterias, meeting rooms, and washrooms.
- Office areas of manufacturing and production facilities, not including process areas.
- Office areas of businesses such as food and beverage establishments, agricultural operations, construction, commercial trade, services, etc.

Open riser

A stair step with an air space between treads has an open riser.

Organic peroxide

This is an organic compound containing the bivalent-0-0-structure. It may be considered a structural derivative of hydrogen peroxide if one or both of the hydrogen atoms has been replaced by an organic radical.

Outlet

See definition for electrical outlets.

Oxidizer

A chemical other than a blasting agent or explosive as defined in WAC 296-52-60130 or CFR 1910.109(a), that starts or promotes combustion in other materials, causing fire either of itself or through the release of oxygen or other gases.

Permissible exposure limits (PELs)

Permissible exposure limits (PELs) are employee exposures to toxic substances or harmful physical agents that must not be exceeded. PELs are specified in applicable WISHA rules.

Person

Based on chapter 49.17 RCW, one or more individuals, partnerships, associations, corporations, business trusts, legal representatives, or any organized group of persons.

Personal eyewash units

Personal eyewash units are portable, supplementary units that support plumbed units or self-contained units, or both, by delivering immediate flushing for less than fifteen minutes.

Personal service room

Used for activities not directly connected with a business’ production or service function such as:

- First aid
- Medical services
- Dressing
- Showering
- Bathrooms
- Washing
- Eating

Personnel

See the definition for employees.

Physical hazard

As used in Employer Chemical Hazard Communication, WAC 296-800-170 means a chemical that has scientifically valid evidence to show it is one of the following:

- Combustible liquid
- Compressed gas
- Explosive
- Flammable
- Organic peroxide
- Oxidizer
- Pyrophoric
- Unstable (reactive)
- Water reactive

Platform

Platform means an extended step or landing that breaks a continuous run of stairs.

Plug

See definition for attachment plug.

Potable water

Predictable and regular basis

Employee functions such as, but not limited to, inspection, service, repair and maintenance which are performed

- at least once every 2 weeks

OR

- 4 man-hours or more during any sequential 4-week period (to calculate man-hours multiply the number of employees by the number of hours during a 4-week period).

Produce

As used in Employer Chemical Hazard Communication, WAC 296-800-170, any one of the following:

- Manufacture
- Process
- Formulate
- Blend
- Extract
- Generate
- Emit
- Repackage

Purchaser

As used in Employer Chemical Hazard Communication, WAC 296-800-170, an employer who buys one or more hazardous chemicals to use in their workplace.

Pyrophoric

A chemical is pyrophoric if it will ignite spontaneously in the air when the temperature is 130°F (54.4°C) or below.

Qualified person

A person who has successfully demonstrated the ability to solve problems relating to the subject matter, work, or project, either by:

- Possession of a recognized degree, certificate, or professional standing;

OR

- Extensive knowledge, training and experience.

(2005 Ed.)
Railing or standard railing
A vertical barrier erected along exposed edges of a floor opening, wall opening, ramp, platform, or runway to prevent falls of persons.

Rescind jurisdiction
The department has decided to take back its control over a citation and notice being appealed.

Receptacle or receptacle outlet
As used in basic electrical rules, WAC 296-800-280 means outlets that accept a plug to supply electric power to equipment through a cord or cable.

Record
A record is any item, collection, or grouping of information. Examples include:
- Paper document
- Microfiche
- Microfilm
- X-ray film
- Computer record

Repeat violation
A violation is a repeat violation if the employer has been cited one or more times previously for a substantially similar hazard.

Responsible party
As used in employer chemical hazard communication, WAC 296-800-170. Someone who can provide appropriate information about the hazardous chemical and emergency procedures.

Rise
The vertical distance from the top of a tread to the top of the next higher tread.

Riser
The vertical part of the step at the back of a tread that rises to the front of the tread above.

Rungs
Rungs are the cross pieces on ladders that are used to climb up and down the ladder.

Runway
An elevated walkway above the surrounding floor or ground level. Examples of runways are footwalks along shafting or walkways between buildings.

Safety factor
The term safety factor means the ratio of when something will break versus the actual working stress or safe load when it is used.

Serious violation
Serious violation must be deemed to exist in a workplace if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use in such workplace, unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

Short-term exposure limit (STEL)
An exposure limit, averaged over a short time period (usually measured for 15 minutes) that must not be exceeded during any part of an employee's workday.

Should
Should means recommended.
Toxic chemical
As used in first aid, WAC 296-800-150, is a chemical that produces serious injury or illness when absorbed through any body surface.

Toxic substance
Any chemical substance or biological agent, such as bacteria, virus, and fungus, which is any of the following:

- Listed in the latest edition of the National Institute for Occupational Safety and Health (NIOSH) Registry of Toxic Effects of Chemical Substances (RTECS)
- Shows positive evidence of an acute or chronic health hazard in testing conducted by, or known to, the employer
- The subject of a material safety data sheet kept by or known to the employer showing the material may pose a hazard to human health.

Toxicant
A substance that has the inherent capacity to produce personal injury or illness to individuals by absorption through any body surface.

Trade secret
Any confidential:
- Formula
- Pattern
- Process
- Device
- Information
- Collection of information

The trade secret is used in an employer's business and gives an opportunity to gain an advantage over competitors who do not know or use it.

See WAC 296-62-053 for requirements dealing with trade secrets.

Tread
As used in stairs and stair railings, WAC 296-800-250 means the horizontal part of the stair step.

Tread run
As used in stairs and stair railings, WAC 296-800-250 means the distance from the front of one stair tread to the front of an adjacent tread.

Tread width
The distance from front to rear of the same tread including the nose, if used.

UL (Underwriters’ Laboratories, Inc.)
You will find these initials on electrical cords and equipment. The initials mean the cord or equipment meets the standards set by the Underwriters’ Laboratories, Inc.

Unstable (reactive)
As used in employer chemical hazard communication, WAC 296-800-170. An unstable or reactive chemical is one that in its pure state, or as produced or transported, will vigorously polymerize, decompose, condense, or will become self-reactive under conditions of shocks, pressure or temperature.

Use
As used in employer chemical hazard communication, WAC 296-800-170, means to:
- Generate as a by-product
- Transfer.

Vapor
The gaseous form of a substance that is normally in the solid or liquid state.

Voltage of a circuit
The greatest effective potential difference between any two conductors or between a conductor and ground.

Voltage to ground
The voltage between a conductor and the point or conductor of the grounded circuit. For undergrounded circuits, it is the greatest voltage between the conductor and any other conductor of the circuit.

Voltage, nominal
Nominal voltage is a value assigned to a circuit or system to designate its voltage class (120/240, 480Y/277, 600, etc.). The actual circuit voltage can vary from the value if it is within a range that permits the equipment to continue operating in a satisfactory manner.

WAC
This is an acronym for Washington Administrative Code, which are rules developed to address state law.

Water-reactive
As used in Employer Chemical Hazard Communication, WAC 296-800-170, a water-reactive chemical reacts with water to release a gas that is either flammable or presents a health hazard.

Watertight
Constructed so that moisture will not enter the enclosure or container.

Weatherproof
Constructed or protected so that exposure to the weather will not interfere with successful operation. Rainproof, rain-tight, or watertight equipment can fulfill the requirements for weatherproof where varying weather conditions other than wetness, such as snow, ice, dust, or temperature extremes, are not a factor.

Wet location
As used in basic electrical rules, WAC 296-800-280 means:

- Underground installations or in concrete slabs or masonry that are in direct contact with the earth
- Locations that can be saturated by water or other liquids
- Unprotected locations exposed to the weather (like vehicle washing areas)

WISHA
This is an acronym for the Washington Industrial Safety and Health Act.

Work area
As used in employer chemical hazard communication, WAC 296-800-170, a room or defined space in a workplace where hazardous chemicals are produced or used, and where employees are present.

Working days
Means a calendar day, except Saturdays, Sundays, and legal holidays. Legal holidays include:
- New Year's Day - January 1
- Martin Luther King, Jr. Day
- Presidents' Day
- Memorial Day

(2005 Ed.)
This chapter applies to:
- All employers who make, maintain, contract for, or have access to records relating to employee exposure to toxic substances or harmful physical agents, whether or not they are required by specific occupational safety and health rules. These records include:
  - Employee medical records.
  - Employee exposure records.
  - Analyses of employee medical or exposure records.

**IMPORTANT:**
- The requirements of this chapter do not affect any other legal and ethical obligations the employer has to keep employee medical information confidential.

**Exemption:**
Agricultural operations covered by chapter 296-307 WAC, Safety standards for agriculture, are exempt from the requirements of this chapter.

**Reference:**
- Requirements for material safety data sheets are found in WAC 296-800-180, Material safety data sheets (MSDSs) as exposure records.
- Additional information about accessing medical information can be found in chapter 70.02 RCW, Medical record—Health care information access and disclosure.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-10-026, § 296-802-100, filed 4/27/04, effective 8/1/04.]

**WAC 296-802-200** Keep employee medical and exposure records.

**Summary:**
To keep employee medical records, exposure records, and analyses.

**IMPORTANT:**
- Physicians or other health care personnel may keep medical records for you.
- You may keep information in any form as long as the information is retrievable.
- Unless a specific occupational safety and health rule provides a different time period, you must keep records for the period required by this chapter.

**You must:**
- Keep employee medical records
- WAC 296-802-20005.
- Keep employee exposure records
- WAC 296-802-20010.
- Keep analyses of medical or exposure records
- WAC 296-802-20015.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-10-026, § 296-802-200, filed 4/27/04, effective 8/1/04.]

**WAC 296-802-20005** Keep employee medical records.

**You must:**
- Keep medical records for at least as long as the employee works for you plus thirty years.

**Exemption:**
- If an employee works for you for less than one year and you provide the records to them when they leave employment, you do not have to keep their medical records.
- You do not need to keep the following records for any specific period:
  - Health insurance claims records maintained separately from your medical program and records.
  - Records of first-aid treatment, if made on-site by a nonphysician and if kept separately from the employee medical record.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-10-026, § 296-802-200, filed 4/27/04, effective 8/1/04.]
You must:
- Keep chest X-ray films in their original state, such as film or electronic image.

WAC 296-802-20010  Keep employee exposure records.

IMPORTANT:
You do not need to keep employee exposure records for exposure to toxic substances when they are:
- Purchased as a consumer product;
AND
- Used in the same manner and frequency that a consumer would use them.

You must:
- Keep employee exposure records for at least thirty years from the date the exposure record was made. These records include the following:
  - The sampling results.
  - The collection methodology (sampling plan).
  - A description of the analytical and mathematical methods used.
  - Background data to environmental monitoring or measuring, such as laboratory reports and work sheets.

Note: You do not have to keep the actual background data for more than one year if you keep a summary of the data for thirty years.

You must:
Keep a record, for at least thirty years, of the identity of any toxic substance used in your workplace. Include:
- Where the substance was used.
- When the substance was used.

Note: The identity may be retained either as part of the exposure record or as a separate record.

WAC 296-802-20015  Keep analyses of medical or exposure records.

You must:
- Keep each analysis using medical or exposure records for at least thirty years.

WAC 296-802-300  Inform employees about records.

Summary:
Your responsibility:
To inform current employees about their medical and exposure records.

You must:
- Inform current employees about their medical and exposure records.

WAC 296-802-30005  Inform current employees about their medical and exposure records.

You must:
- Inform employees covered by this rule about medical and exposure records when they first start employment, and then at least annually. Include the following information:
  - Where the records are located.
  - Who is responsible for the records.
  - Who to contact for access to the records.
  - Their rights to copy the records.
  - Make copies of this rule available upon request to employees.
  - Distribute to your employees any information about this chapter that you are given by the department.

Note: Some of the ways to inform employees that you have medical and exposure records include e-mail, letters, posters, or classroom training.

WAC 296-802-400  Provide employees access to records and analyses.

Summary:
Your Responsibility:
To provide employees access to records and analyses.

IMPORTANT:
- Employees or their designated representatives can use the collective bargaining process to gain access to records beyond what is required by this chapter.
- The requirements of this section apply to both current and former employees.

You must:
- Provide access to employee medical records, exposure records, and analyses.
- Provide employee medical records.
- Provide employee exposure records.

WAC 296-802-40005  Provide access to employee medical records, exposure records, and analyses.

You must:
- Provide employees and their designated representatives access to requested records and analyses as follows:
  - In a reasonable time, place, and manner.
  - Within fifteen working days.
  - If there is a delay, inform the requesting party of the reason and the earliest date the record will be made available.
  - You do not have to provide analyses that are currently being worked on or have not been reported to you.

You must:
- Provide a copy of the record, when requested, to the employee or designated representative without cost. This may be done by one of the following methods:
  - Make a copy for the requestor.
  - Make the record and a copier available.
  - Loan the record to the employee or designated representative for a reasonable time, so a copy can be made.

(2005 Ed.)
Note: • Access to employee medical records will be provided to designated representatives only when the employee provides specific written authorization. See WAC 296-802-40010.

• To locate or identify the records being requested, you may request, from employees or their designated representatives, only known and necessary information. For example, you may request dates and location of where the employee worked during the time period in question.

• You are not required to perform an analysis of medical or exposure records at the request of an employee or designated representative.

• When there is an original X-ray you may restrict access to an on-site examination or make other arrangements for a temporary loan.

• When a record has been provided without cost to an employee or designated representative, and they request additional copies, you may charge a reasonable, nondiscriminatory administrative cost. For example, you may charge search and copying expenses but not overhead expenses.
  – A reasonable fee for copying, as defined in chapter 70.02 RCW, should not exceed sixty-five cents per page for the first thirty pages and fifteen cents per page for all additional pages. In addition, a clerical fee for searching and handling may be charged not to exceed fifteen dollars.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-10-026, § 296-802-40010, filed 4/27/04, effective 8/1/04.]

WAC 296-802-40010 Provide employee medical records.

You must:
• Make sure employees have access, upon request, to their own medical records.

Note: • A physician, nurse, or other responsible health care professional who maintains employee medical records may delete from requested medical records the identity of individuals who provided confidential information regarding an employee’s health status.

• If a physician represents you and believes that providing an employee access to their specific diagnosis of a terminal illness or psychiatric condition could harm the employee, they may request that the record be released only to a designated representative having specific written authorization.

• The physician representing you may recommend that the employee or designated representative do one of the following:
  – Consult with the physician to review and discuss requested records.
  – Accept a summary of facts and opinions instead of requested records.
  – Accept the release of requested records only to another physician or designated representative.

You must:
• Make sure that individual employees are not identified in any portion of analyses that report the contents of employee medical records.

  – Identifying information includes both direct identifiers such as name, address, Social Security number, and payroll number, and other information that could reasonably be used in the circumstances to identify individual employees such as exact age, height, or weight.

Note: If it is not feasible to remove personal identifying information from a document, you do not have to provide the portions where personal identifiers cannot be moved.

You must:
• Provide designated representatives access to employee medical records when the employee provides specific written authorization.

  – If the written authorization does not contain an expiration date, it expires ninety days after it is signed.

  – Release only medical information that exists on the date of the written employee consent, unless the consent specifically states that future information may be released.

Note: An employee may revoke the specific written authorization in writing at any time.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-10-026, § 296-802-40010, filed 4/27/04, effective 8/1/04.]

WAC 296-802-40015 Provide employee exposure records.

You must:
• Provide requested exposure records that show the type and amount of toxic substances or harmful physical agents to which the employee is or has been exposed, for an employee’s current or transfer work assignment.

  – In the absence of records specific to the employee, exposure records of other employees with the same job duties or related working conditions will be used to the extent necessary to respond to the request.

  – Provide a designated representative, who does not have specific employee consent, access to employee exposure records only when a reasonable written request is made that includes the following:
    – The records requested.
    – The occupational health need for accessing these records.

Note: Trade secret information may be withheld from exposure records. See chapter 296-816 WAC, Protecting trade secrets, for more information.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-10-026, § 296-802-40015, filed 4/27/04, effective 8/1/04.]

WAC 296-802-500 Respond to medical record access orders.

Summary:
IMPORTANT:
This section describes how WISHA accesses employee medical records and your related rights and obligations.

Your responsibility:
To post written WISHA access orders.

You must:
Respond to WISHA access orders for employee medical records
WAC 296-802-50005. Content of WISHA written access orders WAC 296-802-50010.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-10-026, § 296-802-50005, filed 4/27/04, effective 8/1/04.]

WAC 296-802-50005 Respond to WISHA access orders for employee medical records.

You must:
• Promptly respond to a written access order you receive from WISHA for personally identifiable employee medical information.

  • Post a copy of the cover letter you receive from WISHA for fifteen working days where employees can easily review it.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-10-026, § 296-802-50005, filed 4/27/04, effective 8/1/04.]

[Title 296 WAC—p. 2812] (2005 Ed.)
**WAC 296-802-50010 Content of WISHA written access orders.** A written access order from WISHA will contain at least the following information:

- The identity of employees whose medical information is being requested.
  - This may be either by name, job classification, time clock number, department, or similar identifier.
- A description of the medical information that will be examined.
- The purpose for seeking access to this medical information.
  - Any additional evidence supporting access to the medical information.
- A step-by-step description of how the records will be obtained, copied, reviewed, and stored, specifying the following:
  - Who will be in charge of on-site review of the records, or who will take possession of the records for off-site review.
  - Where the records will be reviewed.
  - When review or receipt of the records is to take place.
  - If the records are to be reviewed on-site, what type of information will be copied and removed off-site.
- How personal identifiers will be separated from the medical information and how long this information will be kept.
- The principal WISHA investigator’s full name, business address and telephone number.
- The full names and titles of all individuals that will review the records.
- The WISHA industrial hygiene program manager’s full name, business address and telephone number.

**Note:** WISHA does not need a written access order for the following types of employee medical records:
- Medical records and analyses that do not contain personal identification information.
- Examination of records to verify compliance with the medical surveillance requirements of another occupational health and safety rule.
- The following records when required by another occupational health and safety rule:
  - Medical opinions.
  - Biological monitoring results.
  - Results of medical examinations and laboratory tests.

**WAC 296-802-600 Transfer and disposal of employee records.**

**Summary:**
Your responsibility:
To transfer or dispose of employee medical and exposure records when you go out of business.

You must:
- Transfer or dispose of employee medical and exposure records when you go out of business

**WAC 296-802-60005 Transfer or dispose of employee medical and exposure records when you go out of business.

You must:
- Follow the requirements in Table 1 when transferring or disposing of records.

<p>| Table 1 |
| Transfer or Disposal of Records |</p>
<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
</tr>
</thead>
<tbody>
<tr>
<td>Another employer continues the business when you go out of business</td>
<td>Transfer all employee records to that employer</td>
</tr>
<tr>
<td>No other employer continues the business when you go out of business</td>
<td>Do the following:</td>
</tr>
<tr>
<td></td>
<td>– Notify affected current employees of their rights of access to records at least three months prior to the termination of your business AND EITHER:</td>
</tr>
<tr>
<td></td>
<td>– Notify WISHA in writing of your impending decision to dispose of records at least three months prior to your planned disposal; OR</td>
</tr>
<tr>
<td></td>
<td>– Transfer the records to WISHA, if required by a specific WISHA safety and health rule</td>
</tr>
<tr>
<td>You intend to dispose of records after the retention period has expired</td>
<td>Do the following:</td>
</tr>
<tr>
<td></td>
<td>– Notify WISHA in writing of your impending decision to dispose of records at least three months prior to your planned disposal; OR</td>
</tr>
<tr>
<td></td>
<td>– Transfer the records to WISHA, if required by a specific WISHA safety and health rule</td>
</tr>
</tbody>
</table>

**Note:** The address to notify WISHA in writing is:
Department of Labor & Industries/WISHA Services
Attention: Medical Records
P.O. Box 44610
Olympia, WA 98504-4610

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-10-026, § 296-802-60005, filed 4/27/04, effective 8/1/04.]

**WAC 296-802-900 Definitions.**

**Access**
The right and opportunity to examine and copy an employee record.

**Analysis using exposure or medical records**
- Any collection of data or a statistical study based on either:
  - Information from individual employee exposure or medical records;
  - Information collected from health insurance claim records.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-10-026, § 296-802-60005, filed 4/27/04, effective 8/1/04.]

[Title 296 WAC—p. 2813]
Designated representative
- Any individual or organization to which an employee gives written authorization.
- A recognized or certified collective bargaining agent without regard to written employee authorization.
- The legal representative of a deceased or legally incapacitated employee.

Employee exposure record
Means a record containing any of the following kinds of information:
- Environmental (workplace) monitoring or measuring of a toxic substance or harmful physical agent, including personal, area, grab, wipe, or other form of sampling, as well as related collection and analytical methodologies, calculations, and other background data relevant to interpretation of the results obtained.
- Biological monitoring results which directly assess the absorption of a toxic substance or harmful physical agent by body systems (such as the level of a chemical in the blood, urine, breath, hair, or fingernails) but not including results which assess the biological effect of a substance or agent or which assess an employee's use of alcohol or drugs.
- Material safety data sheets indicating that the material may pose a hazard to human health;
  OR
- In the absence of the above:
  – A chemical inventory or any other record that reveals where and when used and the identity (e.g., chemical, common or trade name) of a toxic substance or harmful physical agent.
  – Exposure records of other employees with past or present job duties or related working conditions.

Employee medical record
A record concerning the health status of an employee which is made or maintained by a physician, nurse, or other health care personnel, or technician, including:
- Medical and employment questionnaires or histories (including job description and occupational exposures).
- The results of medical examinations (preemployment, preassignment, periodic, or episodic) and laboratory tests (including chest and other X-ray examinations taken for purposes of establishing a baseline or detecting occupational illness, and all biological monitoring not defined as an "employee exposure record").
- Medical opinions, diagnoses, progress notes, and recommendations.
- First-aid records.
- Descriptions of treatments and prescriptions.
- Employee medical complaints.

An employee medical record does not include any of these types of medical information:
- Physical specimens (for example, blood or urine samples), which are routinely discarded as a part of normal medical practice.
- Records concerning health insurance claims if maintained separately from the employer's medical program and its records, and not accessible to the employee by employee name or other direct personal identifier, such as Social Security number or payroll number.
- Records concerning voluntary employee assistance programs, such as alcohol, drug abuse, or personal counseling programs, if maintained separately from the employer's medical program and records.

Exposure or exposed
The contact an employee has with a toxic substance, harmful physical agent or oxygen deficient condition. Exposure can occur through various routes, such as inhalation, ingestion, skin contact, or skin absorption.

First aid
Any of the following are considered first aid:
- Using a nonprescription medication at nonprescription strength.
- Administering tetanus immunizations. Other immunizations, such as Hepatitis B vaccine or rabies vaccine, are considered medical treatment.
- Cleaning, flushing or soaking wounds on the surface of the skin.
- Using wound coverings such as bandages, Band-Aids™, or gauze pads.
- Using butterfly bandages or Steri-Strips™.
- Using hot or cold therapy.
- Using any nonrigid means of support, such as elastic bandages, wraps, or nonrigid back belts.
- Using temporary immobilization devices, such as splints, slings, neck collars, or back boards, while transporting an accident victim.
- Drilling a fingernail or toenail to relieve pressure.
- Draining fluid from a blister.
- Using eye patches.
- Removing foreign bodies from the eye using only irrigation or a cotton swab.
- Removing splinters or foreign material from areas other than the eye by irritation, tweezers, cotton swabs or other simple means.
- Using finger guards.
- Using massages.
- Drinking fluids for relief of heat stress.

Harmful physical agent
Any physical stress such as noise, vibration, repetitive motion, heat, cold, ionizing and nonionizing radiation, and hyp- or hyperbaric pressure which:
- Is listed in the latest edition of the National Institute for Occupational Safety and Health (NIOSH) Registry of Toxic Effects of Chemical Substances (RTECS);
  OR
- Has shown positive evidence of an acute or chronic health hazard in testing conducted by, or known to, the employer;
  OR
- Is the subject of a material safety data sheet kept by or known to the employer showing that the material may pose a hazard to human health.

Health professional
A physician, occupational health nurse, industrial hygienist, toxicologist, or epidemiologist, who provides medical or other occupational health services to exposed employees.

[Title 296 WAC—p. 2814] (2005 Ed.)
Lockout/Tagout 296-803-100

296-803-20005 Establish a written energy control program.
296-803-30005 Make sure new or modified machines and equipment can accept lockout devices.
296-803-40005 Provide appropriate means to control energy.
296-803-40010 Make sure lockout and tagout devices meet these requirements.
296-803-40015 Make sure lockout devices meet these additional requirements.
296-803-40020 Make sure tagout devices meet these additional requirements.
296-803-50005 Use energy control procedures.
296-803-50010 Meet these requirements when applying lockout or tagout devices.
296-803-50015 Meet these additional requirements when applying lockout devices.
296-803-50020 Meet these additional requirements when applying tagout devices.
296-803-50025 Protect employees from the hazards of stored and residual energy.
296-803-50030 Verify that the machine or equipment is safe before starting work.
296-803-50035 Meet these requirements when removing lockout or tagout devices and energizing the machine or equipment.
296-803-50040 Meet these requirements if it’s necessary to temporarily energize a machine, equipment, or component for testing or positioning.
296-803-50045 Protect employees during shift or personnel changes.
296-803-50050 Protect employees working in a group.
296-803-50055 Meet these additional requirements if more than one group is used.
296-803-50060 Coordinate with outside employers servicing or maintaining your machines or equipment.
296-803-60005 Provide and document employee training on the energy control program.
296-803-60010 Provide additional training if you use tagout devices.
296-803-60015 Retrain employees when necessary.
296-803-70005 Perform and document periodic reviews to verify employees know and follow the energy control procedures.
296-803-70010 Do periodic reviews of procedures using lockout devices.
296-803-70015 Do periodic reviews of procedures using tagout devices.
296-803-80005 Coordinate with outside employers servicing or maintaining your machines or equipment.

WAC 296-803-100 Scope. This chapter applies to the service and maintenance of machines and equipment, including piping systems, if employees could be injured by the:

- Unexpected energization or start up of the machine or equipment;
- Release of stored energy.

Energy sources include mechanical, hydraulic, pneumatic, chemical, thermal, or other energy, including gravity.

Note:

- Machines and equipment include those that produce high intensity electromagnetic fields.
- When other Title 296 WAC standards require the use of lockout or tagout, they have to be used and supplemented by the procedural and training requirements of this chapter.

Exemption:

This chapter does not apply to:

- Construction activities covered by chapter 296-155 WAC, Safety standards for construction work.
- Agriculture activities covered by chapter 296-307 WAC, Safety standards for agriculture.
- Maritime activities covered by chapter 296-56 WAC, Safety standards—Longshore, stevedore and related waterfront operations and chapter 296-304 WAC, Safety standards for ship repairing, shipbuilding and shipbreaking.
- Oil and gas well drilling and servicing.
- Installations for generating, transmitting, and distributing electric power (including related communication and metering equipment) that are controlled exclusively by electric utilities.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-10-026, § 296-802-900, filed 4/27/04, effective 8/1/04.]

Chapter 296-803 WAC

LOCKOUT/TAGOUT
(CONTROL OF HAZARDOUS ENERGY)

WAC
296-803-100  Scope.
296-803-200  Summary.

(2005 Ed.)

Record
Any item, collection, or grouping of information. Examples include:
• Paper document.
• Microfiche.
• Microfilm.
• X-ray film.
• Computer record.

Specific chemical identity
Any other information that reveals the precise chemical designation of the substance, such as:
• Chemical name;
OR
• Chemical abstracts service (CAS) registry number.

Specific written authorization
A written authorization containing at least the following:
• The name and signature of the employee authorizing the release of medical information.
• The date of the written authorization.
• The name of the individual or organization that is authorized to release the medical information.
• The name of the designated representative (individual or organization) that is authorized to receive the information.
• A general description of the medical information that is authorized to be released.
• A general description of the purpose for the release of the medical information.
• A date or condition upon which the written authorization will expire.

Toxic substance
Any chemical substance or biological agent, such as bacteria, virus, and fungus, which is any of the following:
• Listed in the latest edition of the National Institute for Occupational Safety and Health (NIOSH) Registry of Toxic Effects of Chemical Substances (RTECS).
• Shows positive evidence of an acute or chronic health hazard in testing conducted by, or known to, the employer.
• The subject of a material safety data sheet kept by or known to the employer showing the material may pose a hazard to human health.

Trade secrets
Any confidential information that is used in an employer’s business and gives an opportunity to gain an advantage over competitors who do not know or use it. It can be a:
• Formula.
• Pattern.
• Process.
• Device.
• Information.
• Collection of information.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-10-026, § 296-802-900, filed 4/27/04, effective 8/1/04.]
Hot tap operations on pressurized pipelines used to transmit and distribute substances such as gas, steam, water, or petroleum products if the employer can demonstrate that:

- Continuity of service is essential.
- Shutdown of the system is impractical.
- Proven effective employee protection is provided by following documented procedures and using special equipment.
- Service and maintenance of fire alarm and extinguishing systems and their components if:
  - Other employees depend on these systems for fire safety;
  - Employees working on fire extinguishing systems are protected from the unexpected release of hazardous energy by appropriate alternative measures.
- Work on electric equipment receiving power only through a cord and plug if:
  - Unplugging the equipment eliminates the possibility of unexpected energization, unexpected start up, or the release of stored energy;
  - The plug is kept under the exclusive control of the employee doing the service or maintenance.
- Exposure to electrical hazards from electrical work on, near, or with conductors or equipment that is covered by chapter 296-24 WAC, General safety and health standards, Part L, Electrical.
- Service and maintenance during normal production operations, if an employee is not required to:
  - Remove or bypass a guard or other safety device;
  - Place any body part into the point of operation or any other hazardous area created by machine operation.
- Minor tool changes, adjustments, and other minor service during normal production operations if:
  - They are routine, repetitive, and integral to the use of the equipment for production;
  - The work is done using measures which provide effective protection from hazards.

You must:

- Make sure energy-isolating devices designed to accept lockout devices are identified by at least type and location.
- They have the same or similar types of controls.
- They use the same type and magnitude of energy.
- Place any body part into the point of operation or any other hazardous area created by machine operation.
- They are routine, repetitive, and integral to the use of the equipment for production.
- The work is done using measures which provide effective protection from hazards.

Exemption: You do not have to have written energy control procedures for a particular machine or equipment if all of the following apply:

- The machine or equipment has a single energy source that is easily identified and can be isolated.
- The machine or equipment is completely deenergized and deactivated by isolating and locking out the energy source.
- There's no stored or residual energy that could be a hazard to employees, and the machine or equipment cannot reaccumulate such energy after it's been shut down.
- The energy source can be locked out with a single lockout device.
- The machine or equipment is isolated from the energy source and locked out during service or maintenance.
- The authorized employee doing the service or maintenance has exclusive control of the lockout device.
- The service or maintenance does not create a hazard for other employees.
- The machine or equipment has never been unexpectedly energized or activated during service or maintenance.

You must:

- Make sure energy control procedures clearly and specifically outline:
  - The scope, purpose, authorization, rules, and techniques to control hazardous energy;
  - How you'll make sure employees follow the procedures.
  - Make sure energy control procedures specifically identify at least the following:
    - The scope, purpose, authorization, rules, and techniques to control hazardous energy;
    - How you'll make sure employees follow the procedures.
- Place any body part into the point of operation or any other hazardous area created by machine operation.
- They are routine, repetitive, and integral to the use of the equipment for production.
- The work is done using measures which provide effective protection from hazards.

WAC 296-803-200 Summary.

Your responsibility:
To establish an energy control program.

You must:
WAC 296-803-20005 Establish a written energy control program.

WAC 296-803-20005 Establish a written energy control program.

You must:

- Establish a written energy control program to protect employees that service or maintain a machine or equipment from injury caused by the:
  - Unexpected energization or start up of the machine or equipment;
  - Release of stored energy.
- Make sure the program contains all of the following:
  - Energy control procedures as described in WAC 296-803-500.
  - Employee training as described in WAC 296-803-600.
  - Periodic reviews as described in WAC 296-803-700.
  - Develop and document in writing energy control procedures to protect employees doing service or maintenance of a machine or equipment from potentially hazardous energy.

Exemption: You do not have to have written energy control procedures for a particular machine or equipment if all of the following apply:

- The machine or equipment has a single energy source that is easily identified and can be isolated.
- The machine or equipment is completely deenergized and deactivated by isolating and locking out the energy source.
- There's no stored or residual energy that could be a hazard to employees, and the machine or equipment cannot reaccumulate such energy after it's been shut down.
- The energy source can be locked out with a single lockout device.
- The machine or equipment is isolated from the energy source and locked out during service or maintenance.
- The authorized employee doing the service or maintenance has exclusive control of the lockout device.
- The service or maintenance does not create a hazard for other employees.
- The machine or equipment has never been unexpectedly energized or activated during service or maintenance.

You must:

- Make sure energy control procedures clearly and specifically outline:
  - The scope, purpose, authorization, rules, and techniques to control hazardous energy;
  - How you'll make sure employees follow the procedures.
  - Make sure energy control procedures specifically identify at least the following:
    - The scope, purpose, authorization, rules, and techniques to control hazardous energy;
    - How you'll make sure employees follow the procedures.
  - Place any body part into the point of operation or any other hazardous area created by machine operation.
  - They are routine, repetitive, and integral to the use of the equipment for production.
  - The work is done using measures which provide effective protection from hazards.

WAC 296-803-300 Summary.

Your responsibility:
To make sure new or modified machines and equipment can accept lockout devices.

You must:
WAC 296-803-30005 Make sure new or modified machines and equipment can accept lockout devices.

WAC 296-803-30005 Make sure new or modified machines and equipment can accept lockout devices.

You must:

- Make sure energy-isolating devices designed to accept a lockout device are provided on machines and equipment that:
– Are newly installed.
– Have major repair.
– Are renovated or modified.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-30005, filed 7/20/04, effective 11/1/04.]

**WAC 296-803-400 Summary.**

**Your responsibility:**
To provide appropriate lockout and tagout devices and means to control energy.

**You must:**
- WAC 296-803-40005 Provide appropriate means to control energy.
- WAC 296-803-40010 Make sure lockout and tagout devices meet these requirements.
- WAC 296-803-40015 Make sure lockout devices meet these additional requirements.
- WAC 296-803-40020 Make sure tagout devices meet these additional requirements.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-400, filed 7/20/04, effective 11/1/04.]

**WAC 296-803-40005 Provide appropriate means to control energy.**

**You must:**
- Provide the means necessary to isolate, secure, or block machines and equipment from energy sources.

**Note:** Examples of means to control energy include:
- Locks.
- Tags.
- Chains.
- Wedges.
- Key blocks.
- Adapter pins.
- Self-locking fasteners.
- Blind flanges.
- Cribbing.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-40005, filed 7/20/04, effective 11/1/04.]

**WAC 296-803-40010 Make sure lockout and tagout devices meet these requirements.**

**You must:**
- Make sure lockout devices meet these additional requirements.
- Make sure tagout devices meet these additional requirements.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-400, filed 7/20/04, effective 11/1/04.]

**WAC 296-803-40015 Make sure lockout devices meet these additional requirements.**

**You must:**
- Make sure lockout devices are strong enough so that removing them by other than the normal unlocking method requires:
  - Excessive force;
  - Unusual techniques such as the use of bolt cutters or other metal-cutting tools.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-40015, filed 7/20/04, effective 11/1/04.]

**WAC 296-803-40020 Make sure tagout devices meet these additional requirements.**

**You must:**
- Make sure all tags:
  - Use the same print and format within a facility.
  - Are constructed and printed so they will not deteriorate and the message on the tag remains legible when:
    - Exposed to weather.
    - Used in wet or damp locations.
    - Used in corrosive environments such as areas where acid or alkali chemicals are handled or stored.
  - Have a warning about not energizing the machine or equipment.

**Note:** The warning on the tag should include wording such as:
- Do not start.
- Do not open.
- Do not close.
- Do not energize.
- Do not operate.

**You must:**
- Make sure tagout devices are strong enough to prevent unintentional or accidental removal.
- Make sure the means used to attach the tag to the energy-isolating device meets all of the following:
  - Is not reusable.
  - Is self-locking.
  - Can be attached by hand.
  - Cannot be released with a force of less than fifty pounds.
  - Is similar in design and basic characteristics to a one-piece, all-environment-tolerant, nylon cable tie.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-40020, filed 7/20/04, effective 11/1/04.]

**WAC 296-803-500 Summary.**

**Your responsibility:**
To make sure energy control procedures are used and include these requirements.

**You must:**
- **ENERGY CONTROL PROCEDURES**
  - WAC 296-803-50005 Use energy control procedures.
  - **APPLYING LOCKOUT OR TAGOUT DEVICES**
  - WAC 296-803-50010 Meet these requirements when applying lockout or tagout devices.
  - WAC 296-803-50015 Meet these additional requirements when applying lockout devices.
  - WAC 296-803-50020 Meet these additional requirements when applying tagout devices.

[Title 296 WAC—p. 2817]
WAC 296-803-50005 Use energy control procedures. You must:

- Use energy control procedures to protect employees servicing or maintaining machines and equipment from potentially hazardous energy.
- Use a lockout system if an energy-isolating device can be locked out.

Exemption: A tagout system may be used instead of a lockout system if it meets all of the following:

- The tagout device is attached where you would have put the lockout device.
- The tagout system provides the same level of employee protection as a lockout system.
- You can demonstrate that the tagout system:
  - Meets all tagout requirements of this chapter.
  - Includes additional safety measures to provide the same level of safety as a lockout system.

Note: Additional safety measures used with the tagout system to provide protection equal to a lockout system could include actions such as:

- Removing part of the isolating circuit.
- Blocking a controlling switch.
- Opening an extra disconnecting device.
- Removing a valve handle.

You must:
- Use a tagout system if an energy-isolating device cannot be locked out.

WAC 296-803-50010 Meet these requirements when applying lockout or tagout devices.

You must:

- Make sure, before a machine or equipment is turned on, that the authorized employee knows all of the following:
  - Type and magnitude of the energy.
  - Hazards of the energy to be controlled.

- Method or means to control the energy.
- Turn off or shut down the machine or equipment using established procedures.
- Completely isolate the machine or equipment from its energy sources using the appropriate energy-isolating devices after the machine or equipment has been turned off.
- Make sure you or the authorized employee notify affected employees that the machine or equipment is being locked or tagged out before the devices are applied.
- Make sure a lockout or tagout device is applied:
  - For each energy-isolating device.
  - Only by the authorized employee doing the service or maintenance.

WAC 296-803-50015 Meet these additional requirements when applying lockout devices.

You must:

- Make sure lockout devices hold the energy-isolating device in a "safe" or "off" position.

WAC 296-803-50020 Meet these additional requirements when applying tagout devices.

You must:

- Make sure a tagout device is put on an energy-isolating device so it clearly shows that moving the energy-isolating device from the "safe" or "off" position is prohibited.
- Make sure a tagout device, when used with an energy-isolating device that can be locked out, is fastened to the device at the same point a lock would have been attached.
- Make sure a tagout device that cannot be attached directly to an energy-isolating device is located:
  - As close as safely possible to the energy-isolating device;

AND

- In a position that is immediately obvious to anyone attempting to operate the energy-isolating device.

WAC 296-803-50025 Protect employees from the hazards of stored and residual energy.

You must:

- Make sure all potentially hazardous stored and residual energy is relieved, disconnected, restrained, or otherwise rendered safe after the lockout or tagout devices have been put on the energy-isolating devices.
- Continue to verify the isolation of machines and equipment that could reaccumulate stored energy to a hazardous level until:
  - Service or maintenance is completed;
  - The possibility of reaccumulating hazardous energy does not exist.
WAC 296-803-50030 Verify that the machine or equipment is safe before starting work.

You must:

• Make sure the authorized employee verifies that the machine or equipment that’s been locked out or tagged out has been isolated from all energy sources and deenergized before starting work.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 04-15-105, § 296-803-50030, filed 7/20/04, effective 11/1/04.]

WAC 296-803-50035 Meet these requirements when removing lockout or tagout devices and energizing the machine or equipment.

You must:

• Make sure the authorized employee does the following before removing any lockout or tagout device:
  – Inspects the work area to make sure nonessential items have been removed;
  – Verifies the machine or equipment is in operating condition and ready to energize;

AND

• Check that employees in the area are in positions that make it safe to energize the machine or equipment.

• Make sure only the authorized employee who applied a lockout or tagout device removes it.

Exemption: The employer may have the lockout or tagout device removed by someone other than the authorized employee who applied it if all of the following conditions are met:

• The energy control program has documented, specific procedures and training for this situation.
• You can show that the specific procedures used are as safe as having the device removed by the authorized employee who applied it.
• The specific procedures include at least the following:
  – Verifying the authorized employee who applied the device is not at the facility.
  – Making all reasonable efforts to contact and inform the authorized employee that the lockout or tagout device is being removed.
  – Making sure the authorized employee is informed, before resuming work at the facility, that the lockout or tagout device has been removed.

You must:

• Do the following before energizing or starting the machine or equipment:
  – Notify affected employees that the lockout or tagout devices have been removed.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-50035, filed 7/20/04, effective 11/1/04.]

WAC 296-803-50040 Meet these requirements if it's necessary to temporarily energize a machine, equipment, or component for testing or positioning.

You must:

• Follow your normal energy control procedures to:
  – Remove the lockout or tagout devices.
  – Energize the machine, equipment, or component.
  – Reapply the lockout or tagout devices when testing or positioning is completed.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-50040, filed 7/20/04, effective 11/1/04.]

WAC 296-803-50045 Protect employees during shift or personnel changes.

You must:

• Use specific procedures for shift or personnel changes to:
  – Make sure there’s continuous lockout or tagout protection during the change;

AND

• Provide for the orderly transfer of lockout or tagout device protection between employees.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-50045, filed 7/20/04, effective 11/1/04.]

WAC 296-803-50050 Protect employees working in a group.

You must:

• Make sure your energy control procedures provide each member of a crew, craft, department, or other group with the same level of protection as that provided by an individual lockout or tagout device.
  – Make sure each authorized employee:
    – Puts a personal lockout or tagout device on the group lockout device, lockbox, or comparable mechanism before beginning work;

AND

• Is the last person to remove their lockout or tagout device when the job is completed.

Definition:

The primary authorized employee is the authorized employee who has overall responsibility for meeting the requirements of the lockout/tagout procedures.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-50050, filed 7/20/04, effective 11/1/04.]

WAC 296-803-50055 Meet these additional requirements if more than one group is used.

You must:

• Do all of the following if more than one group works on a machine or equipment that has to be locked or tagged out:
  – Assign an authorized employee as the group coordinator with overall responsibility to:
    ■ Coordinate the different work groups;

AND

■ Maintain continuous lockout or tagout protection.
  – Assign a primary authorized employee in each group who has:
    ■ Responsibility for the group of employees who are protected by a group lockout or tagout device;

AND

(2005 Ed.) [Title 296 WAC—p. 2819]
A way to determine which employees of the group are exposed to the machine or equipment that's locked or tagged out.

WAC 296-803-50060 Coordinate with outside employers servicing or maintaining your machines or equipment.

You must:
- Do the following before allowing another employer's personnel to service or maintain machines or equipment if your energy control procedures require they be locked or tagged out:
  - Inform the outside employer of your lockout or tagout procedures.
  - Make sure the outside employer informs you of their lockout or tagout procedures.
  - Make sure you and the outside employer confirm that all employees understand and will follow the restrictions of the other employer's energy control program.

WAC 296-803-60005 Provide and document employee training on the energy control program.

You must:
- Train employees to make sure that they:
  - Understand the purpose and function of the energy control program;
  - Have the knowledge and skills necessary to carry out their program responsibilities.
- Train each authorized employee in:
  - The type and magnitude of energy available in the workplace.
  - Recognizing hazardous energy sources that apply.
  - Methods and means to isolate and control energy.
- Instruct each affected employee in the purpose and use of the energy control procedures.
- Instruct all employees who work or may work where energy control procedures might be used about the:
  - Procedures being used;
  - Prohibition against attempting to restart or reenergize a machine or equipment that's locked out or tagged out.
  - Document that employee training has been done and kept up to date.

WAC 296-803-60010 Provide additional training if you use tagout devices.

You must:
- Make sure employees are trained in the following:
  - Tags are warning devices and do not provide the same level of physical restraint as a lock.
  - When attached to energy-isolating devices, tags are not to be:
    - Removed without the approval of the authorized person responsible for it;
    OR
    - Bypassed, ignored, or otherwise defeated.
    - Tags need to be legible and understandable to be effective.
    - Tags may evoke a false sense of security.
    - The meaning of tags needs to be understood as part of the overall energy control program.
    - Tags and their means of attachment must be:
      - Made of materials that will withstand the environmental conditions they will be exposed to.

WAC 296-803-700 Summary.

Your responsibility:
To do periodic reviews to make sure employees know and use your energy control procedures.

You must:
- WAC 296-803-70005 Perform and document periodic reviews to verify employees know and follow the energy control procedures.
WAC 296-803-70010 Do periodic reviews of procedures using lockout devices.

WAC 296-803-70015 Do periodic reviews of procedures using tagout devices.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-70015, filed 7/20/04, effective 11/1/04.]

WAC 296-803-70005 Perform and document periodic reviews to verify employees know and follow the energy control procedures.

You must:
- Do a periodic review at least annually to:
  - Make sure employees know and can apply the energy control procedures.
  - Correct any deviations or inadequacies identified.

Exemption: Energy control procedures used less frequently than once a year only need to be reviewed before being used.

You must:
- Have the periodic review done by an authorized employee other than the ones using the energy control procedure being reviewed.
  - Document that periodic reviews have been done.
    - Include all of the following:
      ■ Machine or equipment the energy control procedure was used for.
      ■ Date of the review.
      ■ Employees included in the review.
      ■ Person doing the review.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-70005, filed 7/20/04, effective 11/1/04.]

WAC 296-803-70010 Do periodic reviews of procedures using lockout devices.

You must:
- Make sure, if a periodic review involves lockout devices, the reviewing employee reviews responsibilities with each authorized employee who uses the procedure.

Note: Periodic reviews of authorized employees using energy control procedures involving only lockout devices can be done in a group meeting if desired.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-70010, filed 7/20/04, effective 11/1/04.]

WAC 296-803-70015 Do periodic reviews of procedures using tagout devices.

You must:
- Make sure, if a periodic review involves tagout devices, the reviewing employee reviews each authorized and affected employee the:
  - Employee's responsibilities under the procedure;
  AND
  - Limitations of tagout devices.

Note: Periodic reviews of authorized and affected employees using energy control procedures involving tagout devices have to be done with each employee individually.

Reference: See WAC 296-803-60010, Provide additional training if you use tagout devices, in this chapter for the limitations of tagout devices.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-70015, filed 7/20/04, effective 11/1/04.]

(2005 Ed.)

WAC 296-803-800 Definitions.

Affected employee. An employee who's required to operate, use, or be in the area where a machine or equipment could be locked or tagged out for service or maintenance.

Authorized employee. An employee who locks or tags out a machine or equipment to do service or maintenance.

Can be locked out. An energy-isolating device that can be locked in the "off" or "safe" position.

Employer. Based on chapter 49.17 RCW, an employer is any person, firm, corporation, partnership, business trust, legal representative, or other business entity which engages in any business, industry, profession, or activity in this state and employs one or more employees or who contracts with one or more persons, the essence of which is the personal labor of such person or persons and includes the state, counties, cities, and all municipal corporations, public corporations, political subdivisions of the state, and charitable organizations: Provided, That any persons, partnership, or business entity not having employees, and who is covered by the Industrial Insurance Act must be considered both an employer and an employee.

Energized. Connected to an energy source or containing residual or stored energy.

Energy-isolating device. A mechanical device that physically prevents transmitting or releasing energy. This includes, but is not limited to:
- Manually operated electrical circuit breakers.
- Disconnect switches.
- Manually operated switches that disconnect the conductors of a circuit from all ungrounded supply conductors if no pole of the switch can be operated independently.
  ■ Line valves.
  ■ Blocks.
  ■ Similar devices used to block or isolate energy.

Energy source. Any source of electrical, mechanical, hydraulic, pneumatic, chemical, thermal or other energy, including gravity.

Hot tap. A procedure which involves welding on pressurized pipelines, vessels, or tanks to install connections or accessories. It's commonly used to replace or add sections of pipeline used in air, gas, water, steam, and petrochemical distribution systems without interrupting service.

Lockout. Placing a lockout device on an energy-isolating device using an established procedure to make sure the machine or equipment cannot be operated until the lockout device is removed.

Lockout device. A device that uses a positive means, such as a key or combination lock, to hold an energy-isolating device in the "safe" or "off" position. This includes blank flanges and bolted slip blinds.

Normal production operations. Using a machine or equipment for its intended production function.

Primary authorized employee. An authorized employee who has overall responsibility for meeting the requirements of the lockout/tagout procedures.

Service and maintenance. Activities such as constructing, installing, setting-up, adjusting, modifying, maintaining, and servicing machines or equipment. It also includes lubricating, cleaning, unjamming, and making tool changes.

Setting-up. Work done to prepare a machine or equipment for normal production operations.

[Title 296 WAC—p. 2821]
Tagout. Placing a tagout device on an energy-isolating device using an established procedure to indicate that the energy-isolating device and the machine or equipment being controlled may not be operated until the tagout device is removed.

Tagout device. A prominent warning device, such as a tag and a means of attachment. It can be securely fastened to an energy-isolating device to indicate that the energy-isolating device and the machine or equipment being controlled may not be operated until the tagout device is removed.

You. See definition of employer.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-15-105, § 296-803-800, filed 7/20/04, effective 11/1/04.]

[Title 296 WAC—p. 2822] (2005 Ed.)
Machine Safety  Chapter 296-806

296-806-4216  Inspect and replace worn conveyor parts.
296-806-4218  Follow these requirements for replacing conveyor parts.
296-806-4220  Follow these requirements for spill guards.
296-806-4222  Provide pedestrian overpasses for conveyors.
296-806-4224  Guard openings to hoppers and chutes.
296-806-4226  Install guideposts.

BELT CONVEYORS
296-806-4228  Guard nip points on belt conveyors.
296-806-4230  Install emergency stop controllers on overland belt conveyors.
296-806-4232  Install belt conveyor overpasses.

CHAIN CONVEYORS
296-806-4234  Safeguard chain conveyors.
296-806-4236  Guard return strands on chain conveyors.
296-806-4238  Guard chain conveyors that are used as a transfer mechanism.

ELEVATOR CONVEYORS
296-806-4240  Prevent material from falling off of elevator conveyors.

INCLINED RECIPROCATING CONVEYORS (SHAKERS)
296-806-4242  Provide protection where employees must load shakers.
296-806-4244  Provide grating over silo and bunker openings for shutters.

MOBILE CONVEYORS
296-806-4246  Guard wheels and rails on mobile conveyors.
296-806-4248  Prevent hazardous motion on mobile conveyors.
296-806-4250  Provide a detector for mobile conveyors.
296-806-4252  Provide safe access on mobile conveyors.

PUSHER-BAR CONVEYORS
296-806-4254  Guard pusher-bar conveyors.

ROLLER CONVEYORS
296-806-4256  Prohibit walking on roller-type conveyors.
296-806-4258  Use speed controls for roller and wheel conveyors.
296-806-4260  Safeguard belt-driven live roller conveyors.

SCREW CONVEYORS
296-806-4262  Guard screw conveyors.

SKIP HOISTS
296-806-4264  Provide slack-cable switches on hoists.
296-806-4266  Block the skip bucket and counterweight guides.
296-806-4268  Protect against wire rope coming off sheaves.

SLAT AND ROLLER-SLAT CONVEYORS
296-806-4270  Safeguard slat and roller-slat conveyors.

TOWED CONVEYORS
296-806-4272  Provide a safe method for disengaging the tow pin.
296-806-4274  Protect employees from moving carts on towed conveyors.

296-806-4276  Provide clearances and warnings for carts on towed conveyors.
296-806-4278  Mark projections above the floor.

FOOD PROCESSING EQUIPMENT
296-806-4250  Provide locks on chamber doors of large air conditioning units.
296-806-4252  Use proper door locks on rack-type bread coolers.
296-806-4254  Provide see-through panels on fermentation room doors.
296-806-4256  Cover exposed hot pipes.
296-806-4258  Provide extension piping on stationary lubrication fittings.
296-806-4252  Provide hoods for pan-washing tanks.
296-806-4254  Safeguard proof boxes.
296-806-4256  Safeguard storage bins.

MATERIAL HANDLING
296-806-4258  Follow these design requirements for bag lifts (bag arm elevators) and chutes.
296-806-4259  Follow these requirements for chain tackle.
296-806-4260  Safeguard conveyors.

(2005 Ed.)
GENERAL REQUIREMENTS FOR ALL CIRCULAR SAWING MACHINES

296-806-48060 Make sure band saws meet these requirements.
296-806-48058 Guard horizontal cutting heads on hand-fed jointers.
296-806-48056 Make sure jointers with horizontal cutting heads meet these requirements.
296-806-48054 Protect employees from falling into chipper and hog mills.

GENERAL REQUIREMENTS FOR ALL SAWING MACHINES

296-806-48006 Make sure saws are safe to use.
296-806-48004 Make sure saws and cutting heads are sharpened and tensioned by qualified people.
296-806-48002 Protect employees using saws and cutting heads.
296-806-48000 Make sure saws are safe to use.

GENERAL REQUIREMENTS FOR ALL SAW AND CUTTING HEADS

296-806-48018 Provide kickback protection for self-feed circular rip saws when ripping wood products.
296-806-48026 Guard inverted swing (jump) saws.
296-806-48024 Protect employees from automatic saw hazards.
296-806-48022 Provide spreaders for circular resaws.
296-806-48014 Provide kickback protection for employees using hand-fed circular table saws when ripping wood products.
296-806-48010 Make sure circular saw jages meet these requirements.
296-806-48008 Make sure all circular saws meet these requirements.
296-806-48012 Safeguard hand-fed circular table saws.

GENERAL REQUIREMENTS FOR ALL MACHINES

296-806-47008 Follow these requirements for feed roll guarding.
296-806-47000 Follow these requirements for machine initiation.
296-806-47004 Safeguard nip points of roll-forming and bending machines.
296-806-47002 Follow these requirements for adjustable restrictors when safeguarding ironworkers.
296-806-47004 Make sure presses and operating practices used in the manufacturing process meet these requirements.
MOLDING, STICKING AND MATCHING MACHINES

296-806-48062 Make sure molding, sticking and matching machines meet these requirements.

PANEL RAISERS AND OTHER SIMILAR MACHINES

296-806-48064 Guard hand-fed panel raisers and other similar machines.

PLANEERS

296-806-48066 Make sure planers with a horizontal cutting head meet these requirements.
296-806-48068 Guard planers.
296-806-48070 Guard planer feed rolls.
296-806-48072 Provide kickback protection on planers running stock of varied thicknesses.

SHAPERS

296-806-48074 Make sure shapers meet these requirements.

TENONING MACHINES

296-806-48076 Guard tenoning machine feed chains and sprockets.
296-806-48078 Guard tenoning machines.

VENEER MACHINES

296-806-48080 Guard veneer cutters and wringer knives.
296-806-48082 Guard veneer clippers.
296-806-48084 Follow these requirements for guarding guillotine cutters.
296-806-48086 Provide mechanisms to stop power-driven guillotine cutters.
296-806-48088 Prohibit riders on veneer slicer carriages.

SEWING MACHINES

296-806-485 Summary.
296-806-48502 Guard sewing machine needles.
296-806-500 Definitions.

WAC 296-806-100 Scope. Machines and their moving parts create the potential for workplace injuries. Installed and used properly safeguards can protect workers by helping to reduce or control machine hazards.

This chapter applies if you have machines or machine operations in your workplace. For requirements on hand-held tools go to Portable power tools, chapter 296-807 WAC.

Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 04-14-028, § 296-806-100, filed 6/29/04, effective 1/1/05.

REQUIREMENTS FOR ALL MACHINES

WAC 296-806-200 Summary. This section applies to all machines in your workplace. It is organized into the following four categories:

- General requirements.
- Safeguarding requirements.
- Safeguarding methods.
- Requirements for specific machine hazards.

Reference: In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to determine if additional requirements are listed for machines or operations in your workplace:

- Additional requirements for some machines and machine operations, WAC 296-806-400.
- For requirements that apply to hand-held tools, see Portable power tools, chapter 296-807 WAC.

Your responsibility:
To protect employees from machine hazards in your workplace.

(2005 Ed.)
WAC 296-806-20002 Secure machines designed to stay in one place.
You must:
• Make sure machines designed to stay in one place are secured so they will not move or change position during use.
Exemption: Machines that have either rubber feet or foot pads made of nonskid (high coefficient of friction) or similar vibration dampening materials do not have to be secured as long as the machine will not tip, fall over, or walk (move).

WAC 296-806-20004 Protect employees from slipping hazards around machinery.
You must:
• Make sure employees working around dangerous machines are protected from slipping on smooth, oily, or otherwise slippery floors by providing one of the following types of floor covering:
  – Nonslip matting.
  – Grating.
  – Nonslip composition flooring.
  – Some other effective floor treatment.
Reference: For additional requirements about housekeeping, personal protective equipment (PPE), and work practices, see the Safety and health core rules, chapter 296-800 WAC.

WAC 296-806-20006 Arrange work areas to avoid creating hazards.
You must:
• Make sure work areas around machinery are designed with enough space so each operator:
  – Can clean and handle material without interference from other workers or machines.
  – Does not have to stand in the way of passing traffic.
• Provide enough space so employees can bring in and remove materials safely.
Reference: For requirements that apply to Aisles and passageways, see WAC 296-24-73505.

MACHINE CONTROLS AND OPERATIONS

WAC 296-806-20008 Make sure operating controls meet these requirements.
Exemption: This rule does not apply to constant pressure controls used only for setup.
You must:
(1) Make sure each machine has a control that both:
  • Stops the machine;
  •
WAC 296-806-20010  Protect employees from unintentional machine operation.
You must:
(1) Make sure foot-operated controls are located or guarded so that unintentional movement to the "ON" position is unlikely.
(2) Make sure machines will not automatically restart when power is restored after a power failure, if restarting would create a hazard for employees.

Note: Operating controls can be protected from unintentional movement by methods such as covers on foot treads and collars around machinery start buttons.

WAC 296-806-20012  Make sure emergency stop controls meet these requirements.
You must:
• Make sure emergency stop controls, if required, meet all the following:
  – Are red in color.
  – Are easily reached from the operator's normal work position.
  – Are kept in a good working condition.
  – Have to be manually reset before a machine can be restarted.

WAC 296-806-20014  Control machine vibration.
You must:
• Prevent excessive machine vibration that could create a hazard to employees.

WAC 296-806-20016  Prevent overspeed conditions.
You must:
• Operate tools and equipment within their rated speed.

Note: Actions that could cause an overspeed condition include:
  • Installing a more powerful motor.
  • Changing or increasing the power source.
  • Changing attachment size or type, such as a blade or wheel.
  • The attachment speed (rpm) and motor speed (rpm) should match.

WAC 296-806-20018  Make sure hand feeding and retrieval tools meet these requirements.
You must:
• Make sure hand feeding and retrieval tools:
  – Are suitable for the work to be done.
  – Do not create a hazard when used.
  – Are of a size and shape that will keep the operator's hands outside the hazardous area.
  – Are constructed so they will not shatter if they come in contact with the machine tool or tooling.

Note: Hand feeding and retrieval tools, such as push sticks or push blocks, can not be used instead of required safeguarding, unless a specific machine requirement allows it.

WAC 296-806-20020  Protect employees who are adjusting or repairing machinery.
Exemption: This rule does not apply if the machine has to be in motion to properly adjust it.
You must:
• Make sure power-driven machinery is completely stopped before either:
  – Making adjustments or repairs;
  OR
  – Removing material or refuse from the machine.

Reference: For requirements about maintaining and servicing machinery where the unexpected start-up, energization, or release of stored energy could injure an employee are in Lockout/tagout (control of hazardous energy), chapter 296-803 WAC.

POWER TRANSMISSION PARTS
WAC 296-806-20022  Keep power transmission equipment in good working condition.
Definition:
A power transmission part is a mechanical component of a system that provides motion to a part of a machine or piece of equipment.
You must:
• Make sure power transmission parts are kept in good working condition at all times.
  • Keep bearings free from lost motion and well lubricated.

WAC 296-806-20024  Inspect power transmission parts.
You must:
• Inspect power transmission parts at least once every sixty days to make sure that all:
  – Safeguarding meets the requirements of this chapter.
  – Parts are in proper alignment.
  – Bolts and screws that hold power transmission parts together or support the system are tight.

WAC 296-806-20026  Protect employees lubricating moving machinery.
You must:
(1) Protect employees who lubricate moving machinery by:

(2005 Ed.)
SAFEGUARDING REQUIREMENTS

WAC 296-806-20028 Safeguard employees from the point of operation.

IMPORTANT:
If a specific safeguarding method in this chapter is required for machinery or machine parts found in your workplace, follow the specific requirement.
In the absence of a specific safeguarding method required by this or some other chapter, you need to choose a method or combination of methods from the safeguarding requirements found in Safeguarding methods, WAC 296-806-20042 through 296-806-20058. Examples of safeguarding methods include:

• Guards.
• Devices.
• Safeguarding by distance.
• Safeguarding by location.

You must:
• Protect employees from hazards created by the point of operation by using one or more safeguarding methods.

WAC 296-806-20030 Safeguard employees from nip or shear point hazards.

You must:
• Protect employees from hazards created by nip or shear points by using one or more safeguarding methods.

WAC 296-806-20032 Safeguard employees from rotating or revolving parts.

You must:
• Protect employees from hazards created by rotating or revolving parts by using one or more safeguarding methods.

WAC 296-806-20034 Safeguard employees from reciprocating or other moving parts.

You must:
• Protect employees from hazards created by reciprocating or other moving parts by using one or more safeguarding methods.

WAC 296-806-20036 Safeguard employees from flying objects.

You must:
• Protect employees from hazards created by flying objects, including chips, sparks, and fluids by using one or more safeguarding methods.

WAC 296-806-20038 Safeguard employees from falling objects.

You must:
• Protect employees from hazards created by falling objects by using one or more safeguarding methods.

WAC 296-806-20040 Safeguard employees from moving surfaces with hazards.

You must:
• Safeguard employees from hazards created by moving surfaces with hazards such as sharp edges, burrs, and protruding nails and bolts.

SAFEGUARDING METHODS

Guards

WAC 296-806-20042 Make sure guards meet these requirements.

You must:
• Make sure guards do not create additional hazards such as sharp edges or pinch points between the guard and moving machine parts.
  • Make sure guards are:
    – Made of durable materials.
    – Strong enough to withstand the forces to which they are exposed.
    – Securely fastened to the machine, if possible, or to the building structure if they cannot be attached to the machine.
  • Make sure guards protect employees by doing both of the following:
    – Preventing hands or other body parts from reaching through, over, under, or around the guard into the hazard area;
    AND
    – Preventing objects or debris from falling onto or being thrown towards an employee.
  • Make sure barrier guards:
    – Are properly installed, adjusted, and maintained.
    – Have no opening at any point larger than shown in Table 200-1, Largest Allowable Guard Opening.

Reference: Metal cutting shears are allowed to be guarded with properly applied awareness barrier safeguarding as described in ANSI B11.4-1993, Sections 6.3.3.
Table 200-1

Largest Allowable Guard Opening (inches)

<table>
<thead>
<tr>
<th>If the distance (A) from hazard to the guard is:</th>
<th>Then the opening (B) in the guard or between the table and the guard can NOT be greater than:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/2 to 1 1/2</td>
<td>1/4</td>
</tr>
<tr>
<td>1 1/2 to 2 1/2</td>
<td>3/8</td>
</tr>
<tr>
<td>2 1/2 to 3 1/2</td>
<td>1/2</td>
</tr>
<tr>
<td>3 1/2 to 5 1/2</td>
<td>5/8</td>
</tr>
<tr>
<td>5 1/2 to 6 1/2</td>
<td>3/4</td>
</tr>
<tr>
<td>6 1/2 to 7 1/2</td>
<td>7/8</td>
</tr>
<tr>
<td>7 1/2 to 12 1/2</td>
<td>1 1/4</td>
</tr>
</tbody>
</table>

Table 200-1

Largest Allowable Guard Opening (inches)

<table>
<thead>
<tr>
<th>If the distance (A) from hazard to the guard is:</th>
<th>Then the opening (B) in the guard or between the table and the guard can NOT be greater than:</th>
</tr>
</thead>
<tbody>
<tr>
<td>12 1/2 to 15 1/2</td>
<td>1 1/2</td>

DEVICES

WAC 296-806-20044 Make sure devices meet these requirements.

You must:

• Make sure devices used to safeguard employees do either of the following:
  – Stop the motion of a moving part before an employee comes in contact with it and has to be manually reset before machines can be restarted;
  OR
  – Be designed and constructed to prevent the operator from having any part of their body in the danger zone during the hazardous part of the operating cycle.

WAC 296-806-20046 Make sure light curtains meet these requirements.

IMPORTANT:
All devices must meet the general requirements for devices found in, Make sure devices meet these requirements, WAC 296-806-20044.

You must:

• Make sure light curtains, when used:
  – Respond to the presence of an operator's hand, other body part, or a work piece.
  – Have indicators that are easily seen by the operator showing when the device is functioning or has been bypassed.

  Note: Even if a shiny reflective object or work piece is used with a light curtain or other electro-optical device, it should still respond to the operator's hand or other body part.

You must:

• Make sure only authorized persons can make the following adjustments to light curtains:
  – Variations in operating conditions.
  – Fixed or channel blanking.
  – Floating blanking (sometimes referred to as floating channel or floating window features).

• Safeguard access to the point of operation that is not protected by light curtains.

Reference: For more information on light curtains and their requirements, see Performance criteria for safeguarding, ANSI B11.19-2003
WAC 296-806-20048 Make sure pressure-sensitive mats meet these requirements.

IMPORTANT:
All devices must meet the general requirements for devices found in, Make sure devices meet these requirements, WAC 296-806-2004.

You must:
• Make sure pressure-sensitive mats:
  – Detect the presence or absence of the operator or others.
  – Send the stop command and prevent successive machine cycles if any single component fails.
  – Are connected with the machine control system so the device's stop signal immediately stops action of the machine tool and requires use of the start control before the machine can begin another cycle.
  – Are located so that the operator can not reach the recognized hazard before hazardous motion has stopped.
  – Have an indicator easily seen by the operator that shows the mat is operating.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-20048, filed 6/29/04, effective 1/1/05.]

WAC 296-806-20050 Make sure restraint or pullback devices meet these requirements.

IMPORTANT:
All devices must meet the general requirements for devices found in, Make sure devices meet these requirements, WAC 296-806-20044.

You must:
• Make sure restraint or pullback devices:
  – Prevent the operator from reaching into the point of operation or withdraw the operator's hands from the point of operation before motion of the machine creates a hazard.
  – Have fasteners, pins, and other items used to secure and maintain the setting of the device applied in a way that minimizes loosening, slipping, or failure during use.
  – Are worn inside gloves, if used, so if a glove becomes trapped inside a machine or tool, the device can still remove the operator's hand from the hazard area.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-20050, filed 6/29/04, effective 1/1/05.]

WAC 296-806-20052 Make sure two-hand devices meet these requirements.

IMPORTANT:
All devices must meet the general requirements for devices found in, Make sure devices meet these requirements, WAC 296-806-20044.

You must:
• Make sure two-hand devices:
  – Protect each hand device against accidental operation.
  – Require simultaneous operation of both hand devices to begin the cycle, including the first cycle (automatic mode).
  – Are provided with an antirepeat feature when used in single cycle mode.
  – Have a set of devices for each operator if more than one needs to be safeguarded.
  – Are located far enough from the nearest hazard so the operator can not reach the hazard before hazardous motion stops.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-20052, filed 6/29/04, effective 1/1/05.]

WAC 296-806-20054 Make sure devices used with barrier guards meet these requirements.

IMPORTANT:
All devices must meet the general requirements for devices found in, Make sure devices meet these requirements, WAC 296-806-20044.

You must:
• Make sure movable barrier devices:
  – Return to the open position if they encounter an obstruction while enclosing the hazardous area.
  – Are designed so the operator or others cannot reach the hazard by reaching over, under, around or through the device when it is in the closed position.
  – Make sure interlocks used with barrier guards do all of the following:
    – Stop hazardous motion of machines when interlocks are open.
    – Are not easily bypassed.
    – Are designed and installed so that closing the interlocks will not cause a hazard to employees.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-20054, filed 6/29/04, effective 1/1/05.]

DISTANCE

WAC 296-806-20056 Make sure safeguarding by distance meets these requirements.

You must:
• Make sure means used to safeguard by distance do both of the following:
  – Prevent parts or material from falling on employees below;
  – Separate employees on fixed ladders, stairs, floors, or other walking or working surfaces from the hazard by:
    ■ More than seven feet vertically;
    OR
    ■ A horizontal distance that prevents employees from contacting or being injured by the hazard according to the distances in Table 200-2.

TABLE 200-2

SAFE DISTANCES FROM FIXED BARRIERS TO HAZARDS

Table 200-2 helps you identify either the required horizontal distance from the hazard to the barricade (B), or the required height of the barricade (C), as long as you know A and either variable, B or C.
Note: The height and distance requirements of Table 200-2 are designed to safeguard workers from a fixed hazard. If a hazard involves flying chips, fluids, parts or materials, the barrier height, distance, and construction may need to be adjusted to provide adequate protection.

</table>

Note: The height and distance requirements of Table 200-2 are designed to safeguard workers from a fixed hazard. If a hazard involves flying chips, fluids, parts or materials, the barrier height, distance, and construction may need to be adjusted to provide adequate protection.

Examples:
- If the height of the hazard (A) is seventy-eight inches, and the horizontal distance from the hazard to the barricade (B) is fourteen inches, the required height of the barricade (C) is seventy-eight inches.
- If the height of the hazard (A) is eighty-six inches, and the height of the barricade (C) is fifty-five inches, then the required horizontal distance from the hazard to the barricade (B) is twenty inches.

You must:
- Make sure top rails are:
  - Smooth-surfaced.
  - Strong enough to withstand a force of at least two hundred pounds.
  - Between thirty-nine and forty-five inches above the floor, platform, runway, or ramp.
- Make sure guardrails have an intermediate rail (mid-rail) installed approximately halfway between the top rail and the floor, platform, runway, or ramp.
- Make sure rails do not extend beyond the end posts of the guardrail and create a projection hazard.
- Make sure toe boards, if required by this chapter to safeguard a machinery hazard, are:
  - At least four inches high.
  - Securely fastened in place with no more than one-fourth inch between the bottom of the toe board and the floor, platform, runway, or ramp.
  - Made of substantial material that is either solid or that has openings in the material no larger than one inch.

WAC 296-806-20058 Make sure guardrails used for safeguarding meet these requirements.

Note: Guardrails may be used to safeguard:
- Flywheels.
- Cranks and connecting rods.
- Tail rods and extension piston rods.
- Horizontal belts in a power generating room.
- Clutches, cutoff couplings, or clutch pulleys in an engine room occupied only by an attendant.
- Power transmission parts on a runway used only for oiling, maintenance, running adjustment, or repair work.
REQUIREMENTS FOR SPECIFIC MACHINE HAZARDS

WAC 296-806-30002 Fit arbors and mandrels to the machine.

You must:
- Make sure that arbors and mandrels:
  - Have firm and secure bearing.
  - Are free from play.
- Only place or mount attachments on a machine arbor that have been accurately machined to the correct size and shape.

Reference: WAC 296-806-30004 Safeguard belt and rope drives.

You do not need to safeguard the following types of belts when they are operating at two hundred and fifty linear feet per minute or less:
- Flat belts that are:
  - One inch wide or less.
  - Two inches wide or less and have no metal lacings or fasteners.
- Round belts one-half inch or less in diameter.
- Single-strand v-belts 13/32 inch wide or less.

You do not need to safeguard belts that are in a power generating room, only the lower run of a horizontal belt has to be safeguarded.

Reference: WAC 296-806-30006 Make sure belt or rope drives meet these requirements.

You must:
- Safeguard overhead belts located more than seven feet above the floor or working surface if any of the following apply:
  - The belt is located over a passageway or work space and travels at a speed of eighteen hundred feet per minute or more.
  - The distance between the centers of its pulleys is ten feet or more.
  - The belt is wider than eight inches.
- Safeguard the space between the upper and lower runs of a horizontal belt if there is enough room for an employee to pass between them by providing both:
  - A guard along the upper run to keep the belt from contacting the worker or anything they may be carrying;
  - A platform over the lower run that has a railing that is completely filled in with wire mesh or other filler or by a solid barrier.

Reference: WAC 296-806-30008 Protect employees while shifting belts on belt and pulley drives.

You must:
- Safeguard overhand belts located more than seven feet above the floor or working surface if any of the following apply:
  - The belt is located over a passageway or work space and travels at a speed of eighteen hundred feet per minute or more.
  - The distance between the centers of its pulleys is ten feet or more.
  - The belt is wider than eight inches.
- Safeguard the space between the upper and lower runs of a horizontal belt if there is enough room for an employee to pass between them by providing both:
  - A guard along the upper run to keep the belt from contacting the worker or anything they may be carrying;
  - A platform over the lower run that has a railing that is completely filled in with wire mesh or other filler or by a solid barrier.

Exemption: In a power generating room, only the lower run of a horizontal belt has to be safeguarded.

Reference: WAC 296-806-485, later in this chapter for more information.

You must:
- Make sure that arbors and mandrels:
  - Have firm and secure bearing.
  - Are free from play.
- Only place or mount attachments on a machine arbor that have been accurately machined to the correct size and shape.

Note: You may use a nip point and pulley guard on a vertical or inclined belt if it meets all of the following requirements:
- Two and one-half inches wide or less.
- Running at a speed of less than one thousand feet per minute.
- Free from metal lacings or fastenings.

You must:
- Safeguard overhead belts located more than seven feet above the floor or working surface if any of the following apply:
  - The belt is located over a passageway or work space and travels at a speed of eighteen hundred feet per minute or more.
  - The distance between the centers of its pulleys is ten feet or more.
  - The belt is wider than eight inches.
- Safeguard the space between the upper and lower runs of a horizontal belt if there is enough room for an employee to pass between them by providing both:
  - A guard along the upper run to keep the belt from contacting the worker or anything they may be carrying;
  - A platform over the lower run that has a railing that is completely filled in with wire mesh or other filler or by a solid barrier.

Exemption: In a power generating room, only the lower run of a horizontal belt has to be safeguarded.

Reference: WAC 296-806-30004 Safeguard belt and rope drives.

You do not need to safeguard the following types of belts when they are operating at two hundred and fifty linear feet per minute or less:
- Flat belts that are:
  - One inch wide or less.
  - Two inches wide or less and have no metal lacings or fasteners.
- Round belts one-half inch or less in diameter.
- Single-strand v-belts 13/32 inch wide or less.

You do not need to safeguard belts that are in a power generating room, only the lower run of a horizontal belt has to be safeguarded.

Reference: WAC 296-806-30006 Make sure belt or rope drives meet these requirements.

You must:
- Safeguard belt or rope drives that are seven feet or less above the floor or working surface.

Note: You may need to follow additional requirements for sewing machines. See, Sewing machines, WAC 296-806-485, later in this chapter for more information.
You must:
(1) Provide a permanent mechanical belt shifter on belt drives that use either:
• Tight and loose (drive and idler) pulleys;
OR
• A cone pulley.
(2) Protect employees from the nip point of the belt and pulley by either:
• The belt shifter or clutch handle;
OR
• A vertical guard in front of the pulley that extends at least to the top of the largest step of the cone.
(3) Make sure a belt shifter or clutch handle is:
• Rounded to keep the operator from being injured.
• Easy to reach.
• Positioned to reduce the chance of being accidentally moved.
• Located either:
   – Over the machine;
   OR
   – Not higher than six feet six inches above the floor.
(4) Make sure each belt shifter or clutch handle of the same type in your workplace moves in the same direction to stop a machine, that is, either all right or all left.

Exemption: A friction clutch handle on a countershift carrying two clutch pulleys with open and crossed belts is not required to move in the same direction as all other clutch handles or belt shifters if:
• The clutch handle has three positions;
AND
• The machine is at rest when the clutch handle is in the center position.

You must:
(5) Use a belt shifter to shift a belt on and off a fixed pulley.
• When a belt shifter cannot be used, you may use a belt pole if it is both:
   – Smooth;
   AND
   – Large enough to grasp securely.

Note: A belt pole is also known as a “belt shipper” or “shipper pole.”

You must:
(6) Provide a locking-type belt shifter or other positive securing device on woodworking machines driven by belts and shafting.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-30010, filed 6/29/04, effective 1/1/05.]

WAC 296-806-30012 Safeguard cams, connecting rods, tail rods, and extension piston rods.

You must:
• Safeguard cams, connecting rods, tail rods, or extension piston rods that could be contacted by employees.

Reference: In the absence of a specific safeguarding method, follow the safeguarding requirements found in safeguarding methods, WAC 296-806-20044 through 296-806-20056. Examples of safeguarding methods include:
• Guards.
• Devices.
• Safeguarding by distance.
• Safeguarding by location.

You must:
• Make sure guardrails used to safeguard the side or ends of rods are at least fifteen inches away from the rod when it is fully extended.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-30012, filed 6/29/04, effective 1/1/05.]

WAC 296-806-30014 Safeguard chain and sprocket drives.

Exemption: This section does not apply to hand-operated sprockets.

You must:
• Enclose chains and sprocket wheels that are seven feet or less above the floor or working surface.
• Make sure chain and sprocket drive enclosures that extend over machine or other working areas protect workers from falling drive parts.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-30014, filed 6/29/04, effective 1/1/05.]

WAC 296-806-30016 Safeguard fan blades.

Reference: In the absence of a specific safeguarding method, follow the safeguarding requirements found in safeguarding methods, WAC 296-806-20044 through 296-806-20056. Examples of safeguarding methods include:
• Guards.
• Devices.
• Safeguarding by distance.
• Safeguarding by location.

Exemption: A fan is considered guarded if it meets all of the following requirements:
– It is in a basement, tower, or room locked against unauthorized entrance.
– The vertical clearance in passageways between the floor and power transmission beams, ceiling, or any other objects, is not less than five feet six inches.
– The intensity of illumination must be a minimum of ten foot candles when the area is occupied.
– The footing is dry, firm, and level.
– The route followed by the oiler or authorized personnel is protected in such a manner as to prevent accident.
– The periphery of the fan blade is covered by a shroud.

You must:
• Protect employees from exposure to the blades of any fan less than seven feet above the floor or working surface.
• Prevent rods, pipes, or other material being handled by workers, from contacting moving fan blades.

Reference: For guard opening requirements, see Table 200-1, Largest Allowable Guard Opening in, Make sure

[Title 296 WAC—p. 2833]
guards meet these requirements, WAC 296-806-20042.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-30016, filed 6/29/04, effective 1/1/05.]

FLYWHEELS

WAC 296-806-30018 Safeguard flywheels.

You must:
  • Safeguard flywheels that have any part of the wheel seven feet or less above the floor or working surface with either:
    – An enclosure;
    OR
    – A guardrail, at least fifteen inches but no more than twenty inches from the rim.
  • Make sure enclosures that safeguard flywheels located above a working area are strong enough to hold the weight of the wheel, if a shaft or wheel mounting fails.
  • Provide a toeboard on guardrails used to safeguard flywheels that have any part of the wheel within twelve inches of the floor or working surface.
  • Do both of the following to safeguard spoked flywheels that are five feet or less in diameter with smooth rims, when enclosures or guardrails cannot be used:
    – Cover the spokes on the exposed side of the wheel with a disk guard that creates a smooth surface and edge;
    AND
    – Remove or cover keys or other dangerous projections on the wheel that are not covered by the disk guard.

Exemption:
  • You may leave an open space of four inches or less between the outside edge of the disk guard and the rim of the spoked flywheel to make it easier to turn the wheel over.
  • You may use an adjustable guard for the flywheel of a gasoline or diesel engine for starting the engine or for making running adjustments. A slot opening for a jack bar is permitted.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-30018, filed 6/29/04, effective 1/1/05.]

WAC 296-806-30020 Safeguard gears.

You must:
  • Safeguard gears that are seven feet or less above the floor or working surface.

Reference: In the absence of a specific safeguarding method, follow the safeguarding requirements found in safeguarding methods, WAC 296-806-20042 through 296-806-20058. Examples of safeguarding methods include:
  • Guards.
  • Devices.
  • Safeguarding by distance.
  • Safeguarding by location.

Exemption: You do not need to safeguard gears that are not
  • Controlled by lock and key or have similarly restricted access that allows only authorized persons to enter.
  • Is well lit.
  • Has a dry, level, and firm floor.
  • Has a well-marked route with a vertical clearance of at least five feet six inches for authorized employees to follow to perform their duties.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-30020, filed 6/29/04, effective 1/1/05.]

WAC 296-806-30024 Safeguard pulleys.

You must:
  • Safeguard pulleys that have any part of the pulley seven feet or less above the floor or working surface.

Reference: In the absence of a specific safeguarding method, follow the safeguarding requirements found in safeguarding methods, WAC 296-806-20042 through 296-806-20058. Examples of safeguarding methods include:
  • Guards.
  • Devices.
  • Safeguarding by distance.
  • Safeguarding by location.

Exemption: You do not need to safeguard pulleys that are in a room, vault, or similar space that contain only power transmission parts or equipment if the space:
  • Is controlled by lock and key or has similarly restricted access that allows only authorized persons to enter.
  • Is well lit.
  • Has a dry, level, and firm floor.
  • Has a well-marked route with a vertical clearance of at least five feet six inches for authorized employees to follow to perform their duties.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-30024, filed 6/29/04, effective 1/1/05.]

WAC 296-806-30026 Make sure pulleys meet these requirements.

You must:
  (1) Make sure pulleys are designed and balanced for the speed at which they operate.
  (2) Make sure not to use pulleys that are cracked or have a piece broken out of the rim.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-30026, filed 6/29/04, effective 1/1/05.]

WAC 296-806-30028 Safeguard revolving drums, barrels, and containers.

You must:
  • Safeguard revolving drums, barrels, or containers by an enclosure that is interlocked with the drive mechanism so that they cannot revolve unless the enclosure is in place.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-30028, filed 6/29/04, effective 1/1/05.]

WAC 296-806-30030 Safeguard shafting.

Exemption: You do not need to safeguard shafting that is in a room, vault, or similar space that contains only power transmission parts or equipment if the space:
  • Is controlled by lock and key or has similarly restricted access that allows only authorized persons to enter.
  • Is well lit.
  • Has a dry, level, and firm floor.
  • Has a well-marked route with a vertical clearance of at least five feet six inches for authorized employees to follow to perform their duties.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-30030, filed 6/29/04, effective 1/1/05.]

(2005 Ed.)
You must:
- Enclose shafting that is seven feet or less above the floor or working surface.
- Make sure projecting shaft ends either:
  – Have a smooth edge, smooth end, and project no more than one-half the diameter of the shaft;
  OR
  – Are guarded by a nonrotating cap or safety sleeve.
- Safeguard shafting under a bench or table by enclosing it in a stationary casing or by using a trough with sides that both:
  – Cover the shafting to within six inches of the bottom of the table or to within six inches of the floor or working surface, whichever is appropriate;
  AND
  – Extend two inches beyond the end of the shafting.

WAC 296-806-30032 Make sure shafting meets these requirements.
You must:
1. Keep shafting free of:
   - Excessive oil or grease.
   - Rust or pitting from corrosion.
2. Secure shafting against excessive endwise movement.

WAC 296-806-30034 Safeguard unused keyways.
You must:
- Fill, cover, or otherwise safeguard all unused keyways.

WAC 296-806-30036 Make sure revolving collars meet these requirements.
You must:
- Make sure revolving collars are cylindrical.
- Make sure screws or bolts used in the collar do not project beyond the outside of the collar.

WAC 296-806-30038 Safeguard counterweights.
You must:
- Provide safeguarding for all counterweights where employees are exposed to contact.

ADDITIONAL REQUIREMENTS FOR SOME MACHINES AND MACHINE OPERATIONS

WAC 296-806-400 Summary. If your specific machine or operation is not listed here, then follow the "Requirements for all machines" found in this chapter, WAC 296-806-200 and 296-806-300.

Your responsibility: To protect employees from hazards associated with specific machines and their operations in your workplace.

You must:
- Abrasive wheels and machines
- Calenders
- Compactors
- Conveyors
- Food processing equipment
- Forging machines
- Garbage (waste) disposals
- Glue spreaders
- Ironworkers
- Lathes
- Mechanical power presses
- Mills
- Press brakes
- Roll-forming and bending machines
- Sanding machines
- Saws and cutting heads
- Sewing machines

ABRASIVE WHEELS

WAC 296-806-405 Summary.
- In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards.
- Requirements for all machines, WAC 296-806-200 and 296-806-300.

(2005 Ed.)
• You need to refer to Portable power tools, chapter 296-807 WAC for requirements relating to hand-held abrasive wheel tools.

This section applies to machines that are not hand held and that use an abrasive wheel.

**Definition:**
An abrasive wheel is a grinding tool consisting of bonded abrasive grains. This includes diamond and reinforced wheels.

**Your responsibility:**
To make sure abrasive wheel machines and wheels are safe to use.

**You must:**

**GENERAL REQUIREMENTS FOR ABRASIVE WHEELS**
Make sure abrasive wheels and machines are properly designed and constructed
WAC 296-806-40502.
Make sure machines have safety guards
WAC 296-806-40504.
Make sure safety guards meet specific requirements
WAC 296-806-40506.
Provide a tongue guard on bench, pedestal, floorstand, and cylindrical grinders
WAC 296-806-40508.
Use a work rest for off-hand grinding
WAC 296-806-40510.

**MOUNTING ABRASIVE WHEELS**
Make sure abrasive wheels are safe to use
WAC 296-806-40512.
Mount wheels properly
WAC 296-806-40514.
Use proper flanges
WAC 296-806-40516.
Make sure flanges are in good condition
WAC 296-806-40518.
Use specific flanges for Type 1 cutting-off wheels
WAC 296-806-40520.
Use specific flanges for Type 27A cutting-off wheels
WAC 296-806-40522.
Use blotters when required
WAC 296-806-40524.
Meet specific bloter requirements when using modified Types 6 and 11 wheels (terrazzo)
WAC 296-806-40526.

**WAC 296-806-40502** Make sure abrasive wheels and machines are properly designed and constructed.

**You must:**
• Make sure abrasive wheels and machines, including safety guards and flanges, manufactured on or after January 1, 2005, meet the design and construction requirements of American National Standards Institute (ANSI) B7.1-2000, Safety Requirements for the Use, Care and Protection of Abrasive Wheels.

**Note:** There may be a statement on the machine or in the instruction manual that the machine meets the appropriate ANSI standard. If in doubt, check with the manufacturer.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-40502, filed 6/29/04, effective 1/1/05.]

**WAC 296-806-40504** Make sure machines have safety guards. You must:
• Use abrasive wheels only on machines that have safety guards.
• Make sure the safety guard:
  – Is mounted so it maintains proper alignment with the wheel.
  – Is mounted with fasteners strong enough to keep the guard in position if a wheel breaks.
  – Covers the spindle end, nut, and flange projections.

**Exemption:**
Safety guards are not required on machines that use:
• Wheels for internal grinding while advancing, retracting or within the work.
  • Types 16, 17, 18, 18R, and 19 cones and plugs and threaded hole pot balls where either:
    – The work offers protection;
  OR
    – The size does not exceed three inches in diameter by five inches long.
  • Notched, segmented, or continuous rim metal centered diamond lapidary wheels that are:
    – Used with a coolant deflector;
  AND
    – Operated at 3,500 SFPM or less.
  • Type 1 reinforced wheels that are:
    – Three inches or less in diameter.
    – One-fourth inch or less thick.
    – Operating at peripheral speeds of 9,500 SFPM or less.
    – Used by operators wearing safety glasses and face shields.
    – Valve seating grinding wheels.
  • Remotely operated machines in an enclosure that will retain the pieces of a broken wheel.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-40504, filed 6/29/04, effective 1/1/05.]

**WAC 296-806-40506** Make sure safety guards meet specific requirements.

**You must:**
• Make sure the machine safety guards meet the requirements of Table 405-1, Guard Requirements.

**Definition:**
Maximum exposure angle is the largest part of a wheel that does not need to be covered by a safety guard.

**Note:**
• The maximum exposure angle is measured by lines starting at the center of the spindle and extending to the ends of the guard at the wheel periphery.
• Visors and other accessory equipment are used in determining the size of the guard opening only if they are at least as strong as the safety guard.
WAC 296-806-40508 Provide a tongue guard on bench, pedestal, floorstand, and cylindrical grinders.

You must:

- Make sure, if the operator stands in front of the opening in the safety guard, that the safety guard (tongue guard) at the top of the opening is adjusted to within one-fourth inch of the wheel.

**Definition:**

The tongue guard is an integral part of a safety guard that is located where the upper exposed part of the abrasive wheel meets the safety guard. It can be adjusted as necessary to maintain a set distance from the constantly decreasing diameter of the wheel.

---

### Table 405-1

<table>
<thead>
<tr>
<th>Machine</th>
<th>Maximum exposure angle and other guard restrictions</th>
</tr>
</thead>
</table>
| Bench, pedestal, or floorstand grinders | • Not higher than sixty-five degrees above the horizontal centerline of the wheel  
• One-fourth (ninety degrees) of the wheel for grinding done at or above the horizontal centerline of the wheel  
• One hundred twenty-five degrees if the work has to contact the wheel below the horizontal centerline of the wheel |
| Cylindrical grinders             | • One-half (one hundred eighty degrees) of the wheel  
• Not higher than sixty-five degrees above the horizontal centerline of the wheel |
| Surface grinders                 | • One hundred fifty degrees of the wheel  
• Not higher than fifteen degrees below the horizontal |
| Cutting-off machines             | • One-half (one hundred eighty degrees) of the wheel |
| Swing frame grinders             | • One-half (one hundred eighty degrees) of the wheel  
• Encloses the top one-half of the wheel |
| Swing frame grinders using cup wheels | • One-half (one hundred eighty degrees) of the wheel  
• Covers the wheel on the side towards the operator |
| Semiautomatic snagging machines  | • One-half (one hundred eighty degrees) of the wheel  
• Covers the wheel on the side towards the operator |
| Machines used for top grinding   | • As small as possible up to one-sixth (sixty degrees) of the wheel |

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-40508, filed 6/29/04, effective 1/1/05.]

WAC 296-806-40510 Use a work rest for off-hand grinding.

**Exemption:**

You do not need to use a work rest if:

- The size, shape, weight or finishing area of the workpiece prevents its use;
- Or
  - Contact with the grinding wheel below the horizontal plane of the spindle is necessary.

**You must:**

- Use a work rest to support the work.
- Make sure the work rest is:
  - Rigidly constructed.
  - Adjustable to compensate for wheel wear.
  - Adjusted only when the wheel is stopped.
  - Securely clamped after each adjustment.
  - Kept within one-eighth inch of the wheel.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-40510, filed 6/29/04, effective 1/1/05.]

WAC 296-806-40512 Make sure abrasive wheels are safe to use.

**You must:**

- Do the following before mounting a wheel:
  - Visually inspect the wheel for cracks or damage.
  - Perform a ring test for cracks if the size and shape of the wheel permits testing.
  - Make sure the spindle speed of the machine is not greater than the operating speed of the wheel.

- Make sure a damaged or cracked wheel is not mounted or used.

**Note:** Wheels that have gouges, grooves, other damage, or material buildup on the grinding surface need to be dressed or trued to correct the problem. Wheels that cannot be trued are considered damaged and cannot be used.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-40512, filed 6/29/04, effective 1/1/05.]

WAC 296-806-40514 Mount wheels properly.

**You must:**

1. Make sure wheels fit freely on the spindle, wheel sleeves, or adaptors, and remain free under all grinding conditions.
2. Make sure wheel, blotter and flange surfaces that contact each other are flat and free of foreign particles.
3. Make sure any reducing bushing used in the wheel hole:
   - Fits freely on the spindle and maintains proper clearance;
   - AND
   - Does not exceed the width of the wheel or contact the flanges.
4. Make sure that multiple wheels mounted between a single set of flanges are either:
   - Cemented together;
   - OR
   - Separated by spacers that have a diameter and bearing surface that is the same as the mounting flanges.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-40514, filed 6/29/04, effective 1/1/05.]
WAC 296-806-40516 Use proper flanges.

You must:
- Mount all abrasive wheels between flanges that have a diameter at least one-third the diameter of the wheel.

Exemption: This flange requirement does not apply to the following wheels:
- Mounted wheels (wheels permanently bonded to a shaft or mandrel).
- Abrasive disc wheels (inserted nut, inserted washer and projecting stud type).
- Plate mounted wheels.
- Cylinder, cup, or segmental wheels mounted in chucks.
- Types 27, 28, and 29 wheels.
- Internal wheels less than two inches in diameter.
- Modified Type 6 and 11 wheels (terrazzo).
- Types 1 and 27A cutting-off wheels.

You must:
- Make sure flanges are:
  - Dimensionally accurate.
  - Properly balanced.
  - Flat.
  - Free of rough surfaces or sharp edges.
- Make sure the driving flange is:
  - Part of the spindle;
OR
  - Securely fastened to the spindle.
- Make sure, if a wheel is mounted between two flanges, that both flanges:
  - Are the same diameter;
  - Have equal bearing surfaces.

Exemption: The following wheels do not require same diameter, equal bearing surface flanges:
- Types 27, 28, and 29 wheels with adaptors.
- Modified Types 6 and 11 wheels with tapered K dimension.
- Internal wheels less than two inches in diameter.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-40516, filed 6/29/04, effective 1/1/05.]

WAC 296-806-40518 Make sure flanges are in good condition.

You must:
- Make sure flange bearing surfaces are in good condition.
- Replace or remachine a flange with a mounting surface that has any of the following problems:
  - Warped.
  - Burred on the bearing surface.
  - Excessively worn (thickness or diameter).
  - Out of true.

Reference: Flanges that are refaced or trued need to satisfy minimum dimension requirements specified in Safety Requirements for the Use, Care and Protection of Abrasive Wheels, ANSI B7.1-2000.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-40518, filed 6/29/04, effective 1/1/05.]

WAC 296-806-40520 Use specific flanges for Type 1 cutting-off wheels.

You must:
- Mount Type 1 cutting-off wheels between flanges that are:
  - Properly relieved with matching bearing surfaces.
  - At least one-fourth the wheel diameter.

WAC 296-806-40522 Use specific flanges for Type 27A cutting-off wheels.

You must:
- Mount Type 27A cutting-off wheels between flanges that are:
  - Flat (unrelieved) with matching bearing surfaces;
  - At least one-fourth the wheel diameter.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-40520, filed 6/29/04, effective 1/1/05.]

WAC 296-806-40524 Use blotters when required.

You must:
- Use a blotter between each flange and the abrasive wheel surface to uniformly distribute flange pressure.
- Make sure the blotter covers the entire flange contact area.
- Use a new blotter each time a wheel is mounted unless the wheel has a blotter already attached to it by the manufacturer.
- Make sure scuffed or damaged blotters are not used.

Exemption: You do not need to use a blotter with any of the following:
- Mounted wheels (wheels permanently bonded to a shaft or mandrel).
- Abrasive disc and Type 2 wheels which are mounted by inserted nuts, inserted washers, or projecting studs.
- Plate mounted wheels.
- Wheels mounted in chucks (such as cylinders and segmental wheels).
- Types 27, 28, and 29 wheels.
- Type 1 and Type 27A cutting-off wheels.
- Internal wheels less than two inches in diameter.
- Diamond and cubic boron nitride wheels with metal or carbon fiber cores.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-40524, filed 6/29/04, effective 1/1/05.]

WAC 296-806-40526 Meet specific blotter requirements when using modified Types 6 and 11 wheels (terrazzo).

You must:
- Apply the blotter to the flat side only when mounting Modified Types 6 and 11 wheels (terrazzo).

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-40526, filed 6/29/04, effective 1/1/05.]

Calenders

WAC 296-806-410 Summary. In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards:
- Requirements for all machines, WAC 296-806-200 and 296-806-300.

This section applies only to hazards associated with calenders in the rubber and plastics industry where two or more metal rolls are set vertically and revolving in opposite directions.

[Title 296 WAC—p. 2838] (2005 Ed.)
Your responsibility:
To protect employees from hazards associated with calenders.

You must:
Provide calender safety controls
WAC 296-806-41002.
Follow these stopping limit requirements for calenders
WAC 296-806-41004.

Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-410, filed 6/29/04, effective 1/1/05.

WAC 296-806-41002 Provide calender safety controls.

Exemption: These rules do not apply to calenders if the machinery is permanently set up so employees:
• Cannot reach through, over, under, or around to come in contact with the roll bite;
OR
• Cannot be caught between a roll and nearby objects.

You must:
(1) Provide a safety trip control for the face of the calender that meets all of the following:
• Provided in front and back of each calender.
• Is accessible.
• Operates readily upon contact.
(2) Provide at least one of the following safety trip controls for the face of the calender:
• Safety trip rods, tripwire cables or wire center cords that:
  – Are within reach of the operator and the bite (nip point).
  – Operate whether pushed or pulled.
  – Are located across each pair of in-running rolls extending the length of the face of the rolls.
• Pressure sensitive body bars that:
  – Are approximately forty inches vertically above the working level.
  – Are horizontally at thirty-four inches from the in-running nip point.
  – Operate readily by pressure of the mill operator's body.
(3) Include safety trip rods, cables or cords, in addition to the pressure sensitive body bars, if both of these apply:
• In-running rolls are located below the bar;
AND
• The operator needs to duck under the bar.
(4) Provide a safety cable or wire center cord on both sides of the calender that:
• Operates readily when pushed or pulled.
• Is connected to the safety trip.

Note:
• The center cord should be all of the following:
  – Twelve inches or less from the faces of the individual rolls.
  – At least two inches from the calender frame.
  – Anchored to the frame not more than six inches from the floor or operator's platform.

Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-41002, filed 6/29/04, effective 1/1/05.

(2005 Ed.)

WAC 296-806-41004 Follow these stopping limit requirements for calenders.

You must:
• Make sure that calenders are stopped within one and three-quarters percent of the fastest speed at which they operate when empty.
  – When calenders operate at more than two hundred fifty feet per minute, stopping distances above one and three-quarters percent of their fastest speed are allowed, but must have engineering support.

Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-41004, filed 6/29/04, effective 1/1/05.

COMPACTORS

WAC 296-806-415 Summary. In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards:
• Requirements for all machines, WAC 296-806-200 and 296-806-300.
  This section applies to all stationary compactors in your workplace.

You must:
Safeguard hazardous moving parts of stationary compactors
WAC 296-806-41502.
Follow these requirements for compactor controls
WAC 296-806-41504.
Follow these requirements for compactor access doors and covers
WAC 296-806-41506.
Follow these requirements for compactors that cycle automatically
WAC 296-806-41508.

Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-415, filed 6/29/04, effective 1/1/05.

WAC 296-806-41502 Safeguard hazardous moving parts of stationary compactors.

You must:
• Prevent the compactor from operating while employees have any body parts in the compactor or hazard area.
• Provide a safeguarding method that prevents employees from putting hands, fingers, or any body part into the compactor during operation.

Note:
Examples of safeguarding methods include:
• Making sure the compactor will not compact material while the gate or door is open.
• Installing a guard, loading hopper, or enclosure at least forty-two inches high that prevents:
  – Entry of hands, fingers, or any body part into the loading chamber during operation.
  – An operator from being caught between moving parts of the equipment and material.
  – The creation of any hazard between the guard and moving parts.
• You may also provide sustained manual pressure controls located so the operator cannot reach, but can still see, the point of operation if a guard is not used.

[Title 296 WAC—p. 2839]
296-806-41504  Follow these requirements for compactor controls.

You must:
- Follow these requirements for compactor controls:
  - Each control must have its function clearly labeled.
  - Controls must be designed and located to prevent them from unintentionally activating.
  - Electric stop buttons, including emergency stop buttons, must be:
    - Red in color, distinguishable from all other controls by size, and not recessed.
    - Emergency stop controls must be either:
      - Readily accessible to the operator;
      - Located within three feet (91.4 cm) of the point of operation or feed area or if chute fed, within three feet (91.4 cm) of the access door.
- An electrical disconnect must be located within sight, no more than fifty feet (1,524 cm), from the operating control panel.

WAC 296-806-41506  Follow these requirements for compactor access doors and covers.

You must:
- Make sure access covers meet at least one of the following:
  - Interlocked.
  - Secured by a lockable device.
  - Removable by hand tools only.
- Make sure any loading chamber access door has an interlock system that prevents cycling motion when the door is open.

WAC 296-806-41508  Follow these requirements for compactors that cycle automatically.

You must:
- Use automatic cycling controls only on compactors where the loading chamber is located so that it cannot be accessed during operation.

CONVEYORS

WAC 296-806-420  Summary. If your specific conveyor or operation is not listed here, then follow any general requirements in this section along with the "Requirements for all machines" found in this chapter, WAC 296-806-200 and 296-806-300.

This section applies to hazards related to conveyors and conveying systems, including bulk material, package, or unit handling types. These requirements are designed to protect employees operating, maintaining, cleaning, and working around conveyors.

Exemption: This section does not apply to conveyor systems used primarily for moving people.

Your responsibility:
To make sure all conveyors in your workplace are constructed, operated, and maintained in a safe manner.

You must:
- GENERAL REQUIREMENTS FOR CONVEYORS
  Follow these requirements for conveyors WAC 296-806-42002.
  Provide emergency stops on conveyors WAC 296-806-42004.
  Label conveyor controls WAC 296-806-42006.
  Prohibit riding on conveyors WAC 296-806-42008.
  Provide safe access to conveyors WAC 296-806-42010.
  Provide backstop or antirunaway devices to incline, decline, or vertical conveyors WAC 296-806-42012.
  Make only safe alterations to conveyors WAC 296-806-42014.
  Inspect and replace worn conveyor parts WAC 296-806-42016.
  Follow these requirements for replacing conveyor parts WAC 296-806-42018.
  Follow these requirements for spill guards WAC 296-806-42020.
  Provide pedestrian overpasses for conveyors WAC 296-806-42022.
  Guard openings to hoppers and chutes WAC 296-806-42024.
  Install guideposts WAC 296-806-42026.
- BELT CONVEYORS
  Guard nip points on belt conveyors WAC 296-806-42028.
  Install emergency stop controllers on overland belt conveyors WAC 296-806-42030.
  Install belt conveyor overpasses WAC 296-806-42032.
- CHAIN CONVEYORS
  Safeguard chain conveyors WAC 296-806-42034.
  Guard return strands on chain conveyors WAC 296-806-42036.
  Guard chain conveyors that are used as a transfer mechanism WAC 296-806-42038.
- ELEVATOR CONVEYORS
  Prevent material from falling off of elevator conveyors WAC 296-806-42040.
- INCLINED RECIPROCATING CONVEYORS (SHAKERS)
  Provide protection where employees must load shakers WAC 296-806-42042.
Provide grating over silo and bunker openings for shuttle conveyors
WAC 296-806-42044.

MOBILE CONVEYORS
Guard wheels and rails on mobile conveyors
WAC 296-806-42046.
Prevent hazardous motion on mobile conveyors
WAC 296-806-42048.
Provide a detector for mobile conveyors
WAC 296-806-42050.
Provide safe access on mobile conveyors
WAC 296-806-42052.

PUSHER-BAR CONVEYORS
Guard pusher-bar conveyors
WAC 296-806-42054.

ROLLER CONVEYORS
Prohibit walking on roller-type conveyors
WAC 296-806-42056.
Use speed controls for roller and wheel conveyors
WAC 296-806-42058.
Safeguard belt-driven live roller conveyors
WAC 296-806-42060.

SCREW CONVEYORS
Guard screw conveyors
WAC 296-806-42062.

SKIP HOISTS
Provide slack-cable switches on hoists
WAC 296-806-42064.
Block the skip bucket and counterweight guides
WAC 296-806-42066.
Protect against wire rope coming off sheaves
WAC 296-806-42068.

SLAT AND ROLLER-SLAT CONVEYORS
Safeguard slat and roller-slat conveyors
WAC 296-806-42070.

TOWED CONVEYORS
Provide a safe method for disengaging the tow pin
WAC 296-806-42072.
Protect employees from moving carts on towed conveyors
WAC 296-806-42074.
Provide clearances and warnings for carts on towed conveyors
WAC 296-806-42076.
Mark projections above the floor
WAC 296-806-42078.

GENERAL REQUIREMENTS FOR CONVEYORS

WAC 296-806-42002 Follow these requirements for conveyors.
You must:
• Construct, operate, and maintain all conveyors according to this chapter and the American National Standards Institute (ANSI) B20.1-1957.
• Make sure all new conveyors constructed after January 1, 2005, meet the requirements of the American Society of Mechanical Engineers (ASME) B20.1-1996.

(2005 Ed.)
296-806-42012 Provide backstop or anti-runaway devices on incline, decline, or vertical conveyors.

You must:
• Make sure all incline, decline, or vertical conveyors use backstop or anti-runaway devices when there is a danger of conveyor reversal or runaway.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42012, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42014 Make only safe alterations to conveyors.

You must:
• Make sure, when making conveyor alterations, that you do not affect safety characteristics such as emergency stop controls, guards, or the incline of the conveyor, if such changes would create a danger to workers.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42014, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42016 Inspect and replace worn conveyor parts.

You must:
• Carefully inspect and replace any conveyor part that shows signs of significant wear before it becomes a hazard.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42016, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42018 Follow these requirements for replacing conveyor parts.

You must:
• Make sure replacement conveyor parts are equal to or exceed the manufacturer’s specifications.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42018, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42020 Follow these requirements for spill guards.

You must:
• Install protective or spill guards wherever conveyors pass next to or over working areas or passageways.
  – These guards must be designed to catch and hold any materials that may become dislodged or fall off.

Reference: For specific requirements when conveyors pass over emergency exit routes, see Exit routes, WAC 296-800-310.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42020, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42022 Provide pedestrian overpasses for conveyors.

You must:
• Provide a pedestrian overpass covering the full width of a passageway if one of these conditions exists:
  – The working strand of a conveyor crosses within three feet of floor level.
  – Workers must step over the strand and trough at or below floor level.
• Provide a pedestrian overpass where workers cannot pass under the conveyor safely.
  – The sides of the crossing platform must have standard railings if one of the following exists:
  ■ The overpass is more than four feet high.
  ■ The conveyor feeds a dangerous machine such as saws, chippers, hogs, or galvanizing tanks.

Reference: For guardrail requirements see, Railing, toeboards, and cover specifications, WAC 296-24-75011.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42022, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42024 Guard openings to hoppers and chutes.

You must:
• Guard all openings to hoppers, chutes, and elevator-type conveyors to prevent workers from:
  – Falling or stepping into them.
  – Making any kind of bodily contact with conveyors.

Note: Grating provided at floor level with no openings larger than two inches (50 mm) that is strong enough to withstand any load of personnel or trucks that may be imposed upon it is acceptable guarding.

You must:
• Do all of the following when dumping operations use chutes or hoppers that are flush with the floor and their use cannot be guarded:
  – Place a temporary guardrail around ground or floor-level hoppers when dumping operations are not in progress.
  – Post warning signs in a conspicuous location alerting personnel to the presence of an open pit in order to protect employees when dumping operations are in progress.

Reference: For guardrail requirements see, Railing, toeboards, and cover specifications, WAC 296-24-75011.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42024, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42026 Install guideposts.

You must:
• Install guideposts to direct employees driving trucks, loaders, or other equipment to the pit, hopper, or chute.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42026, filed 6/29/04, effective 1/1/05.]

BELT CONVEYORS

WAC 296-806-42028 Guard nip points on belt conveyors.

Exemption: This rule does not normally require guards along the conveyor at the point where the belt rides on return rollers, such as return-belt idlers, unless hazardous conditions such as long, tight heavy belts exist.
Return-belt idlers

You must:
- Place nip point guards at all of these points:
  - Where the belt wraps around the pulley.
  - At terminals, take-ups, and snub rollers where the belt changes directions at transfers and deflectors.
  - At the discharge end.
  - At other points where workers may be injured by nip or shear points.

Note: The practice of applying a belt dressing or other foreign material to a rotating drive pulley or a conveyor belt is hazardous and should be avoided.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42028, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42030 Install emergency stop controllers on overland belt conveyors.
You must:
- Install permanent emergency pull cords or similar emergency stop controllers at points where workers are normally stationed along overland belt conveyors.

Note: Personnel that patrol overland belt conveyors may use portable emergency stop controllers instead of permanently installed pull cords and push-button stations.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42030, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42032 Install belt conveyor overpasses.
You must:
- Install a pedestrian overpass or underpass along the sides of long overland belt conveyors, where there is the most foot traffic.
  - The distance between overpasses should not exceed three hundred meters or one thousand feet.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42032, filed 6/29/04, effective 1/1/05.]

ELEVATOR CONVEYORS

WAC 296-806-42040 Prevent material from falling off of elevator conveyors.
You must:
- Install strong guards, screens, or barricades to prevent material from falling in any direction into the shaft way of elevator-type conveyors, except at loading and unloading areas.
  - Install automatic shaft way gates or suitable barriers at each floor level where material is loaded or unloaded.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42040, filed 6/29/04, effective 1/1/05.]
INCLINED RECIPROCATING CONVEYORS
(SHAKERS)

WAC 296-806-42042 Provide protection where employees must load shakers.
You must:
• Provide standard guardrails or snap chains along loading sides of the shaker where personnel must load or unload material.
  – Snap chains must be at least thirty-nine inches high at their lowest point.
• Make sure controls are located so the conveyor cannot be started by an employee on the moving part of the conveyor.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42042, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42044 Provide grating over silo and bunker openings for shuttle conveyors.
You must:
• Provide grating with openings to match the size of the material being discharged into silos or bunkers. Make sure openings are:
  – Small enough so that workers cannot fall through.
  – Protected by other effective means if the material size requires openings large enough for a worker to fall through.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42044, filed 6/29/04, effective 1/1/05.]

MOBILE CONVEYORS

WAC 296-806-42046 Guard wheels and rails on mobile conveyors.
You must:
• Install sweeps in front of the nip points created by the wheels and rails to deflect objects that could derail the conveyor.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42046, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42048 Prevent hazardous motion on mobile conveyors.
You must:
• Make sure mobile conveyors have at least one of the following to prevent hazardous motion:
  – Brakes.
  – Rail clamps.
  – Other position-locking devices.
• Provide limit switches that will stop travel when exceeding the design limits of rail-mounted mobile conveyors.
• Provide rail stops to keep the conveyor from traveling past its designed end location.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42048, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42050 Provide a detector for mobile conveyors.
You must:
• Provide a detector to stop conveyor movement when the operation creates a danger of running into a stockpile or other obstacle.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42050, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42052 Provide safe access on mobile conveyors.
You must:
• Make sure that access stairways, ladders, and platforms are designed and located to avoid the shear or nip point hazards of the conveyor and moving machinery.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42052, filed 6/29/04, effective 1/1/05.]

PUSHER-BAR CONVEYORS

WAC 296-806-42054 Guard pusher-bar conveyors.
You must:
• Provide a guard when hazards exist at each of these points:
  – At the discharge point where the bar passes through the bed.
  – Where there is a shear point between the return pusher bar and a frame member.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42054, filed 6/29/04, effective 1/1/05.]

ROLLER CONVEYORS

WAC 296-806-42056 Prohibit walking on roller-type conveyors.
You must:
• Prohibit employees from walking on the rolls of roller-type conveyors.
  – Tread plates or other types of walkways can be used between the rollers as a walking surface for operators when performing their duties.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42056, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42058 Use speed controls for roller and wheel conveyors.
You must:
• Avoid safety hazards created by unit or package speeds by one of the following methods:
  – Limiting the length of the sloped run.
  – Using speed retarders or brakes.
  – Other means of providing speed control.
• Make sure rollers and wheels are free running to prevent locked wheels from steering or pulling materials to one side or off the conveyor.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42058, filed 6/29/04, effective 1/1/05.]

[Title 296 WAC—p. 2844]
WAC 296-806-42060 Safeguard belt-driven live roller conveyors.

You must:
• Guard belt and roller nip points by one of the following methods:
  – Space load-carrying rollers to prevent access to the belt and roller nip points.
  – Insert rods or plates between the rollers to prevent access to the belt and roller nip points.
  – Use rollers that pop out when something contacts the nip point.
• Distance safeguarding found in:
  ■ Make sure safeguarding by distance meets these requirements, WAC 296-806-20056.

Reference: For nip points and shear hazards on power-driven (live) roller conveyors see, Guard nip points on belt conveyors, WAC 296-806-42028.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42062, filed 6/29/04, effective 1/1/05.]

SCREW CONVEYORS

WAC 296-806-42062 Guard screw conveyors.

You must:
• Enclose the rotating screw to prevent contact with the shear points where it passes the sides of the trough or casing.
• Guard screw conveyors requiring an open housing by using one of the following:
  – Make sure safeguarding by distance meets these requirements, WAC 296-806-20056.
  – Make sure guardrails used for safeguarding meet these requirements, WAC 296-806-20058.
• Construct feed openings for shovel, front-end loader, or other manual or mechanical equipment so that the conveyor screw is covered by a grating.
  – If the nature of the material is such that a grating cannot be used, then the exposed section of the conveyor must be guarded by a railing and warning signs.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42062, filed 6/29/04, effective 1/1/05.]

SKIP HOISTS

WAC 296-806-42064 Provide slack-cable switches on hoists.

You must:
• Provide and arrange slack cable switches to cut power to the drive and set the brake when the skip or counterweight hoisting ropes either:
  – Develop slack;
  OR
  – Lose tension due to sticking in the guides, over travel, or for any other reason.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42064, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42066 Block the skip bucket and counterweight guides.

You must:
• Make sure the skip bucket and counterweight are blocked in their guides when the brake or any part of the drive train between the brake and the drum shaft are being repaired or replaced.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42066, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42068 Protect against wire rope coming off sheaves.

You must:
• Fit all sheaves with sheave guards to prevent the wire rope from coming off under slack cable or similar conditions.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42068, filed 6/29/04, effective 1/1/05.]

SLAT AND ROLLER-SLAT CONVEYORS

WAC 296-806-42070 Safeguard slat and roller-slat conveyors.

You must:
• Provide either of these safeguards at the tail end of a slat conveyor if the slats are above the centerline of the chain: – A guard over the hazardous tail end;
  OR
  – Warning signs if guards are impractical because of material flowing over the tail sprocket.
• Provide either of these safeguards when there is a gap between the slats wide enough to permit access to cross members below the slats:
  – A continuous pan under the slats;
  OR
  – Keep all cross members a safe distance from the slats.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42070, filed 6/29/04, effective 1/1/05.]

TOWED CONVEYORS

WAC 296-806-42072 Provide a safe method for disengaging the tow pin.

You must:
• Provide a method for the operator to disengage the tow pin from a conveyor pusher without being in front of the cart.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42072, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42074 Protect employees from moving carts on towed conveyors.

You must:
• Make sure runaway carts are unable to exit ramps and enter work areas.
  • Have a barrier of sufficient strength and height on ramps with pedestrian or traffic aisles to prevent a runaway cart from entering the aisle.
  • Have signs warning employees not to enter ramps that do not have pedestrian or traffic aisles.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42074, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42076 Provide clearances and warnings for carts on towed conveyors.

You must:
• Provide clearance space for personnel in all of the following:

(2005 Ed.)
– Between the sides of carts.
– Between any load overhanging the side of a cart.
– Any fixed or moving object.
• Identify the cart path with floor stripes that are:
  – Parallel to the cart path.
  – Arranged so one line is on each side of the path.
  – Located a safe distance from the edge of the cart or overhanging load.
• Mark reduced clearance areas with appropriate warning signs.
  Note: An example of a reduced clearance area is an area where a cart goes through a wall opening.

You must:
• Place an appropriate warning on those areas where a cart may unexpectedly change direction, such as switching off the main line into a transfer conveyor or a spur.
  Note: An example of an appropriate warning would be to use diagonal stripes on the floor between clearance lines.

You must:
• Install a sign, signal, or other warning where carts start automatically.

FOOD PROCESSING EQUIPMENT

WAC 296-806-425 Summary. If your specific food processing machine or operation is not listed here, then follow any facilities requirements in this section along with the "Requirements for all machines" found in this chapter, WAC 296-806-200 and 296-806-300.

This section applies to:
• All businesses that manufacture or process food, whether or not they are contained inside food stores;
  AND
• The design, installation, operations, and maintenance of machinery and equipment used in the food processing industry.

Your responsibility:
To protect employees from hazards associated with food processing facilities and machines.

You must:

FACILITIES
Provide locks on chamber doors of large air conditioning units
WAC 296-806-42502.
Use proper door locks on rack-type bread coolers
WAC 296-806-42504.
Provide see-through panels on fermentation room doors
WAC 296-806-42506.
Cover exposed hot pipes

WAC 296-806-42508.
Provide extension piping on stationary lubrication fittings
WAC 296-806-42510.
Provide hoods for pan-washing tanks
WAC 296-806-42512.
Safeguard proof boxes
WAC 296-806-42514.
Safeguard storage bins
WAC 296-806-42516.

MATERIAL HANDLING

Follow these design requirements for bag lifts (bag arm elevators) and chutes
WAC 296-806-42518.
Follow these requirements for chain tackle
WAC 296-806-42520.
Safeguard conveyors
WAC 296-806-42522.
Use properly designed covers for screw conveyors (augers)
WAC 296-806-42524.
Safeguard pallet jacks and hand trucks
WAC 296-806-42526.

SPECIFIC FOOD PROCESSING EQUIPMENT

Safeguard bakery slicers
WAC 296-806-42528.
Safeguard bakery wrapping machines
WAC 296-806-42530.
Provide troughs with antifriction-bearing casters
WAC 296-806-42532.
Follow these requirements for trough hoists and similar equipment
WAC 296-806-42534.
Follow these requirements for dividers
WAC 296-806-42536.
Safeguard manually-fed dough and cross-roll brakes
WAC 296-806-42538.
Provide a guard or tripping device on reversible dough brakes
WAC 296-806-42540.
Follow these requirements for doughnut machines
WAC 296-806-42542.
Follow these requirements for dumpbins and blenders
WAC 296-806-42544.
Follow these requirements for flour-handling machines
WAC 296-806-42546.
Follow these requirements for traveling or track-type flour scales
WAC 296-806-42548.
Follow these requirements for food grinders and cutters
WAC 296-806-42550.
Provide covers with interlocks on ingredient premixers, emulsifiers, and similar machines
WAC 296-806-42552.
Follow these requirements for open fat kettles
WAC 296-806-42554.
Follow these requirements for steam kettles
WAC 296-806-42556.
Follow these requirements for chocolate melting, refining, and mixing kettles
WAC 296-806-42558.
Safeguard meat-processing equipment (circular meat-cutting saws)

WAC 296-806-42560.
Follow these requirements for horizontal dough mixers
WAC 296-806-42562.
Follow these requirements for vertical mixers
WAC 296-806-42564.
Follow these requirements for mechanical-feed moulders
WAC 296-806-42566.
Follow these requirements for hand-fed moulders
WAC 296-806-42568.
Design, install, and construct your ovens according to these requirements
WAC 296-806-42570.
Properly locate emergency "stop" buttons and main shut-off valves for ovens
WAC 296-806-42572.
Inspect and test safety devices on ovens
WAC 296-806-42574.
Follow these requirements for peanut-cooling trucks
WAC 296-806-42576.
Follow these requirements for pretzel-rolling, pretzel-stick extruding, rotary, and die machines
WAC 296-806-42578.
Safeguard box and roll-type dough sheeters
WAC 296-806-42580.
Provide proper enclosures for sifters
WAC 296-806-42582.
Follow these requirements for sugar and spice pulverizers
WAC 296-806-42584.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42508, filed 6/29/04, effective 1/1/05.]

FACILITIES

WAC 296-806-42502 Provide locks on chamber doors of large air conditioning units.
You must:
• Make sure all door locks on air conditioning unit chambers, that are large enough for employees to enter, can be operated from both inside and outside the chamber.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42502, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42504 Use proper door locks on rack-type bread coolers.
You must:
• Make sure all door locks can be operated from both inside and outside the bread cooler.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42504, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42506 Provide see-through panels on fermentation room doors.
You must:
• Provide shatterproof, see-through panels, made of wire glass or plastic, on fermentation room doors.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42506, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42508 Cover exposed hot pipes.
You must:
• Cover exposed hot (160°F or more) water and steam pipes with insulating material wherever necessary to prevent employee contact.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42508, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42510 Provide extension piping on stationary lubrication fittings.
You must:
• Provide extension piping on stationary lubrication fittings to prevent workers from reaching into the hazardous area when lubricating moving machinery.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42510, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42512 Provide hoods for pan-washing tanks.
Exemption:  This requirement does not apply to dishwashers or sanitizers used in restaurants or retail establishments.
You must:
• Provide power-ventilated exhaust hoods over the tank.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42512, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42514 Safeguard proof boxes.
You must:
(1) Make sure all door locks can be operated from both inside and outside the proof box.
(2) Provide guide rails to center the racks as they enter, pass through, and leave the proof box if pans, boards, or trays may be easily dislodged.
• Guide rails are not required in proof boxes unless there are two doors with a pass through or pull through design.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42514, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42516 Safeguard storage bins.
Exemption:  This requirement does not apply to under-the-counter ingredient bins found in retail stores.
You must:
(1) Provide locks or latches to keep storage bin covers closed, and gaskets or other equivalent devices, to make sure covers are dust tight.
(2) Make sure employees lock covers in the open position when entering bins.
• Covers for bins that employees may enter must have a metal fastener (hasp) and lock that can be locked in the "open" position.
(3) Provide a standard stationary safety ladder on the inside and outside of storage bins with sides more than five feet deep.
• The ends of ladders must be kept away from moving screw conveyors.
• Outside ladders must reach from floor level to the top of the bin.
• Inside ladders must reach from the top of the bin to the bottom of the bin.
(4) Provide an electric interlock on the main entrance cover of large storage bins near the interior exit ladder.
The interlock needs to prevent feed and unloading screw motors from operating while the cover is open.

**Reference:** You may need to follow other requirements found in Confined spaces, chapter 296-811 WAC.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42516, filed 6/29/04, effective 1/1/05.]

**MATERIAL HANDLING**

**WAC 296-806-42518** Follow these design requirements for bag lifts (bag arm elevators) and chutes.

**You must:**
1. Make sure bag arm elevators with manual takeoff are designed to include:
   - Maximum operating capacity of seven bags per minute.
   - Spacing of arms on the conveyor chain to obtain the full capacity of the elevator with the lowest possible chain speed.
   - An electric limit switch at the unloading end that automatically stops the conveyor chain if any bag does not clear the conveyor arms.
2. Make sure bag chutes (gravity chutes for handling flour bags) that incline more than thirty degrees from horizontal:
   - Are designed to keep the speed of flour bags as low as possible.
   - Provide an upturn at the lower end of the chute to slow down the bags.
3. Prohibit the use of bag or barrel lifts as personnel lifts.
4. Prohibit manlifts in bakeries.

**Definition:**

**Manlift**

A device consisting of a power driven endless belt moving in one direction only, and provided with steps or platforms and handholds attached to it for the transportation of personnel from floor to floor.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42518, filed 6/29/04, effective 1/1/05.]

**WAC 296-806-42520** Follow these requirements for chain tackle.

**You must:**
1. Mark all chain tackle with the maximum load capacity so the marking is:
   - Prominently displayed.
   - Legible.
   - Permanent.
2. Mark all chain tackle with minimum support specifications so the marking is legible and permanent.
3. Use safety hooks with chain tackle.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42520, filed 6/29/04, effective 1/1/05.]

**WAC 296-806-42522** Safeguard conveyors.

**You must:**
1. Install stop bumpers on all delivery ends of conveyors when products are manually removed.
2. Make sure all conveyors have "stop" buttons at all operating stations.
3. Provide emergency stop bars or switches at any point where both of these exist.

[Title 296 WAC—p. 2848]

The conveyor feeds into a machine;

**AND**

• Pinch points or catching hazards exist.

**Reference:** Additional requirements for conveyors are found in WAC 296-806-420.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42522, filed 6/29/04, effective 1/1/05.]

**WAC 296-806-42524** Use properly designed covers for screw conveyors (augers).

**Exemption:** This requirement does not apply to screw conveyors where there are drop or hinged bottom sections that cannot remain airtight.

**You must:**
1. Design covers for screw conveyors that are:
   - Removable in convenient sections.
   - Held in place with stationary clamps.
2. Locate stationary clamps at intervals that will keep all covers dust tight.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42524, filed 6/29/04, effective 1/1/05.]

**WAC 296-806-42526** Safeguard pallet jacks and hand trucks.

**You must:**
1. Make sure motorized and nonmotorized pallet jacks have a lock or other device that holds the handle in the vertical position when the hand truck is not in use.
2. Make sure hand truck casters are set back from corners:
   - Locate them back from corners so they do not present a hazard to employee's toes and heels, but not close enough to cause the hand truck to become unstable.

**Reference:** Motorized hand trucks (pallet jacks) are classified as powered industrial trucks. Additional requirements for powered industrial trucks are found in chapter 296-863 WAC.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42524, filed 6/29/04, effective 1/1/05.]

**SPECIFIC FOOD PROCESSING EQUIPMENT**

**WAC 296-806-42528** Safeguard bakery slicers.

**You must:**
1. Provide all slicers with a mechanical device to push the last loaf through the slicer knives.
2. Equip all slicers with an interlock to deenergize the motor whenever a door, panel, or other point of access to the cutting blades is open.
3. Protect employees sharpening blades by installing a barrier guard that provides an opening large enough for the sharpening stone to reach and sharpen slicer blades.
4. Provide automatic braking to stop slicers with endless band knives when the motor is not energized.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42528, filed 6/29/04, effective 1/1/05.]

**WAC 296-806-42530** Safeguard bakery wrapping machines.

**You must:**
1. Extend or locate mechanical control levers that start and stop slicing machine conveyors and wrapping machines.
WAC 296-806-42538 Safeguard manually-fed dough and cross-roll brakes.

You must:

1. Guard the top roll with a heavy-gage metal shield that extends over the roll to within six inches of the hopper bottom board.
   
   Note: The shield may be perforated to allow observation of the dough entering the rolls.

2. Provide an emergency "stop" bar that includes a self-engaging brake.
   
   • Locate it so that if the operator falls forward or gets their hands caught in the rolls, their body will press against the bar, causing the rolls to stop instantly by opening the circuit to:
     
     – Deenergize the drive motor.
     – Activate a spring-set magnetic brake.
     – Activate the emergency "stop" bar before each shift to make sure it is functioning properly.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42538, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42540 Provide a guard or tripping device on reversible dough brakes.

You must:

• Provide a guard or tripping device on each side of the rolls of reversible dough brakes.
  
  • The guard or device must be designed so that it stops the machine or reverses the direction of the rolls, if moved by the operator.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42540, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42542 Follow these requirements for doughnut machines.

Definition:

Dumpbin and blender

The part of the flour handling system where the containers of flour are emptied.

You must:

1. Make sure dumpbin and blender hoods are large enough to prevent circulation of flour dust outside the hoods.

2. Provide a stop control device for dumpbins and blenders located close to the operator’s work station.

3. Position dumpbins at an appropriate height from the floor so that operators can dump flour from bags without excessive strain or fatigue.

4. Provide a bag rest stop, when the edge of a dumpbin is more than twenty-four inches above the floor.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42542, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42544 Follow these requirements for dumpbins and blenders.

Definition:

Dumpbin and blender

The part of the flour handling system where the containers of flour are emptied.

You must:

1. Make sure dumpbin and blender hoods are large enough to prevent circulation of flour dust outside the hoods.

2. Provide a stop control device for dumpbins and blenders located close to the operator’s work station.

3. Position dumpbins at an appropriate height from the floor so that operators can dump flour from bags without excessive strain or fatigue.

4. Provide a bag rest stop, when the edge of a dumpbin is more than twenty-four inches above the floor.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42544, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42536 Follow these requirements for trough hoists and similar equipment.

You must:

1. Mark all hoists and similar equipment with the maximum loading capacity so the marking is:
   
   • Prominently displayed.
   • Legible.
   • Permanent.

2. Mark all hoists with minimum support specifications so that the marking is legible and permanent.

3. Provide safety catches for the chain so that it will hold the load in any position.

4. Use safety hooks with hoists.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42536, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42534 Follow these requirements for trough hoists and similar equipment.

You must:

1. Provide antifriction-bearing casters on troughs so operators can move and direct them with minimal effort.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42534, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42532 Provide troughs with antifriction-bearing casters.

You must:

• Provide antifriction-bearing casters on troughs so operators can move and direct them with minimal effort.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42532, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42542 Follow these requirements for doughnut machines.

Definition:

Dumpbin and blender

The part of the flour handling system where the containers of flour are emptied.

You must:

1. Make sure dumpbin and blender hoods are large enough to prevent circulation of flour dust outside the hoods.

2. Provide a stop control device for dumpbins and blenders located close to the operator’s work station.

3. Position dumpbins at an appropriate height from the floor so that operators can dump flour from bags without excessive strain or fatigue.

4. Provide a bag rest stop, when the edge of a dumpbin is more than twenty-four inches above the floor.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42542, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42538 Safeguard manually-fed dough and cross-roll brakes.

You must:

1. Guard the top roll with a heavy-gage metal shield that extends over the roll to within six inches of the hopper bottom board.

2. Provide an emergency "stop" bar that includes a self-engaging brake.

• Locate it so that if the operator falls forward or gets their hands caught in the rolls, their body will press against the bar, causing the rolls to stop instantly by opening the circuit to:
  
  – Deenergize the drive motor.
  – Activate a spring-set magnetic brake.
  – Activate the emergency "stop" bar before each shift to make sure it is functioning properly.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42538, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42540 Provide a guard or tripping device on reversible dough brakes.

You must:

• Provide a guard or tripping device on each side of the rolls of reversible dough brakes.

• The guard or device must be designed so that it stops the machine or reverses the direction of the rolls, if moved by the operator.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42540, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42542 Follow these requirements for doughnut machines.

Definition:

Dumpbin and blender

The part of the flour handling system where the containers of flour are emptied.

You must:

1. Make sure dumpbin and blender hoods are large enough to prevent circulation of flour dust outside the hoods.

2. Provide a stop control device for dumpbins and blenders located close to the operator’s work station.

3. Position dumpbins at an appropriate height from the floor so that operators can dump flour from bags without excessive strain or fatigue.

4. Provide a bag rest stop, when the edge of a dumpbin is more than twenty-four inches above the floor.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42542, filed 6/29/04, effective 1/1/05.]

WAC 296-806-42544 Follow these requirements for dumpbins and blenders.

Definition:

Dumpbin and blender

The part of the flour handling system where the containers of flour are emptied.

You must:

1. Make sure dumpbin and blender hoods are large enough to prevent circulation of flour dust outside the hoods.

2. Provide a stop control device for dumpbins and blenders located close to the operator’s work station.

3. Position dumpbins at an appropriate height from the floor so that operators can dump flour from bags without excessive strain or fatigue.

4. Provide a bag rest stop, when the edge of a dumpbin is more than twenty-four inches above the floor.
WAC 296-806-42546 Follow these requirements for flour-handling machines.
You must:
- Make sure the following safeguards are used when flour-handling systems are run in electrical unity with one another:
  - When the beginning of the system is located far from its final delivery end, make sure:
    ■ All electric motors operating the system have one control at each end;
    AND
    ■ Either control will stop all motors.
  - Arrange control circuits for magnetic controllers so opening any limit switch on an individual unit will deenergize all motors on that unit.

WAC 296-806-42548 Follow these requirements for traveling or track-type flour scales.
You must:
- Provide bar handles for the moving of traveling or track-type flour scales.
  Note: For easier grip, the bar should be at least one inch in diameter.
You must:
- Guard trolley track wheels.

WAC 296-806-42550 Follow these requirements for food grinders and cutters.
You must:
- Make sure that food grinders and cutters:
  - Have an interlock so machines with removable hoppers cannot be operated when the hopper is removed;
  - Limit access to hoppers where grid guards cannot be used by providing feed conveyors or baffle-type hoppers. Hoppers must be both:
    ■ Enclosed and provided with hinged covers;
    AND
    ■ Equipped with an electric interlock so the machine will not operate with the cover open.

WAC 296-806-42552 Provide covers with interlocks on ingredient premixers, emulsifiers, and similar machines.
You must:
- Provide covers that attach to machines that have top openings.
  Note: The covers should be arranged and interlocked so that power to the machine is shut off when the cover is opened far enough for the operator's fingers to come in contact with the beaters.

WAC 296-806-42554 Follow these requirements for open fat kettles.
You must:
1. Keep the floor around kettles in nonslip condition.
2. Make sure the top of the kettle is at least thirty-six inches above the floor or working level.

WAC 296-806-42556 Follow these requirements for steam kettles.
You must:
1. Provide positive locking devices to hold kettles in the desired position.
2. Provide safety devices for steam kettles according to:
   - The American Society of Mechanical Engineers (ASME) Pressure Vessel Code, section VIII, division 1, Unfired Pressure Vessels, 2001, Kettles with Steam Jackets.

WAC 296-806-42558 Follow these requirements for chocolate melting, refining, and mixing kettles.
You must:
1. Provide a cover to enclose the top of the kettle.
2. Make sure the bottom outlet of each kettle is designed so the operator cannot:
   - Reach in to touch the revolving paddle.
   - Come in contact with the shear point between the paddle and the side of the kettle.

WAC 296-806-42560 Safeguard meat-processing equipment (circular meat-cutting saws).
Exemption: These requirements do not apply to table-top slicers such as those used in delis and restaurants.
Reference: When bandsaws are used to cut meat, follow the requirements in, Make sure bandsaws meet these requirements, WAC 296-806-48042.
You must:
1. Make sure all circular meat-cutting saws have both:
   - Constant pressure controls; AND
   - A brake that automatically begins to stop the blade when the switch is released.
2. Make sure each circular meat-cutting saw has a protective guard between the operator and the blade.
3. Provide suspended, counterbalanced circular meat-cutting saws with guards that cover at least one of the following:
   - Twenty-five degrees of the blade if the saw has two-hand controls;
   - Ninety degrees of the blade if the saw can be operated with one hand.
4. Provide saws that are not suspended with a guard that covers ninety degrees of the blade.
  Note: The size of the guard depends on whether it is suspended or has one- or two-handed controls.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-42560, filed 6/29/04, effective 1/1/05.]
WAC 296-806-42562 Follow these requirements for horizontal dough mixers.

You must:
(1) Make sure mixers are equipped with both of the following:
• An individual motor and control;
AND
• A conveniently located manual switch that prevents the mixer from being started during servicing or cleaning.
(2) Locate electrical control stations so control operators have a full view of bowls in the "open" position.
• These controls, other than a "stop" switch, must not be duplicated.
(3) Provide mixers with a full enclosure over the bowl that remains closed whenever the agitator is in motion.
• Minor openings in the enclosure during operation, such as ingredient doors and flour inlets, must each be less than one and one-half square feet in area.

Exemption: The full enclosure does not have to remain closed if the mixer has a dumping arrangement that provides safety devices where operators must use both hands in either of these situations:
• When the agitator is in motion under power and the bowl is open more than one-fifth of its total opening;
OR
• When starting the agitator, if the bowl is open more than one-fifth of its total opening.

You must:
(4) Make sure overhead covers or doors that can accidentally close are either:
• Counterbalanced to remain in the "open" position;
OR
• Provided with a catch, brace, or other positive means to hold them open until the operator releases them.
(5) Locate valves and controls that regulate the coolant in mixer jackets so they can be accessed without creating hazards to the operator.

WAC 296-806-42570 Design, install, and construct your ovens according to these requirements.

You must:
(1) Provide hand-fed moulders with either of the following, so employee's hands cannot contact the in-running rolls:
• A hopper that can be extended high enough to protect the employee;
– The top edge of the hopper needs to be well rounded to prevent injury when struck or bumped by an employee's hand;
OR
• A belt feed device.
(2) Provide each of these workers with a stopping device that can be easily reached:
• The operator feeding the moulder.
• The employee taking the dough away from the moulder.

WAC 296-806-42564 Follow these requirements for vertical mixers.

You must:
(1) Provide a safeguarding device to protect employees from the point of operation, if the nature of the work exposes them to contact with:
• The pinch point where the mixing tool meets the bowl.
• The catching hazard of the mixing tool.

Note:
• When evaluating exposure, the following conditions need to be considered:
– How the mixer functions such as visibility of the agitator or ability to accidentally switch the mixer on.
– How the worker performs operations such as adding ingredients without scraping the bowl or reaching into the bowl when the mixer is in motion.
– How close the worker gets to the hazard during operation.
– The worker's tools, clothing, jewelry, or hair that might get caught or fall into mixer.
– Type of guarding, if any.
– Slipping or tripping hazards in the area.

You must:
(2) Make sure mixers are equipped with both of the following:
• An individual motor and control;

AND
• A conveniently located manual switch that prevents the mixer from being started during servicing or cleaning.
(3) Make sure overhead panels or doors on mixers that can accidentally close are either:
• Counterbalanced to remain in an open position;
OR
• Provided with catches, braces, or other positive means to hold them open until the operator releases them.
(4) Make sure bowl-locking devices are the type that must be intentionally unlocked by the operator.
(5) Provide devices for moving filled bowls that weigh more than eighty pounds in and out of the mixing position on the machine.

WAC 296-806-42566 Follow these requirements for mechanical-feed moulders.

You must:
• Make sure hoppers for mechanical-feed moulders are designed and connected to the proofer so employee's hands cannot contact the in-running rolls.

WAC 296-806-42568 Follow these requirements for hand-fed moulders.

You must:
(1) Provide hand-fed moulders with either of the following, so employee's hands cannot enter the hopper and contact in-running rolls:
– A hopper that can be extended high enough to protect the employee;
– The top edge of the hopper needs to be well rounded to prevent injury when struck or bumped by an employee's hand;
OR
– A belt feed device.
(2) Provide each of these workers with a stopping device that can be easily reached:
• The operator feeding the moulder.
• The employee taking the dough away from the moulder.
WAC 296-806-42572 Properly locate emergency "stop" buttons and main shut off valves for ovens.
You must:
(1) Locate emergency stop buttons on mechanical ovens close to where operators are stationed.
(2) Locate main shutoff valves where they can be accessed in case of an emergency.
• Main shutoff valves that permit turning off the fuel or steam in case of an emergency must operate independently of any automatic valves.

WAC 296-806-42574 Inspect and test safety devices on ovens.
You must:
(1) Inspect ovens at least twice a month by a formally appointed, properly trained, bakery employee.
• Include the following in your inspection:
  – All safety devices.
  – Testing of all safety shutoff valves, making sure they are positively tight.
(2) Make sure a representative of the oven manufacturer performs an annual inspection.
(3) Test all piping on ovens to make sure they are gas tight.
(4) Test oven systems as follows:
• Test duct systems on indirect recirculating ovens that operate under pressure for tightness at the following intervals:
  – When the oven is first started.
  – At least every six months after that.

WAC 296-806-42576 Follow these requirements for peanut-cooling trucks.
You must:
• Make sure the entire top of the peanut-cooling truck has a grid-type cover.

WAC 296-806-42578 Follow these requirements for pretzel-rolling, pretzel stick extruding, rotary, and die machines.
You must:
• Protect the operator's hands from getting caught in moving parts by doing at least one of the following:
  – Cover the entire opening of dough hoppers with grid-type guards.
  – Extend the hopper higher.

WAC 296-806-42580 Safeguard box and roll-type dough sheeters.
You must:
(1) Guard exposed rolls with either of these methods:
• Guard the nip point of exposed sheeting rolls at the point where the dough enters the rolls;
  – If machine construction does not allow for this, place the bar or device where it will be most effective.

WAC 296-806-42582 Provide proper enclosures for sifters.
You must:
• Make sure enclosures on flour sifters:
  – Are dust tight.
  – Allow for ease of interior inspection.

WAC 296-806-42584 Follow these requirements for sugar and spice pulverizers.
You must:
(1) Remove static electricity by grounding all drive belts used in sugar and spice pulverizers by using metal combs.
(2) Follow the National Fire Protection Association (NFPA) 61-1999, standard for pulverizing sugar and spice grinding in order to prevent fires and dust explosions in agricultural and food products facilities.
(3) Provide magnetic separators to reduce fire and explosion hazards.

FORGING MACHINES

WAC 296-806-430 Summary. If your specific machine or operation is not listed here, then follow any general requirements in this section along with the "Requirements for all machines" found in this chapter, WAC 296-806-200 and 296-806-300.

The requirements in this section apply to machines used in the forming of hot metal, such as hot trimming presses, forging hammers, hot forging presses, upsetters, hot bending and hot metal presses, and equipment used in boltheading and rivet making, as well as other forging equipment. For specific forging machine requirements, see Table 430-1.

Exemption: This section does not apply to cold forging operations.

Your responsibility:
To make sure all forging and associated equipment in your workplace are constructed, operated, and maintained in a safe manner.

You must:
GENERAL REQUIREMENTS FOR FORGING MACHINES
Follow these safety requirements when using lead and lead casts
WAC 296-806-43002.
Properly inspect and maintain forging equipment
WAC 296-806-43004. Use safety blocks on hammers and presses WAC 296-806-43006.
Make sure tongs meet these requirements WAC 296-806-43008.
Protect employees when removing scale WAC 296-806-43010.
Provide adequate foundations for hammers and presses WAC 296-806-43012.
Follow these requirements for manually operated valves and switches WAC 296-806-43014.

Hammers
Use die keys and shims made of proper-grade material WAC 296-806-43016.
Provide a safety cylinder head WAC 296-806-43018.
Provide a shutoff valve WAC 296-806-43020.
Provide a means for cylinder draining WAC 296-806-43022.
Follow these requirements for pressure pipes WAC 296-806-43024.
Follow these requirements when using board hammers WAC 296-806-43026.

Other Forge Facility Equipment
Protect against sparks from saws WAC 296-806-43028.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-430, filed 6/29/04, effective 1/1/05.]

**GENERAL REQUIREMENTS FOR FORGING**

WAC 296-806-43002 Follow these safety requirements when using lead and lead casts.
You must:
1. Provide thermostats for heating elements to prevent overheating.
2. Provide a means of exhaust for fixed or permanent lead pot installations.
3. Provide a covered container to store dross skim-mings.
4. Keep equipment clean, especially from accumulations of yellow lead oxide.

Reference: • For requirements about, Personal protective equipment (PPE), see the Safety and health core rules, WAC 296-800-160.
• For ventilation requirements when using portable lead pot units, see the General occupational health standards, chapter 296-62 WAC.

WAC 296-806-43004 Properly inspect and maintain forging equipment.
You must:
• Keep all forge shop equipment in safe operating condition.
• Train personnel in proper inspection and maintenance procedures.
• Establish periodic and regular safety inspections.
• Schedule frequent and regular safety inspections of all guards and point-of-operation protection devices.
• Keep written records of safety inspections that include all of the following:
  – Date of the inspection.
  – Signature of the person doing the inspection.
  – Serial number or other identification for the piece of equipment inspected.
• Safeguard all overhead machinery parts so they do not fly off or fall, if the equipment breaks.

WAC 296-806-43006 Use safety blocks on hammers and presses.
You must:
• Use safety blocks on hammers and presses when dies are being changed and maintenance or repair work is being done on the machine.
• Provide safety blocks or wedges that meet or exceed the specifications and dimensions shown in Table 430-2.

Table 430-1

<td>50,000</td>
<td>72,000</td>
</tr>
<tr>
<td>Maximum allowable length of timber in inches</td>
<td>44</td>
<td>66</td>
<td>88</td>
<td>100</td>
<td>132</td>
</tr>
</tbody>
</table>

**Note:** Adapted from U.S. Department of Agriculture Technical Bulletin 479. Hardwoods recommended are those whose ultimate crushing strengths in compression parallel to grain are 5,000 p.s.i. (pounds per square inch) or greater.

**Note:** Slenderness ratio formula for short columns is \( L/d = 11 \), where \( L = \) length of timber in inches and \( d = \) least dimension in inches; this ratio should not exceed 11.

---

**WAC 296-806-43008** Make sure tongs meet these requirements.

You must:

- Make sure tongs used with hammers, presses, upsetters, and forging equipment used in boltheading and rivet making, meet the following requirements:
  - They are long enough so the worker can use the tongs without standing behind them, in order to avoid injury, in case of kickback.
  - The handle ends are not sharp.

**Note:**

- The worker should be instructed about proper body positions when using tongs.
- Tongs should be checked periodically to see that they remain at the proper hardness level for the job.
- Rings or equivalent devices that are used for locking tongs should be inspected periodically to make sure they are safe.

**WAC 296-806-43010** Protect employees when removing scale.

You must:

- Protect employees at every hammer and press by:
  - Making sure they do not place a hand or arm between the dies by providing them with devices that reach the full length of the die when removing scale. Examples include:
    - Oil swabs.
    - Scale removers.
    - Other devices that remove scale by reaching the full length of the die.
  - Stopping flying scale through construction and arrangement of a scale guard that is of substantial construction at the back of every hammer and press.

**WAC 296-806-43012** Provide adequate foundations for hammers and presses.

You must:

- Provide foundations adequate to support the imposed weight and normal work stress for hammers and presses.
- Hammers and presses must remain on their foundations.

**WAC 296-806-43014** Follow these requirements for manually operated valves and switches.

You must:

- Make sure all manually operated valves and switches are clearly identified and readily accessible for all of the following:
  - Presses.
  - Upsetters.
  - Forging equipment involved in boltheading and rivet making.
Hammers

WAC 296-806-43016 Use die keys and shims made of proper-grade material.

You must:
• Make sure that die keys and shims are made from a grade of material that will not easily crack or splinter.

Note: Die keys and shims should not project more than two inches in front and four inches in back of the ram or die.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 04-14-028, § 296-806-43016, filed 6/29/04, effective 1/1/05.]

WAC 296-806-43018 Provide a safety cylinder head.

You must:
• Make sure that every steam, airlift, or air hammer has a safety cylinder head that acts as a cushion if the rod breaks or pulls out of the ram.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 04-14-028, § 296-806-43018, filed 6/29/04, effective 1/1/05.]

WAC 296-806-43020 Provide a shutoff valve.

You must:
• Provide each steam and airlift hammer with a quick-closing emergency valve in the admission pipeline that is distinctly marked and in a convenient location.
  – This valve needs to be closed and locked in the "off" position when the hammer is being adjusted, repaired, or serviced, or the dies are being changed.

Reference: For requirements about Lockout/tagout (control of hazardous energy), see chapter 296-803 WAC.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 04-14-028, § 296-806-43020, filed 6/29/04, effective 1/1/05.]

WAC 296-806-43022 Provide a means for cylinder draining.

You must:
• Provide a means for draining cylinders on steam hammers.
  • Provide airlift hammers with both main head and clamp cylinder drains.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 04-14-028, § 296-806-43022, filed 6/29/04, effective 1/1/05.]

WAC 296-806-43024 Follow these requirements for pressure pipes.

You must:
• Provide steam or air pressure piping on power-driven hammers that meets or exceeds the requirements in:

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 04-14-028, § 296-806-43024, filed 6/29/04, effective 1/1/05.]

GARBAGE (WASTE) DISPOSALS

WAC 296-806-435 Summary. In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards:
• Requirements for all machines, WAC 296-806-200 and 296-806-300.
  This section applies to the hazards associated with garbage (waste) disposals found in the workplace. These requirements are designed to protect employees from hazards associated with the point of operation and flying materials.

Your responsibility:
To protect employees from hazards associated with garbage (waste) disposals.

You must:
Safeguard garbage waste disposal equipment

WAC 296-806-43502. You may need to follow additional requirements found in, Make sure guards meet these require-
GLUE SPREADERS

WAC 296-806-440 Summary. In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards:

• Requirements for all machines, WAC 296-806-200 and 296-806-300.

This section applies to safeguarding and emergency controls used to protect employees from the hazards associated with cleaning and operating glue spreaders.

Your responsibility:
To protect employees from hazards associated with glue spreaders.

You must:
Provide guards and automatic shutoffs on glue spreaders WAC 296-806-44002.

IRONWORKERS

WAC 296-806-445 Summary. In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards:

• Requirements for all machines, WAC 296-806-200 and 296-806-300.

This section applies to the hazards associated with hydraulic and mechanical ironworkers.

Your responsibility:
To protect employees from hazards associated with ironworkers.

You must:
Safeguard ironworkers point of operation WAC 296-806-44502.

LATHES

WAC 296-806-450 Summary. In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards:

• Requirements for all machines, WAC 296-806-200 and 296-806-300.

This section applies to the hazards associated with metal and woodworking lathes.

Your responsibility:
To protect employees from hazards associated with metal and woodworking lathes.

METAL LATHES

You must:
Provide shields or guards on metal lathes for chip or coolant hazards.

WOODWORKING LATHES

Guard cutting heads on profile lathes and swing-head lathes.

Guard cutting heads on turning lathes.

Guard automatic turning lathes.

Guard wood lathes used for turning long pieces of stock.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45004, filed 6/29/04, effective 1/1/05.]

[Title 296 WAC—p. 2856]
METAL LATHES

WAC 296-806-45002 Provide shields or guards on metal lathes for chip or coolant hazards.

You must:
- Provide a shield or other equally effective guard to prevent chips or coolant from being thrown or splashed on the operator, aisle, or other assigned work area, when exposed to these hazards.
- Examples of guards include permanent chip and coolant shields.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45006, filed 6/29/04, effective 1/1/05.]

WAC 296-806-45004 Safeguard work-holding devices (chucks).

You must:
- Provide a fixed or movable guard, device, awareness barrier, or peripheral cover over areas exposed to the operator on work-holding devices or chucks when:
  - It is in the clamped mode and has parts that extend beyond the outside diameter of the holding device.
  - It has an irregular shape to the periphery of its body.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45002, filed 6/29/04, effective 1/1/05.]

WAC 296-806-45006 Follow these requirements for chip control and handling.

You must:
- Make sure employees' hands do not contact chips that are being generated, such as long stringy chips.

Note: Chips may be removed by using things such as tools, pullers, brushes, and shovels.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45006, filed 6/29/04, effective 1/1/05.]

WAC 296-806-45008 Safeguard power-clamping devices.

You must:
- Protect the operator from the hazards of thrown material when the clamping device does not have adequate pressure to hold the material.

Note:
- Examples of safeguarding methods include:
  - Interlocks.
  - Retaining covers:
    - That contain the workpiece if it falls or flies out from the clamped work-holding device.
    - Visual or audible warnings:
    - That are located so they can be seen or heard by the operator in the normal work area, making the operator aware that there is no pressure on the clamp side of the actuator.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45008, filed 6/29/04, effective 1/1/05.]

WAC 296-806-45010 Restrain extended workpieces on horizontal lathes.

You must:
- Safeguard employees from the hazards of work pieces that extend beyond the edges of the horizontal lathe by:
  - Restraining work pieces as needed to prevent whipping:
    - Isolating work pieces with an awareness barrier, fixed or movable guard, or railing.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45010, filed 6/29/04, effective 1/1/05.]

WOODWORKING LATHES

WAC 296-806-45012 Guard cutting heads on profile lathes and swing-head lathes.

You must:
- Cover all cutting heads on profile lathes, swing-head lathes, and heel-turning machines with a metal guard.
- Make sure guards are made of:
  - Sheet metal at least one-sixteenth inches thick.
  - Cast iron at least three-sixteenth inches thick.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45012, filed 6/29/04, effective 1/1/05.]

WAC 296-806-45014 Guard cutting heads on turning lathes.

You must:
- Install hoods or shields that cover as completely as possible all cutting heads, whether or not they rotate.

Note: The hood or shield should be hinged to the machine so it can be moved to make adjustments.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45014, filed 6/29/04, effective 1/1/05.]

WAC 296-806-45016 Guard automatic turning lathes.

You must:
- Install hoods that completely enclose the cutter blades, except at contact points where stock is being cut, on the following types of machines:
  - Shoe last and spoke lathes.
  - Doweling machines.
  - Heel-turning machines.
  - Automatic turning lathes with rotating knives.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45016, filed 6/29/04, effective 1/1/05.]

WAC 296-806-45018 Guard wood lathes used for turning long pieces of stock.

You must:
- Install long, curved guards extending over lathe tops where work pieces are held only between the two centers, to prevent stock from being thrown out of the machine.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45018, filed 6/29/04, effective 1/1/05.]

MECHANICAL POWER PRESSES

WAC 296-806-45 Summary. In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards:

- Requirements for all machines, WAC 296-806-200 and 296-806-300.

This section applies to mechanically powered machines that transmit force to cut, form, or assemble metal or other materials.
materials through tools or dies attached to or operated by slides.

Exemption: This section does not apply to:
- Power press brakes.
- Hydraulic power presses.
- Pneumatic power presses.
- Slow-acting horizontal mechanical presses with large beds (bulldozers).
- Hot bending and hot metal presses.
- Forging presses and hammers.
- Riveting machines.
- Cold headers and cold formers.
- Eyelet machines.
- High energy rate presses.
- Ironworkers and detail punches.
- Metal shears.
- Powdered metal presses.
- Press welders.
- Turret and plate punching machines.
- Wire termination machines.
- Welding presses.

Reference:
- See, Forging machines, for forging press and hammer requirements, WAC 296-806-430.
- See, Ironworkers, for requirements for ironworkers, WAC 296-806-445.
- See, Press brakes, for power press brake requirements, WAC 296-806-465.

Your responsibility:
To make sure mechanical power presses meet the requirements of this section.

You must:
Design and construction
- Make sure mechanical power presses are properly designed and constructed.
  WAC 296-806-45502.

Safeguarding
- Safeguard presses that use unitized tooling.
  WAC 296-806-45504.
- Protect operators from guidepost hazards.
  WAC 296-806-45506.
- Safeguard the point of operation.
  WAC 296-806-45508.
- Make sure point-of-operation guards are properly designed and constructed.
  WAC 296-806-45510.
- Make sure barrier guards used to safeguard the point of operation meet these requirements.
  WAC 296-806-45512.
- Make sure point-of-operation devices are effective.
  WAC 296-806-45514.
- Make sure presence-sensing devices used to safeguard the point of operation meet these requirements.
  WAC 296-806-45516.
- Make sure pull-back devices used to safeguard the point of operation meet these requirements.
  WAC 296-806-45518.
- Make sure restraint (holdout) devices used to safeguard the point of operation meet these requirements.
  WAC 296-806-45520.
- Make sure two-hand control devices used to safeguard the point of operation meet these requirements.
  WAC 296-806-45522.
- Make sure two-hand trip devices used to safeguard the point of operation meet these requirements.
  WAC 296-806-45524.
- Provide additional safeguards when the operator puts one or both hands into the point of operation.
  WAC 296-806-45526.

Operations
- Establish a die setting procedure.
  WAC 296-806-45528.
- Handle dies safely.
  WAC 296-806-45530.
- Protect die setters during setup and tryout.
  WAC 296-806-45532.
- Train press operators.
  WAC 296-806-45534.
- Operate mechanical power presses safely.
  WAC 296-806-45536.
- Provide tools and other means to protect press operators.
  WAC 296-806-45538.
- Inspect and maintain presses.
  WAC 296-806-45540.
- Make sure presses and operating practices used in the PSDI mode of operation meet these requirements.
  WAC 296-806-45542.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-455, filed 6/29/04, effective 1/1/05.]

DESIGN AND CONSTRUCTION

WAC 296-806-45502 Make sure mechanical power presses are properly designed and constructed.
You must:
- Make sure mechanical power presses manufactured, reconstructed, or modified on or after January 1, 2005, meet the requirements of ANSI B11.1-2001, Safety Requirements for Mechanical Power Presses.

[Safeguarding]

WAC 296-806-45504 Safeguard presses that use unitized tooling.
You must:
- Safeguard the opening between the top of the punch holder and the face of the slide or striking pad by using properly installed, adjusted, and maintained guards or devices.

[Safeguarding]

WAC 296-806-45506 Protect operators from guidepost hazards.
You must:
- Use properly installed, adjusted, and maintained guards or devices to protect operators from the hazards created by:
  - Guideposts separating from their bushings.
  - Similar pinch points between the slide (moving die) and fixed die or press attachments.

Exemption: This requirement does not apply if the opening is one-fourth inch or less, before use.

[Title 296 WAC—p. 2858]
WAC 296-806-45508 Safeguard the point of operation.
You must:
• Protect employees from point-of-operation hazards by using properly installed, adjusted, and maintained guards or devices.

Exemption: This requirement does not apply if the point-of-operation opening is one-fourth inch or less, before use.

Note: You may use a combination of guards and devices as long as employees are completely protected from point-of-operation hazards.

Hand tools used for placing materials into the press, or removing them from the press, are not a substitute for point-of-operation guards or devices.

WAC 296-806-45510 Make sure point-of-operation guards are properly designed and constructed.
You must:
• Make sure each guard:
  – Prevents the operator's hands or other body parts from reaching through, over, under, or around the guard into the point of operation.
  – Has no opening larger than the maximum permissible openings shown in Table 200-1, Largest Allowable Guard Openings, WAC 296-806-20042:
    – Does not create a pinch point between the guard and moving machine parts.
    – Uses fasteners that cannot be easily removed by the operator.
    – Is easy to inspect.
    – Provides the best view of the point of operation for the type of work.

Reference: See, Provide additional safeguards when the operator puts one or both hands into the point of operation, WAC 296-806-45526, for additional safeguards that are required if the operator puts one or both hands into the point of operation to feed or remove parts, and the point of operation is protected by a Type B gate or movable barrier device.

WAC 296-806-45512 Make sure barrier guards meet these requirements.
You must:
• Make sure a fixed barrier guard is attached to a fixed surface such as the stripper, die shoe, press frame, or bolster plate.
• Make sure the interlocked barrier guard:
  – Is attached to a fixed surface such as the press frame or bolster plate.
  – Prevents cycling (stroking) of the press when the interlocked section of the guard is not in the protecting position.
  – Cannot open until hazardous motion of the slide has stopped.
• Not use the hinged or movable sections of an interlocked barrier guard for manual feeding.
• Make sure an adjustable barrier guard is:
  – Attached to a fixed surface such as the press frame, bolster plate, or die shoe.
  – Adjusted only by authorized persons who can apply Table 200-1, Largest Allowable Guard Openings, WAC 296-806-20042.

Reference: See, Provide additional safeguards when the operator puts one or both hands into the point of operation, WAC 296-806-45526, for additional safeguards that are required if the operator puts one or both hands into the point of operation to feed or remove parts, and the point of operation is protected by a Type B gate or movable barrier device.

Table 455-1
Point-of-Operation Devices

<table>
<thead>
<tr>
<th>Type of device</th>
<th>Type of operator protection that must be provided:</th>
</tr>
</thead>
</table>
| Presence-sensing device (part-revolution clutch press) | If the operator’s hands or other body part are in the point of operation:  
  • Prevents initiating a press cycle (stroke);  
  OR  
  • Stops the press during the closing portion of the cycle (stroke) |
| Presence-sensing device (full-revolution clutch press) | Do NOT use for point-of-operation safeguarding |
| Pull-back device | As the die closes:  
  • Withdraws the operator's hands if they are located in the point of operation;  
  OR  
  • Prevents the operator from reaching into the point of operation |
| Restraint (holdout) device | Prevents the operator from reaching into the point of operation at all times |
| Two-hand control device  
  Two-hand trip device | Requires operators to use both hands to activate controls that are far enough away from the point of operation so the slide completes the closing portion of the cycle (stroke) or stops before they can reach into the point of operation |
| Type A gate or movable barrier device | Encloses the point of operation:  
  • Before a press cycle (stroke) can be initiated;  
  AND  
  • Remains closed until slide motion has stopped |
| Type B gate or movable barrier device | Encloses the point of operation:  
  • Before a press cycle (stroke) can be initiated;  
  AND  
  • Prevents the operator from reaching into the point of operation |

WAC 296-806-45514 Make sure point-of-operation devices are effective.
You must:
• Make sure point-of-operation devices protect the operator from hazards as shown in Table 455-1, Point-of-Operation Devices.
• Make sure the motor start button is protected against accidental contact.

(2005 Ed.)
Table 455-1
Point-of-Operation Devices

<table>
<thead>
<tr>
<th>Type of device</th>
<th>Type of operator protection that must be provided:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sweep device</td>
<td>Do NOT use for point-of-operation safeguarding</td>
</tr>
<tr>
<td></td>
<td>• Remains closed until slide motion has stopped during the closing portion of the cycle (stroke)</td>
</tr>
</tbody>
</table>

WAC 296-806-45516 Make sure presence-sensing devices used to safeguard the point of operation meet these requirements.

You must:
• Make sure the presence-sensing device is interlocked into the control circuit to prevent or stop slide motion if the operator's hand or other body part is within the sensing field of the device during the downstoke of the press slide.
• Make sure muting of the device is done only during the upstroke of the press slide.
• Make sure failure of any component of the device:
  – Does not prevent normal stopping action of the press.
  – Prevents initiation of another cycle (stroke) until corrected.
  – Is indicated by the system.
• Use guards to protect all areas of entry to the point of operation not protected by the presence-sensing device.
• Make sure the sensing field of the device is located farther from the point of operation than the minimum safety distance as determined by the following formula:
  \[ D = 63 \times T \]

Where:
- \( D \) = minimum safety distance (in inches)
- \( T \) = stopping time of the press measured at approximately the 90 degree position of crankshaft rotation (in seconds)

Example: The number in the formula represents the hand speed of the operator (sixty-three inches per second). If your press has a stopping time of one-half second (.5 second), the calculations would be:
  \[ D = 63 \times .5 = 31.5 \]
The sensing field would need to be at least thirty-one and one-half inches from the point of operation.

Reference: See, Provide additional safeguards when the operator puts one or both hands into the point of operation, WAC 296-806-45526, while feeding or removing parts, for additional safeguards that are required if the operator puts one or both hands into the point of operation to feed or remove parts, and the point of operation is protected by a presence-sensing device.

WAC 296-806-45518 Make sure pull-back devices used to safeguard the point of operation meet these requirements.

You must:
• Make sure presses requiring more than one operator have a separate pull-back device for each operator.
• Make sure each pull-back device has attachments:
  – For each of the operator's hands.
  – That are connected to and operated only by the press slide or its attached die.
  – That are adjusted to either:
    • Prevent the operator from reaching into the point of operation;
    OR
    • Withdraw the operator's hands from the point of operation before the dies close.
  • Check each pull-back device that is being used for proper adjustment at these times:
    – At the start of each operator shift.
    – After a new die set-up.
    – When operators are changed.
  • Complete necessary maintenance or repair work before operating the press.

Reference: For recordkeeping requirements for maintenance or repair work, see Inspect and maintain presses, WAC 296-806-45540.

WAC 296-806-45520 Make sure restraint (holdout) devices used to safeguard the point of operation meet these requirements.

You must:
• Make sure presses requiring more than one operator have separate restraint devices for each operator.
• Make sure each restraint device has attachments:
  – For each of the operator's hands.
  – That are securely anchored.
  – That are adjusted so the operator cannot reach into the point of operation.

WAC 296-806-45522 Make sure two-hand control devices used to safeguard the point of operation meet these requirements.

You must:
• Make sure presses that require more than one operator:
  – Have separate two-hand controls for each operator.
  – Need concurrent application of all operators' controls to activate the slide.
• Make sure the slide stops if any operator's hand is removed from a control button.
• Make sure two-hand controls are fixed in position and can be moved only by authorized persons.
• Make sure the controls are located farther from the point of operation than the minimum safety distance as determined by the following formula:
  \[ D = 63 \times T \]

Where:
- \( D \) = minimum safety distance (in inches)
- \( T \) = stopping time of the press measured at approximately the 90 degree position of crankshaft rotation (in seconds)

Example: The number in the formula represents the hand speed of the operator (63 inches per second). If your press has a stopping time of one-half second (.5 second), the calculations would be:
  \[ D = 63 \times .5 = 31.5 \]
The controls would need to be at least 31 1/2 inches from the point of operation.
WAC 296-806-45524 Make sure two-hand trip devices used to safeguard the point of operation meet these requirements.

You must:
- Make sure presses requiring more than one operator:
  - Have separate two-hand trips for each operator.
  - Need concurrent application of all operators' controls to activate the slide.
- Make sure the two-hand trips are fixed in position and can be moved only by authorized persons.
- Make sure the controls are located farther from the point of operation than the minimum safety distance as determined by the following formula:
  \[ D = 63 \times T \]

Where:
- \( D \) = minimum safety distance (in inches)
- \( T \) = the maximum time the press takes for the die to close after the press has been tripped (in seconds)

Example: The number in the formula represents the hand speed of the operator (63 inches per second). If your press has a die closing time of one-half second (0.5 seconds), the calculations would be:
  \[ D = 63 \times 0.5 = 31.5 \]
  The trip devices would need to be at least 31 1/2 inches from the point of operation.

WAC 296-806-45526 Provide additional safeguards when the operator puts one or both hands into the point of operation.

IMPORTANT:
This rule applies when the operator puts one or both hands into the point of operation to feed or remove parts, and the point of operation is protected by any of the following:
- Presence-sensing device.
- Two-hand control.
- Type B gate or movable barrier device.

You must:
- Make sure the press has both a:
  - Stopping-performance monitor (previously called brake-system monitor);
  AND
  - Control system that monitors the performance of safety-related functions (previously called control reliability).
- Make sure the stopping-performance monitor meets the requirements of:

- Make sure the control system monitors the performance of safety-related functions so that failure of any component in the control system:
  - Does not prevent normal stopping action of the press.
  - Prevents initiation of another cycle (stroke) until the failure is corrected.
  - Can be detected by a simple test or is indicated by the control system.

Exemption: This requirement does not apply to control system components that do not affect protection from point-of-operation hazards.

Definition:
The control system includes the sensors, manual input and mode selection elements, interlocking and decision-making circuitry, and output elements of the press-operating devices and mechanisms.

WAC 296-806-45528 Establish die setting procedures.

You must:
- Develop and use procedures to protect employees from the hazards of die setting.
- Make sure die setters are provided with at least the following information:
  - Rated press capacity requirements for the die.
  - Weight of the upper die and other slide attachments required for setup and setting counterbalance air pressure.
  - Total die weight.

Note: This information may be stamped on the die or kept in a file that is readily available to the die setters.

WAC 296-806-45530 Handle dies safely.

You must:
- Make sure dies requiring mechanical handling have handling equipment attachment points.
- Use die stops or other means to prevent losing control of the die while setting or removing dies from presses that are inclined.
- Make sure the upper and lower shoes will securely mount the die to the bolster and slide.
- Use additional means of securing the upper shoe to the slide where clamp caps or set screws are used in conjunction with punch stems.
- Make sure spring-loaded turnover bars are provided for presses designed to accept them.

WAC 296-806-45532 Protect die setters during setup and tryout.

You must:
- Use safety blocks when an employee has to put their hands or other body part into the point of operation to adjust or repair dies.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45528, filed 6/29/04, effective 1/1/05.]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45524, filed 6/29/04, effective 1/1/05.]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45530, filed 6/29/04, effective 1/1/05.]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45528, filed 6/29/04, effective 1/1/05.]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45524, filed 6/29/04, effective 1/1/05.]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45532, filed 6/29/04, effective 1/1/05.]

Note: See, Provide additional safeguards when the operator puts one or both hands into the point of operation, WAC 296-806-45526, for additional required safeguards.
(2) Protect die setters doing die tryout from point-of-operation hazards by at least one of the following:
• Properly installed, adjusted, and maintained guards or devices.
• Proper use of INCH mode (part-revolution clutch press).
• Proper use of JOG mode (full-revolution clutch press).

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45534, filed 6/29/04, effective 1/1/05.]

WAC 296-806-45534 Train press operators.
You must:
(1) Train operators to safely operate the press.
(2) Make sure modified or reconstructed presses have instructions to establish new or changed guidelines for use and care of the press.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45534, filed 6/29/04, effective 1/1/05.]

WAC 296-806-45536 Operate mechanical power presses safely.
You must:
• Operate the press within the manufacturer’s rated capacities.

Note: Rated capacities include, but are not limited to:
– Structural capacity.
– Torque capacity.
– Energy capacity.
– Thermal capacity.
– Attachment weight.
– Die shutheight.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45536, filed 6/29/04, effective 1/1/05.]

WAC 296-806-45538 Provide tools and other means to protect press operators.
You must:
• Make sure hand tools are provided and used to free and remove workpieces or scrap stuck in the die.
• Provide means for handling scrap from roll feed or random length stock operations.
• Provide and use means to keep operators and die setters from reaching into the point of operation or other hazard area to lubricate material or die components.

Note: • Means for lubricating include, but are not limited to:
– Brushes.
– Swabs.
– Lubricating rolls.
– Manual spray systems.
– Automatic spray systems.
• Handles on brushes or swabs should be long enough to keep persons using them clear of the point of operation.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45538, filed 6/29/04, effective 1/1/05.]

WAC 296-806-45540 Inspect and maintain presses.
You must:
(1) Make sure maintenance personnel are trained and competent to inspect and maintain power presses.
(2) Keep records of all maintenance or repair work.
(3) Inspect and test the following press systems at least weekly:
• Clutch/brake mechanism.
• Antirepeat feature.
• Single stroke mechanism.
• Keep records of inspections and tests.

Exemption: You do not have to do weekly inspections if your press has both:
– Performance of safety-related functions monitoring (previously called control reliability);
AND
– A stopping-performance monitor (previously called brake-system monitor) does not require weekly inspections.

Reference: For requirements for these monitoring devices, see the PSDI (presence sensing device initiation) mode of operation meet these requirements.
You must:
• Make sure presses and operating practices used in the PSDI mode meet the requirements of 29 CFR 1910.217(h), Presence Sensing Device Initiation (PSDI).

Note: 29 CFR 1910.217(h) contains requirements for certification and validation of mechanical power presses used in the PSDI mode of operation.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-45542, filed 6/29/04, effective 1/1/05.]

MILLS

WAC 296-806-460 Summary. In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards:
• Requirements for all machines, WAC 296-806-200 and 296-806-300.
This section applies only to mills in the rubber and plastics industry that have in-running metal rolls that are set horizontally and run toward each other.

Your responsibility:
To protect employees from hazards associated with mills.
You must:
Meet height requirements for mill rolls WAC 296-806-46002.
Provide mill safety controls WAC 296-806-46004.
Follow these stopping limit requirements for mills WAC 296-806-46006.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-460, filed 6/29/04, effective 1/1/05.]

WAC 296-806-46002 Meet height requirements for mill rolls.
You must:
• Make sure that the tops of mill rolls installed after August 27, 1971, are at least fifty inches above the working level where the operator stands.
  – This distance applies to the actual working level, which could be:
    ■ The general floor level.
    ■ In a pit.
■ On a platform.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-46002, filed 6/29/04, effective 1/1/05.]

WAC 296-806-46004 Provide mill safety controls.

Exemption: These rules do not apply to mills if the machinery is permanently set up so employees:
• Cannot reach through, over, under, or around to come in contact with the roll bite;
or
• Cannot be caught between a roll and nearby objects.

You must:
(1) Provide a safety trip control that is easy to reach, operates readily on contact, and is located in front and back of each mill. Each safety trip control must include at least one of the following:
• Pressure-sensitive body bars that:
  – Are installed at the front and back of mills having a forty-six inch roll height or over.
  – Operate readily on contact from the pressure of the mill operator's body.
• Safety trip rods that are:
  – Installed in the front and back of each mill and located within two inches of the front and rear rolls.
  – Installed so the top rods are no more than seventy-two inches above the level where the operator stands.
  – Easy to reach and operate when the rods are pushed or pulled.
• Safety tripwire cables or wire center cords that are:
  – Installed in the front and back of each mill.
  – Located within two inches of the face of the rolls.
  – Installed so that cables are no more than seventy-two inches above the level where the operator stands.
  – Easy to operate whether pushed or pulled.
(2) Make sure that all auxiliary equipment such as mill dividers, support bars, spray pipes, feed conveyors, and strip knives do not interfere with safety devices.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-46002, filed 6/29/04, effective 1/1/05.]

WAC 296-806-46006 Follow these stopping limit requirements for mills.

You must:
• Make sure that mills are stopped within one and one-half percent of the fastest speed at which they operate when empty.
  – When mills operate at more than two hundred fifty feet per minute, stopping distances above one and one-half percent of their fastest speed are allowed, but must have engineering support.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-46002, filed 6/29/04, effective 1/1/05.]

PRESS BRAKES

WAC 296-806-465 Summary. If your specific machine or operation is not listed here, then follow any general requirements in this section along with the "Requirements for all machines" in this chapter, WAC 296-806-200 and 296-806-300.

This section applies to all machines classified as power press brakes. Power press brakes use a ram and bed to bend material.

Your responsibility:
To protect employees from hazards associated with power press brakes.

You must:
General requirements for press brakes
Provide auxiliary safety aids
WAC 296-806-46502.
Safeguard the point of operation on press brakes
WAC 296-806-46504.
Safe distance safeguarding
Follow this requirement when using safe distance safeguarding
WAC 296-806-46506.
Develop a safe distance safeguarding program
WAC 296-806-46508.
Follow these requirements for safe distance training
WAC 296-806-46510.
Require safe distance retraining
WAC 296-806-46512.
Conduct periodic safe distance inspections
WAC 296-806-46514.
Supervise the safe distance program
WAC 296-806-46516.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-46002, filed 6/29/04, effective 1/1/05.]

GENERAL REQUIREMENTS FOR PRESS BRAKES

WAC 296-806-46502 Provide auxiliary safety aids on press brakes.

IMPORTANT:
This rule applies if the safeguarding method prevents the operator from holding the work piece during the closing of the stroke.

You must:
• Provide one of the following auxiliary safety aids that will allow operators to remove their hands from the work during the closing of the stroke:
  – Work supporting devices.
  – Magnetic material-position gages.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-46002, filed 6/29/04, effective 1/1/05.]

WAC 296-806-46504 Safeguard the point of operation on press brakes.

You must:
• Safeguard the point of operation on press brakes by at least one of the following:
  – Physical guards.
  – Devices.
  – One-quarter inch maximum die opening.
  – Safe distance safeguarding if all of the following apply:
  ■ Physical barriers and devices such as two-hand controls, holdouts, restraints, and presence sensors, are demonstrated to not be feasible.

[Title 296 WAC—p. 2863]
This safeguarding method is only for one-time fabrication, custom made parts, or small quantity runs of no more than four hours per month.

A safety program is provided that includes safe work procedures, training, and supervision to make sure work is performed using safe distance measures.

There is no workplace record of injuries from failing to maintain a safe distance.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-46504, filed 6/29/04, effective 1/1/05.]

SAFE DISTANCE SAFEGUARDING

WAC 296-806-46506 Follow this requirement when using safe distance safeguarding.

You must:

• Make sure employees position themselves no closer than necessary and never closer than four inches from the power press brake point of operation.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-46506, filed 6/29/04, effective 1/1/05.]

WAC 296-806-46508 Develop a safe distance safeguarding program for press brakes.

You must:

• Develop, document, and use an effective safe distance safeguarding program.
  – Include methods for maintaining the minimum safe distance requirements in, Follow this requirement when using safe distance safeguarding, WAC 296-806-46506.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-46508, filed 6/29/04, effective 1/1/05.]

WAC 296-806-46510 Follow these requirements for safe distance training for press brakes.

You must:

(1) Train your employees in the safe distance safeguarding program and include all of the following:
  • The need for safety awareness between the power press brake operator and, when required, the helper.
  • The purpose and function of operating controls, operating mode controls, die space height adjustment positions, and other brake controls.
  • The hazards of placing any parts of the body into the point of operation.
  • The hazards related to each specific work piece bending operation.
  • The purpose and function of hand-feeding tools.
  • The dangers of unsafe work practices, inattention, horseplay, and misuse of equipment.
  • The importance of reporting unsafe conditions immediately to the supervisor.

(2) Make sure employees are proficient in safe distance safeguarding after training, and follow both:
  • Safe-operating instructions and recommendations of power press brake manufacturers; AND
  • Industry-recognized safe working practices for power press brakes.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-46510, filed 6/29/04, effective 1/1/05.]

WAC 296-806-46512 Require safe distance retraining for press brake operations.

You must:

(1) Require safe distance retraining when employees either:
  • Are seen operating the power press brake in an unsafe manner;
  OR
  • Fail to use safe distance procedures.

(2) Require safe distance retraining when conditions in the workplace change that can affect safe operation of the power press brakes, such as introducing new or revised control methods and procedures.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-46512, filed 6/29/04, effective 1/1/05.]

WAC 296-806-46514 Conduct periodic safe distance inspections on press brakes.

You must:

(1) Conduct periodic inspections of safe distance procedures at least annually to make sure that established procedures are being followed.

(2) Make sure inspections are performed by a trained person who is not the person using the safe distance procedure.

(3) You must identify all of the following during safe distance procedure inspections:
  • The date of the inspection.
  • The person performing the inspection.
  • The power press brake for which you are using the procedures.
  • Any deviations or inadequacies with procedures and requirements.
  • Joint reviews with each trained employee about their responsibilities under the safe distance program.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-46514, filed 6/29/04, effective 1/1/05.]

WAC 296-806-46516 Supervise the safe distance program for press brakes.

You must:

• Provide adequate supervision to make sure that:
  – Only trained employees operate power press brakes.
  – Employees use work practices learned in your training program.
  – Periodic safe distance inspections are conducted as outlined in, Conduct periodic safe distance inspections on press brakes, WAC 296-806-46514.
  – Any deviations from, or inadequacies in, program procedures or work practices are promptly corrected.
  – Designated safeguarding means are used, installed, and functioning properly.
  – Recommended hand-feeding tools are used, when needed.
  – To require retraining and other appropriate corrective action when necessary.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-46516, filed 6/29/04, effective 1/1/05.]
ROLL-FORMING AND BENDING MACHINES

WAC 296-806-470 Summary. In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards:

- Requirements for all machines, WAC 296-806-200 and 296-806-300.

This section applies to power driven roll-forming and bending machines that change the shape or the direction of materials by using rolls, rotary forming dies, and associated tooling.

Your responsibility:
To protect employees from hazards associated with roll-forming and bending machines.

You must:
Follow these requirements for machine initiation

- Make sure all of the following occur before starting machines:
  - Select "normal" operation mode.
  - Safeguards are in place and functioning.
  - No workers are within the hazard zones.
  - Other proper work practices are followed.
- Make sure in the "jog mode," the machine function is initiated by the operator either:
  - During set-up;
  - By threading the material through the forming rolls.
- Make sure only assigned test employees perform machine testing and start-up.

WAC 296-806-47004 Safeguard nip points of roll-forming and bending machines

You must:
- Safeguard in-running nip points on roll-forming and bending machines with at least one of the following:
  - A point-of-operation guard or device.
  - An emergency stop device.
- An emergency stop device must be used when a point-of-operation guard or device is not feasible.

WAC 296-806-47504 Guard disk sanders.
You must:
- Make sure disk sanders have an exhaust hood, when required, or a guard that encloses the part of the disk not used to work on the material.
- Exhaust hood.

SANDING MACHINES

WAC 296-806-475 Summary. In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards:

- Requirements for all machines, WAC 296-806-200 and 296-806-300.

This section applies to sanding machines that remove material from stock with an abrasive sanding surface such as a belt, disk, or drum.

Exemption:
This section does not apply to hand-held sanders. See, Portable power tools, chapter 296-807 WAC, for requirements that apply to hand-held tools.

Reference:
- If you have multiple specific machines and operations in your workplace, you need to follow all requirements in WAC 296-806-400 that apply.
- For example, if you use sanding machines and saws and cutting heads, you need to refer to both of these sections.
- In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards:
  - WAC 296-806-200, Requirements for all machines.
  - WAC 296-806-300, Requirements for machine parts.
- See chapter 296-807 WAC, Portable power tools, for requirements that apply to hand-held sanders.

Your responsibility:
To protect employees from hazards associated with drum, disk, and belt sanders.

You must:
Guard drum sanders
WAC 296-806-47502.
Guard disk sanders
WAC 296-806-47504.
Guard belt sanders
WAC 296-806-47506.

Follow these requirements for feed roll guarding
WAC 296-806-47508.

SANDING MACHINES

WAC 296-806-47502 Guard disk sanders.
You must:
- Make sure disk sanders have one of the following to enclose that part of the drum not used to work on the material:
  - Guard.
  - Exhaust hood.

Reference:
Exhaust hoods are required on sanders when dust levels exceed exposure limits. For requirements about air contaminants, see Respiratory hazards, chapter 296-841 WAC.

Exemption:
When a table is used for the application of material to be finished, you do not need to enclose the portion of the drum above the table that is necessary to do the work.

WAC 296-806-47504 Guard disk sanders.
You must:
- Make sure disk sanders have an exhaust hood, when required, or a guard that encloses the part of the disk not used to work on the material.

Reference:
When a table is used for the application of material to be finished, you do not need to enclose the portion of the disk above the table that is necessary to do the work.
WAC 296-806-47506 Guard belt sanders.
You must:
• Protect the operator by guarding:
  – Nip points where the sanding belt runs on the pulleys.
  – The unused run of the sanding belt.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 04-14-028, § 296-806-47506, filed 6/29/04, effective 1/1/05.]

WAC 296-806-47508 Follow these requirements for feed roll guarding.
You must:
• Make sure that feed rolls have a hood or guard to prevent the operator's hands from coming in contact with the in-running rolls at any point.
• Make sure that the guard meets ALL of the following:
  – Is constructed of heavy material, preferably metal.
  – The bottom of the guard comes down to within three-eighths inch of the plane formed by the bottom or working surfaces of the feed rolls.
■ When the three-eighths inch distance is increased to three-quarter inch, the lead edge of the hood must be extended to five and one-half inches or more in front of the nip point between the front roll and the work.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 04-14-028, § 296-806-47508, filed 6/29/04, effective 1/1/05.]

SAWS AND CUTTING HEADS

WAC 296-806-480 Summary. If your specific machine or operation is not listed here, then be sure to follow any of the following requirements that apply:
• General requirements for all saws and cutting heads in this section.
• General requirements for all saws in this section.
• General requirements for all cutting heads in this section.
• "Requirements for all machines" found in this chapter, WAC 296-806-200 and 296-806-300.
Reference: For requirements on hand-held tools, see Portable power tools, chapter 296-807 WAC.
This section applies to fixed machines using saws or cutting heads that are used on any material.
Your responsibility:
To make sure machines using saws and cutting heads meet these requirements.
You must:
GENERAL REQUIREMENTS FOR ALL SAWs AND CUTTING HEADS
Protect employees using saws and cutting heads
WAC 296-806-48002.
Make sure saws and cutting heads are sharpened and tensioned by qualified people
WAC 296-806-48004.
SAws
General Requirements for All Saws
Make sure saws are safe to use
WAC 296-806-48006.
Requirements for All Circular Saws
Make sure all circular saws meet these requirements
WAC 296-806-48008.
Make sure circular saw gages meet these requirements
WAC 296-806-48010.
Guard hand-fed circular table saws
WAC 296-806-48012.
Provide kickback protection for employees using hand-fed circular table ripsaws when ripping wood
WAC 296-806-48014.
Safeguard self-feed circular saws
WAC 296-806-48016.
Provide kickback protection for self-feed circular ripsaws when ripping wood
WAC 296-806-48018.
Guard circular resaws
WAC 296-806-48020.
Provide spreaders for circular resaws
WAC 296-806-48022.
Requirements for Specific Circular Saws
Protect employees from automatic saw hazards
WAC 296-806-48024.
Guard inverted swing (jump) saws
WAC 296-806-48026.
Guard miter saws
WAC 296-806-48028.
Guard radial saws
WAC 296-806-48030.
Limit the travel of radial saws
WAC 296-806-48032.
Provide kickback protection for radial saws used for ripping wood
WAC 296-806-48034.
Guard revolving double arbor saws
WAC 296-806-48036.
Guard swing saws
WAC 296-806-48038.
Limit the travel of swing saws
WAC 296-806-48040.
Requirements for Band Saws and Drag Saws
Make sure bandsaws meet these requirements
WAC 296-806-48042.
Protect employees from drag saw hazards
WAC 296-806-48044.
CUTTING HEADS
General Requirements for All Cutting Heads
Maintain and balance knives and cutting heads
WAC 296-806-48046.
BORING AND MORTISING MACHINES
Make sure boring and mortising machines meet these requirements
WAC 296-806-48048.
CHIPPER AND HOG MILLS
Follow these requirements for chipper mills
WAC 296-806-48050.
Follow these requirements for hog mills
WAC 296-806-48052.
Protect employees from falling into chipper and hog mills
WAC 296-806-48054.
JOINTERS
Make sure jointers with horizontal cutting heads meet these requirements
WAC 296-806-48056.
Guard horizontal cutting heads on hand-fed jointers

[Title 296 WAC—p. 2866]
WAC 296-806-48058
Guard vertical cutting heads on jointers
WAC 296-806-48060.

**MOLDING, STICKING AND MATCHING MACHINES**
Make sure molding, sticking and matching machines meet these requirements
WAC 296-806-48062.

**PANEL RAISERS AND OTHER SIMILAR MACHINES**
Guard hand-fed panel raisers and other similar machines
WAC 296-806-48064.

**PLANERS**
Make sure planers with a horizontal cutting head meet these requirements
WAC 296-806-48066.
Guard planers
WAC 296-806-48068.
Guard planer feed rolls
WAC 296-806-48070.
Provide kickback protection on planers running stock of varied thicknesses
WAC 296-806-48072.

**SHAPERS**
Make sure shapers meet these requirements
WAC 296-806-48074.

**TENONING MACHINES**
Guard tenoning machines feed chains and sprockets
WAC 296-806-48076.
Guard tenoning machines
WAC 296-806-48078.

**VENEER MACHINERY**
Guard veneer cutters and wringer knives
WAC 296-806-48080.
Guard veneer clippers
WAC 296-806-48082.
Follow these requirements for guarding guillotine cutters
WAC 296-806-48084.
Provide mechanisms to stop power-driven guillotine cutters
WAC 296-806-48086.
Prohibit riders on veneer slicer carriages
WAC 296-806-48088.

**GENERAL REQUIREMENTS FOR ALL SAWS AND CUTTING HEADS**

**WAC 296-806-48002**
Protect employees using saws and cutting heads.
You must:
• Provide safeguarding to protect employees from the hazards of feed rolls.
• Provide types and sizes of push sticks or push blocks that are suitable for the work being done.
• Use a comb (featherboard) or a suitable jig to protect employees when a standard guard cannot be used.

**Note:** Operations where you may need a comb or jig include:
• Dadoing.
• Grooving.
• Joining.
• Moulding.
• Rabbeting.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48002, filed 6/29/04, effective 1/1/05.]

**SAWS**

**General Requirements for All Saws**

**WAC 296-806-48006**
Make sure saws are safe to use.
You must:
• Immediately remove from service a saw that has any of the following problems:
  – Cracked.
  – Dull.
  – Badly set.
  – Improperly filed.
  – Improperly tensioned.
• Immediately clean any saw where gum has begun to stick on the sides.
• Eliminate unintended fence and table movement during operation.
• Keep hinged tables and fences firmly secured and in true alignment for all positions.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48006, filed 6/29/04, effective 1/1/05.]

**Requirements for All Circular Saws**

**WAC 296-806-48008**
Make sure all circular saws meet these requirements.
You must:
• Protect employees from contacting the portion of the saw beneath or behind the table by covering it with either:
  – An exhaust hood, if one is required;
  OR
  – A guard.
• Prohibit workers from inserting wedges between the saw disk and the collar to form a wobble saw.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48008, filed 6/29/04, effective 1/1/05.]

**WAC 296-806-48010**
Make sure circular saw gages meet these requirements.
You must:
• Make sure circular saw gages slide in grooves or tracks that are accurately machined to maintain exact alignment with the saw for all positions of the guide.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48010, filed 6/29/04, effective 1/1/05.]
WAC 296-806-48012 Safeguard hand-fed circular table saws.

You must:
• Guard each hand-fed circular saw with a hood that completely encloses both the portion of the saw that is above both:
  – The table;
  AND
  – The material being cut.
• Make sure the hood is designed and constructed to do all of the following:
  – Protect the operator from flying splinters and broken saw teeth.
  – Strong enough to resist damage from reasonable operation, adjustments, and handling.
  – Made of material soft enough to not break saw teeth.

Note: Hoods should be made of material that:
• Does not shatter when broken.
• Is not explosive.
• Is less combustible than wood.

You must:
• Mount the hood so it does all of the following:
  – Operates positively and reliably.
  – Maintains true alignment with the saw.
  – Resists any side thrust or force that could throw it out of line.
• Make sure the hood:
  – Allows the material to be inserted or sawed without any considerable resistance;
  AND
  – Does one of the following:
    ■ Automatically remains in contact with the material being cut;
    OR
    ■ Is manually adjusted to within one-quarter inch of the material being cut.

Exemption: Saws may be guarded with a fixed enclosure, fixed barrier guard, or a manually adjusted guard when specific conditions prevent using a standard automatic adjusting guard. Alternative guards have to both:
• Provide protection equivalent to a standard automatic adjusting guard;
  AND
• Be used according to the manufacturer’s instructions with sufficient supervision to comply with this requirement.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48012, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48014 Provide kickback protection for employees using hand-fed circular table ripsaws when ripping wood products.

Definition:
Ripping is a sawing operation made:
• Through the thickness of the work piece with the grain of natural wood;
  AND
• Along the long dimension of a rectangular work piece;
  OR
• Usually parallel to that edge on reconstituted wood products.
This can also be described as cutting stock to width. Two or more pieces result from the operation.

You must:
• Provide a spreader or riving knife that is:
  – Made of hard-tempered steel or its equivalent.
  – Thinner than the saw kerf.
  – Wide enough to provide sufficient stiffness and rigidity to resist any reasonable side thrust or blow that could bend or throw it out of position.
  – Attached so it remains in true alignment with the saw when the saw or table is tilted.

Note: The spreader or riving knife should:
• Prevent material from either squeezing the saw or being thrown back at the operator.
• Be placed so there is one-half inch or less space between it and the back of the saw when the largest saw is mounted in the machine.

Exemption: You do not have to provide a spreader or riving knife when grooving, dadoing, or rabbiting. When you finish these operations, replace the spreader immediately.

You must:
• Provide nonkickback fingers or dogs that are:
  – Located so they prevent the saw from either picking up the material or throwing the material back towards the operator.
  – Designed to hold any thickness of material being cut.

Note: Kickbacks occur when a saw seizes the stock and hurls it back at the operator. This can happen when the stock twists and binds against the side of the blades or is caught in the teeth. Kickbacks occur more often when cutting parallel to the wood grain (ripping) than when cross cutting. Common contributors to kickbacks include:
• A blade that is not sharpened.
• A blade set at an incorrect height.
• Poor quality lumber, such as frozen lumber, lumber with many knots, or foreign objects, such as nails.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48014, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48016 Safeguard self-feed circular saws.

You must:
• Provide saws and feed rolls with a hood or guard to protect the operator from contacting the in-running rolls.
• Make sure the guard is constructed of heavy material, preferably metal.
• Make sure the distance between the bottom of the guard and the plane formed by the bottom or working surface of the feed rolls meets the requirements of Table 200-1, Largest Allowable Guard Opening, in WAC 296-806-20042.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48016, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48018 Provide kickback protection for self-feed circular ripsaws when ripping wood products.

You must:
• Provide saws with sectional nonkickback fingers that meet all of the following requirements:
  – They cover the full width of the feed roll.
  – They are located in front of the saw.
  – They are arranged so they keep continuous contact with the material being fed.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48018, filed 6/29/04, effective 1/1/05.]
WAC 296-806-48020 Guard circular resaws.
You must:
• Provide each circular resaw with a metal hood or shield that is:
  – Located above the saw.
  – Designed to protect the operator from flying splinters or broken saw teeth.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48020, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48022 Provide spreaders for circular resaws.
Exemption: This requirement does not apply to self-feed saws with a roller or wheel at the back of the saw.
You must:
• Provide a spreader that is all of the following:
  – Securely fastened behind the saw.
  – Slightly thinner than the saw kerf.
  – Slightly thicker than the saw disk.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48022, filed 6/29/04, effective 1/1/05.]

Requirements for Specific Circular Saws

WAC 296-806-48024 Protect employees from automatic saw hazards.
You must:
• Make sure automatic saws that stroke continuously without the operator controlling each stroke are not used where employees could be exposed to:
  – Saw hazards during operations such as loading, clamping, cutting, or unloading.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48024, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48026 Guard inverted swing (jump) saws.
You must:
(1) Guard jump saws with a hood that both:
  • Covers the part of the saw that is exposed above the top of the table or above the material being cut;
  AND
  • Automatically adjusts to the thickness of the material being cut and remains in contact with it.
(2) Provide a holding device that will prevent stock from moving while cutting materials.
(3) Provide warning signs, stickers, or placards when the pinching hazard created by the holding device cannot be eliminated by design.
(4) Provide the following for automatically fed jump saws.
  • Place guards over the roller conveyor to prevent persons from walking into or over the saw.
  • Enclose jump saws when below the table or roller conveyor and not in actual use.
  • Install a positive stop to prevent the saw from passing the front edge of the roller conveyor or table.
  • Make sure the throat in the table or roller conveyor is only wide enough to permit unobstructed operation of the saw.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48026, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48028 Guard miter saws.
IMPORTANT:
Miter saws include:
• Miter.
• Compound miter.
• Slide miter.
• Compound slide miter.
You must:
(1) Guard miter saws with an upper hood that completely encloses the upper half of the blade.
(2) Provide a method to protect employees from contacting the blade underneath the table while in its recommended carrying position.
(3) Guard the lower blade:
  • By making sure the teeth are guarded at least three-quarters of an inch beyond the root of the teeth, toward the center of the blade, except for a maximum forty-five degree exposure of quadrant C when in the full retract position. See Illustration 480-1, Miter Saw Guarding.
  • With a retractable guard that cannot be locked in any position.

Illustration 480-1
Miter Saw Guarding
This illustration shows miter saws in full retract position, and quadrant C, where 45 degrees, or half of quadrant C may be exposed when in the full retract position.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48028, filed 6/29/04, effective 1/1/05.]

**WAC 296-806-48030 Guard radial saws.**

You must:
- Make sure the radial saw has a hood that does all of the following:
  - Completely encloses the upper portion of the blade down to a point that includes the end of the saw arbor.
  - Protects the operator from flying splinters and broken saw teeth.
  - Deflects sawdust away from the operator.
- Provide a lower blade guard that does all of the following (see Guard radial saws, illustration 480-2):
  - Guards the sides of the lower exposed portion of the blade to its full diameter.
  - Automatically adjusts to the thickness of the stock being cut.
  - Remains in contact with the stock to provide the maximum protection possible for the operation being performed;
  - Is manually adjusted (wing) guard that:
    - Is made of material strong enough to withstand the forces put on it.
    - Suggested materials include polycarbonates or expanded metal.
    - Has edges that are smooth so no hazards from the guard exist.
    - Extends a minimum of eight inches to both the front and arbor-end sides.
    - Is adjustable in a vertical plane to the different thicknesses of stock so the gap is three-eighths inch or less between the bottom of the guard and the top of the stock.

**Exemption:** Saws may be guarded with a fixed enclosure, fixed barrier guard, or a manually adjusted guard when specific conditions prevent using a standard, automatic adjusting guard. Alternative guards have to both:
- Provide protection equivalent to a standard automatic adjusting guard;
- Be used according to the manufacturer's instructions with sufficient supervision to meet this requirement.

**Illustration 480-2 Guard radial saws**

A manually adjusted awareness barrier guard that extends 8 inches to the front and sides of the blade.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48030, filed 6/29/04, effective 1/1/05.]

**WAC 296-806-48032 Limit the travel of radial saws.**

You must:
- Provide an adjustable stop that prevents:
  - Forward travel of the blade beyond the position necessary to complete the cut;
  - Any part of the saw blade from extending beyond the front edge of the work support table.
- Install the saw so that the front end is slightly higher than the rear in order to cause the cutting head to return to the starting position when released by the operator.
- Make sure the cutting head or carriage does all of the following:
  - Returns gently to the rest or starting position when released by the operator.
  - Does not bounce or recoil when reaching the rest or starting position.
  - Remains in the rest or starting position.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48032, filed 6/29/04, effective 1/1/05.]

**WAC 296-806-48034 Provide kickback protection for radial saws used for ripping wood products.**

You must:
- Provide nonkickback fingers or dogs that are both:
  - Located on both sides of the saw to resist the tendency of the saw to pick up material or throw it back toward the operator;
  - Designed to hold any thickness of material being cut.
- Make sure when ripping or ploughing that you feed the material from the end where the blade teeth enter the upper guard, which is against the direction in which the saw turns. See, Ripping with a radial arm saw, illustration 480-3.
  - Make sure the direction of saw rotation is clearly marked on the hood.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48034, filed 6/29/04, effective 1/1/05.]
• Fasten a permanent label at the rear of the guard hood, at about the level of the arbor, where the blade teeth exit the upper hood during saw operation that:
  – Reads, "DANGER: DO NOT RIP OR PLOUGH FROM THIS END."
  – Is colored standard danger red.
  – Is not less than one and one-half inches by three-quarters inch with standard proportional lettering.

RIPPING WITH A RADIAL ARM SAW

Illustration 480-3
Important requirements for ripping with a radial arm saw.

WAC 296-806-48036 Guard revolving double arbor saws.
You must:
• Guard each revolving double arbor saw with a hood that completely encloses the portion of the saw that is above both:
  – The table;
  AND
  – The material being cut.

Note: Hoods should be made of material that:
• Does not shatter when broken.
• Is not explosive.
• Is less combustible than wood.

Exemption: Saws may be guarded with a fixed enclosure, fixed barrier guard, or a manually adjusted guard when specific conditions prevent using a standard, automatic adjusting guard. Alternative guards have to:
• Provide protection equivalent to a standard automatic adjusting guard;
  AND
• Be used according to the manufacturer's instructions with sufficient supervision to meet this requirement.

WAC 296-806-48038 Guard swing saws.
IMPORTANT:
This section applies to swing saws that are mounted above the table.
You must:
• Provide saws with a device that:
  – Automatically returns the saw to the back of the table when the saw is released at any point in its travel.
  – Does not depend on a rope, cord, or spring to function properly.
• Make sure devices that use a counterweight meets these requirements:
  – The bolts supporting the bar and the counterweight use cotter pins.
  – The counterweight is prevented from dropping by one of these methods:
    ■ A bolt passing through both the bar and the counterweight.
    ■ A bolt through the extreme end of the bar.
    ■ A safety chain to hold it to the bar if the counterweight does not completely encircle the bar.
• Provide limit chains or another equally effective device to prevent the saw from swinging either:
  – Beyond the front or back edge of the table;
  OR
  – Forward to a position where the gullets of the lowest saw teeth will rise above the table top.

WAC 296-806-48040 Limit the travel of swing saws.

Requirements for Band Saws and Drag Saws

WAC 296-806-48042 Make sure band saws meet these requirements.
You must:
• Enclose or guard all portions of the blade except for the working portion of the blade between the guide rolls and the table.
• Make sure the guard for the portion of the blade between the sliding guide and the wheel guard meets these requirements:
  – Protects the front and outer side of the blade.
  – Is self-adjusting to move with the guide.
  – Adjusts so the gap between the guide rolls and stock is as small as is practical.
• Fully enclose band saw wheels with wheel guards that meet both of the following requirements:
  – The outside periphery of the wheel enclosure is solid;
  AND
– The front and back of the wheels are enclosed by solid material, wire mesh, or perforated metal.
• Make sure the material used for wheel guards meets these requirements:
  – Wire mesh and perforated metal guards:
    □ Are at least 0.037 inch (U.S. Gage No. 20) thick.
    □ Have openings in them that are three-eighths inch or less.
  – Solid material has strength and firmness equivalent to a wire mesh or perforated steel guard.
• Make sure band saws have a tension control device to indicate the proper tension for standard saws used on the machine.

WAC 296-806-48044 Protect employees from drag saw hazards.
You must:
• Protect employees passing near a drag saw by either:
  – Providing a four-foot clearance when the saw is at the extreme end of the stroke;
  OR
  – Enclosing the saw and its driving mechanism, if you cannot provide a four-foot clearance.

CUTTING HEADS
General Requirements for All Cutting Heads

WAC 296-806-48046 Maintain and balance knives and cutting heads.
You must:
• Make sure knives and cutting heads are kept:
  – Sharp.
  – Properly adjusted.
  – Firmly secured.
• Make sure knives are properly balanced when two or more are used in one cutting head.

BORING AND MORTISING MACHINES

WAC 296-806-48048 Make sure boring and mortising machines meet these requirements.
Exemption: This section does not apply to drill presses, boring machines, or mortising machines if both of the following apply:
• The downward stroke of the chuck and bit is controlled manually by the operator;
AND
• The chuck and bit automatically rises to the start position when control is released.
You must:
• Completely enclose universal joints on spindles of boring machines to prevent accidental contact by the operator.
• Make sure you do not use safety bit chucks that have projecting set screws.
• Enclose the top of the cutting chain and driving mechanism.

CHIPPER AND HOG MILLS

WAC 296-806-48050 Follow these requirements for chipper mills.
Exemption: This section does not apply to mobile chippers.
Reference: Safety requirements for mobile chippers can be found in, Pruning, Repairing, Maintaining and Removing Trees and Cutting Brush, section 9.6, ANSI Z133.1-2000.
You must:
(1) Arrange the feed system so the operator does not stand in direct line with the chipper blades or spout (hopper).
(2) Protect the operator from chips or chunks being thrown out while feeding the machine.
(3) Enclose the chipper spout to a height or distance of at least forty inches from the floor or the operator’s station, whichever is higher.
(4) Provide a mirror or other device to allow monitoring of material when the operator cannot readily observe the material being fed into the chipper.

WAC 296-806-48052 Follow these requirements for hog mills.
You must:
(1) Make sure that feed chutes are at least forty inches from the knives or feed roll.
(2) Provide baffles or other suitable safeguards to prevent material from being thrown from the hog mill.

WAC 296-806-48054 Protect employees from falling into chipper and hog mills.
You must:
• Protect employees working near the feed openings of chipper and hog mills from falling into the openings by providing at least one of the following:
  – A safety belt (or harness) and a lifeline short enough to prevent workers from falling into the mill.
  – Barriers or other types of protective guarding.
WAC 296-806-48056 Make sure jointers with horizontal cutting heads meet these requirements.
You must:
• Make sure the cutting head on hand-fed jointers is cylindrical:
  – Install and adjust the knife blade so it does not protrude more than one-eighth inch beyond the body of the head.
• Make sure the opening in the table meets all of the following:
  – Is kept as small as possible.
  – The clearance between the edge of the rear table and the cutting head is not more than one-eighth inch.
  – The table throat opening is not more than two and one-half inches when the tables are set or aligned with each other for zero cut.

WAC 296-806-48058 Guard horizontal cutting heads on hand-fed jointers.
You must:
• Provide jointers with an automatic guard on the working side of the fence or gage that does all of the following:
  – Covers all sections of the head.
  – Effectively keeps the operator's hand from contacting the revolving knives.
  – Automatically adjusts to cover the unused portion of the head.
  – Remains in contact with the material at all times.
• Provide jointers with a guard that covers the section of the head behind the gage or fence.

WAC 296-806-48060 Guard vertical cutting heads on jointers.
You must:
• Provide each jointer that has a vertical cutting head with an exhaust hood or other type of guard that completely encloses the revolving head except for a slot that is wide enough for the material being jointed.

WAC 296-806-48062 Make sure molding, sticking and matching machines meet these requirements.
You must:
• Make sure all cutting heads, and saws if used, are covered by a guard that:
  – Is metal.
  – Forms all or part of the exhaust hood if an exhaust system is used.
• Make sure a guard constructed from:
  – Sheet metal is at least one-sixteenth inch thick.
  – Cast iron is at least three-sixteenths inch thick.
• Make sure feed rolls are guarded by a hood or other suitable guard that both:
  – Prevents the operator's hand from contacting the running rolls at any point;
  – Is attached to the frame carrying the rolls so it adjusts for any thickness of stock.

WAC 296-806-48064 Guard hand-fed panel raisers and other similar machines.
You must:
• Guard the cutting heads of hand-fed panel raisers and other similar machines by enclosing the cutting head with either:
  – A fixed guard such as a cage;
  – An adjustable guard designed to keep the operator's hand away from the cutting edge.

WAC 296-806-48066 Make sure planers with a horizontal cutting head meet these requirements.
You must:
• Make sure the cutting head on hand-fed planers is cylindrical:
  – Install and adjust the knife blade so it does not extend more than one-eighth inch beyond the body of the head.

WAC 296-806-48068 Guard planers.
You must:
• Make sure all cutting heads, and saws if used, are covered by a guard that:
  – Is metal.
  – Forms all or part of the exhaust hood if an exhaust system is used.
• Make sure a guard constructed from:
  – Sheet metal is at least one-sixteenth inch thick.
  – Cast iron is at least three-sixteenths inch thick.

WAC 296-806-48070 Guard planer feed rolls.
You must:
• Make sure feed rolls are guarded by a hood or other suitable guard that:
– Prevents the operator's hand from contacting the in-running rolls at any point.
– Is attached to the frame carrying the rolls so it remains in adjustment for any thickness of stock.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48070, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48072 Provide kickback protection on planers running stock of varied thicknesses.

You must:
• Provide kickback protection on planers running stock of varied thicknesses at the same time by providing either:
  – Sectional feed rolls that provide feeding contact pressure on the stock;
  OR
  – Suitable nonkickback fingers at the infeed end of each section.

Note: The sectional feed rolls need to have sufficient yield in their construction to provide contact pressure on:
– Any thickness of stock the machine is capable of processing.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48072, filed 6/29/04, effective 1/1/05.]

SHAPERS

WAC 296-806-48074 Make sure shapers meet these requirements.

You must:
• Guard the cutting head of the shaper by enclosing it with either:
  – A fixed guard, such as a cage;
  OR
  – An adjustable guard designed to keep the operator's hand away from the cutting edge.
• Make sure the diameter of a circular shaper guard is at least as large as the greatest diameter of the cutter.

Note: A warning device of leather or other material attached to the spindle is NOT an acceptable substitute for a guard.

You must:
• Guard all sections of the cutting tool except for an opening to allow access to the work piece by the cutting tool.

Note: A ring guard is one means of satisfying the guarding requirement for cutting tools when involved in free hand or template shaping.

You must:
• Make sure all double-spindle shapers have a spindle starting and stopping device for each spindle.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48074, filed 6/29/04, effective 1/1/05.]

TENONING MACHINES

WAC 296-806-48076 Guard tenoning machine feed chains and sprockets.

You must:
• Guard feed chains and sprockets of all double-end tenoning machines by completely enclosing both of the following:
  – All sprockets;
  AND
  – Portions of the chain that are not used for conveying stock.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48076, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48078 Guard tenoning machines.

You must:
• Make sure all cutting heads, and saws if used, are covered by a metal guard that:
  – Covers at least the unused part of the periphery of the cutting head.
  – Forms all or part of the exhaust hood if an exhaust system is used.
• Make sure a guard constructed from:
  – Sheet metal is at least one-sixteenth inch thick.
  – Cast iron is at least three-sixteenths inch thick.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48078, filed 6/29/04, effective 1/1/05.]

VENEER MACHINES

WAC 296-806-48080 Guard veneer cutters and wringer knives.

You must:
• Provide guards to prevent accidental contact with the front or rear knife edge.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48080, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48082 Guard veneer clippers.

You must:
• Make sure employees do not accidentally contact the knife edge of veneer clippers by providing either:
  – An automatic feed;
  OR
  – Guarding at both the front and rear of the clippers.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48082, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48084 Follow these requirements for guarding guillotine cutters.

Exemption: These requirements do not apply to continuous-feed trimmers.

You must:
(1) Provide one of the following to hand and foot powered guillotine cutters, so employees' hands cannot reach the cutting edge of the knife:
• Rods.
• Plates.
• Other satisfactory means of protection such as those outlined in, Safeguarding methods, WAC 296-806-20042 through 296-806-20058.
(2) Provide power-driven guillotine veneer cutters with either of the following:
• Starting devices for each operator that require all of the following:
  – Both hands activating controls at the same time to start the cutting motion;
  – At least one hand on a control during the complete stroke of the knife;
  OR
• An automatic guard that does all of the following:
  – Keeps the hands of the operator away from the danger zone every time the blade comes down.
  – Is used in combination with one-handed starting devices that require two separate movements of the device to start the cutting motion.
  – Is designed to return positively to the nonstarting position after each complete cycle of the knife.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48084, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48086 Provide mechanisms to stop power-driven guillotine cutters.

**Exemption:** This requirement does not apply to continuous-feed trimmers.

**You must:**
• Provide power-driven guillotine cutters with both:
  – Brakes or other stopping mechanism;
  AND
  – An emergency device that will prevent the machine from operating if the brake fails when the starting mechanism is in the nonstarting position.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48086, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48088 Prohibit riders on veneer slicer carriages.

**You must:**
• Prohibit employees from riding on veneer slicer carriages.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48088, filed 6/29/04, effective 1/1/05.]

SEWING MACHINES

WAC 296-806-485 Summary. In addition to the requirements in this section, you need to refer to the following sections of this chapter in order to fully protect your employees from machine hazards:

• Requirements for all machines, WAC 296-806-200 and 296-806-300.

This section applies to the hazards of needle injuries from domestic or light duty sewing machines.

**Your responsibility:**
To protect employees from hazards associated with sewing machines.

**You must:**
Guard sewing machine needles
WAC 296-806-48502.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-485, filed 6/29/04, effective 1/1/05.]

WAC 296-806-48502 Guard sewing machine needles.

**Exemption:** This section does not apply to domestic-type sewing machines having a presser-foot that is in the "down" position during operation of the machine.

**You must:**
• Provide a permanently attached guard on each sewing machine that:
  – Prevents the operator's fingers from passing under the needle.
  – Allows the needle to be conveniently threaded without removing the guard.

**Reference:** For specific requirements about safeguarding sewing machine belts can be found in, Safeguard belt and rope drives, WAC 296-806-30004.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-48502, filed 6/29/04, effective 1/1/05.]

WAC 296-806-500 Definitions.

**Abrasive wheel**
A grinding tool consisting of bonded abrasive grains. This includes diamond and reinforced wheels.

**Adjustable barrier guard**
A barrier guard with provisions for adjustment to accommodate various jobs or tooling set-ups.

**Air-lift hammer**
A type of gravity drop hammer in which the ram is raised for each stroke by an air cylinder. Because the length of stroke can be controlled, ram velocity, and therefore the energy delivered to the work piece, can be varied.

**Antirepeat**
A device that limits the machine to a single stroke if the activating means is held in the operative position.

**Arbor**
A rotating shaft used for mounting and transmitting torque to a cutting tool.

**Authorized person**
Someone the employer has given the authority and responsibility to perform a specific assignment.

**Awareness barrier**
A barrier device that allows more access to the hazard area, but still restricts access enough to warn of an approaching hazard.

**Barricade**
A barrier such as a guardrail, fence, or other framework designed to prevent employee access and exposure to a hazard.

**Barrier guard**
A barrier that provides a physical restriction from a hazard.

**Belt conveyors**
An endless belt of any material, operating over suitable pulleys to move materials placed on the belt.

**Belt pole**
A device used in shifting belts on and off fixed pulleys on line or countershaft where there are no loose pulleys. Belt poles are sometimes called "belt shippers" or "shipper poles."

**Belt shifter**
A device for mechanically shifting belts from tight to loose idler pulleys or vice versa, or for shifting belts on cones of speed pulleys.

**Bench grinder**
A bench mounted off-hand grinding machine with either one or two wheels mounted on a horizontal spindle.

**Bending**
The application of stress concentrated at specific points to permanently turn, press or force from a straight, level or flat condition to a curved or angular configuration.

**Blade**
A replaceable tool having one or more cutting edges for shearing, notching or coping.

(05 Ed.)
Blanking
To bypass a portion of the sensing field of a presence-sensing device. The purpose is to allow objects such as tooling, feedstock, and workpieces to pass through the sensing field without sending a stop signal to the controlled machine. There are two blanking modes: Fixed and floating.

Blanking
To bypass a portion of the sensing field of a presence-sensing device. The purpose is to allow objects such as tooling, feedstock, and workpieces to pass through the sensing field without sending a stop signal to the controlled machine. There are two blanking modes: Fixed and floating.

Blind hole
A hole drilled in an object, such as an abrasive wheel, that does not go all the way through the object.

Blotter
A compressible disc or washer, usually of blotting paper, plastic, cardboard, or gasket material, that is used between the wheel and the flanges to evenly distribute flange pressure on the wheel.

Board hammer
A type of gravity drop hammer where wood boards attached to the ram are raised vertically by action of counter-rotating rolls, and then released. Energy for forging is obtained by the mass and velocity of the freely falling ram and the attached upper die.

Bolster plate
Plate attached to the press bed having holes, T-slots, or other means for attaching the lower die or die shoe.

Brake
Mechanism for stopping or preventing motion.

Chain conveyor
A conveyor in which one or more chains (including those with paddles or bars attached to them) move the conveyor. Specific examples of chain conveyors include drag, rolling, pusher bar, pusher chain and sliding chain conveyors.

Channel blanking
A feature that allows a safety light curtain system to be programmed to ignore objects. Also called "fixed blanking."

Chipper
A machine that cuts material into chips.

Chuck
A revolving clamp-like device used for holding and driving the workpiece.

Clutch
A mechanism to couple the flywheel to the crankshaft. When engaged, it allows the driving force to be transmitted to the press slide.

Comb
See feather board.

Concurrent
Occurring at the same time.

Cone pulley
A pulley having two or more steps in a conical shape for driving machinery.

Cone and plug wheels (Types 16, 17, 18, 18R, and 19)
Abrasive wheels manufactured with blind hole threaded bushings. They may be used on all surfaces except the flat mounting surface. Specific characteristics of the different cone and plug wheels are:
- Type 16 cones have a curved side with a nose radius.
- Type 17 cones have straight sides with or without a nose radius.
- Type 18 and 18R plug wheels are cylindrical in shape with either a square or curved grinding end.
- Type 19 cone wheels are a combination of cone and plug shapes.

Control system
Sensors, manual input and mode selection elements, interlocking and decision-making circuitry, and output elements of the press-operating devices and mechanisms.

Coping-notch
Where the edge or periphery of the work piece is sheared.

Counterbalance
Mechanism used to balance or support the weight of the connecting rods, slide, and slide attachments.

Cutting-off wheels
Abrasive wheels used to cut material such as masonry, pipe, etc.

Cutting tool or saw blade
A tool used on a metal sawing machine.

Cycle
The complete movement of the ram from its starting position and return to that same starting position.

Dado
A straight-sided groove, perpendicular to the face of the workpiece, having a width greater than the thickness of a single saw blade.

Device
A control or attachment that is any of the following:
- Restrains the operator from inadvertently reaching into the hazardous area.
- Prevents normal or hazardous operation if any part of an individual's body is inadvertently within the hazardous area.
- Automatically withdraws the operator's hands, if the operator's hands are inadvertently within the hazardous area during the hazardous portion of the machine cycle.
- Maintains the operator or the operator's hands during the hazardous portion of the machine cycle at a safe distance from the hazardous area.

Die or dies
Tooling used in a press for shearing, punching, forming, drawing, or assembling metal or other material.

Die enclosure guard
Guard attached to the die shoe or stripper in a fixed position.

Die setter
A person who installs or removes dies from the press, and makes the necessary adjustments so the tooling functions properly and safely.

Die setting
Process of installing or removing dies, and adjusting the dies, other tooling and the safeguarding guards or devices.

Die shoe
Plate or block that a die holder is mounted on. It functions primarily as a base for the complete die assembly and, if used, is bolted or clamped to the bolster plate or the face of the slide.

Die shutheight
Actual or design dimension between the mounting surfaces of a die.

Divider
A machine that mechanically divides the dough into pieces of predetermined volume or weight.
Dough sheeter
See sheeter.
Dressed
When material is removed from the cutting surfaces of an abrasive wheel to expose new sharp cutting surfaces.
Drilling/boring machine
A single or multiple spindle machine that uses a rotating cylindrical tool such as a drill, a counterboring tool, and similar tools to produce a hole, blind hole, counterbore, countersink, and similar cavities in work pieces. A work support means is provided to feed the tool into the work piece or the work piece into the tool.
Dross
Waste product or impurities formed on the surface of molten metal.
Dump bin and blender
That part of the flour handling system where the containers of flour are emptied.
Face of the slide
Surface of the slide to which the punch or upper die is generally attached.
Feather board/comb
A work-guiding and hold-down device consisting of stock with a series of spring-like fingers along the edge, set and positioned at an angle to the work piece.
Feeding
Placing material in or removing it from the point of operation.
Fence
A device used to locate and guide a work piece relative to the cutting tool.
Fixed barricade
A guard attached to a fixed surface used to enclose a hazardous area and prevent employees from placing any part of their body into the point of operation.
Fixed barrier guard
A guard attached to the frame, bolster, or other surface to enclose all or part of the point of operation or other hazard area.
Fixed blade
A stationary blade having one or more cutting edges.
Fixed blanking
A feature that allows a safety light curtain system to be programmed to ignore objects. Also called "channel blanking."
Fixture/jig
A device used to locate, hold, or clamp one or more work pieces in a desired position.
Flanges
Collars, discs, or plates between or against which wheels are mounted. There are four types of flanges:
• Adaptor.
• Sleeve.
• Straight relieved.
• Straight unrelieved.
Floating blanking (floating window)
A feature that allows a safety light curtain system to be programmed to ignore the interruption of one or two beams within the light curtain. This allows the feeding of an object through the defined area at any point along the length of the curtain without causing it to produce a stop signal.

Floorstand grinder
A floor mounted, off-hand grinding machine with one or two wheels mounted on a horizontal spindle. The wheels are normally twenty-four inches or thirty inches in diameter and used for snagging operations.
Forging
Metal formed to a desired shape by impact or pressure in hammers, forging machines (upsetters), presses, rolls, and related forming equipment.Forging hammers, counterblow equipment, and high-energy-rate forging machines impart impact to the work piece, while most other types of forging equipment impart squeeze pressure in shaping the stock. Some metals can be forged at room temperature, but the majority of metals are made more plastic for forging with heat. Forged or drop forged parts are much stronger than poured or cast parts from foundries.
Forging presses
A class of forging equipment where the shaping of metal between dies is performed by mechanical or hydraulic pressure and usually is accomplished with a single workstroke of the press for each die station.
Full revolution clutch
Type of clutch that, when engaged, cannot be disengaged until the press has completed a single cycle (stroke).
Gage
See miter gage.
Gap (throat)
An opening or recess in the frame of the machine to permit positioning of material or work pieces.
Gate or movable barrier device
Safeguarding device that encloses the point of operation before press motion can be initiated.
Guard (abrasive wheels)
An enclosure designed to restrain the pieces of an abrasive wheel and furnish protection to the operator if the wheel is broken during operation.
Guard
A barrier that does at least one of the following:
• Prevents the hands or other body part from reaching through, over, under, or around the guard into the hazard area.
• Prevents objects or debris from falling onto or being ejected towards an employee.
Guidepost
The pin attached to the upper or lower die shoe. It operates within the bushing on the opposing die shoe to maintain the alignment of the upper and lower dies.
Hazard
A condition that could cause physical harm to a person.
Hazard area
An area or space that poses an immediate or impending physical hazard.
Hog
A machine used for cutting or grinding slabs and other coarse residue from the mill.
Horizontal lathe
A turning machine in which the work piece revolves about a horizontal axis. While the work is revolving, it is being shaped by cutting tools working either parallel to the axis of the work or at an angle to the axis of the work.
Idler (pulley)
A pulley or roller on a shaft that presses against or rests on a drive belt to guide it or take up slack.

Inch
Die setting mode that engages the driving clutch so a small portion of one cycle (stroke) occurs, depending upon the length of time the operator control is held actuated.

Indirect recirculating ovens
Ovens that are equipped with a gas-tight duct system, a furnace, and a circulating fan. Combustion gases are circulated through this enclosed system and mixed with fresh combustion gases generated by the burner in the combustion chamber. A vent or overflow removes a portion of the gases to make room for the fresh gases added by the burner. No unburned gases or products of combustion enter the baking chamber.

Interlocked barrier guard
Barrier attached to the press frame and interlocked with the press control system so the press stroke cannot be started normally unless the guard, or its hinged or movable sections, enclose the point of operation.

Inverted swing and jump saws
Saws with a saw blade starting position below the table, where the blade must travel through the horizontal plane of the tabletop to make the cut on the stock.

Ironworker
A machine with multiple workstations at which various operations may be performed singly or simultaneously, including but not limited to:
- Punching;
- Shearing;
- Notching;
- Coping; and
- Forming.

Jig
See fixture.

Jog
Die setting mode where intermittent motion is imparted to the slide by momentary operation of the drive motor after the flywheel is at rest and the clutch is engaged.

Jointer
A machine that has a cylindrical cutter head with more than one knife or cutting edge. It has an adjustable in-feed means of work support, or an adjustable cutter head or knives, as well as a fence or other work piece guide.

Jump saw
A machine that utilizes a means of work support and hold down, and has a powered arbor on an arm that pivots about a point located behind the saw arbor at approximately the same height. At rest position the saw blade is below the work piece. See inverted swing and jump saws.

Kerf
The slot made by a saw blade as it saws through a work piece.

Kickback
The uncontrolled propulsion or self-feed type action of a work piece in the direction of the rotation or travel of the working portion of the saw, cutting tool, sanding belt, or sanding head.

Live roller conveyor
A series of rollers with objects moving over them through power to all or some of the rollers. The power is usually transmitted by a belt or chain.

Mandrel
Tooling or a machine component used to provide internal support. It can be a spindle or shaft on which a tool is mounted, such as a drill bit.

Manlift
A device consisting of a power-driven endless belt moving in one direction only, and provided with steps or platforms and handholds attached to it for the transportation of personnel from one floor to another.

Manual feeding
The operator puts material or the part being processed into the press for each cycle (stroke).

Maximum exposure angle
The largest part of a wheel that does not need to be covered by a safety guard.

Miter gage
A device used as a work piece pusher, guided by a table groove.

Miter saw
A cutoff saw with a means of work support. It utilizes a powered arbor on an arm that pivots about a point located behind the saw arbor at approximately the same height. The saw arbor may also slide vertically. In the at-rest position, the saw blade is above the maximum capacity work piece.

Mode
The state or condition of the control system that allows specific operations of the machine.

Modified Types 6 and 11 wheels (terrazzo)
Similar to Type 6 “straight cup” wheels and Type 11 “flaring cup” wheels except for the bottom of the cup. The bottom of the cup is flat in Type 6 and 11 wheels. The modified wheels have bottoms that are sloped downwards towards the mounting hole. These modified wheels need to be mounted using a special tapered flange furnished by the tool manufacturer. These wheels are used in the terrazzo trade.

Molding machine
A machine that uses more than one arbor-mounted cylindrical, rotating cutting tool. It also uses power feeding, where once a work piece is engaged, it carries the work piece linearly through the balance of the intended operations, without further operator action. Operations can be performed on all surfaces of a work piece. Work pieces can be hopper- or hand-loaded and are fed ribbon-style into the machine.

Mortiser
A machine designed to produce a square or rectangular cavity through use of a moving, forming, or reciprocating tool. Means are provided to clamp and support the stock, and either move the stock into the tool or the tool into the stock.

Moulder
A machine in which the dough pieces are shaped and formed prior to final proofing.

Mounted wheels
Bonded abrasive wheels of various shapes, usually two inches diameter or smaller, that are secured to plain or threaded steel shafts or mandrels.
Movable barrier device
See gate or movable barrier device.

Nip-point belt and pulley guard
A guard that encloses the pulley and has rounded or rolled edge slots for the belt to pass through.

Off-hand grinding
Grinding of a work piece that is held in the operator’s hand.

Overland conveyor
A single or series of belt conveyors designed to carry bulk material long distances, usually following the general contour of the land.

Part revolution clutch
Type of clutch that can be disengaged before the press slide completes a full stroke.

Pedestal grinder
An off-hand grinding machine similar to a bench grinder mounted on or otherwise attached to a floor-mounted pedestal.

Pinch point
Any point, other than the point of operation, where it is possible for a part of the body to be caught between moving parts or between a moving part and stationary one.

Planer
A machine with at least one cylindrical cutter head, that includes one or more inserted knife or cutting edge. A planer has a cutter head mounted over a means of work support. It also uses either an adjustable work support or cutter head to size the stock. The work piece is usually power-fed.

Point of operation
The area on a machine where work is actually performed upon the material being processed.

Power-driven hammers
Types of drop hammers in which the ram is raised for each stroke by a double-action steam, air, or hydraulic cylinder, and the energy delivered to the work piece is supplied by the velocity and weight of the ram and attached upper die driven downward by steam, air, or hydraulic pressure. Energy delivered during each stroke may be varied.

Power transmission parts
The mechanical components of a piece of equipment that, together with a source of power (sometimes referred to as a prime mover), provide the motion to a part of a machine or piece of equipment.

Presence-sensing device
A device that creates a sensing field, area, or plane to detect the presence of an individual or object.

Presence-sensing device initiation (PSDI)
Operating mode of a mechanical power press where a single cycle (stroke) is initiated by a presence-sensing device when it senses that the operator has finished feeding or removing parts and all parts of the operator’s body are withdrawn from the sensing field of the device.

Pull-back device
A device attached to the operator’s hands and connected to the upper die or slide of the press that will pull the operator’s hands out of the point of operation as the dies close.

Push block
A nonmetallic device with one or more handles. A push block also has a flat bottom surface with either a heel or friction material on it, used as a hold-down and feed device. The purpose of this is to provide a safe distance between the hands and the cutting tool.

Push-bar conveyor
Two endless chains cross-connected at intervals by bars or pushers that propel the load along the bed or trough.

Push stick
A nonmetallic stick shaped device designed to provide a safe distance between the hands and the cutting tool. It has, as part of its design, a notched end with a heel and toe to hold down and feed the work piece past the cutting tool.

Racks
Carriers of pans, panned dough and bakery products. They are usually constructed of metal and mounted on casters or provided with trolleys for use on a monorail system.

Reinforced wheels
Organic bonded abrasive wheels which have webbing, fabric or filament to provide resistance to complete breaking of the wheel should it become cracked or damaged.

Repeat
An unintended or unexpected successive stroke of the press resulting from a malfunction.

Restraint device
A device with attachments for the operator’s hands and wrists that prevent the operator from reaching into the hazardous area.

Return-belt idlers
A roller that supports the return run of the conveyor belt.

Ripping
A sawing operation made through the thickness of the work piece with the grain of natural wood, along the long dimension of a rectangular work piece, and usually parallel to that edge on reconstituted wood products. Two or more pieces result from the operation.

Rivet-making machines
The same as upsetters and bolt-headers when producing rivets with stock diameter of one inch or more.

Riving knife
See spreader.

SFPM
See surface feet per minute.

Safeguarding by distance
Because of its location, no employee can inadvertently come in contact with a hazard during operation, maintenance, or servicing.

Safeguarding by location
See device.

Safety block
A prop inserted between the upper and lower dies or between the bolster plate and the face of the slide to prevent the slide from falling of its own weight.

Safety cylinder
This safety device may be of the direct cushion type integral with the main cylinder or it may be of the separate cushion type whereby a constant supply of live steam or air is applied behind a separate piston adjacent to the main cylinder. A spring, suitably constrained, may also be employed.
Safety cylinder head
An air cushion at the top of the hammer, just below the head, to protect the head from damage by the piston.

Scale
Any layer or leaf of metal resembling the scale of a fish in size and thinness; such as a scale of iron.

Screw conveyor
A screw or auger that revolves in a suitably shaped trough or casing, used to move material in one specific direction.

Shaper
A machine that uses one or more vertical spindles that are either fixed or able to be tilted, usually with an arbor mounted rotating cylindrical cutter, to form decorative or functional forms on a manually or power-fed work piece. The work piece is supported on a stationary or moving table. A guide, fixture, or template is used to control the operation. The spindle can be mounted above or below the work support means.

Sheeter
A machine that forms dough into a sheet by compression through one or more sets of driven rolls.

Sifter
A device that sifts flour. Sifter types are brush, oscillating, or vibrating.

Single stroke mechanism
Used on a full revolution clutch to limit the travel of the slide to one complete stroke at each engagement of the clutch.

Slat and roller slot conveyor
A conveyor employing one or more endless chains to which nonoverlapping, noninterlocking, spaced slats are attached.

Slide
Part of the press that moves back and forth in a straight line. Also called a ram, plunger, or platen.

Snagging
Grinding which removes relatively large amounts of material without regard to close tolerances or surface finish.

Spreader
A flat metal device slightly narrower than the saw kerf. It is designed to prevent the saw blade kerf in the work piece from closing on the sides of the blade during a sawing operation.

Steam hammers
A type of drop hammer where the ram is raised for each stroke by a double-action steam cylinder and the energy delivered to the work piece is supplied by the velocity and weight of the ram and attached upper die driven downward by steam pressure. Energy delivered during each stroke may be varied.

Stripper
A mechanism or die part for removing parts or material from the punch.

Surface feet per minute (SDFP)
A measure of the speed of a point on the periphery (outer edge) of an abrasive wheel. It is calculated using the formula: SDFP = .262 x diameter of the wheel (in inches) x RPM (revolutions per minute)
Example:
Wheel diameter = 24 inches

Spindle speed = 1000 RPM
SDFP = .262 x 24 x 1000 = 3,144 SDFP

Sweep device
A single or double arm (rod) attached to the upper die or slide of the press that is designed to move the operator's hands to a safe position as the dies close. Sweep devices are not allowed for point-of-operation safeguarding.

Swing saw/overhead swing cutoff saw
A machine with a means of work support using a powered arbor and circular saw blade that pivots about a point located above the saw arbor.

Tenoning machine
A machine designed to use two or more cylindrical cutters, or one or two circular saws, to size or prepare (or both) the ends of a work piece. The work piece is supported on a table or conveying means. A means for clamping the work piece is provided.

Terrazzo
A material of stone chips, such as marble, set in mortar and polished.

Threaded hole wheels
Abrasive wheels that have one central threaded bushing, securely anchored in place. They are mounted by being screwed onto a threaded machine spindle so that the wheel back seats firmly against an unrelieved flat back flange.

Tongs
Metal holder used to handle hot or cold forgings.

Tongue guard
An integral part of a safety guard that is located where the upper exposed part of the abrasive wheel meets the safety guard. It can be adjusted as necessary to maintain a set distance from the constantly decreasing diameter of the wheel.

Tooling
Elements for guiding or imparting a desired configuration to the material.

Top grinding
Grinding done above the horizontal centerline of the wheel.

Towed conveyor
An endless chain supported by trolleys from an overhead track or running in a track on the floor with means for towing floor-supported trucks, dollies, or carts.

Trimming presses
A class of auxiliary forging equipment that removes flash (metal splash) or excess metal from a forging. This trimming operation can also be done cold, as in can coining, a product-sizing operation.

Trip (or tripping)
Momentary actuation of the activating control to initiate the cycle (stroke).

Trued
When the cutting surfaces of an abrasive wheel have been reshaped to expose new sharp cutting surfaces.

Turnover bar
A bar used in die setting to manually turn the crankshaft of the press.

Two-hand device
A device that requires the concurrent use of both of the operator's hands to both initiate and continue the machine cycle during the hazardous portion of the machine cycle.
Two-hand trip device
A device that requires concurrent operation of the trip controls or levers by the operator’s hands to initiate the machine cycle.

Type A movable gate
A device that encloses the hazardous area when the machine cycles and does not open until the end of the cycle.

Type B movable gate
A device that encloses the hazardous area when the machine cycles and opens when hazardous motion of the cycle is over. Type B devices are not allowed on full revolution type machinery.

Type 1 wheel
An abrasive wheel shaped like a disc with a mounting hole in the middle. Sometimes called a “straight wheel.” It has diameter (D), thickness (T), and hole size (H) dimensions. Grinding is normally done on the periphery (outside curve) of the wheel (T dimension). Can be used for grinding, cutting-off, and tuck pointing.

Type 2 wheel
An abrasive wheel shaped like an open-ended, hollow cylinder. Sometimes called a cylinder wheel. It has diameter (measured from the outer wall of the cylinder), wheel thickness (height of the cylinder), and rim thickness (thickness of the cylinder wall). Grinding is done on the end of the cylinder (rim thickness dimension).

Type 6 wheel
An abrasive wheel shaped like a straight-sided cup or bowl with a mounting hole in the bottom of the cup. Sometimes called a “cup wheel.” It has diameter (D), thickness (T), hole size (H), rim thickness (W), and back thickness (E) dimensions. Grinding is normally done on the cup rim (W dimension).

Type 11 wheel
An abrasive wheel shaped like a cup or bowl with a mounting hole in the bottom of the cup. The sides of the cup are not straight-sided but are angled outward. Sometimes called a “flaring cup wheel” since the sides are “flared” out. It has double diameter dimensions (top D and bottom J). It also has thickness (T), hole size (H), rim thickness (W) and back thickness (E) dimensions. Grinding is normally done on the cup rim (W dimension).

Type 16, 17, 18, 18R, and 19 wheels
See cone and plug wheels.

Type 27 wheel
An abrasive wheel similar to a Type 1 wheel, but the center of the wheel around the mounting hole is pushed back (depressed). Sometimes called a “depressed center” wheel. It has diameter (D), thickness (U) and hole size (H) dimensions. The depressed center allows grinding without interference from the flange or mounting hardware.

Type 27A cutting-off wheel
Similar to a Type 27 wheel. Specifically designed for use on cutting-off machines.

Type 28 wheel
An abrasive wheel similar to a Type 27 wheel, but the face of the wheel is angled upward and away from the mounting hole. The face of a Type 27 wheel is flat and perpendicular to the mounting hole. A Type 28 wheel is also called a “depressed center” wheel. It has diameter (D), thickness (U) and hole size (H) dimensions. The depressed center allows grinding without interference from the mounting. A Type 28 wheel has a saucer-shaped grinding rim and is designed for corner grinding and side grinding.

Type 29 wheel
An abrasive wheel that has reversed, saucer-shaped grinding rims (similar to a partially opened umbrella).

Unitized tooling
A die that has the upper and lower members incorporated into a self-contained unit that holds the die members in alignment.

Upsetters (or forging machines, or headers)
A type of forging equipment, related to the mechanical press, in which the main forming energy is applied horizontally to the work piece that is gripped and held by prior action of the dies.

Wood products
Wood products include wood and reconstituted wood products that generate chips or dust in the processing of a wood piece.

WAC
Portable Power Tools Chapter 296-807

PORTABLE POWER TOOLS

Chapter 296-807 WAC

296-807-010 Scope.
296-807-015 Make sure tools are adequately designed and constructed.
296-807-020 Make sure safeguards are used when cleaning with compressed air.
296-807-025 Make sure airhose and plastic pipe supplying compressed air to portable air tools are safe.
296-807-030 Make sure air tools are adequately designed and constructed.
296-807-035 Use air tools safely.
296-807-040 Make sure fastener driving air tools (nailers and staplers) are safe.
296-807-045 Powder actuated fastening systems.
296-807-050 Make sure tool operators are qualified.
296-807-055 Make sure employees are aware tools are in use and wear appropriate personal protective equipment (PPE).
296-807-060 Make sure tools are adequately designed and constructed.
296-807-065 Make sure poweder loads and power levels are properly identified.
296-807-070 Use proper powder loads.
296-807-075 Make sure the tool is appropriate to the job.
296-807-080 Make sure the operator uses the tool safely.
296-807-085 Use fasteners safely.
296-807-090 Inspect and maintain tools properly.
296-807-095 Make sure tools are stored properly.
296-807-100 Make sure equipment meets minimum design and construction requirements.
296-807-105 Make sure the equipment has the appropriate labels and decals.
296-807-110 Make sure the operator understands and follows instructions before starting the mower.
296-807-115 Use the equipment safely.
296-807-120 Protect employees from fuel and exhaust.
296-807-125 Use walk-behind mowers safely.
296-807-130 Use ride-on mowers safely.
296-807-135 Jacks.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-028, § 296-806-500, filed 6/29/04, effective 1/1/05.]
296-807-17005 Make sure jacks are labeled with their rated load(s).
296-807-17010 Make sure the jack is safe to lift the load.
296-807-17015 Lift the load safely.
296-807-17020 Visually inspect jacks and keep them in good working order.
296-807-180 Portable tools using abrasive wheels.
296-807-18005 Make sure abrasive wheels and tools are properly designed and constructed.
296-807-18010 Make sure machines have safety guards.
296-807-18015 Keep safety guards in good functional condition.
296-807-18020 Use specific safety guards for machines using Type 1 grinding wheels, cutting-off wheels, and tuck pointing wheels.
296-807-18025 Use specific safety guards for vertical and angle grinders using Type 6 or Type 11 wheels.
296-807-18030 Use specific safety guards for vertical and angle grinders using Type 27, 28 and 29 wheels.
296-807-18035 Use specific safety guards for vertical and angle grinders using Type 27A cutting-off wheels.
296-807-18040 Use specific safety guards for vertical and angle grinders using Type 27, 28 and 29 wheels.
296-807-18045 Make sure abrasive wheels are safe to use.
296-807-18050 Use proper flanges.
296-807-18055 Make sure flanges are in good condition.
296-807-18060 Use specific flanges for Type 1 cutting-off wheels.
296-807-18065 Use specific flanges for Type 27A cutting-off wheels.
296-807-18070 Use specific flanges for threaded hole wheels.
296-807-18075 Use specific flanges for cup, cone or plug wheels with threaded inserts or projecting studs.
296-807-18080 Use blotters when required.
296-807-18085 Meet specific blotter requirements when using modified Types 6 and 11 wheels (terrazzo).
296-807-190 Definitions.

WAC 296-807-100 Scope. This chapter applies to the tools and equipment shown in Table 1, Scope of this chapter.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-100, filed 4/4/03, effective 8/1/03.]

Your responsibility:
Make sure hand-held portable power tools have safe switches (controls).

Exemption:
WAC 296-807-110 does not apply to:
- Concrete vibrators
- Concrete breakers
- Powered tampers
- Jackhammers
- Rock drills
- Garden appliances
- Household and kitchen appliances
- Personal care appliances
- Medical or dental equipment
- Fixed machinery.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-110, filed 4/4/03, effective 8/1/03.]

WAC 296-807-11005 Make sure switches are safe.
You must:
1. Make sure the operating switch is located in a position that makes it difficult to accidentally operate the tool.
2. Use the correct operating switch.
   - Make sure hand-held gasoline-powered chain saws have a constant pressure throttle control that will shut off power to the chain when the pressure is released.
   - Use a constant pressure switch that will shut off the power when the switch is released to turn on or operate any hand-held power tool.

Exemptions:
- Some tools can use a lock-on feature with the constant pressure switch if the lock-on feature can be turned off with a single motion of the same finger(s) that turned it on. You can use a lock-on feature with these hand-held tools:
  - Drills
  - Tappers
  - Fastener drivers
  - Grinders using a wheel greater than two inches in diameter
  - Disc Sanders
  - Belt Sanders
  - Reciprocating Saws
  - Saber, scroll and jig saws using a blade with a shank width greater than one-quarter inch
  - Other similarly operating powered tools.
- You can use a positive "on-off" switch with these hand-held tools:
  - Platen Sanders
  - Grinders using a wheel two inches or less in diameter
  - Routers
  - Planers
  - Laminate trimmers
  - Nibblers
  - Shears
  - Saber, scroll and jig saws using a blade with a shank width of one-quarter inch (± .05 inch) or less.
Portable Power Tools 296-807-14015

Note: The shank width of saber, scroll and jig saw blades is measured at the narrowest point on the blade shank.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-11005, filed 4/4/03, effective 8/1/03.]

WAC 296-807-120 Portable circular saws.
Your responsibility:
Make sure portable circular saws are safe.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-12005, filed 4/4/03, effective 8/1/03.]

WAC 296-807-12005 Make sure portable circular saws are safe to use.
You must:
(1) Use a constant pressure switch to turn on or operate any circular saw using a blade that has a diameter greater than two inches.
(2) Remove cracked saws and saw blades from service.
(3) Make sure power driven circular saws that have a blade diameter larger than two inches have guards above and below the base plate (shoe) as listed in Table 2, Portable circular saw guarding requirements.

Exemption: Guarding requirements in subsection (3) of this section do not apply to saws used in the meat cutting industry to cut meat.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-12005, filed 4/4/03, effective 8/1/03.]

WAC 296-807-130 Portable belt sanding machines.
Your responsibility:
Make sure portable belt sanding machines are safe.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-13005, filed 4/4/03, effective 8/1/03.]

WAC 296-807-13005 Guard portable belt sanding machines.
You must:
• Guard:
  – Nip points where the sanding belt runs onto a pulley
  – The unused run of the sanding belt.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-13005, filed 4/4/03, effective 8/1/03.]

WAC 296-807-140 Compressed air tools. Summary.
This section applies to portable, hand-held compressed air powered tools. It also applies to airhose and plastic pipe used to supply compressed air to these tools.

Your responsibility:
Make sure compressed air and compressed air tools are used safely.

You must:
• GENERAL TOOL REQUIREMENTS
• Follow the manufacturer's instructions
WAC 296-807-14005
• Prevent air tools from ejecting attachments
WAC 296-807-14010
• CONTACT WITH COMPRESSED AIR
• Protect employees from contact with compressed air
WAC 296-807-14015
• CLEANING
• Make sure safeguards are used when cleaning with compressed air
WAC 296-807-14020
• AIRHOSE AND PLASTIC PIPE
• Make sure airhose and plastic pipe supplying compressed air to portable air tools are safe
WAC 296-807-14025
• TOOL DESIGN AND CONSTRUCTION
• Make sure air tools are adequately designed and constructed
WAC 296-807-14030
• TOOL USE
• Use air tools safely
WAC 296-807-14035
• FASTENER DRIVING TOOLS
• Make sure fastener driving air tools (nailers and staplers) are safe
WAC 296-807-14040.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-140, filed 4/4/03, effective 8/1/03.]

WAC 296-807-14005 Follow the manufacturer's instructions.
You must:
• Follow the manufacturer's instructions for safe use of the tool.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-14005, filed 4/4/03, effective 8/1/03.]

WAC 296-807-14010 Prevent air tools from ejecting attachments.
You must:
• Make sure the tool cannot accidentally eject an attachment.

Note: A retainer is needed if the tool does not have a positive method of keeping the attachment in the tool.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-14010, filed 4/4/03, effective 8/1/03.]

WAC 296-807-14015 Protect employees from contact with compressed air.
You must:
• Make sure a tool nozzle or an airhose opening is not:
  – Pointed at anyone

[Title 296 WAC—p. 2883]
WAC 296-807-14020 Make sure safeguards are used when cleaning with compressed air.

You must:

- Use the following when cleaning with compressed air:
  - Air pressure that has been reduced to less than 30 p.s.i.
  - Effective chip guarding.

Note: ■ You may use air pressure greater than 30 p.s.i. if you use a nozzle with vents, holes, slits or slots that will direct the air flow away from the tip of the nozzle and will reduce the air flow to less than 30 p.s.i. if the nozzle becomes blocked.

■ Effective chip guarding means any method or equipment that protects the eyes and skin of the cleaner and other workers from flying chips or particles. Examples include:
  - A protective cone around the nozzle to protect the cleaner
  - Barriers, baffles or screens to protect other workers.

Reference: Appropriate personal protective equipment (PPE) needs to be worn when cleaning with compressed air. See WAC 296-800-160 in the safety and health core rules.

WAC 296-807-14025 Make sure airhose and plastic pipe supplying compressed air to portable air tools are safe.

You must:

1. Make sure the airhose and hose connections are suitable for the:
   - Air pressure
   - Use.
2. Make sure any plastic pipe used to supply compressed air to portable air tools has been specifically identified by the manufacturer as being suitable for compressed air use.

Note: Existing unapproved pipe that is buried underground or enclosed in shatter-resistant material is acceptable only if it completely eliminates the hazards created by the brittle nature of the pipe.

WAC 296-807-14030 Make sure air tools are adequately designed and constructed.

Exemption:

This section does not apply to:

- Tools specifically for medical or dental use
- Tools specifically for use in the food processing industry
- Tools mounted in stationary installations
- Air hoists
- Construction and mining tools such as paving breakers, diggers, tampers, and rock drills.

You must:

- Make sure portable, hand-held air tools meet the requirements of:

WAC 296-807-14035 Use air tools safely.

Exemption:

This section does not apply to:

- Tools specifically for medical or dental use
- Tools specifically for use in the food processing industry

You must:

1. Relieve the pressure in the air line before disconnecting a compressed air tool from the line or disconnecting a hose joint unless there is automatic valve closing protection at the joint being separated.
2. Disconnect the tool from the compressed air supply before repairs are done.
3. Make sure that eye protection is worn at all times by:
   - The person operating the tool
   - Other persons in the area where tools are being used.

References: ■ Use the PPE hazard assessment to determine which employees other than the tool operator need to wear eye protection and the type of eye protection they need to wear. See WAC 296-800-160 in the safety and health core rules.

■ Chapter 296-62 WAC, Part K, Hearing conservation, may require the use of hearing protection.

WAC 296-807-14040 Make sure fastener driving air tools (nailers and staplers) are safe.

You must:

1. Make sure any fastener driving air tool discharges all air in the tool when disconnected from the compressed air supply.
2. Make sure that all pneumatically driven nailers, staplers, and other similar equipment provided with automatic fastener feed have a safety device on the muzzle to prevent the tool from ejecting fasteners, unless the muzzle is in contact with the work surface.

Note: Pneumatic nailers or staplers do not need this safety device if:

- The overall weight of the fastening device does not exceed the weight of one and one-half inches of standard 18-gauge wire. The normal maximum diameter tolerance for manufacturing standard 18-gauge wire is .045 inches.
- The operator and any other person within twelve feet of the point of operation wear approved eye protection.

[Title 296 WAC—p. 2884] (2005 Ed.)
WAC 296-807-150 Powder actuated fastening systems. Summary.

IMPORTANT:
This section applies to any powder actuated fastening system designed to use the expanding gases from a powder load to propel a stud, pin, fastener, or other object into hard structural material.

Exemption:
This section does not apply to:
- Devices designed to attach objects to soft construction material such as wood, plaster, tar, and drywallboard
- Stud welding equipment.

Your responsibility:
Make sure powder actuated fastening systems are used safely.

You must:

TOOL OPERATORS
Make sure tool operators are qualified

PERSONAL PROTECTIVE EQUIPMENT
Make sure employees are aware tools are in use and wear appropriate personal protective equipment (PPE)

TOOL DESIGN AND CONSTRUCTION
Make sure tools are adequately designed and constructed

LABELING
Make sure tools and containers are properly labeled

POWDER LOADS
Make sure powder loads and power levels are properly identified

Use proper powder loads

TOOL USE
Make sure the tool is appropriate to the job

Make sure the operator uses the tool safely

FASTENERS
Use fasteners safely

INSPECTION AND MAINTENANCE
Inspect and maintain tools properly

STORAGE
Make sure tools are stored properly

Note: Authorized instructors have to meet the instructor qualifications of ANSI A10.3-1995, Safety Requirements for Powder-Actuated Fastening Systems.

You must:
- Make sure all tool operators can:
  - Understand the manufacturer's instructions
  - Clean the tool properly
  - Recognize any visibly worn or damaged parts
  - Identify power load levels
  - Operate the tool correctly.
- Make sure tool operators have a valid qualified operator's card in their possession when they are using the tool.

WAC 296-807-15010 Make sure employees are aware tools are in use and wear appropriate personal protective equipment (PPE).

You must:
(1) Make sure eye or face protection is worn by:
- Tool operators
- Assistants
- Persons close to where the tool is being used.

Reference: ■ Use the PPE hazard assessment to determine which employees other than the tool operator need to wear eye protection and the type of eye protection they need to wear. See WAC 296-800-160 in the safety and health core rules.
- Chapter 296-62 WAC, Part K, Hearing conservation may require the use of hearing protection.

You must:
(2) Post signs where tools are being used and in adjacent areas where tool use could pose a hazard. Signs must:
- Be easily seen
- Be at least 8 x 10 inches (20 x 25 cm)
- Use letters in boldface type at least one inch (2.5 cm) high
- Read "POWDER ACTUATED TOOL IN USE" or similar wording.

Note: Tool use could create a hazard in adjacent areas by allowing a fastener to penetrate one or more of the following:
- Wall
- Floor
- Other working surface.

WAC 296-807-15015 Make sure tools are adequately designed and constructed.

You must:
(1) Make sure the tool meets the design and construction requirements of the American National Standards Institute (ANSI) standard ANSI A10.3-1995, Safety Requirements for Powder-Actuated Fastening Systems.

Note: There may be a statement on the tool or in the instruction manual indicating the tool meets the requirements of the appropriate ANSI standard. If in doubt, check with the manufacturer.

You must:
(2) Make sure each tool has:
- Operator instructions and a tool service manual
- Powder load and fastener chart
- Service tools and accessories.

Note: [Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-1505, filed 4/4/03, effective 8/1/03.]

(2005 Ed.)
WAC 296-807-15020 Make sure tools and containers are properly labeled.

You must:
(1) Make sure tools are properly labeled.
• Make sure each tool has a readable, permanent label that shows the manufacturer’s:
  – Model number
  – Unique serial number.
• Make sure there is a durable warning label on each tool that:
  – Reads "WARNING - FOR USE ONLY BY QUALIFIED OPERATORS ACCORDING TO MANUFACTURER'S INSTRUCTION MANUAL."

OR
• Uses words with the same meaning.
(2) Make sure the tool storage container has these labels:
• "POWDER ACTUATED TOOL" on the outside of the container in an easily seen position
• "WARNING - POWDER ACTUATED TOOL. TO BE USED ONLY BY A QUALIFIED OPERATOR AND KEPT UNDER LOCK AND KEY WHEN NOT IN USE" on the inside cover.

WAC 296-807-15025 Make sure powder loads and power levels are properly identified.

You must:
• Make sure powder loads and power levels are identified as specified in Table 3, Powder-Load Identification

Table 3
Powder-Load Identification

WAC 296-807-15030 Use proper powder loads.

You must:
• Use only a powder load that is:
  – Recommended by the tool manufacturer for the particular tool

OR
• One that provides the same level of safety and performance.

WAC 296-807-15035 Make sure the tool is appropriate to the job.

You must:
(1) Use the lowest velocity class of tool and load that will properly set the fastener.
(2) Use the proper shield, fixture, adaptor, or accessory that is:
• Suitable for the job
• Recommended and supplied by the manufacturer.

WAC 296-807-15040 Make sure the operator uses the tool safely.

You must:
(1) Make sure the operator:
• Inspects the tool before using it, as recommended by the tool manufacturer
• Uses the tool according to the manufacturer’s instructions
• Keeps the tool unloaded until just before using it
• Unloads the tool at once if work is interrupted after the tool has been loaded
• Does not leave a tool or powder load unattended where it would be available to an unauthorized person
• Never points a tool (loaded or unloaded) at any part of a person’s body.

Note: A magazine or clip fed tool is not considered loaded until a powder load is actually in the ram (firing chamber).

You must:
(2) Make sure tools are not used in an explosive or flammable atmosphere.
(3) Do this if the tool misfires:
• Hold it firmly against the work surface for thirty seconds
Then
• Follow the instructions in the tool manufacturer's instruction manual.
(4) Hold the tool perpendicular to the work surface when fastening to any material.

Exemption:
This does not apply if the tool manufacturer recommends a different technique for a specific job.

WAC 296-807-15045 Use fasteners safely.

You must:
(1) Use fasteners:
• Recommended by the tool manufacturer for the particular tool

OR
• Fasteners that provide the same level of safety and performance.
(2) Keep the fastener from passing completely through the structural material by using a backing material when driving a fastener into any material that is any of the following:
• Easily penetrated
• Thin
• Of questionable resistance.
(3) Make sure the material is suitable for fastening. Do not drive fasteners into very hard or brittle material such as:
- Cast iron
- Glazed tile
- Hardened steel
- Glass block
- Natural rock
- Hollow tile
- Most brick.

(4) Make sure positive alignment with an existing hole is maintained by using a guide or other means supplied or recommended by the tool manufacturer before driving a fastener into the hole.

(5) Make sure fasteners are not driven into any spalled (chipped or crumbled) area.

(6) Drive fasteners into concrete only if the fastener shank will penetrate no more than one-third the thickness of the concrete.

(7) Make sure fasteners are driven at least:
- One-half inch (13 mm) from the edge of steel
- Three inches (75 mm) from the unsupported edge of masonry material.

Exemption:
This does not apply if an application is specifically required or recommended by the tool manufacturer.

WAC 296-807-15050 Inspect and maintain tools properly.
You must:
- Make sure any tool that is not in proper working condition is:
  - Immediately removed from service
  - Tagged
  - Properly repaired as specified in the manufacturer's instructions before being used again.
- Regularly service the tool and inspect it for worn or damaged parts at intervals recommended by the tool manufacturer.
- Replace worn or damaged parts before the tool is used. This must be done:
  - By a qualified person
  - Using only parts supplied by the tool manufacturer.
  - Keep a written record of inspection dates.

WAC 296-807-15055 Make sure tools are stored properly.
You must:
(1) Make sure there is a container that can be locked for each tool.
(2) Make sure tools and powder loads that are not being used are:
  - Locked in a container
  - Stored in a safe place
  - Only available to authorized persons.
(3) Store all manuals, maintenance tools, and accessories in the tool container when they are not being used.
WAC 296-807-16010 Make sure the equipment has the appropriate labels and decals.
You must:
(1) Make sure all positions of the operating controls are clearly identified.
(2) Make sure warning and caution labels or decals on the mower are readable and replace them if necessary.

WAC 296-807-16015 Make sure the operator understands and follows instructions before starting the mower.
You must:
(1) Make sure the operator understands all instructions for operating the mower that are in the manufacturer's instructions and on the machine.
• Make sure the operator is thoroughly familiar with the controls and proper use of the mower before starting it.
(2) Make sure the proper guards, plates, grass catcher or other safety devices are in place before starting the mower.

WAC 296-807-16020 Use the equipment safely.
You must:
(1) Follow the manufacturer's instructions for safe use of the equipment.
(2) Keep people clear of discharge opening(s).
(3) Keep people's hands and feet clear of rotating parts.
(4) Clear the area of objects such as rocks, toys, wire, bones, sticks, etc., which could be picked up and thrown by the blade and create a hazard for the operator or other persons.
(5) Make sure the operator stops the engine before:
• Leaving the equipment
• Unclogging the grass discharge chute
• Cleaning the mower.
(6) Make sure the operator wears safety goggles or safety glasses with side shields when operating the mower.

WAC 296-807-16025 Protect employees from fuel and exhaust.
Exemption:
This section does not apply to electric engines.
You must:
(1) Make sure to:
• Keep the gas cap on whenever the engine is running.
• Shut off the engine before and during refueling.
(2) Make sure not to refuel the machine indoors.
(3) Make sure not to run the engine in a closed area.

WAC 296-807-16030 Use walk-behind mowers safely.
You must:
(1) Make sure the operator wears substantial footwear when operating a walk-behind mower.

WAC 296-807-16035 Use ride-on mowers safely.
You must:
(1) Make sure not to carry passengers.
(2) Make sure the operator looks down and behind before and while moving backwards.

IMPORTANT:
This section applies to portable hand- or power-operated:
• Hydraulic jacks
• Mechanical ratchet jacks
• Mechanical screw jacks.
Your responsibility:
Make sure jacks are safe to use.
You must:
LABELING
Make sure jacks are labeled with their rated load(s)

WAC 296-807-1705 BEFORE USE
Make sure the jack is safe to lift the load

WAC 296-807-17010 LIFTING THE LOAD
Lift the load safely
WAC 296-807-17015
INSPECTION AND MAINTENANCE
Visually inspect jacks and keep them in good working order
WAC 296-807-17020.
[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-170, filed 4/4/03, effective 8/1/03.]

WAC 296-807-17005 Make sure jacks are labeled with their rated load(s).
You must:
- Make sure the rated load(s) of the jack is:
  - Readable
  - Durably marked in an easily seen location on the jack.
[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-17005, filed 4/4/03, effective 8/1/03.]

WAC 296-807-17010 Make sure the jack is safe to lift the load.
You must:
1. Visually examine the general condition of the jack before each use.
   - If a jack is to be used more than once on a shift, the visual examination is only required before the jack is used for the first time that shift.

You must:
2. Make sure the weight to be lifted or supported is within the rated load of the jack.
3. Make sure the base of the jack is on a firm foundation or blocked before lifting the load.
4. Make sure hydraulic jacks exposed to freezing temperatures function properly at the temperature they will be used.
[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-17010, filed 4/4/03, effective 8/1/03.]

WAC 296-807-17015 Lift the load safely.
You must:
1. Place a block between the load cap and the load if the load could slip off the jack.
2. Secure the load from falling or slipping immediately after it is raised by one or more of the following:
   - Cribbing
   - Blocking
   - Some other equally effective method.
3. Make sure you do not exceed the limit of travel of the jack.
   - The limit of travel can be determined by one or more of the following:
     - A positive stop
     - A stop indicator
     - Some other equally effective method.
[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-17015, filed 4/4/03, effective 8/1/03.]

WAC 296-807-17020 Visually inspect jacks and keep them in good working order.
Note: There are two types of inspection, frequent or periodic, depending on how often they are done.
You must:
1. Inspect jacks at appropriate intervals:
   - Make sure frequent inspections are done by the operator or other designated person as follows:
     - Before a jack is first placed in service.
     - Monthly for a jack used in normal service.
     - Daily or before each use for a jack used for other than normal service.
     - Before using a jack that has been altered, modified, or repaired.
     - Before using a jack that has not been used in one year or more.
   - Make sure a periodic inspection of the jack is done once a year.
   - Inspect the jack using Table 4, Jack Inspection Requirements, during any frequent or periodic inspection.
   - More detailed inspection required if a designated person determines any condition discovered is a hazard
   - Clean and check internal parts for wear or damage if inspection indicates an internal problem

Note: The jack should be lubricated following the manufacturer's instructions.
[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-17020, filed 4/4/03, effective 8/1/03.]

IMPORTANT:
This section applies to portable tools using abrasive wheels.

Definition:
Abrasive wheel. A grinding tool consisting of bonded abrasive grains. This includes diamond and reinforced wheels.

Exemption: This section does not apply to machines using:
- Natural sandstone wheels
- Pulpstone wheels
- Coated abrasive products
- Loose abrasives.

Your responsibility:
Make sure abrasive wheel tools and wheels are safe to use.

You must:
DESIGN AND CONSTRUCTION
Make sure abrasive wheels and tools are properly designed and constructed
WAC 296-807-18005
GUARDS
Make sure machines have safety guards
WAC 296-807-18010
Keep safety guards in good functional condition
WAC 296-807-18015
GUARDS - SPECIFIC WHEELS
Use specific safety guards for machines using Type 1 grinding wheels, cutting-off wheels, and tuck pointing wheels
WAC 296-807-18020
Use specific safety guards for vertical and angle grinders using Type 6 or Type 11 wheels
WAC 296-807-18025
Use specific safety guards for vertical and angle grinders using Type 27, 28 and 29 wheels
WAC 296-807-18030
SIDE HANDLES
Use side handles on vertical and angle grinders
WAC 296-807-18035
ABRASIVE WHEELS
Make sure abrasive wheels are safe to use
WAC 296-807-18040
MOUNTING
Mount wheels properly
WAC 296-807-18045
FLANGES
Use proper flanges
WAC 296-807-18050
Make sure flanges are in good condition
WAC 296-807-18055
FLANGES - SPECIFIC WHEELS
Use specific flanges for Type 1 cutting-off wheels
WAC 296-807-18060
Use specific flanges for Type 27A cutting-off wheels
WAC 296-807-18065
Use specific flanges for threaded hole wheels
WAC 296-807-18070

Use specific flanges for cup, cone or plug wheels with threaded inserts or projecting studs
WAC 296-807-18075
BLOTTERS
Use blotters when required
WAC 296-807-18080
BLOTTERS - TYPE 6 AND 11 WHEELS
Meet specific blotter requirements when using modified Types 6 and 11 wheels (terrazzo)
WAC 296-807-18085.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-009, § 296-807-180, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18005  Make sure abrasive wheels and tools are properly designed and constructed.

You must:
- Make sure abrasive wheels and tools meet the design and construction requirements of:
  - American National Standards Institute (ANSI) B7.1-2000, Safety Requirements for the Use, Care and Protection of Abrasive Wheels
  OR

Note: Tools may have a statement on the tool or in the instruction manual that the tool meets the appropriate ANSI standard. If in doubt, check with the manufacturer.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-009, § 296-807-18005, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18010  Make sure machines have safety guards.

You must:
- Use abrasive wheels only on machines that have safety guards.
  - Make sure the safety guard:
    - Is mounted so it maintains proper alignment with the wheel
    - Is mounted with fasteners strong enough to keep the guard in position if a wheel breaks
    - Is positioned to deflect pieces of an accidentally broken wheel away from the operator
    - Covers the spindle end, nut, and flange projections.

Exemption:
Safety guards are not required on machines that use:
- Wheels for internal grinding while advancing, retracting or within the work
  - Mounted wheels two inches or less in diameter
  - Types 16, 17, 18, 18R, and 19 cones and plugs and threaded hole pot balls where:
    - The work offers protection
  OR
    - The size does not exceed three inches in diameter by five inches long.
  - Notched, segmented, or continuous rim metal centered diamond lapidary wheels that are:
    - Used with a coolant deflector
    AND
    - Operated at 3,500 SFPM or less.
  - Type 1 wheels that are:
    - Two inches or less in diameter
WAC 296-807-18015 Keep safety guards in good functional condition.

You must:
• Make sure safety guards are in good functional condition.
  • Replace any safety guard that:
    – Is damaged, bent or severely worn
  OR
    – Has been hit by parts from a breaking wheel.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-009, § 296-807-18015, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18020 Use specific safety guards for machines using Type 1 grinding wheels, cutting-off wheels, and tuck pointing wheels.

You must:
• Make sure the safety guard covers the top and sides of the wheel for at least one hundred eighty degrees.

Note: It is not required to cover the spindle end, nut and outer flange.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-009, § 296-807-18020, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18025 Use specific safety guards for vertical and angle grinders using Type 6 or Type 11 wheels.

You must:
• Make sure the safety guard:
  – Covers the wheel's plane of rotation toward the operator for at least one hundred eighty degrees
  – Covers the side of the wheel toward the driving flange for at least one hundred eighty degrees
  – Has a skirt which is adjustable to within one-eighth inch of the plane of the surface of the wheel.
• Make sure not to use a "revolving cup guard."

Note: "Cup back bushings" do not substitute for safety guards.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-009, § 296-807-18025, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18030 Use specific safety guards for vertical and angle grinders using Type 27, 28 and 29 wheels.

You must:
• Make sure safety guards:
  – Cover the wheel's plane of rotation toward the operator for at least one hundred eighty degrees
  – Cover the side of the wheel toward the driving flange for at least one hundred eighty degrees
  – Have a lip on the outer edge that:
    ■ Extends beyond the surface of the wheel throughout the one hundred eighty degree coverage
    AND
    ■ Curls inward to deflect wheel fragments.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-009, § 296-807-18030, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18035 Use side handles on vertical and angle grinders.

You must:
• Use a side handle on all four-inch and larger vertical and angle grinders.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-009, § 296-807-18035, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18040 Make sure abrasive wheels are safe to use.

You must:
• Do the following before mounting a wheel:
  – Visually inspect the wheel for cracks or damage
  – Perform a ring test for cracks (size and shape of the wheel permitting)
  – Make sure the spindle speed of the machine is not greater than the operating speed of the wheel.
  – Make sure a damaged or cracked wheel is not mounted or used.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-009, § 296-807-18040, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18045 Mount wheels properly.

You must:
(1) Make sure wheels fit freely on the spindle, wheel sleeves, or adaptors, and remain free under all grinding conditions.
(2) Make sure wheel, blotter and flange surfaces that contact each other are flat and free of foreign particles.
(3) Make sure any reducing bushing used in the wheel hole:
  — Fits freely on the spindle and maintains proper clearance
  — Does not exceed the width of the wheel or contact the flanges.
(4) Make sure that multiple wheels mounted between a single set of flanges are either:
  — Cemented together
  OR
  — Separated by spacers that have a diameter and bearing surface that is the same as the mounting flanges.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-009, § 296-807-18045, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18050 Use proper flanges.

You must:
• Mount all abrasive wheels between flanges that have a diameter at least one-third the diameter of the wheel.

Exemption:
• Mounted wheels
• Cup, cone or plug wheels with threaded inserts or projecting studs

(2005 Ed.)
• Abrasive disc wheels (inserted nut, inserted washer and projecting stud type)
  • Plate mounted wheels
  • Cylinder, cup, or segmental wheels mounted in chucks
  • Types 27, 28 and 29 wheels
  • Internal wheels less than two inches in diameter
  • Modified Type 6 and 11 wheels (terrazzo)
  • Types 1 and 27A cutting-off wheels.

You must:
• Make sure flanges are:
  – Dimensionally accurate
  – Properly balanced
  – Flat
  – Free of rough surfaces or sharp edges.

Make sure, if a wheel is mounted between two flanges, that both flanges:
• Are the same diameter
• Have equal bearing surfaces.

Exemption:
The following wheels do not require same diameter, equal bearing surface flanges:
• Types 27, 28, and 29 wheels with adaptors
• Modified Types 6 and 11 wheels with tapered K dimension
• Internal wheels less than two inches in diameter.

You must:
• Make sure the driving flange is:
  – Part of the spindle
  OR
  – Securely fastened to the spindle.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-18050, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18055 Make sure flanges are in good condition.
You must:
• Make sure flange bearing surfaces are in good condition.
• Replace or remachine any flange with a mounting surface that has any of the following problems:
  – Warped
  – Burred on the bearing surface
  – Excessively worn (thickness or diameter)
  – Out of true.

Note: Flanges that are refaced or trued need to satisfy minimum dimension requirements specified in ANSI B7.1-2000, Safety Requirements for the Use, Care and Protection of Abrasive Wheels.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-18055, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18060 Use specific flanges for Type 1 cutting-off wheels.
You must:
• Mount Type 1 cutting-off wheels between flanges that are:
  – Properly relieved with matching bearing surfaces
  – At least one-quarter the wheel diameter.

Note: American National Standards Institute (ANSI) B7.1-2000, Safety Requirements for the Use, Care and Protection of Abrasive Wheels, has specific exemptions for some reinforced, bonded abrasive cutting-off wheels and steel centered, diamond cutting-off wheels. These wheels are primarily used for masonry cutting and concrete sawing.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-18060, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18065 Use specific flanges for Type 27A cutting-off wheels.
You must:
• Mount Type 27A cutting-off wheels between flanges that are:
  – Flat (unrelieved) with matching bearing surfaces
  – At least one-quarter the wheel diameter.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-18065, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18070 Use specific flanges for threaded hole wheels.
You must:
• Use a back flange to mount threaded hole wheels that is:
  – Flat (unrelieved)
  – Securely fastened and square to the spindle axis
  – Able to properly support the wheel.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-18070, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18075 Use specific flanges for cup, cone or plug wheels with threaded inserts or projecting studs.
You must:
• Mount cup, cone or plug wheels with threaded inserts or projecting studs against a straight, unrelieved flange.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-18075, filed 4/4/03, effective 8/1/03.]

WAC 296-807-18080 Use blotters when required.
You must:
• Use a blotter between each flange and the abrasive wheel surface to uniformly distribute flange pressure.
• Make sure the blotter covers the entire flange contact area.
• Use a new blotter each time a wheel is mounted unless the wheel has a blotter already attached to it by the manufacturer.
• Make sure scuffed or damaged blotters are not used.

Exemption:
You do not need to use a blotter with:
• Mounted wheels
• Abrasive disc and Type 2 wheels which are mounted by inserted nuts, inserted washers, or projecting studs
• Plate mounted wheels
• Wheels mounted in chucks (such as cylinders and segmental wheels)
• Types 27, 28 and 29 wheels
• Type 1 and Type 27A cutting-off wheels
• Internal wheels less than two inches in diameter
• Diamond and cubic boron nitride wheels with metal or carbon fiber cores.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-18080, filed 4/4/03, effective 8/1/03.]
WAC 296-807-18085 Meet specific blotter requirements when using modified Types 6 and 11 wheels (terrazzo).

You must:
- Mount modified Types 6 and 11 wheels (terrazzo) with a blotter applied to the flat side of the wheel only.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 03-09-009, § 296-807-18085, filed 4/4/03, effective 8/1/03.]

WAC 296-807-190 Definitions.

Abrasive wheel. A grinding tool consisting of bonded abrasive grains. This includes diamond and reinforced wheels.

Blind hole. A hole drilled in an object, such as an abrasive wheel, that does not go all the way through.

Blotter. A compressible disc or washer, usually of blotting paper, plastic, cardboard, or gasket material, that is used between the wheel and the flanges to evenly distribute flange pressure on the wheel.

Cone and plug wheels (Types 16, 17, 18, 18R, and 19). Abrasive wheels manufactured with blind hole threaded bushings. They may be used on all surfaces except the flat mounting surface. Specific characteristics of the different cone and plug wheels are:
- Type 16 cones have a curved side with a nose radius
- Type 17 cones have straight sides with or without a nose radius
- Type 18 and 18R plug wheels are cylindrical in shape with either a square or curved grinding end
- Type 19 cone wheels are a combination of cone and plug shapes

Cutting-off wheels. Abrasive wheels used to cut material such as masonry, pipe, etc.

Designated person. A person selected or assigned by the employer or the employer's representative as competent to perform specific duties.

Discharge opening. An opening in a mower housing for discharging grass.

Flanges. Collars, discs or plates between or against which wheels are mounted. There are four types of flanges:
- Adaptor
- Sleeve
- Straight relieved
- Straight unrelieved

Grass catcher. Parts or a combination of parts to collect grass clippings or debris.

Guard (abrasive wheels). An enclosure designed to restrain the pieces of an abrasive wheel and furnish protection to the operator if the wheel is broken during operation.

Guard. A part or assembly to prevent accidental contact with hazardous machine parts or to protect persons from other hazards created by the machinery.

Inorganic bonded wheel. Abrasive wheels that are bonded by means of inorganic material such as clay, glass, porcelain, sodium silicate, magnesium oxychloride, or metal.

Jack. A portable hand- or power-operated mechanism for lifting, lowering or moving horizontally a load by applying a pushing force.

Modified Types 6 and 11 wheels (terrazzo). Similar to Type 6 “straight cup” wheels and Type 11 “flaring cup” wheels except for the bottom of the cup. The bottom of the cup is flat in Type 6 and 11 wheels. The modified wheels have bottoms that are sloped downwards towards the mounting hole. These modified wheels need to be mounted using a special tapered flange furnished by the tool manufacturer. These wheels are used in the terrazzo trade.

Mounted wheels. Bonded abrasive wheels of various shapes, usually two inches diameter or smaller, that are secured to plain or threaded steel mandrels.

Normal service (jacks). Raising or lowering axial loads that are eighty-five percent or less of the rated load under controlled conditions.

Organic bonded wheels. Abrasive wheels that are bonded by means of organic material such as resin, rubber, shellac, or other similar bonding agent.

Rated load. The maximum load that the jack is designed to lift or support.

Reinforced wheels. Organic bonded abrasive wheels which have webbing, fabric or filament to provide resistance to complete breaking of the wheel should it become cracked or damaged.

Terrazzo. A material of stone chips, such as marble, set in mortar and polished.

Threaded hole wheels. Abrasive wheels that have one central threaded bushing, securely anchored in place. They are mounted by being screwed onto a threaded machine spindle so that the wheel back seats firmly against an unrelieved flat back flange.

Tuck pointing wheels. Tuck pointing abrasive wheels are Type 1 reinforced, organic bonded wheels and have diameter, thickness and hole size dimensions. They are used to remove cement, mortar, or other nonmetallic jointing material.

Type 1 wheel. An abrasive wheel shaped like a disc with a mounting hole in the middle. Sometimes called a “straight wheel.” It has diameter (D), thickness (T), and hole size (H) dimensions. Grinding is normally done on the periphery (outside curve) of the wheel (T dimension). Can be used for grinding, cutting-off, and tuck pointing.

Type 2 wheel. An abrasive wheel shaped like an open-ended, hollow cylinder. Sometimes called a cylinder wheel. It has diameter (measured from the outer wall of the cylinder), wheel thickness (height of the cylinder), and rim thickness (thickness of the cylinder wall). Grinding is done on the end of the cylinder (rim thickness dimension).

Type 6 wheel. An abrasive wheel shaped like a straight-sided cup or bowl with a mounting hole in the bottom of the cup. Sometimes called a "cup wheel." It has diameter (D), thickness (T), hole size (H), rim thickness (W), and back thickness (E) dimensions. Grinding is normally done on the cup rim (W dimension).

Type 11 wheel. An abrasive wheel shaped like a cup or bowl with a mounting hole in the bottom of the cup. The sides of the cup are not straight-sided but are angled outward. Sometimes called a "flaring cup wheel" since the sides are "flared" out. It has double diameter dimensions (top D and bottom J). It also has thickness (T), hole size (H), rim thickness (W) and back thickness (E) dimensions. Grinding is normally done on the cup rim (W dimension).

Type 16, 17, 18, 18R, and 19 wheels. See cone and plug wheels.
Type 27 wheel. An abrasive wheel similar to a Type 1 wheel, but the center of the wheel around the mounting hole is pushed back (depressed). Sometimes called a "depressed center" wheel. It has diameter (D), thickness (U) and hole size (H) dimensions. The depressed center allows grinding on the flat surface of the wheel without interference from the flange or mounting hardware.

Type 27A cutting-off wheel. Similar to a Type 27 wheel. Specifically designed for use on cutting-off machines.

Type 28 wheel. An abrasive wheel similar to a Type 27 wheel, but the face of the wheel is angled upward and away from the mounting hole. The face of a Type 27 wheel is flat and perpendicular to the mounting hole. A Type 28 wheel is also called a "depressed center" wheel. It has diameter (D), thickness (U) and hole size (H) dimensions. The depressed center allows grinding without interference from the mounting. A Type 28 wheel has a saucer-shaped grinding rim and is designed for corner grinding and side grinding.

Type 29 wheel. An abrasive wheel that has reversed, saucer-shaped grinding rims (similar to a partially opened umbrella).

Chapter 296-809 WAC

CONFINED SPACES

WAC 296-809-100 Scope.
296-809-200 Summary.
296-809-20002 Identify permit-required confined spaces.
296-809-20004 Inform employees and control entry to permit-required confined spaces.
296-809-20006 Follow these requirements when you contract with another employer to enter your confined space.

PERMIT-REQUIRED CONFINED SPACE PROGRAM
296-809-300 Summary.
296-809-30002 Develop a written permit-required confined space program.
296-809-30004 Meet these additional requirements if your employees enter another employer's confined space.

EMPLOYEE TRAINING
296-809-400 Summary.
296-809-40002 Provide employee training.
296-809-40004 Certify employee proficiency.

PERMIT ENTRY PROCEDURES
296-809-500 Summary.
296-809-50002 Implement procedures for entry permits.
296-809-50004 Use an entry permit that contains all required information.
296-809-50006 Keep and review your entry permits.
296-809-50008 Prevent unauthorized entry.
296-809-50010 Provide, maintain, and use proper equipment.
296-809-50012 Evaluate and control hazards for safe entry.
296-809-50014 Make sure you have adequate rescue and emergency services available.
296-809-50016 Use nontentry rescue systems or methods whenever possible.
296-809-50018 Make sure entry supervisors perform their responsibilities and duties.
296-809-50020 Provide an attendant outside the permit-required confined space.
296-809-50022 Make sure entrants know the hazardous conditions and their duties.
296-809-50024 Implement procedures for ending entry.
296-809-50060 Alternate entry procedures.
296-809-60002 Make sure the following conditions are met if using alternate entry procedures.
296-809-60004 Follow these alternate entry procedures for permit-required confined spaces.
296-809-700 Nonpermit confined spaces requirements.
296-809-70002 Follow these requirements when classifying a confined space as a nonpermit confined space.
296-809-70004 Reevaluate nonpermit confined spaces if hazards develop.
296-809-800 Definitions.

WAC 296-809-100 Scope. This chapter applies to all confined spaces and provides requirements to protect employees from the hazards of entering and working in confined spaces. This chapter applies in any of the following circumstances:

- You have confined spaces in your workplace.
- Your employees will enter another employer's confined spaces.
  - A contractor will enter your confined spaces.
  - You provide confined space rescue services.
  - You use Table 1 to help you decide which requirements to follow for confined spaces.

Table 1

Definition:
A confined space is a space that is ALL of the following:
• Large enough and arranged so an employee could fully enter the space and work.
• Has limited or restricted entry or exit. Examples of spaces with limited or restricted entry are tanks, vessels, silos, storage bins, hoppers, vaults, excavations, and pits.
• Not primarily designed for human occupancy.

Rules in other chapters that cover confined spaces may also apply to your work. You can find a list of these rules in the resources section of this chapter.

Note: Requirements in other chapters may apply to your work. You will find some safety and health requirements are addressed on a broad level in this chapter, while being
addressed for a specific application in another rule. When this happens, both requirements apply and should not conflict. When a conflict does occur, you need to follow the more specific requirement.

- If you are uncertain which requirements to follow, contact your local labor and industries (L&I) office.
- For a complete list of local L&I offices, see the resources section of the safety and health core rules, chapter 296-800 WAC.

WAC 296-809-200 Summary. Identifying and controlling permit-required confined spaces.

Your responsibility:
To identify your permit-required confined spaces and control employee entry.

You must:
- Identify permit-required confined spaces.

WAC 296-809-20002 Inform employees and control entry to permit-required confined spaces.

WAC 296-809-20004 Follow these requirements when you contract with another employer to enter your confined space.

WAC 296-809-20006 Identify permit-required confined spaces.

IMPORTANT:
If your workplace contains only nonpermit confined spaces and your employees do not enter another employer’s confined space, you may follow only the requirements in:
- WAC 296-809-200, Identifying and controlling permit-required confined spaces; and
- WAC 296-809-700, Nonpermit confined space requirements.

- See the resources section for other chapters covering confined spaces that may apply to your work.

You must:
- Identify all permit-required confined spaces in your workplace.
- Assume any confined space is a permit-required confined space, unless you determine the space to be a nonpermit confined space.
  - If you evaluate the confined space and there are no potential or actual hazards, you can consider it to be a nonpermit confined space.
  - Document your determination that the space is nonpermit, as required by WAC 296-809-700.

Definitions:
A permit-required confined space or permit space is a confined space that has one or more of the following characteristics capable of causing death or serious physical harm:
- Contains or has a potential to contain a hazardous atmosphere.
- Contains a material with the potential for engulfing someone who enters the space.
- Has an internal configuration that could allow someone entering to be trapped or asphyxiated by inwardly converging walls or by a floor, which slopes downward and tapers to a smaller cross-section.
- Contains any physical hazard. This includes any recognized health or safety hazards including engulfment in solid or liquid material, electrical shock, or moving parts.
- Contains any other recognized safety or health hazard that could either:
  - Impair the ability to self rescue;
  - Result in a situation that presents an immediate danger to life or health.

A nonpermit confined space is a confined space that does NOT contain actual hazards or potential hazards capable of causing death or serious physical harm.

WAC 296-809-20004 Inform employees and control entry to permit-required confined spaces.

You must:
1. Provide information about confined spaces as follows:
   - Make available to affected employees and their authorized representatives all information and documents required by this chapter.
   - Inform affected employees about the existence, location, and danger of any permit-required confined spaces in your workplace by:
     - Posting danger signs; or
     - Using any other equally effective means to inform employees.

Note: A sign reading “Danger-Permit Required Confined Space, DO NOT ENTER” or using pictures or other similar wording employees can understand would satisfy the requirement for a sign.

You must:
2. Take effective measures to prevent unauthorized employees from entering permit-required confined spaces.

Note: Examples of measures to prevent employee entry include padlocks, bolted covers, special tools to remove covers, and providing employee training.

WAC 296-809-20006 Follow these requirements when you contract with another employer to enter your confined space.

IMPORTANT:
The contractor is responsible for following all confined space requirements in this chapter and in other rules that apply. For a list of other rules that may apply, see the resources section of this chapter.

You must:
- Do all of the following if you arrange to have another employer (contractor) perform work that involves entry into your permit-required confined space:
  - Inform the contractor:
    - That the workplace contains permit-required confined spaces and entry is allowed only if the applicable requirements of this chapter are met.

(2005 Ed.)
■ Of the identified hazards and your experience with each permit-required confined space.
■ Of any precautions or procedures you require for the protection of employees in or near spaces where the contractor will be working.
   – Coordinate entry operations with the contractor, when either employees or employers from the different companies will be working in or near permit-required confined spaces.
   – Discuss entry operations with the contractor when they are complete. Include the following in your discussion:
     ■ The program followed during confined space entry; and
     ■ Any hazards confronted or created.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-03-081, § 296-809-30004, filed 1/20/04, effective 5/1/04.]

**PERMIT-REQUIRED CONFINED SPACE PROGRAM**

WAC 296-809-300 Summary.
Your responsibility:
To develop your permit-required confined space program and practices.

IMPORTANT:
This section applies if employees will enter a permit-required confined space.

You must:
Develop a written permit-required confined space program.

WAC 296-809-30002
Meet these additional requirements if your employees enter another employer’s confined space.

WAC 296-809-30004

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-03-081, § 296-809-30002, filed 1/20/04, effective 5/1/04.]

**WAC 296-809-30002 Develop a written permit-required confined space program.**

IMPORTANT:
- Identify and evaluate the hazards of permit-required confined spaces and the work performed, to assist you in developing your entry program.

You must:
- Develop a written program, before employees enter, that describes the means, procedures, and practices you use for the safe entry of permit-required confined spaces as required by this chapter. Include the following when applicable to your confined space entry program:
  - Documentation of permit entry procedures.
  - Documentation used for alternate entry procedures.
  - How to reclassify permit-required confined spaces to nonpermit spaces.
  - Designation of employee roles, such as entrants, attendants, entry supervisors, rescuers, or those who test or monitor the atmosphere in a permit-required space.
  - Identification of designated employee duties.
  - Training employees on their designated roles.
  - How to identify and evaluate hazards.
  - Use and maintenance of equipment.
  - How to prevent unauthorized entry.
  - How to coordinate entry with another employer.
  - How to rescue entrants.

Note: For alternate entry, your written program only needs to meet the requirements of WAC 296-809-400, Employee training, and WAC 296-809-600, Alternate entry procedures, of this chapter.

You must:
- Consult with affected employees and their authorized representatives when developing and implementing all aspects of your permit-required confined space program.
- Make the written program available to employees and their authorized representatives.
- Update your written program as necessary.

Link: You can find a sample permit-required confined space entry program in the user guide located in the resources section of this chapter or by visiting the labor and industries website at http://www.lni.wa.gov/whs/permitspaces.

WAC 296-809-30004 Meet these additional requirements if your employees enter another employer’s confined space.

You must:
- Obtain any available information about permit-required confined space hazards and entry operations from the host employer.
- Coordinate entry operations with any other employers whose employees will be working in or near the permit-required confined space.
- Inform the host employer, either through a debriefing or during entry operations, about:
  - The entry program you will follow; and
  - Any hazards you confronted or created in the space during entry operations.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-03-081, § 296-809-30004, filed 1/20/04, effective 5/1/04.]

**EMPLOYEE TRAINING**

WAC 296-809-400 Summary.
Your responsibility:
To make sure employees are trained to perform their designated roles safely.

You must:
- Provide employee training.

WAC 296-809-40002
Certify employee proficiency.

WAC 296-809-40004

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-03-081, § 296-809-40002, filed 1/20/04, effective 5/1/04.]

**WAC 296-809-40002 Provide employee training.**

You must:
- Provide training to each employee involved in permit-required confined space activities, so they acquire the understanding, knowledge and skills necessary to safely perform assigned duties.
  - Establish employee proficiency in their confined space duties.
  - Introduce new or revised procedures as necessary.

Note: Employers can determine employee proficiency by:
- Observing employee performance during training exercises that simulate actual confined space conditions.
- A comprehensive written examination; or

[Title 296 WAC—p. 2896] (2005 Ed.)
You must:

- Provide training at the following times:
  - Before an employee is first assigned to duties covered by this chapter.
  - Before there is a change in an employee’s assigned duties.
  - When there is a permit-required confined space hazard for which the employee has not already been trained.
  - If you have reason to believe that there are either:
    - Deviations from your procedures for permit-required confined space entry; or
    - Employee knowledge or use of your procedures is inadequate.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-03-081, § 296-809-50002, filed 1/20/04, effective 5/1/04.]

**WAC 296-809-40004 Certify employee proficiency.**

You must:

- Certify employee proficiency in their assigned duties.
- Make sure the certification:
  - Contains each employee’s name, the trainer’s written or electronic signature or initials, and the dates of training.
  - Is available for inspection by employees and their authorized representatives.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-03-081, § 296-809-40004, filed 1/20/04, effective 5/1/04.]

**PERMIT ENTRY PROCEDURES**

**WAC 296-809-500 Summary.**

Your responsibility:

To establish procedures for the safe permit-required entry of confined spaces.

Implement procedures for entry permits.

**WAC 296-809-50002 Use an entry permit that contains all required information.**

You must:

- Use an entry permit that contains all required information.
- Implement procedures for ending entry.

**WAC 296-809-50004 Keep and review your entry permits.**

You must:

- Prevent unauthorized entry.
- Provide, maintain, and use proper equipment.
- Evaluate and control hazards for safe entry.
- Make sure you have adequate rescue and emergency services available.
- Use nonentry rescue systems or methods whenever possible.
- Make sure entry supervisors perform their responsibilities and duties.
- Provide an attendant outside the permit-required confined space.
- Make sure entrants know the hazardous conditions and their duties.

(2005 Ed.)

**WAC 296-809-50022 Implement procedures for ending entry.**

You must:

- Make sure your entry permit identifies all of the following that apply to your entry operation:
  - The space to be entered.
  - Purpose of the entry.
  - Date and the authorized duration of the entry permit.
  - Hazards of the space to be entered.
  - Acceptable entry conditions.
  - Results of initial and periodic tests performed to evaluate and identify the hazards and conditions of the space, accompanied by the names or initials of the testers and by an indication of when the tests were performed.
  - Appropriate measures used before entry to isolate the space, and eliminate or control hazards.
  - Examples of appropriate measures include the lockout or tagging of equipment and procedures for purging, inerting, ventilating, and flushing permit-required confined spaces.
  - Names of entrants and current attendants:
    - Other means include the use of rosters or tracking systems as long as the attendant can determine quickly and accurately, for the duration of the permit, which entrants are inside the space.
WAC 296-809-50006 Keep and review your entry permits.
You must:
- Keep entry permits for at least one year.
- Keep entry permits or other atmospheric monitoring records that show the actual atmosphere an employee entered or worked in, as employee exposure records.
- Review your permit-required confined space entry program as follows:
  - Conduct a review when you have any reason to believe your entry program may not protect employees, and revise your program before allowing subsequent entries.

Note: Examples of circumstances requiring the review of your program include the following:
- There is an unauthorized entry of a permit space.
- A permit space hazard not covered by the permit is found.
- A condition prohibited by the permit occurs.
- An injury or near-miss occurs during entry.
- There is a change in the use or configuration of a permit space.
- An employee complains about the effectiveness of the program.

You must:
- Review canceled entry permits within one year following each entry to evaluate:
  - Your permit-required confined space program.
  - The protection provided to employees entering permit-required confined spaces.
- Update your written permit-required confined space entry program as necessary.

Note: Employers may perform a single annual review covering all entries performed during a twelve-month period. If no entry is performed during a twelve-month period, no review is necessary.

Reference: Keep employee exposure records according to chapter 296-62 WAC. Part B, Access to records.

WAC 296-809-50008 Prevent unauthorized entry.
You must:
- Implement measures necessary to prevent unauthorized entry into permit-required confined spaces, when conducting authorized entry.

Note: When removing entrance covers to open the confined space, protect entrants and those outside the confined space from hazards.
Examples of measures to prevent unauthorized entry are signs, barricades, warning tape, and an attendant.

WAC 296-809-50010 Provide, maintain, and use proper equipment.
You must:
- Provide the equipment in Table 2, when needed and at no cost to employees.
- Make sure that employees use provided equipment properly.
- Maintain the provided equipment.

Table 2 Equipment Provided to Employees at No Cost

WAC 296-809-50012 Evaluate and control hazards for safe entry.
- Evaluate and control hazards for safe entry into permit-required confined spaces by doing all the following:
  - Test for atmospheric hazards, in this order:
    - Oxygen.
    - Combustible gases and vapors.
Confined Spaces

You must:

(1) Make sure you have adequate rescue and emergency services available during your permit-required confined space entry operations.

• Evaluate and select rescue teams or services who can:
  – Respond to a rescue call in a timely manner. Timeliness is based on the identified hazards. Rescuers must have the capability to reach potential victims within an appropriate time frame based on the identified permit space hazards.
  – Proficiently rescue employees from a permit-required confined space in your workplace. Rescuers must have the appropriate equipment for the type of rescue.
  – Make sure that at least one member of the rescue team or service holds a current certification in first aid and cardiopulmonary resuscitation (CPR).

• Inform each rescue team or service about the hazards they may confront when called to perform rescue.

• Provide the rescue team or service with access to all permit spaces from which rescue may be necessary.
  – This will allow them to develop appropriate rescue plans and to practice rescue operations.

Note: What will be considered timely will vary according to the specific hazards involved in each entry. For example, chapter 296-842 WAC, Respirators, requires that employers provide a standby person or persons capable of immediate action to rescue employee(s) for work areas considered to contain an IDLH atmosphere.

You must:

(2) Provide employees, assigned to provide permit-required confined space rescue and emergency services, with:

• Personal protective equipment (PPE) needed for safe entry.

• Other equipment required to conduct rescues safely.
  – Training so they are:
    – Proficient in the use of the PPE and other equipment.
    – Proficient as an entrant of permit-required confined spaces.
    – Able to safely perform assigned rescue and emergency duties.
    – Knowledgeable in basic first aid and cardiopulmonary resuscitation (CPR).

• Practice sessions for permit-required confined space rescues at least once every twelve months where dummies, manikins, or actual persons are removed from either:
  – The actual permit spaces; or
  – Representative permit spaces that simulate the opening size, configuration, and accessibility, of permit spaces where rescue will be performed.

(3) Establish procedures for:

• Contacting rescue and emergency services.

• Rescuing entrants from permit-required confined spaces.

• Providing necessary emergency services to rescued entrants.

• Preventing unauthorized persons from attempting a rescue.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-03-081, § 296-809-50012, filed 1/20/04, effective 5/1/04.]

WAC 296-809-50014 Make sure you have adequate rescue and emergency services available.

You must:

(1) Make sure you have adequate rescue and emergency services available during your permit-required confined space entry operations.

• Evaluate and select rescue teams or services who can:
  – Respond to a rescue call in a timely manner. Timeliness is based on the identified hazards. Rescuers must have the capability to reach potential victims within an appropriate time frame based on the identified permit space hazards.
  – Proficiently rescue employees from a permit-required confined space in your workplace. Rescuers must have the appropriate equipment for the type of rescue.
  – Make sure that at least one member of the rescue team or service holds a current certification in first aid and cardiopulmonary resuscitation (CPR).
WAC 296-809-50018 Make sure entry supervisors perform their responsibilities and duties.

You must:

• Make sure that an entry supervisor:
  – Authorizes the entry into a permit-required confined space by signing the entry permit.
  – Oversees entry operations.
  – Knows about the hazards that may be faced during entry, including the mode, signs or symptoms, and consequences of the exposure.
  – Verifies and checks all of the following:
    ■ The appropriate entries have been made on the permit.
    ■ All tests specified by the permit have been conducted.
    ■ All procedures and equipment specified by the permit are in place before approving the permit and allowing entry to the space.
  – Terminates the entry and cancels the permit when:
    ■ The assigned task or job has been completed.
    ■ A condition in the space that is not covered by the entry permit is discovered.
  – Verifies that rescue services are available and that there is a way to contact them.
  – Removes unauthorized individuals who enter or attempt to enter the permit-required confined space during entry operations.
  – Determines that entry operations remain consistent with the terms of the entry permit and acceptable entry conditions are maintained:
    ■ Whenever responsibility for a permit-required space entry operation is transferred; and
    ■ At regular intervals dictated by the hazards and operations performed within the space.

Note: Make sure entry supervisors have the required knowledge and proficiency to perform the job duties and responsibilities required by this chapter.

WAC 296-809-50020 Provide an attendant outside the permit-required confined space.

IMPORTANT:

• The number of attendants assigned should be tailored to the requirements of the space and the work performed.

You need to assess if it is appropriate or possible to have multiple permit spaces monitored by a single attendant, or have an attendant stationed at a location outside each space. Video cameras and radios are examples of tools that may assist an attendant monitoring more than one space.

• Attendants may be stationed at any location outside the permit-required confined space if the duties described in this section can be effectively performed for each space that is monitored.

You must:

• Provide at least one attendant outside the permit-required confined space during entry operations.
  – Make sure each permit-required confined space attendant:
    – Understands the hazards that may be faced during entry, including the mode, signs or symptoms, and results of exposure to the hazards.
    – Is aware of the behavioral effects of exposure to the hazard.
    – Continuously maintains an accurate count of entrants in the space.
    – Maintains an accurate record of who is in the permit-required confined space.
    – Communicates with entrants as necessary to monitor their status or alert them of the need to evacuate the space.
    – Monitors activities inside and outside the space to determine if it is safe for entrants to remain in the space.
    – Orders entrants to evacuate the space immediately if any of the following conditions occur:
      ■ A prohibited condition.
      ■ The behavioral effects of hazardous exposure in an entrant.
      ■ A situation outside the space that could endanger entrants.
      ■ The attendant cannot effectively and safely perform all the duties required in this chapter.
    – Takes the following actions when unauthorized persons approach or enter a space:
      ■ Warn unauthorized persons to stay away from the space.
      ■ Tells the unauthorized persons to exit immediately if they have entered the space.
      ■ Informs entrants and the entry supervisor if unauthorized persons have entered the space.
      ■ Performs nonentry rescues as specified by your rescue procedure.
    – Has the means to respond to an emergency affecting one or more of the permit spaces being monitored without preventing performance of the attendant’s duties to the other spaces being monitored.
    – Carries out no duties that might interfere with their primary duty to monitor and protect the entrants.
    – Calls for rescue and other emergency services as soon as entrants may need assistance to escape from the space.
    – Monitors entry operations until relieved by another attendant or all entrants are out of the space.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 04-03-081, § 296-809-50018, filed 1/20/04, effective 5/1/04.]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 04-03-081, § 296-809-50020, filed 1/20/04, effective 5/1/04.]

(2005 Ed.)
WAC 296-809-50022 Make sure entrants know the hazardous conditions and their duties.

You must:
• Make sure that all entrants:
  – Know the hazards they may face during entry, including the mode, signs or symptoms, and results of exposure to the hazards.
  – Use equipment properly.
  – Communicate with the attendant as necessary so the attendant can:
    ■ Monitor entrant status.
    ■ Alert entrants of the need to evacuate.
  – Alert the attendant whenever either of these situations exist:
    ■ A warning sign or symptom of exposure to a dangerous situation such as, behavioral changes, euphoria, giddiness potentially from lack of oxygen or exposure to solvents.
    ■ A prohibited condition.
  – Exit from the permit-required confined space as quickly as possible when one of the following occurs:
    ■ The attendant or entry supervisor gives an order to evacuate.
    ■ The entrant recognizes any warning sign or symptom of exposure to a dangerous situation.
    ■ The entrant detects a prohibited condition.
    ■ An evacuation alarm is activated.

[Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-03-081, § 296-809-50022, filed 1/20/04, effective 5/1/04.]

WAC 296-809-50024 Implement procedures for ending entry.

You must:
• Make sure you terminate the entry when entry operations are completed, including securing an entrance cover and canceling the permit.

[Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-03-081, § 296-809-50024, filed 1/20/04, effective 5/1/04.]

WAC 296-809-600 Alternate entry procedures.

Summary:
Your responsibility:
To choose alternate entry procedures for spaces where the only hazard is a hazardous atmosphere.

IMPORTANT:
In addition to this section, you also need to meet the requirements in the following sections of this chapter:
– WAC 296-809-300, Permit-required confined space program.
– WAC 296-809-400, Employee training.

You must:
Make sure the following conditions are met if using alternate entry procedures.

WAC 296-809-60002 Follow these alternate entry procedures for permit-required confined spaces.

[Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-03-081, § 296-809-60002, filed 1/20/04, effective 5/1/04.]

(2005 Ed.)

WAC 296-809-60002 Make sure the following conditions are met if using alternate entry procedures.

You must:
• Make sure, when using alternate entry procedures, instead of permit entry procedures, that you have monitoring and inspection data that supports the following:
  ■ That the only hazard of the permit-required confined space is an actual or potentially hazardous atmosphere.
  ■ That continuous forced air ventilation alone is all that is needed to maintain the permit-required confined space for safe entry.
• Make sure an entry to obtain monitoring and inspection data or to eliminate hazards is performed according to WAC 296-809-500, Permit entry procedures.
• Make sure all documentation produced is available to each affected employee and their authorized representative.

[Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-03-081, § 296-809-60002, filed 1/20/04, effective 5/1/04.]

WAC 296-809-60004 Follow these alternate entry procedures for permit-required confined spaces.

You must:
• Use the following alternate entry procedures:
  – Eliminate any unsafe conditions before removing an entrance cover.
  ■ When entrance covers are removed, promptly guard the opening with a railing, temporary cover, or other temporary barrier to prevent accidental falls through the opening and protect entrants from objects falling into the space.
  ■ Certify that preentry measures have been taken (such as safe removal of the cover and having protection needed to gather preentry data), with the date, location of the space, and signature of the person certifying.
  ■ Make the preentry certification available before entry to each entrant.
  – Before an employee enters the confined space, test the internal atmosphere with a calibrated, direct-reading instrument for all of the following, in this order:
    ■ Oxygen content.
    ■ Flammable gases and vapors.
    ■ Potential toxic air contaminants.
  – Provide entrants, or their authorized representatives, with an opportunity to observe the preentry and periodic testing.
  – Make sure the atmosphere within the space is not hazardous when entrants are present.
  – Use continuous forced air ventilation, as follows:
    ■ Wait until the forced air ventilation has removed any hazardous atmosphere before allowing entrants into the space.
  ■ Direct forced air ventilation toward the immediate areas where employees are, or will be, and continue ventilation until all employees have left the space.
  ■ Provide the air supply from a clean source and make sure it does not increase hazards in the space.
  – Test the atmosphere within the space as needed to make sure hazards do not accumulate.
  – If a hazardous atmosphere is detected during entry, do all of the following:
  ■ Evacuate employees from the space immediately.

[Title 296 WAC—p. 2901]
WAC 296-809-700 Nonpermit confined spaces requirements.

Summary:
Your responsibility:
To make sure any space you classify as nonpermit, does not have the potential to contain serious health or safety hazards.

You must:
Follow these requirements when classifying a confined space as a nonpermit confined space.

WAC 296-809-70002
Reevaluate nonpermit confined spaces if hazards develop.

WAC 296-809-70004
IMPORTANT:
A confined space may be classified as a nonpermit confined space for as long as the hazards remain eliminated. Once a hazard is present, you must follow all requirements of this chapter that apply.

You must:
• Make sure the confined space meets these conditions to be classified as nonpermit confined space:
  – The confined space does not contain an actual or potential hazardous atmosphere.
  – The confined space does not contain hazards capable of causing death or serious physical harm. This includes any recognized health or safety hazards including engulfment in solid or liquid material, electrical shock, or moving parts.
  – If you must enter to remove hazards, the space must be treated as a permit-required confined space until hazards have been eliminated.

Note:
• Controlling atmospheric hazards through forced air ventilation does not eliminate the hazards.
• You should evaluate the use of lockout-tagout, as covered in WAC 296-24-110, to determine if using it fully eliminates the hazard.
• You are allowed to use alternate entry procedures covered in WAC 296-809-600, if you can demonstrate that forced air ventilation alone will control all hazards in the space.

You must:
• Document how you determined the confined space contained no permit-required confined space hazards. Certify this documentation with the following:
  – Date.
  – Location of the space.
  – Signature of the person making the determination.

Note:
• Make the certification available to each entrant, or their authorized representative.

WAC 296-809-70004 Reevaluate nonpermit confined spaces if hazards develop.

You must:
• Reclassify a nonpermit confined space to a permit-required confined space, if necessary, when changes in the use or configuration of the space increase the hazards to entrants,
• Make sure all employees exit the space if hazards develop. You must then reevaluate the space and determine whether it must be reclassified as a permit-required confined space.

WAC 296-809-800 Definitions.
Acceptable entry conditions:
The conditions that must exist in a permit-required confined space to allow safe entry and work.

Attendant:
An individual stationed outside one or more permit-required confined spaces to monitor the entrants.

Blanking or blinding:
The absolute closure of a pipe, line, or duct by fastening a solid plate (such as a spectacle blind or a skillet blind) that completely covers the bore. It is capable of withstanding the maximum pressure of the pipe, line, or duct with no leakage beyond the plate.

Confined space:
A space that is all of the following:
  – Large enough and arranged so an employee could fully enter the space and work.
  – Has limited or restricted entry or exit. Examples of spaces with limited or restricted entry are tanks, vessels, silos, storage bins, hoppers, vaults, excavations, and pits.
  – Not primarily designed for human occupancy.

Double block and bleed:
The closure of a line, duct, or pipe by closing and locking or tagging two in-line valves and by opening and locking or tagging a drain or vent valve in the line between the two closed valves.

Emergency:
Any occurrence (including any failure of hazard control or monitoring equipment) or event internal or external to the permit-required confined space that could endanger authorized entrants.

Engulfment:
The surrounding capture of a person by a liquid or finely divided (flowable) solid substance that can be inhaled to cause death by filling or plugging the respiratory system or that can exert enough force on the body to cause death by strangulation, constriction, or crushing.
**Confined Spaces 296-809-800**

**Enter (entry):**

The action by which a person passes through an opening into a permit-required confined space and includes work activities in that space. Entry is considered to have occurred as soon as any part of the entrant’s body breaks the plane of an opening into the space.

**Note:** If the opening is large enough for the worker to fully enter the space, a permit is required even for partial body entry. Permits are not required for partial body entry where the opening is not large enough for full entry, although other rules such as lockout-tagout, WAC 296-24-110 or respiratory hazards, chapter 296-841 WAC may apply.

**Entrant:**

An employee who is authorized by the employer to enter a permit-required confined space.

**Entry permit (permit):**

The written or printed document that is provided by you to allow and control entry into a permit-required confined space and that contains the information required in WAC 296-809-500, Permit entry procedures.

**Entry supervisor:**

The person (such as the employer, crew leader, or crew chief) responsible for:

- Determining if acceptable entry conditions are present at a permit-required confined space where entry is planned;
- Authorizing entry and overseeing entry operations; and
- Terminating entry as required.

**Hazardous atmosphere:**

An atmosphere that may expose employees to the risk of death, incapacitation, impairment of ability to self-rescue (that is, escape unaided from a permit-required confined space), injury, or acute illness caused by one or more of the following:

- Flammable gas, vapor, or mist in excess of ten percent of its lower flammable limit (LFL).
- Airborne combustible dust at a concentration that meets or exceeds its LFL.

**Note:** This concentration may be approximated as a condition in which the dust obscures vision at a distance of five feet (1.52 m) or less.

- Atmospheric oxygen concentration below 19.5 percent or above 23.5 percent.
- Atmospheric concentration of any substance which may exceed a permissible exposure limit. For additional information about atmospheric concentration, see chapter 296-62 WAC, Parts F, G, and I, General occupational health standards and chapter 296-841 WAC, Respiratory hazards.

**Note:** An airborne concentration of a substance that is not capable of causing death, incapacitation, impairment of ability to self-rescue, injury, or acute illness due to its health effects is not covered by this definition.

- Any other atmospheric condition that is immediately dangerous to life or health.

**Note:** You can find guidance on establishing acceptable atmospheric conditions for air contaminants, which have no WISHA-determined doses or permissible exposure limits using other sources of information, such as:

- Material safety data sheets required by WAC 296-800-170, Employer chemical hazard communication.
- Published information.
- Internal documents.

**Hot work permit:**

A written authorization to perform operations, for example, riveting, welding, cutting, burning, and heating, that can provide a source of ignition.

**Immediately dangerous to life or health (IDLH):**

Any of the following conditions:

- An immediate or delayed threat to life.
- Anything that would cause irreversible adverse health effects.
- Anything that would interfere with an individual’s ability to escape unaided from a permit-required confined space.

**Note:** Some materials - hydrogen fluoride gas and cadmium vapor, for example - may produce immediate transient effects that, even if severe, may pass without medical attention, but are followed by sudden, possibly fatal collapse twelve to seventy-two hours after exposure. The victim feels normal after recovery from transient effects until collapse. Such materials in hazardous quantities are considered to be “immediately” dangerous to life or health (IDLH).

**Inerting:**

The displacement of the atmosphere in a permit-required confined space by a noncombustible gas (such as nitrogen) to such an extent that the resulting atmosphere is noncombustible.

**Note:** This procedure produces an IDLH oxygen-deficient atmosphere.

**Isolation:**

The process by which a permit-required confined space is removed from service and completely protected against the release of energy and material into the space by such means as: Blanking or blinding; misaligning or removing sections of lines, pipes, or ducts; a double block and bleed system; lockout or tagout of all sources of energy; or blocking or disconnecting all mechanical linkages.

**Line breaking:**

The intentional opening of a pipe, line, or duct that is or has been carrying flammable, corrosive, or toxic material, an inert gas, or any fluid at a volume, pressure, or temperature capable of causing injury.

**Nonpermit confined space:**

A confined space that does NOT contain actual hazards or potential hazards capable of causing death or serious physical harm.

**Oxygen deficient atmosphere:**

An atmosphere containing less than 19.5 percent oxygen by volume.

**Oxygen enriched atmosphere:**

An atmosphere containing more than 23.5 percent oxygen by volume.

**Permit-required confined space or permit space:**

A confined space that has one or more of the following characteristics capable of causing death or serious physical harm:

- Contains or has a potential to contain a hazardous atmosphere.
- Contains a material with the potential for engulfing someone who enters.
- Has an internal configuration that could allow someone entering to be trapped or asphyxiated by inwardly converging walls or by a floor, which slopes downward and tapers to a smaller cross section.
- Contains any physical hazard. This includes any recognized health or safety hazards including engulfment in solid or liquid material, electrical shock, or moving parts.
- Contains any other recognized serious safety or health hazard that could either:

(2005 Ed.)

[Title 296 WAC—p. 2903]
Chapter 296-816

Title 296 WAC: Labor and Industries, Department of

WAC 296-816-100 Scope. This chapter applies to both:
• Withholding trade secret information from material safety data sheets (MSDSs) and employee exposure records; AND
• Providing trade secret information in medical emergencies and nonemergency situations.

Definition:
Trade secrets: Any confidential information that is used in an employer's business and gives an advantage over competitors who do not know or use it. It can be a:
• Formula.
• Pattern.
• Process.
• Device.
• Information.
• Collection of information.

WAC 296-816-200 Protecting trade secrets.
Your responsibility:
To meet requirements that apply to your workplace when withholding or providing trade secret information.
You must:
WAC 296-816-20005 Indicate when trade secret information has been withheld.
WAC 296-816-20010 Provide trade secret information in a medical emergency.
WAC 296-816-20015 Provide trade secret information in nonemergency situations.
WAC 296-816-20020 Provide trade secret information when requested by WISHA.

WAC 296-816-20005 Indicate when trade secret information has been withheld.
You must:
• Indicate clearly in the MSDS or employee exposure records that trade secret information has been withheld.

WAC 296-816-20010 Provide trade secret information in a medical emergency.
You must:
• Immediately provide the specific chemical identity to the treating physician or nurse when they determine:
  – That a medical emergency exists; AND
  – The specific chemical identity is necessary to treat the employee involved in the medical emergency.

WAC 296-816-20020 Provide trade secret information when requested by WISHA.

WAC 296-816-20015 Respond to requests for trade secret information in nonemergency situations.
You must:
• Provide specific chemical identity information in nonemergency situations when a written request by a health professional, employee, or designated representative, includes the following:
  – Details showing that the specific chemical identity is needed for one or more of the following occupational health reasons:
    ■ Assessing the hazards of the chemicals employees will be exposed to.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-026, § 296-816-100, filed 6/29/04, effective 9/1/04.]

WAC 296-816-200 Protecting trade secrets.
Your responsibility:
To meet requirements that apply to your workplace when withholding or providing trade secret information.
You must:
WAC 296-816-20005 Indicate when trade secret information has been withheld.
WAC 296-816-20010 Provide trade secret information in a medical emergency.
WAC 296-816-20015 Provide trade secret information in nonemergency situations.
WAC 296-816-20020 Provide trade secret information when requested by WISHA.

WAC 296-816-20005 Indicate when trade secret information has been withheld.
You must:
• Indicate clearly in the MSDS or employee exposure records that trade secret information has been withheld.

WAC 296-816-20010 Provide trade secret information in a medical emergency.
You must:
• Immediately provide the specific chemical identity to the treating physician or nurse when they determine:
  – That a medical emergency exists; AND
  – The specific chemical identity is necessary to treat the employee involved in the medical emergency.

WAC 296-816-20020 Provide trade secret information when requested by WISHA.

WAC 296-816-20015 Respond to requests for trade secret information in nonemergency situations.
You must:
• Provide specific chemical identity information in nonemergency situations when a written request by a health professional, employee, or designated representative, includes the following:
  – Details showing that the specific chemical identity is needed for one or more of the following occupational health reasons:
    ■ Assessing the hazards of the chemicals employees will be exposed to.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-026, § 296-816-100, filed 6/29/04, effective 9/1/04.]

WAC 296-816-200 Protecting trade secrets.
Your responsibility:
To meet requirements that apply to your workplace when withholding or providing trade secret information.
You must:
WAC 296-816-20005 Indicate when trade secret information has been withheld.
WAC 296-816-20010 Provide trade secret information in a medical emergency.
WAC 296-816-20015 Provide trade secret information in nonemergency situations.
WAC 296-816-20020 Provide trade secret information when requested by WISHA.

WAC 296-816-20005 Indicate when trade secret information has been withheld.
You must:
• Indicate clearly in the MSDS or employee exposure records that trade secret information has been withheld.

WAC 296-816-20010 Provide trade secret information in a medical emergency.
You must:
• Immediately provide the specific chemical identity to the treating physician or nurse when they determine:
  – That a medical emergency exists; AND
  – The specific chemical identity is necessary to treat the employee involved in the medical emergency.

WAC 296-816-20020 Provide trade secret information when requested by WISHA.

WAC 296-816-20015 Respond to requests for trade secret information in nonemergency situations.
You must:
• Provide specific chemical identity information in nonemergency situations when a written request by a health professional, employee, or designated representative, includes the following:
  – Details showing that the specific chemical identity is needed for one or more of the following occupational health reasons:
    ■ Assessing the hazards of the chemicals employees will be exposed to.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-14-026, § 296-816-100, filed 6/29/04, effective 9/1/04.]

WAC 296-816-200 Protecting trade secrets.
Your responsibility:
To meet requirements that apply to your workplace when withholding or providing trade secret information.
You must:
WAC 296-816-20005 Indicate when trade secret information has been withheld.
WAC 296-816-20010 Provide trade secret information in a medical emergency.
WAC 296-816-20015 Provide trade secret information in nonemergency situations.
WAC 296-816-20020 Provide trade secret information when requested by WISHA.

WAC 296-816-20005 Indicate when trade secret information has been withheld.
You must:
• Indicate clearly in the MSDS or employee exposure records that trade secret information has been withheld.

WAC 296-816-20010 Provide trade secret information in a medical emergency.
You must:
• Immediately provide the specific chemical identity to the treating physician or nurse when they determine:
  – That a medical emergency exists; AND
  – The specific chemical identity is necessary to treat the employee involved in the medical emergency.

WAC 296-816-20020 Provide trade secret information when requested by WISHA.

WAC 296-816-20015 Respond to requests for trade secret information in nonemergency situations.
You must:
• Provide specific chemical identity information in nonemergency situations when a written request by a health professional, employee, or designated representative, includes the following:
  – Details showing that the specific chemical identity is needed for one or more of the following occupational health reasons:
    ■ Assessing the hazards of the chemicals employees will be exposed to.
Conducting or assessing sampling of the workplace atmosphere to determine employee exposure levels.

- Conducting medical surveillance of exposed employees.
- Providing medical treatment to exposed employees.
- Selecting or assessing personal protective equipment for exposed employees.
- Designing or assessing engineering controls or other protective measures.
- Conducting studies to determine the health effects of exposure.

- Details showing why the following alternative information does not meet the needs of the requestor:
  - The properties and effects of the chemical.
  - Measures for controlling employees' exposure to the chemical.
  - Methods of monitoring and analyzing employee exposure to the chemical.
  - Methods of diagnosing and treating harmful exposures to the chemical.
    - The procedures that will be used to keep the information confidential.
    - A written confidentiality agreement that says:
      - The information will not be used for anything other than the stated health needs.
      - The information will not be released to anyone else, except according to the terms of the agreement or to WISHA.

Note: If the health care professional, employee, or designated representative receiving the trade secret information decides that there is a need to disclose it to WISHA, they need to inform you prior to, or at the same time as, disclosure being made to WISHA.

You must:
- Meet all the following requirements if you decide not to provide the requested trade secret information:
  - Provide a written denial within thirty days that includes the following information:
    - The reasons for denying the request.
    - Evidence that the requested information is a trade secret.
    - A detailed explanation of how alternative information may satisfy the requesting party's needs without revealing any specific chemical identity.
    - Provide alternative information that allows the requesting party to identify where and when an exposure occurred, if trade secret information was deleted.
    - Make available all other information about the properties and effects of the specific chemical.

Note: If you deny a request for trade secret information, the requestor may refer the written denial, along with the original request, to WISHA for consideration. WISHA will review the denial and determine if it meets the requirements of this chapter, such as whether:
  - It is a bona fide trade secret.
  - There is a medical or occupational health need for the information.
  - Adequate means are in place to protect the confidentiality of the information.
  - WISHA may issue orders or impose additional limitations or conditions on the release of the information to make sure that the occupational health needs are met without risk to you when you show WISHA that a confidentiality agreement will not provide enough protection against harm that could be caused to your business by disclosing a specific chemical identity.

WAC 296-816-20020 Provide trade secret information when requested by WISHA.

You must:
- Provide trade secret information to WISHA when requested.
  - Make any trade secret claim, including supporting documentation, by the time you provide WISHA with the information.

WAC 296-816-300 Definitions.

- Designated representative:
  - Any individual or organization to which an employee gives written authorization.
  - A recognized or certified collective bargaining agent without regard to written employee authorization.
  - The legal representative of a deceased or legally incapacitated employee.

- Employee exposure record:
  A record containing any of the following information:
  - Environmental (workplace) monitoring or measuring of a toxic substance or harmful physical agent, including personal, area, grab, wipe, or other form of sampling, as well as related collection and analytical methodologies, calculations, and other background data relevant to interpretation of the results obtained.
  - Biological monitoring results which directly assess the absorption of a toxic substance or harmful physical agent by body systems, such as the level of a chemical in the blood, urine, breath, hair, or fingernails, but not including results which assess the biological effect of a substance or agent or which assess an employee's use of alcohol or drugs.
  - Material safety data sheets (MSDSs) indicating that the material may pose a hazard to human health;

OR
- In the absence of the above:
  - A chemical inventory or any other record that reveals where and when used and the identity (e.g., chemical, common or trade name) of a toxic substance or harmful physical agent.
  - Exposure records of other employees with past or present job duties or related working conditions.

- Exposure or exposed:
  The contact an employee has with a toxic substance, harmful physical agent, or oxygen deficient condition. Exposure can occur through various routes, such as inhalation, ingestion, skin contact, or skin absorption.

- Health professional:
  A physician, occupational health nurse, industrial hygienist, toxicologist, or epidemiologist, providing medical or other occupational health services to exposed employees.

- Record:
  Any item, collection, or grouping of information. Examples include:
  - Paper document.
  - Microfiche.
  - Microfilm.
Chapter 296-817 WAC

HEARING LOSS PREVENTION (NOISE)

WAC 296-817-100 Scope.

HEARING LOSS PREVENTION PROGRAM

296-817-200 Summary.
296-817-20005 Conduct employee noise exposure monitoring.
296-817-20010 Control employee noise exposures that equal or exceed 90 dBA TWA.
296-817-20015 Make sure employees use hearing protection when their noise exposure equals or exceeds 85 dBA TWA.
296-817-20020 Make sure exposed employees receive training about noise and hearing protection.
296-817-20025 Make sure warning signs are posted for areas where noise levels equal or exceed 115 dBA.
296-817-20030 Arrange for oversight of audiometric testing.
296-817-20035 Identify and correct deficiencies in your hearing loss prevention program.
296-817-20040 Document your hearing loss prevention activities.

NOISE MEASUREMENT AND COMPUTATION

296-817-300 Summary.
296-817-30005 Make sure that noise-measuring equipment meets recognized standards.
296-817-30010 Measure employee noise exposure.
296-817-30015 Use these equations when estimating full-day noise exposure from sound level measurements.

AUDIOMETRIC TESTING

296-817-400 Summary.
296-817-40005 Provide audiometric testing at no cost to employees.
296-817-40010 Establish a baseline audiogram for each exposed employee.
296-817-40015 Conduct annual audiograms.
296-817-40020 Review audiograms that indicate a standard threshold shift.
296-817-40025 Keep the baseline audiogram without revision, unless annual audiograms indicate a persistent threshold shift or a significant improvement in hearing.
296-817-40030 Make sure a record is kept of audiometric tests.
296-817-40035 Make sure audiometric testing equipment meets these requirements.

OPTIONS TO AUDIOMETRIC TESTING

296-817-500 Summary.
296-817-50005 Conduct hearing protection audits at least quarterly.
296-817-50010 Make sure staff conducting audits are properly trained.
296-817-50015 Assess the hearing protection used by each employee during audits.
296-817-50020 Document your hearing protection audits.

THIRD-PARTY AUDIOMETRIC TESTS

296-817-50025 Make sure third-party hearing loss prevention programs meet the following requirements.
296-817-600 Noise definitions.

WAC 296-817-100 Scope.
The purpose of this chapter is to:

• Prevent employee hearing loss by minimizing employee noise exposures

AND

• Make sure employees exposed to noise are protected.

These goals are accomplished by:

• Measuring and computing the employee noise exposure from all equipment and machinery in the workplace, as well as any other noise sources in the workplace

• Protecting employees from noise exposure by using feasible noise controls

• Making sure employees use hearing protection, if you cannot feasibly control the noise

• Training employees about hearing loss prevention

• Evaluating your hearing loss prevention efforts by tracking employee hearing or periodically reviewing controls and protection

• Making appropriate corrections to your program.

Use Table 1 to help you determine the hearing loss prevention requirements for your workplace:

### Table 1: Noise Evaluation Criteria

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Description</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>85 dBA TWA</td>
<td>Full-day employee noise exposure dose. If you have one or more employees whose exposure equals or exceeds this level, you must have a hearing loss prevention program.</td>
<td>– Hearing protection&lt;br&gt;– Training&lt;br&gt;– Audiometric testing</td>
</tr>
<tr>
<td>90 dBA TWA</td>
<td>Full-day employee noise exposure dose. If you have one or more employees whose exposure equals or exceeds this level, you must reduce employee noise exposures in the workplace.</td>
<td>– Noise controls&lt;br&gt;AND&lt;br&gt;– Hearing protection&lt;br&gt;– Training&lt;br&gt;– Audiometric testing</td>
</tr>
<tr>
<td>115 dBA measured using slow response</td>
<td>Extreme noise level (greater than one second in duration)</td>
<td>– Hearing protection&lt;br&gt;– Signs posted in work areas warning of exposure</td>
</tr>
<tr>
<td>140 dBC measured using fast response</td>
<td>Extreme impulse or impact noise (less than one second in duration)</td>
<td>Hearing protection</td>

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-06o, § 296-817-100, filed 5/19/03, effective 8/1/03.]
HEARING LOSS PREVENTION PROGRAM

WAC 296-817-200 Summary.
Your responsibility:
To prevent employee hearing loss by minimizing, and providing protection from, noise exposures.

You must:
Conduct employee noise exposure monitoring
WAC 296-817-20005
Control employee noise exposures that equal or exceed 90 dBA TWA₈
WAC 296-817-20010
Make sure employees use hearing protection when their noise exposure equals or exceeds 85 dBA TWA₈
WAC 296-817-20015
Make sure exposed employees receive training about noise and hearing protection
WAC 296-817-20020
Make sure warning signs are posted for areas with noise levels that equal or exceed 115 dBA
WAC 296-817-20025
Arrange for oversight of audiometric testing
WAC 296-817-20030
Identify and correct deficiencies in your hearing loss prevention program
WAC 296-817-20035
Document your hearing loss prevention activities
WAC 296-817-20040.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-20005, filed 5/19/03, effective 8/1/03.]

WAC 296-817-20005 Conduct employee noise exposure monitoring.

You must:
• Conduct employee noise exposure monitoring to determine the employee’s actual exposure when reasonable information indicates that any employee’s exposure may equal or exceed 85 dBA TWA₈.

Note:
• Representative monitoring may be used where several employees perform the same tasks in substantially similar conditions
• Examples of information or situations that can indicate exposures which equal or exceed 85 dBA TWA₈, include:
  – Noise in the workplace that interferes with people speaking, even at close range
  – Information from the manufacturer of equipment you use in the workplace that indicates high noise levels for machines in use
  – Reports from employees of ringing in their ears or temporary hearing loss
  – Warning signals or alarms that are difficult to hear
  – Work near abrasive blasting or jack hammering operations
  – Use of tools and equipment such as the following:
    – Heavy equipment or machinery
    – Fuel-powered hand tools
    – Compressed air-driven tools or equipment in frequent use
    – Power saws, grinders or chippers
    – Powder-actuated tools.

You must:
• Follow applicable guidance in WAC 296-817-300 when conducting noise exposure monitoring
• Make sure your sampling for noise exposure monitoring identifies:

  – All employees whose exposure equals or exceeds the following:
    • 85 dBA TWA₈ (noise dosimetry, providing an average exposure over an eight-hour time period)
    • 115 dBA (slow response sound level meter, identifying short-term noise exposures)
    • 140 dBC (fast response sound level meter, identifying almost instantaneous noise exposures).
  – Exposure levels for selection of hearing protection.
    • Provide exposed employees and their representatives with an opportunity to observe any measurements of employee noise exposure that are conducted
    • Notify each employee whose exposure equals or exceeds 85 dBA TWA₈ of the monitoring results within five working days of when you receive the results
    • Conduct additional noise monitoring whenever a change in production, process, equipment or controls, may reasonably be expected to result in:
      – Additional employees whose exposure equals or exceeds 85 dBA TWA₈
      – Employees exposed to higher level of noise requiring more effective hearing protection

Note: Conditions that may be expected to increase exposure include:
• Adding machinery to the work area
• Increasing production rates
• Removal or deterioration of noise control devices
• Increased use of noisy equipment
• Change in work schedule
• Change of job duties.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-20005, filed 5/19/03, effective 8/1/03.]

WAC 296-817-20010 Control employee noise exposures that equal or exceed 90 dBA TWA₈.

IMPORTANT:
Hearing protection provides a barrier to noise and protects employees but is not considered a control of the noise hazard. Separate requirements apply to hearing protection and are found in WAC 296-817-20015.

You must:
• Reduce employee noise exposure, using feasible controls, wherever exposure equals or exceeds 90 dBA TWA₈.

Note:
• Once noise exposures are brought below 90 dBA TWA₈, no further reduction is required. However, further reduction of noise may reduce the need for other hearing loss prevention requirements
• Controls that eliminate noise at the source or establish a permanent barrier to noise are typically more reliable.
  For example:
  – Replacing noisy equipment with quiet equipment
  – Using silencers and mufflers
  – Installing enclosures
  – Damping noisy equipment and parts.
• Other controls and work practices may also be useful for reducing noise exposures. Examples include:
  – Employee rotation
  – Limiting use of noisy equipment
  – Rescheduling work.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-20010, filed 5/19/03, effective 8/1/03.]

WAC 296-817-20015 Make sure employees use hearing protection when their noise exposure equals or exceeds 85 dBA TWA₈.

You must:

[Title 296 WAC—p. 2907]
• Make sure employees wear hearing protectors that will provide sufficient protection when exposure equals or exceeds:
  – 85 dBA TWA8 (noise dosimetry, providing an average exposure over an eight-hour time period)
  – 115 dBA (slow response sound level meter, identifying short-term noise exposures)
  – 140 dBC (fast response sound level meter, identifying almost instantaneous noise exposures).
• Provide employees with an appropriate selection of hearing protectors:
  – The selection must include at least two distinct types (such as molded earplugs, foam earplugs, custom-molded earplugs, earcaps, or earmuffs) for each exposed employee and must be sufficient to cover:
    ■ Different levels of hearing protection needed in order to reduce all employee exposures to a level below 85 dBA TWA8
    ■ Different sizes
    ■ Different working conditions.
      – Consider requests of the employees regarding:
        ■ Physical comfort
        ■ Environmental conditions
        ■ Medical needs
        ■ Communication requirements.
      Note: Hearing protector selection should include earplugs, earcaps and earmuffs.
• You must:
  • Provide hearing protection at no cost to employees
  • Supervise employees to make sure that hearing protection is used correctly
    • Make sure hearing protectors are:
      – Properly chosen for fit
      – Replaced as necessary.
    • Make sure all hearing protection is sufficient to reduce the employee’s equivalent eight-hour noise exposure to 85 dBA or less. When using the A-weighted exposure measurements, reported as "dBA TWA8," the reduction in noise exposure by hearing protectors is given by Table 2:

### Table 2
Effective Protection of Hearing Protectors

<table>
<thead>
<tr>
<th>Type of hearing protection</th>
<th>Effective protection</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single hearing protection (earplugs, earcaps or earmuffs)</td>
<td>7 dB less than the manufacturer assigned noise reduction rating (NRR); for example, earplugs with an NRR of 20 dB are considered to reduce employee exposures of 95 dBA TWA8 to 82 dBA TWA8</td>
</tr>
<tr>
<td>Dual hearing protection (earplug and earmuff worn together)</td>
<td>2 dB less than the higher NRR of the two protectors; for example, earplugs with an NRR of 20 dB and earmuffs with an NRR of 12 dB are considered to reduce employee exposures of 100 dBA TWA8 to 82 dBA TWA8</td>
</tr>
</tbody>
</table>

In addition to protection based on daily noise dose, make sure hearing protection has an NRR of at least 20 dB when exposures involve noise that equals or exceeds 115 dBA (slow response sound level meter) or 140 dBC (fast response sound level meter).

Note: You may also evaluate hearing protection by using the other methods given in the NIOSH Compendium of Hearing Protection (NIOSH Publication No. 95-105). These methods require additional monitoring and are more complex, but provide a more thorough evaluation of protection. This may be useful in cases where communication is critical or for evaluating hearing protection for employees with hearing impairment.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-20015, filed 5/19/03, effective 8/1/03.]

**WAC 296-817-20020** Make sure exposed employees receive training about noise and hearing protection.

You must:
• Train all employees whose noise exposure equals or exceeds 85 dBA TWA8
  • Provide training when an employee is first assigned to a position involving noise exposure that equals or exceeds 85 dBA TWA8 and at least annually after that
  • Update information provided in the training program to be consistent with changes in controls, hearing protectors and work processes
  • Make sure your noise and hearing protection training includes:
    – The effects of noise on hearing (including both occupational and nonoccupational exposures)
    – Noise controls used in your workplace
    – The purpose of hearing protectors: The advantages, disadvantages, and attenuation of various types
    – Instructions about selecting, fitting, using, and caring for hearing protection
    – The purpose and procedures for program evaluation including audiometric testing and hearing protection auditing when you choose to rely upon auditing (see WAC 296-817-500)
    – The employees’ right to access records kept by the employer.
  • Maintain a written program describing initial and refresher training.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-20025, filed 5/19/03, effective 8/1/03.]

**WAC 296-817-20025** Make sure warning signs are posted for areas where noise levels equal or exceed 115 dBA.

You must:
• Make sure warning signs are posted at the entrances or boundaries of all well-defined work areas where employees may be exposed to noise that equals or exceeds 115 dBA (measured using a sound level meter with slow response).
  – Warning signs must clearly indicate that the area is a high noise area and that hearing protectors are required.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-20025, filed 5/19/03, effective 8/1/03.]
WAC 296-817-20030 Arrange for oversight of audiometric testing.
You must:
• Make sure audiometric testing as described by WAC 296-817-400 is supervised and reviewed by one of the following licensed or certified individuals:
  – An audiologist
  – An otolaryngologist
  – Another qualified physician.
• Make sure audiograms are conducted by one of the above individuals or by a technician certified by the Council of Accreditation in Occupational Hearing Conservation (CAOHC) and responsible to a qualified reviewer.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-20030, filed 5/19/03, effective 8/1/03.]

WAC 296-817-20035 Identify and correct deficiencies in your hearing loss prevention program.
You must:
• Use audiometric testing to identify hearing loss, which may indicate program deficiencies
• Take appropriate actions when deficiencies are found with your program.
  – A deficiency may be indicated when:
    ■ Any employee experiences measurable hearing loss indicated by a standard threshold shift
OR
  ■ Any employee is not wearing appropriate hearing protection during an audit when auditing is used in place of baseline audiograms for short term employees (see WAC 296-817-500, Option to audiometric testing).
Note: A standard threshold shift or audit deficiency does not necessarily indicate that a significant hearing loss has occurred. These criteria are intended to help identify where there may be flaws in your hearing loss prevention program that can be fixed before permanent hearing loss occurs.
There are additional statistical tools and tests that may be used to improve the effectiveness of your program. Staff conducting audiometric testing and auditing may be able to suggest additional ways to improve your hearing loss prevention program and tailor it to your worksite.

You must:
• Evaluate the following, at a minimum, when responding to a standard threshold shift:
  – Employee noise exposure measurements
  – Noise controls in the work area
  – The selection of hearing protection available and refit employees as necessary
  – Employee training on noise and the use of hearing protection and conduct additional training as necessary.
Reference: You may use the option of auditing hearing protection (see WAC 296-817-500) for employees hired or transferred to jobs with noise exposure for less than one year. You may also use audiograms provided by a third-party hearing loss prevention program in some circumstances. Details of these program options are found in WAC 296-817-500, Options to audiometric testing.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-20035, filed 5/19/03, effective 8/1/03.]

WAC 296-817-20040 Document your hearing loss prevention activities.
You must:
• Create and retain records documenting noise exposures. Include, at a minimum:
  – Exposure measurements required by this chapter for at least two years and for as long as you rely upon them to determine employee exposure
  – Audiometric test records for the duration of employment for the affected employees
  – Hearing protection audits, if you choose to rely upon them, for the duration of employment of the affected employees.
Note: You need to keep as complete a record as possible. Records developed under previous rules or in other jurisdictions need to be kept, even when they do not fulfill the full requirements of this chapter. Similarly, records found to have errors in collection or processing need to be kept if they provide an indication of employee exposure or medical condition not found in other records.
• You may want to consider your other business needs, such as worker’s compensation claims management, before discarding these records.
Reference: You need to follow additional requirements for records considered employee exposure or medical records. See chapter 296-62 WAC, Part B, Access to records for requirements for access to records, employee rights, and transfer of records.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-20040, filed 5/19/03, effective 8/1/03.]

NOISE MEASUREMENT AND COMPUTATION

WAC 296-817-300 Summary.
Your responsibility:
Conduct noise monitoring or measurement to evaluate employee exposures in your workplace.
You must:
• Make sure that noise-measuring equipment meets recognized standards
WAC 296-817-30005
• Measure employee noise exposure
WAC 296-817-30010
Use these equations when estimating full-day noise exposure from sound level measurements
WAC 296-817-30015.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-300, filed 5/19/03, effective 8/1/03.]

WAC 296-817-30005 Make sure that noise-measuring equipment meets recognized standards.
You must:
• Make sure that noise dosimetry equipment meets these specifications:
  – Dosimeters must be equipment class 2AS-90/80-5 of the American National Rule Specification for Personal Noise Dosimeters, ANSI S1.25-1991, such dosimeters are normally marked "Type 2."
Note: Make sure any dosimeter you use is Type 2 equipment that:
  • Uses slow integration and A-weighting of sound levels.
  • Has the criterion level set to 90 dB, so the dosimeter will report a constant 8-hour exposure at 90 dBA as a 100% dose.
  • Has the threshold level set at 80 dB, so the dosimeter will register all noise above 80 dB.
  • Uses a 5 dB exchange rate for averaging of noise levels over the sample period.

You must:
• Make sure that sound level meters meet these specifications:

(2005 Ed.)
WAC 296-817-30010 Measure employee noise exposure.

**IMPORTANT:**
A noise dosimeter is the basis for determining total daily noise exposure for employees. However, where you have constant noise levels, you may estimate employee noise exposure using measurements from a sound level meter. Calculation of the employee noise exposure must be consistent with WAC 296-817-30015.

You must:
- Include all:
  - Workplace noise from equipment and machinery in use
  - Other noise from sources necessary to perform the work
  - Noise outside the control of the exposed employees.
- Use a noise dosimeter when necessary to measure employee noise dose
- Use a sound level meter to evaluate continuous and impulse noise levels
- Identify all employees whose exposures equal or exceed the Noise Evaluation Criteria in Table 1:

<table>
<thead>
<tr>
<th>Criteria</th>

**WAC 296-817-30015** Use these equations when estimating full-day noise exposure from sound level measurements.

You must:
- Compute employee’s full-day noise exposure by using the appropriate equations from Table 3 "Noise Dose Computation" when using a sound level meter to estimate noise dose.

**Table 3**

**Noise Dose Computation**

<table>
<thead>
<tr>
<th>Description</th>
<th>Equation</th>
</tr>
</thead>
</table>
| Compute the noise dose based on several time periods of constant noise during the shift | The total noise dose over the work day, as a percentage, is given by the following equation where \( C_n \) indicates the total time of exposure at a specific noise level, and \( T_n \) indicates the reference duration for that level.\[
D = 100\% \left( \sum \frac{C_n}{T_n} \right)
\]
| The reference duration is equal to the time of exposure to continuous noise at a specific sound level that will result in a one hundred percent dose | The reference duration, \( T \), for sound level, \( L \), is given in hours by the equation: \[
T = \frac{8}{(2^\frac{(L - 90)}{5})}
\]
| Given a noise dose as a percentage, compute the equivalent eight-hour time weighted average noise level | The equivalent eight-hour time weighted average, TWA<sub>8</sub>, is computed from the dose, \( D \), by the equation: \[
TWA_8 = 16.61 \times \log_{10}(D/100) + 90
\]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-11-060, § 296-817-30015, filed 5/19/03, effective 8/1/03.]
AUDIOMETRIC TESTING

WAC 296-817-400  Summary.
Your responsibility:
To conduct audiometric testing of employees exposed to noise to make sure that their hearing protection is effective.
You must:
Provide audiometric testing at no cost to employees
WAC 296-817-40005
Establish a baseline audiogram for each exposed employee
WAC 296-817-40010
Conduct annual audiograms
WAC 296-817-40015
Review audiograms that indicate a standard threshold shift
WAC 296-817-40020
Keep the baseline audiogram without revision, unless annual audiograms indicate a persistent threshold shift or a significant improvement in hearing
WAC 296-817-40025
Make sure a record is kept of audiometric tests
WAC 296-817-40030
Make sure audiometric testing equipment meets these requirements
WAC 296-817-40035.

[Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-40010, filed 5/19/03, effective 8/1/03.]

WAC 296-817-40005  Provide audiometric testing at no cost to employees.
You must:
• Provide audiograms, including any required travel or necessary additional examinations or testing, at no cost to exposed employees.

[Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-40005, filed 5/19/03, effective 8/1/03.]

WAC 296-817-40010  Establish a baseline audiogram for each exposed employee.
You must:
• Conduct a baseline audiogram when an employee is first assigned to work involving noise exposures that equal or exceed 85 dBA TWA8.
  – Make sure this audiogram is completed no more than one hundred eighty days after the employee is first assigned
  OR
  – Make sure employee is covered by a hearing protection audit program (as described by WAC 296-817-500 and available as an alternative only for employees hired for less than one year).

Note: Employers who utilize mobile test units are allowed up to one year to obtain a valid baseline audiogram for each exposed employee. The employees must still be given training and hearing protection as required by this chapter.

You must:
• Make sure employees are not exposed to workplace noise at least fourteen hours before testing to establish a baseline audiogram.
  – Hearing protectors may be used to accomplish this.
  • Notify employees of the need to avoid high levels of nonoccupational noise exposure (such as loud music, headphones, guns, power tools, motorcycles, etc.) during the fourteen-hour period immediately preceding the baseline audiometric examination.
  [Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-40010, filed 5/19/03, effective 8/1/03.]

WAC 296-817-40015  Conduct annual audiograms.
You must:
• Conduct annual audiograms for employees as long as they continue to be exposed to noise that equals or exceeds 85 dBA TWA8.

Note:
Annual audiometric testing may be conducted at any time during the work shift. By conducting the annual audiogram during the work shift with the employee exposed to typical noise for their job, the test may record a temporary threshold shift. This makes the test more sensitive to potential hearing loss and may help you improve employee protection before a permanent threshold shift occurs. A suspected temporary shift is one reason an employer may choose to retest employee hearing.

You must:
• Make sure each employee is informed of the results of his or her audiometric test.
  – Include whether or not there has been a hearing level decrease or improvement since their previous test.
• Make sure each employee’s annual audiogram is compared to his or her baseline audiogram by an audiologist, otolaryngologist, another qualified physician, or the technician conducting the test to determine if a standard threshold shift has occurred.
  – If the annual audiogram indicates that an employee has suffered a standard threshold shift, you may obtain a retest within thirty days and consider the results of the retest as the annual audiogram.
• Make sure that an audiologist, otolaryngologist, or other qualified physician sees any annual audiogram that indicates a standard threshold shift.
  [Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-40015, filed 5/19/03, effective 8/1/03.]

WAC 296-817-40020  Review audiograms that indicate a standard threshold shift.
You must:
• Make sure the health care professional supervising audiograms has:
  – A copy of this chapter
  – The baseline audiogram and most recent audiogram of the employee to be evaluated
  – Background noise level records for the testing room
  – Calibration records for the audiometer.
• Obtain an opinion from the health care professional supervising audiograms as to whether the audiograms indicate possible occupational hearing loss and any recommendations for changes in hearing protection.
  • Pay for any clinical audiological evaluation or otological examination required by the reviewer, if:
    – Additional review is necessary to evaluate the cause of hearing loss
    OR
    – If there is indication of a medical condition of the ear caused or aggravated by the wearing of hearing protectors.

(2005 Ed.)
• Inform the employee in writing of the existence of a standard threshold shift within twenty-one calendar days of the determination.
• Make arrangements for the reviewer to communicate to the employee any suspected medical conditions that are found unrelated to your workplace. This information is confidential and must be handled appropriately.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-40020, filed 5/19/03, effective 8/1/03.]

WAC 296-817-40025 Keep the baseline audiogram without revision, unless annual audiograms indicate a persistent threshold shift or a significant improvement in hearing.

You must:
• Keep the baseline audiogram without revision, unless a qualified reviewer determines:
  – The standard threshold shift revealed by the audiogram is persistent
  OR
  – The hearing threshold shown in the annual audiogram indicates significant improvement over the baseline audiogram.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-40025, filed 5/19/03, effective 8/1/03.]

WAC 296-817-40030 Make sure a record is kept of audiometric tests.

You must:
• Retain a legible copy of all employee audiograms conducted under this chapter.
  – Make sure the record includes:
    ■ Name and job classification of the employee
    ■ Date of the audiogram
    ■ The examiner’s name
    ■ Date of the last acoustic or exhaustive calibration of the audiometer
    ■ Employee’s most recent noise exposure assessment
    ■ The background sound pressure levels in audiometric test rooms.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-40030, filed 5/19/03, effective 8/1/03.]

WAC 296-817-40035 Make sure audiometric testing equipment meets these requirements.

You must:
• Use pure tone, air conduction, hearing threshold examinations, with test frequencies including as a minimum 500, 1000, 2000, 3000, 4000, and 6000 Hz
  – Tests at each frequency must be taken separately for each ear
  – Supra-aural headphones must be used.
• Conduct audiometric tests with audiometers (including microprocessor audiometers) that meet the specifications of, and are maintained and used according to, American National Standard Specification for Audiometers, S3.6-1996
  • Check the functional operation of the audiometer each day before use by doing all of the following:
    – Make sure the audiometer’s output is free from distorted or unwanted sound
    • Test either a person with known, stable hearing thresholds or a bio-acoustic simulator
    • Perform acoustic calibration for deviations of 10 dB or greater.
   • Audiometer calibration must be checked acoustically at least annually to verify continued conformance with ANSI S3.6-1996. Test frequencies below 500 Hz and above 6000 Hz may be omitted from this check
   • An exhaustive calibration must be performed at least every two years according to the American National Standard Specification for Audiometers, S3.6-1996. Test frequencies below 500 Hz and above 6000 Hz may be omitted from the calibration.
   • Provide audiometric test rooms that meet the requirements of ANSI S3.1-1999 American National Standard Maximum Permissible Ambient Noise Levels for Audiometric Test Rooms using the following table of maximum ambient sound pressure levels:

<table>
<thead>
<tr>
<th>Frequency (Hz)</th>
<th>500</th>
<th>1000</th>
<th>2000</th>
<th>4000</th>
<th>8000</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sound Pressure</td>
<td>40</td>
<td>40</td>
<td>47</td>
<td>57</td>
<td>62</td>
</tr>
</tbody>
</table>

Note: The American Industrial Hygiene Association and National Hearing Conservation Association recommend conducting audiograms using the requirements of ANSI S3.1-1999 American National Standard Maximum Permissible Ambient Noise Levels for Audiometric Test Rooms with adjustments at only 500 Hz and below.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-40035, filed 5/19/03, effective 8/1/03.]

OPTIONS TO AUDIOMETRIC TESTING

WAC 296-817-500 Summary.
Your responsibility:
This section provides options to baseline audiometric testing for employees assigned to duties with noise exposures for less than one year. These program options may also be used to provide added assessment of longer-term employees in addition to audiometric testing.

The requirements of this section apply only if you decide to use auditing or a third-party hearing loss prevention program and do not conduct baseline audiometric testing for those employees.

Hearing Protection Audits
You must:
Conduct hearing protection audits at least quarterly
WAC 296-817-50005
Make sure staff conducting audits are properly trained
WAC 296-817-50010
Assess the hearing protection used by each employee during audits
WAC 296-817-50015
Document your hearing protection audits
WAC 296-817-50020

Third-Party Audiometric Testing
You must:
Make sure third-party hearing loss prevention programs meet the following requirements
WAC 296-817-50025

IMPORTANT:

Hearing protection audits are a tool for use in evaluating your hearing loss prevention program in cases where audiometric testing does not provide a useful measure. For example, if most of your employees are hired on a temporary basis for a few months at a time, audiometric testing may not identify the small changes in hearing acuity that could occur. Auditing provides an alternative to audiometric testing in these cases.

Auditing is not required unless you use it in place of baseline audiometric testing for employees hired for a period of less than one year and is permitted as a substitute for audiometric testing only for these employees.

Third-party hearing loss prevention programs are full hearing loss prevention programs and are distinct from audiometric testing provided by third parties as part of your own hearing loss prevention program. These programs may be organized by labor groups, trade associations, labor-management cooperatives, or other organizations to:

- Cover a specific group of employees
  OR
- Combine efforts for several employers with common employees.

Although you remain responsible for the program, third-party programs can have at least two benefits over running your own program:

- The audiometric testing is portable between the participating employers so new testing will not be needed when an employee changes employers
- Employees who only work for short periods for any one employer can be monitored under the group program over a longer period of time increasing the effectiveness of the audiometric testing in preventing hearing loss for these employees.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-500, filed 5/19/03, effective 8/1/03.]

WAC 296-817-50005 Conduct hearing protection audits at least quarterly.

You must:

- Conduct audits at least quarterly to provide a representative assessment of your workplace
  - The assessment is representative if it:
  - Covers all processes and work activities in your business at full production levels
  AND
  - Covers all employees present on the audit day.
    - If your business is mobile or involves variable processes, auditing may need to be repeated more often than quarterly
    - Auditing does not need to be repeated more than monthly as long as a reasonable effort is made to cover:
      - The activities with greatest exposure
  AND
  - As many employees as possible.
- Assess exposures and hearing protection for the full shift for each employee covered at the time of the audit.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-50005, filed 5/19/03, effective 8/1/03.]
For seasonal employees.
However, other employees may be included as long as you meet all requirements for hearing loss follow-ups and recordkeeping.

You must:
- Make sure that the third-party program is:
  - Equivalent to an employer program as required by this chapter
  AND
  - Uses audimetric testing to evaluate hearing loss.
- Make sure a licensed or certified audiologist, otolaryngologist, or other qualified physician administers the third-party program
- Make sure the third-party program has written procedures for:
  - Communicating with participating employers of program requirements
  - Follow-up procedures for detected hearing loss
  - Annual review of participating employer programs.
- Make sure the following program elements are corrected by you or the third-party program when deficiencies are found:
  - Noise exposures
  - Hearing protection
  - Employee training
  - Noise controls.
- Obtain a review of your hearing loss prevention program at least once per year, conducted by the third-party program administrator or their representative, in order to:
  - Identify any tasks needing a revised selection of hearing protection
  AND
  - Provide an overall assessment of the employers’ hearing loss prevention activities.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-11-060, § 296-817-50025, filed 5/19/03, effective 8/1/03.]

## WAC 296-817-600 Noise definitions.

A-weighted - An adjustment to sound level measurements that reflects the sensitivity of the human ear. Used for evaluating continuous or average noise levels.

Audiogram - A chart, graph, or table resulting from an audimetric test showing an individual’s hearing threshold levels as a function of frequency.

Audiologist - A professional, specializing in the study and rehabilitation of hearing, who is certified by the American Speech, Hearing, and Language Association, or the American Academy of Audiology, and is licensed by the state board of examiners.

Baseline audiogram - The audiogram against which future audiograms are compared. The baseline audiogram is collected when an employee is first assigned to work with noise exposure. The baseline audiogram may be revised if persistent standard threshold shift (STS) of improvement is found.

Continuous noise - Noise with peaks spaced no more than one second apart. Continuous noise is measured using sound level meters and noise dosimeters with the slow response setting.

Criterion sound level - A sound level of ninety decibels.

Decibel (dB) - Unit of measurement of sound level. A-weighting, adjusting for the sensitivity of the human ear, is indicated as "dBA." C-weighting, an even reading across the frequencies of human hearing, is indicated as "dBC."

Fast response - A setting for a sound level meter that will allow the meter to respond to noise events of less than one second. Used for evaluating impulse and impact noise levels.

Hertz (Hz) - Unit of measurement of frequency, numerically equal to cycles per second.

Impulsive or impact noise - Noise levels which involve maxima at intervals greater than one second. Impulse and impact noise are measured using the fast response setting on a sound level meter.

Noise dose - The total noise exposure received by an employee during their shift. It can be expressed as a percentage indicating the ratio of exposure received to the noise exposure received in an eight-hour exposure to constant noise at 90 dBA. It may also be expressed as the sound level that would produce the equivalent exposure during an eight-hour period (TWA).

Noise dosimeter - An instrument that integrates a function of sound pressure over a period of time in such a manner that it directly indicates a noise dose.

Occupational hearing loss - A reduction in the ability of an individual to hear either caused or contributed to by exposure in the work environment.

Otolaryngologist - A physician specializing in diagnosis and treatment of disorders of the ear, nose and throat.

Permanent threshold shift - A hearing level change that has become persistent and is not expected to improve.

Qualified reviewer - An audiologist, otolaryngologist, or other qualified physician who has experience and training in evaluating occupational audiograms.

Slow response - A setting for sound level meters and dosimeters in which the meter does not register events of less than about one second. Used for evaluating continuous and average noise levels.

Sound level - The intensity of noise as indicated by a sound level meter.

Sound level meter - An instrument that measures sound levels.

Standard threshold shift (STS) - A hearing level change, relative to the baseline audiogram, of an average of 10 dB or more at 2000, 3000, and 4000 Hz in either ear.

Temporary threshold shift - A hearing level change that improves. A temporary threshold shift may occur with exposure to noise and hearing will return to normal within a few days. Temporary threshold shifts can be indicators of exposures that lead to permanent hearing loss.

TWA - Equivalent eight-hour time-weighted average sound level - That sound level, which if constant over an eight-hour period, would result in the same noise dose measured in an environment where the noise level varies.
Chapter 296-823 WAC

OCCUPATIONAL EXPOSURE TO BLOODBORNE PATHOGENS

WAC

296-823-100 Scope.
296-823-110 Planning.
296-823-11005 Determine if you have employees with occupational exposure.
296-823-11010 Develop and implement a written exposure control plan.
296-823-120 Training.
296-823-12005 Provide training to your employees.
296-823-12010 Provide additional training.
296-823-12015 Maintain training records.
296-823-130 Hepatitis B virus (HBV) vaccinations.
296-823-13005 Make hepatitis B vaccination available to employees.
296-823-13010 Obtain a copy of the health care professional's written opinion for hepatitis B vaccination and provide it to the employee.
296-823-14005 Use feasible controls, including appropriate equipment and safer medical devices, to eliminate or minimize occupational exposure.
296-823-14010 Handle contaminated sharps properly and safely.
296-823-14015 Handle reusable sharps properly and safely.
296-823-14020 Minimize splashing, spraying, splattering, and generation of droplets.
296-823-14025 Make sure items are appropriately labeled.
296-823-14030 Make sure employees clean their hands.
296-823-14035 Prohibit pipetting or suctioning by mouth.
296-823-14040 Prohibit pipetting or suctioning by mouth.
296-823-14045 Place specimens in an appropriate container.
296-823-14050 Examine and label contaminated equipment.
296-823-14055 Make sure your worksite is maintained in a clean and sanitary condition.
296-823-14060 Handle regulated waste properly and safely.
296-823-14065 Handle contaminated laundry properly and safely.
296-823-150 Personal protective equipment (PPE).
296-823-15005 Provide and make sure personal protective equipment is used when there is occupational exposure.
296-823-15010 Make sure gloves are worn.
296-823-15015 Make sure appropriate masks, eye protection, and face shields are worn.
296-823-15020 Wear appropriate protective clothing.
296-823-15025 Make resuscitator devices available.
296-823-15030 Maintain personal protective equipment.
296-823-15035 Protect vacuum lines.
296-823-160 Examine and label contaminated equipment.
296-823-16005 Make a confidential medical evaluation and follow-up available to employees who experience an exposure incident.
296-823-16010 Test the blood of the source person.
296-823-16015 Provide the results of the source person's blood test to the exposed employee.
296-823-16020 Collect and test the blood of the exposed employee.
296-823-16025 Provide information to the health care professional evaluating the employee.
296-823-16030 Obtain and provide a copy of the health care professional's written opinion on post-exposure evaluation to the employee.
296-823-170 Records.
296-823-17005 Establish and maintain medical records.
296-823-17010 Maintain a sharps injury log.
296-823-180 Additional requirements for HIV and HBV research laboratories and production facilities.
296-823-18005 Prepare, review, and update a biosafety manual.
296-823-18010 Follow these special practices for the work area.
296-823-18015 Make sure these practices for contaminated material and waste are followed.
296-823-18020 Make sure these special practices for personal protective equipment (PPE) and other safe guards are followed.
296-823-18025 Protect vacuum lines.
296-823-18030 Use and handle hypodermic needles and syringes appropriately and safely.
296-823-18035 Handle all spills and accidents properly.
296-823-18040 Post signs.
296-823-18045 Provide additional training for facility employees.

WAC 296-823-100 Scope. This chapter provides requirements to protect employees from exposure to blood or other potentially infectious materials (OPIM) that may contain bloodborne pathogens. Examples of bloodborne pathogens are the human immunodeficiency virus (HIV) and hepatitis B virus (HBV).

This chapter applies to you if you have employees with occupational exposure to blood or OPIM, even if no actual exposure incidents have occurred.

Definitions:

OCCUPATIONAL EXPOSURE means reasonably anticipated skin, eye, mucous membrane, or parenteral contact with blood or OPIM that may result from the performance of an employee's duties.

EXPOSURE INCIDENT means a specific eye, mouth, other mucous membrane, nonintact skin or parenteral contact with blood or other potentially infectious materials (OPIM) that results from the performance of an employee's duties. Examples of nonintact skin include skin with dermatitis, hangnails, cuts, abrasions, chafing, or acne.

PARENTERAL CONTACT occurs when mucous membranes or skin is pierced by needlesticks, human bites, cuts, or abrasions.

Occupations that are typically covered by this chapter. The following list illustrates a number of jobs typically associated with tasks that involve occupational exposure to blood or OPIM. The absence of a particular job from the list does not suggest that it falls outside the scope of this chapter. At the same time, employees in jobs found on the list are covered only if they have occupational exposure.

Health care:
- Physicians and physicians assistants
- Nurses, nurse practitioners, dental hygienists, and other health care employees in clinics and offices
- Employees of clinical, dental, and diagnostic laboratories
- Staff in laundries that provide service to health care facilities
- Staff in laboratories that provide service to health care facilities
- Tissue bank personnel
- Employees in blood banks and plasma centers who collect, transport, and test blood
- Freestanding clinic employees (for example, hemodialysis clinics, urgent care clinics, health maintenance organization (HMO) clinics, and family planning clinics)
- Employees in clinics in industrial, educational, and correctional facilities
- Staff of institutions for the developmentally disabled
- Hospice employees
- Home health care workers
- Staff of nursing homes and long-term care facilities
- HIV and HBV research laboratory and production facility workers
- Medical equipment service and repair personnel
- Emergency medical technicians, paramedics, and other emergency medical service providers
- Nuclear medical technologists.

[Title 296 WAC—p. 2915]
WAC 296-823-110 Planning, Summary.

Your responsibility:
To plan ways to protect your employees from the risk of exposure to blood or other potentially infectious materials.

You must:
Determine if you have employees with occupational exposure
WAC 296-823-11005
Develop and implement a written exposure control plan WAC 296-823-11010.

WAC 296-823-11005 Determine if you have employees with occupational exposure.

You must:
• Prepare a written exposure determination if your employees have occupational exposure to blood or other potentially infectious materials (OPIM).
  – This determination must be made without considering the use of personal protective equipment (PPE).
  – Make sure the exposure determination contains:
    – A list of job classifications where all employees have occupational exposure:
    – A list of job classifications where some employees have occupational exposure and a description of all tasks and procedures or groups of related tasks and procedures with occupational exposure for these employees.

WAC 296-823-11010 Develop and implement a written exposure control plan.

You must:
• Establish a written exposure control plan designed to eliminate or minimize employee exposure in your workplace.

Note: The elements of your exposure control plan may be located in other documents such as policies and procedures. Make sure to reference their location in your plan.

You must:
• Make sure the plan contains at least the following elements:
  – The exposure determination, WAC 296-823-11005
  – A procedure for evaluating the circumstances surrounding exposure incidents, including documentation of the routes of exposure, and the circumstances under which the exposure incident happened
  – How and when you will implement applicable requirements of this rule.

Note: The implementation dates need to be included only until your exposure control plan is fully implemented or when you are adding new requirements to your plan.

You must:
• Document the infection control system used in your workplace to protect employees from exposure to blood or OPIM.
  – Use universal precautions or other at least as effective infection control systems.

Note: Universal precautions is an infection control system that considers the blood and OPIM from all persons as containing a bloodborne disease, whether or not the person has been identified as having a bloodborne disease. Other effective infection control systems include standard precautions, universal blood-body fluid precautions, and body substance isolation. These methods define all body fluids and substances as infectious. They incorporate not only the fluids and materials covered by universal precautions and this chapter, but expand coverage to include all body fluids and substances.

• Solicit input in the identification, evaluation, and selection of effective safer medical devices. This input must be solicited from nonmanagerial employees responsible for direct patient care with potential exposure to contaminated sharps.
  – Document the process you used to solicit input and include the identity of the employees or positions that were involved.

Note: You are not required to request input from every exposed employee; however, the employees selected must represent the range of exposure situations encountered in the workplace. Your safety committee may assist in identifying employees.
• Although you are required to include nonmanagerial employees, you are not prohibited from soliciting input from managerial and other employees.

You must:
• Make sure the exposure control plan is reviewed and updated:
  – At least annually
  AND
  – Whenever necessary to:
    ■ Reflect new or modified tasks and procedures which affect occupational exposure
    ■ Reflect new or revised job classifications with occupational exposure.
    ✦ Reflect changes in technology that eliminate or reduce exposure to bloodborne pathogens
    ✦ Document consideration and implementation of appropriate commercially available and effective safer medical devices designed to eliminate or minimize occupational exposure.

[Title 296 WAC—p. 2916]
• Make sure a copy of the exposure control plan is accessible at the workplace, when exposed employees are present. For example, if the plan is stored only on a computer, all exposed employees must be trained to operate the computer.
• Make sure a copy of the plan is provided to the employee or their representative within fifteen days of their request for a copy.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-12-070, § 296-823-11010, filed 6/1/04, effective 9/1/04; 03-09-110, § 296-823-11010, filed 4/22/03, effective 8/1/03.]

WAC 296-823-120  Training. Summary.
Your responsibility:
To train your employees about their risk of exposure to bloodborne pathogens and ways to protect themselves.
You must:
• Provide training to your employees
WAC 296-823-12005
• Provide additional training
WAC 296-823-12010
• Maintain training records
WAC 296-823-12015.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-110, § 296-823-120, filed 4/22/03, effective 8/1/03.]

WAC 296-823-12005  Provide training to your employees.
You must:
• Make sure all employees with occupational exposure participate in a training program that is:
  – Provided at no cost to them
  – Conducted during compensated working hours.
• Provide training when any of the following occur:
  – Before assigning tasks where occupational exposure might occur
    – At least annually and within one year of the previous training.
• Make sure the content and vocabulary of your training materials are appropriate to the educational level, literacy, and language of your employees
• Make sure the person conducting the required training is knowledgeable about the subject matter as it relates to your workplace
• Make sure the training program contains at least the following elements:
  – An accessible copy of this chapter and an explanation of the contents
  – A general explanation of the epidemiology and symptoms of bloodborne diseases
  – An explanation of how bloodborne pathogens are transmitted
  – An explanation of your exposure control plan and how the employee can obtain a copy of the written plan
  – An explanation of how to recognize tasks and other activities that could involve exposure to blood and other potentially infectious materials (OPIM)
  – An explanation of the use and limitations of methods that will prevent or reduce exposure including:
    • Equipment and safer medical devices
    • Work practices
    • Personal protective equipment
  – Information about personal protective equipment (PPE) including:
    • The types
    • Proper use and limitations
    • Selection
    • Location
    • Putting it on and taking it off
    • Handling
    • Decontamination
    • Disposal
    – Information about the hepatitis B vaccine, including:
    • Information about its effectiveness
    • Safety
    • Method of administration
    • The benefits of being vaccinated
    • Offered at no cost to the employee for the vaccine and vaccination
    – Information about what actions to take and persons to contact when exposure to blood or OPIM occurs outside of the normal scope of work
    – An explanation of the procedure to follow if an exposure incident occurs, including:
      • The method of reporting the incident
      • The medical evaluation and follow-up that will be available
    – Information about the post-exposure evaluation and follow-up procedure following an exposure incident
    – An explanation of the signs and labeling or color-coding required by this chapter
    – An opportunity for interactive questions and answers with the trainer at the time of the training session.

Note: This may be person-to-person, by telephone, or by e-mail, as long as the employee can both ask and receive answers during the training session.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-110, § 296-823-120, filed 4/22/03, effective 8/1/03.]

WAC 296-823-12010  Provide additional training.
You must:
• Provide additional training when you add or change tasks or procedures that affect the employee's occupational exposure.

Note: This training may be limited to the changes in tasks and procedures.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-12-070, § 296-823-12010, filed 6/1/04, effective 9/1/04; 03-09-110, § 296-823-12010, filed 4/22/03, effective 8/1/03.]

WAC 296-823-12015  Maintain training records.
• Maintain training records for three years from the date of the training
• Include the following information in your training records:
  – Dates of the training sessions
  – Contents or a summary of the training sessions
  – Names and qualifications of persons conducting the training
  – Names and job titles of all persons attending the training sessions.
• Provide these employee-training records upon request for examination and copying to any of the following:

(2005 Ed.)
Title 296 WAC: Labor and Industries, Department of

296-823-130

Hepatitis B virus (HBV) vaccinations. Summary.

Your responsibility:
To make the vaccination available to your employees so they are protected from the hepatitis B virus (HBV).

You must:
- Make hepatitis B vaccination available to employees WAC 296-823-13005
- Obtain a copy of the health care professional's written opinion for hepatitis B vaccination and provide it to the employee WAC 296-823-13010.

WAC 296-823-13005 Make hepatitis B vaccination available to employees.

Exemption:
- You are not required to provide the hepatitis B vaccination series to employees who meet any of the following:
  - The employee has previously received the complete hepatitis B vaccination series
  - An antibody test has revealed that the employee is immune to hepatitis B
  - There are medical reasons not to give the vaccine.
- You are not required to provide the hepatitis B vaccination series to employees assigned to provide first aid only as a secondary duty, when you do all of the following:
  - Make hepatitis B vaccination available to all unvaccinated first-aid providers who render assistance in any situation involving the presence of blood or OPIM.
  - Vaccination must be made available as soon as possible, but no later than twenty-four hours after the incident.
  - Provide a reporting procedure that ensures all first-aid incidents that involve the presence of blood or OPIM are reported before the end of the work shift.
  - Document first-aid incidents that involve blood or OPIM, include at least:
    - The names of all first-aid providers who rendered assistance
    - The time and date of the first-aid incident
    - A description of the first-aid incident.
- Make sure that the hepatitis B vaccination series is available to all employees who have occupational exposure and that it is:
  - Available at no cost to the employee
  - Available to the employee at a reasonable time and location
  - Administered by or under the supervision of a licensed physician or by another licensed healthcare professional

Provided according to recommendations of the United States Public Health Service that are current at the time these evaluations and procedures take place.

Available to any employee who initially declines the vaccination but later decides to accept it while they are still covered by this chapter.

Made available after the employee has received training required by this chapter and within ten working days of initial assignment.

Link:

You must:
- Make sure participation in a prevaccination screening program for antibody status is not a condition for receiving hepatitis B vaccination.
- Make sure that all laboratory tests are conducted by a laboratory licensed by the state or Clinical Laboratory Improvement Amendments (Act) (CLIA).
- Make sure employees who decline the hepatitis B vaccination, offered by you, sign a form with this statement:

  "I understand that due to my occupational exposure to blood or other potentially infectious materials I may be at risk of acquiring hepatitis B virus (HBV) infection. I have been given the opportunity to be vaccinated with hepatitis B vaccine, at no charge to myself. However, I decline hepatitis B vaccination at this time. I understand that by declining this vaccine, I continue to be at risk of acquiring hepatitis B, a serious disease. If in the future I continue to have occupational exposure to blood or other potentially infectious materials and I want to be vaccinated with hepatitis B vaccine, I can receive the vaccination series at no charge to me."

Helpful tool:
Sample declination form:
The declination form can help you document employees who have declined the hepatitis B vaccine. You can find a copy of this form in the resource section of this chapter.

WAC 296-823-13005 Obtain a copy of the health care professional's written opinion for hepatitis B vaccination and provide it to the employee.

You must:
- Obtain and provide the employee a copy of the health care professional's written opinion for hepatitis B vaccination within fifteen days of the employee's evaluation.

Note:
- If the health care professional provides the written opinion directly to the employee, you do not need to do so.
- If the employee's personal health care professional completes the evaluation, you are not required to obtain the health care professional's written opinion.

You must:
- Make sure the health care professional's written opinion is limited to whether a hepatitis B vaccination is indicated and if the employee has received this vaccination.
- Make sure that all other findings or diagnoses remain confidential and are not included in the written report.

[Title 296 WAC—p. 2918] (2005 Ed.)
**Reference:** Requirements for the health care professional's written opinion on post-exposure evaluation can be found in WAC 296-823-16030.

**Helpful tool:**

Health care professional's written opinion for post-exposure evaluation and health care provider's written opinion for hepatitis B vaccination.

These forms are available for your use in the resource section of this chapter.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-110, § 296-823-13010, filed 4/22/03, effective 8/1/03.]

### WAC 296-823-140 Control employee exposure. Summary.

**Your responsibility:**

To use feasible controls to eliminate or minimize occupational exposure to blood or other potentially infectious materials (OPIM).

**IMPORTANT:**

If occupational exposure remains after implementing these controls, personal protective equipment must be used. See WAC 296-823-150, Personal protective equipment.

**You must:**

Use appropriate equipment and safer medical devices to eliminate or minimize occupational exposure

- Handle contaminated sharps properly and safely
- Handle reusable sharps properly and safely
- Minimize splashing, spraying, splattering and generation of droplets
- Place specimens in an appropriate container
- Examine and label contaminated equipment
- Make sure your worksite is maintained in a clean and sanitary condition

### WAC 296-823-14005 Use feasible controls, including appropriate equipment and safer medical devices, to eliminate or minimize occupational exposure.

**You must:**

- Use appropriate equipment and safer medical devices to eliminate or minimize employee exposure.
- Use work practices designed to eliminate or minimize employee exposure.
- Examine and maintain or replace equipment and safer medical devices on a regular schedule to make sure they remain effective.

**Note:**

- Examples of appropriate equipment include:
  - Biosafety cabinets
  - Splash guards
  - Centrifuge cups
  - Specimen storage and transport containers.
- Examples of safer medical devices include:
  - Sharps with engineered sharps injury protections (SESIP)
  - Needleless systems
  - No hand-to-hand instrument passing.

**Definition:** Sharps with engineered sharps injury protections (SESIP) is

- A nonneedle sharp or a needle device used for withdrawing body fluids, accessing a vein or artery, or administering medications or other fluids, with a built-in safety feature or mechanism that effectively reduces the risk of an exposure incident.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-12-070, § 296-823-14005, filed 6/1/04, effective 9/1/04; 03-09-110, § 296-823-14005, filed 4/22/03, effective 8/1/03.]

### WAC 296-823-14010 Handle contaminated sharps properly and safely.

**You must:**

- Make sure that you don't bend, recap, or remove contaminated needles or other contaminated sharps unless you can demonstrate that there is no feasible alternative or that it's required by a specific medical or dental procedure.
  - Bending, recapping or needle removal must be done by using a mechanical device or a one-handed technique.

**Note:**

Demonstrating that no alternative to bending, recapping, or removing contaminated sharps is feasible, may be accomplished through written justification, supported by reliable evidence, in your exposure control plan.

**You must:**

- Make sure you don't shear or break contaminated needles.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-110, § 296-823-14010, filed 4/22/03, effective 8/1/03.]

### WAC 296-823-14015 Handle reusable sharps properly and safely.

**You must:**

- Place contaminated reusable sharps immediately, or as soon as possible after use, in appropriate containers until properly decontaminated. Containers must be all of the following:
  - Puncture resistant
  - Labeled or color-coded as described in this chapter
  - Leakproof on the sides and bottom
  - Meet the same requirements as the container for disposable sharps, except they do not need to be closable.
  - Store or process contaminated reusable sharps so employees aren't required to reach into the container or sink by hand

(2005 Ed.)
\textbf{296-823-14020} Make sure reusable sharps containers aren't opened, emptied, or cleaned manually or in any other manner that would expose employees to contaminated sharps.

\textit{Reference:} Requirements for appropriate labels and color-coding are found in WAC 296-823-14025.

\textit{Statutory Authority:} RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-12-070, § 296-823-14015, filed 6/1/04, effective 9/1/04; 03-09-110, § 296-823-14015, filed 4/22/03, effective 8/1/03.

\textbf{WAC 296-823-14020 Minimize splashing, spraying, splattering, and generation of droplets.}

\textbf{You must:}

- Make sure all procedures involving blood or OPIM are performed so splashing, spraying, spattering, and generation of droplets are minimized.

  - Examples include:
    - Appropriate operation and use of recommended controls for surgical power tools, lasers and electrocautery devices
    - Use of personal protective equipment when contact with blood or OPIM is reasonably anticipated
    - Making sure cleaning procedures do not generate unnecessary splashes, spraying, spattering, or generation of droplets.

\textit{Statutory Authority:} RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-110, § 296-823-14020, filed 4/22/03, effective 8/1/03.

\textbf{WAC 296-823-14025 Make sure items are appropriately labeled.}

\textbf{Exemptions:} The following are exempt from the labeling requirements of this chapter:

- Individual containers placed in an appropriately labeled secondary container.
- Regulated waste that has been decontaminated.
- Containers of blood, blood components, or blood products that are labeled with their contents and have been released for transfusion or other clinical use.
- Extracted teeth, gallstones, kidney stones, or other tissues and body substances that are given to patients.

\textbf{You must:}

- Attach appropriate labels to:
  - Containers used to store, transport, or ship blood or other potentially infectious materials (OPIM) including:
    - Refrigerators
    - Freezers.
  - Sharps containers
  - Contaminated equipment
  - Laundry bags and containers
  - Specimen containers
  - Regulated waste containers.
- Make sure that labels:
  - Include the following symbol:
    - Are all or mostly fluorescent orange or orange-red with lettering and symbol in a contrasting color
    - Are attached to the container by string, wire, adhesive, or other method so they can't become lost or accidentally removed.

\textit{Note:} Red bags or red containers may be substituted for labels as long as they're:

- Covered in the exposure control plan
- Communicated to all affected employees (including employees of laundry services, disposal services, and transport companies) whether they're your employees or not.
- The label does not always need to be attached to each individual container.
- For example, a cart carrying specimen containers could be labeled, rather than each individual container.

\textit{Statutory Authority:} RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-12-070, § 296-823-14025, filed 6/1/04, effective 9/1/04; 03-09-110, § 296-823-14025, filed 4/22/03, effective 8/1/03.

\textbf{WAC 296-823-14030 Make sure employees clean their hands.}

\textbf{You must:}

1. Provide handwashing facilities that are readily accessible to employees, wherever feasible. If handwashing facilities are not feasible, provide either one of the following:
   - Antiseptic towelettes
   - Antiseptic hand rub product along with clean cloth/paper towels.
2. Make sure employees clean their hands as soon as feasible after removing gloves and whenever there is the potential for contact with blood or other potentially infectious materials (OPIM). Do one of the following:
   - Wash with soap and water
   - Use an appropriate waterless antiseptic hand rub product or towelettes, provided there are no signs of visible contamination
   - Use an appropriate waterless antiseptic hand rub product or towelettes followed by washing with soap and water as soon as possible, when hands are visibly contaminated and handwashing facilities are not immediately available.

\textit{Note:} An appropriate waterless antiseptic hand rub product is one that contains a 60-95% alcohol solution (isopropanol or ethanol).
You must:
(3) Make sure employees wash any skin with soap and water, or flush mucous membranes with water as soon as feasible following contact with blood or OPIM.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-09-110, § 296-823-14030, filed 4/22/03, effective 8/1/03.]

WAC 296-823-14035 Prohibit food, drink, and other personal activities in the work area.
You must:
• Make sure eating, drinking, smoking, applying cosmetics or lip balm, and handling contact lenses are prohibited in work areas where there is occupational exposure
• Make sure food and drink are not kept in refrigerators, freezers, shelves, cabinets, or on countertops or benchtops where there is a potential for exposure to blood or other potentially infectious materials (OPIM).

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-09-110, § 296-823-14035, filed 4/22/03, effective 8/1/03.]

WAC 296-823-14040 Prohibit pipetting or suctioning by mouth.
You must:
• Prohibit mouth pipetting or suctioning of blood or other potentially infectious materials (OPIM).

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-09-110, § 296-823-14040, filed 4/22/03, effective 8/1/03.]

WAC 296-823-14045 Place specimens in an appropriate container.
You must:
• Place specimens of blood or other potentially infectious materials (OPIM) in an appropriate container that prevents leakage during collection, handling, processing, storage, transport, or shipping
  • Make sure the container is properly labeled or color-coded and closed before being stored, transported, or shipped.
    – If outside contamination of the container occurs, the container must be placed inside a second container that prevents leakage and is properly labeled or color-coded
    – If the specimen could puncture the container, the container must be placed inside a second container that:
      ■ Is puncture-resistant
      ■ Prevents leakage during handling, processing, storage, transport, or shipping
      ■ Is properly labeled or color-coded.

Exemption: When your facility handles all specimens using universal precautions or other equivalent infection control systems, you don't have to label/color-code specimens as long as the containers can be recognized as containing specimens.
This exemption only applies while these specimens/containers remain within the facility. Proper labeling or color-coding is required when specimens/containers leave the facility.

Reference: Requirements for appropriate labels and color-coding are found in WAC 296-823-14025.

Helpful tool:
Guidance on the handling and storage of criminal evidence
This tool contains information about the handling and storage of criminal evidence. Criminal evidence contaminated with blood or OPIM is considered a specimen under the scope of this chapter. You can find a copy of this tool in the resource section of this chapter.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-09-110, § 296-823-14045, filed 4/22/03, effective 8/1/03.]

WAC 296-823-14050 Examine and label contaminated equipment.
You must:
• Examine equipment which could become contaminated with blood or other potentially infectious materials (OPIM) before servicing or shipping.
  – Decontaminate this equipment and its parts as necessary unless you can demonstrate that decontamination isn’t feasible
  – Attach an easily seen biohazard label to the equipment stating which portions remain contaminated.

Reference: Requirements for appropriate labels and color-coding are found in WAC 296-823-14025.

You must:
• Make sure that information on contaminated equipment is communicated to all affected employees, the servicing representative, and the manufacturer as appropriate, prior to handling, servicing, or shipping so that appropriate precautions will be taken.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 04-12-070, § 296-823-14050, filed 6/1/04, effective 9/1/04; 03-09-110, § 296-823-14050, filed 4/22/03, effective 8/1/03.]

WAC 296-823-14055 Make sure your worksite is maintained in a clean and sanitary condition.
You must:
(1) Develop an appropriate written schedule for cleaning and decontamination based upon the following:
  – The location within the facility
  – Type of surface to be cleaned
  – Type of contamination present
  – Tasks or procedures being performed in the area.
(2) Clean and decontaminate environmental and working surfaces and all equipment after contact with blood or other potentially infectious materials (OPIM).
  • Decontaminate work surfaces with an appropriate disinfectant at these times:
    – After completion of a procedure
    – Immediately or as soon as possible when surfaces are clearly contaminated or after any spill of blood or OPIM
    – At the end of the workshift if the surface could have become contaminated since the last cleaning.
  • Remove and replace protective coverings, such as plastic wrap, aluminum foil, or imperviously backed absorbent paper used to cover equipment and environmental surfaces, as soon as possible when they:
    – Clearly become contaminated
    – At the end of the workshift if they could have become contaminated during the shift.
  • Inspect and clean (on a regularly scheduled basis) all bins, pails, cans, and similar receptacles intended for reuse that have a reasonable likelihood for becoming contaminated with blood or OPIM.
Clean and decontaminate these types of receptacles immediately or as soon as possible when they are visibly contaminated.

- Use a brush and dustpan, tongs, forceps, or other mechanical means to clean up broken glassware that may be contaminated.

**Note:** An appropriate disinfectant is one that is effective against tuberculosis or HBV and HIV such as:

- Diluted bleach solution (1:10 or 1:100).
- Use the 1:10 bleach solution for spills and the 1:100 bleach solution for routine cleaning.
- You can make your own bleach solution. Using household bleach (5.25% sodium hypochlorite) follow these directions:
  - For a 1:100 solution add 2 teaspoons (10 ml) to a container, then add water to make a quart (946 ml). For a 1:10 solution, add 1/3 cup (79 ml) and 1 tablespoon (15 ml) in a container, then add water to make a quart (946 ml).
- EPA registered tuberculocidal (List B)
- Sterilants (List A)
- Products registered against HIV/HBV (List D).

**Link:**
These lists are available from the EPA Office of Pesticides, antimicrobial pesticides website at http://www.epa.gov/oppad001/chemregindex.htm.

[Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-110, § 296-823-14055, filed 4/22/03, effective 8/1/03.]

**WAC 296-823-14060 Handle regulated waste properly and safely.**

**Definition:**
Regulated waste is any of the following:

- Liquid or semiliquid blood or other potentially infectious materials (OPIM)
- Contaminated items that would release blood or OPIM in a liquid or semiliquid state, if compressed
  - Items that are caked with dried blood or OPIM and are capable of releasing these materials during handling
- Contaminated sharps
- Pathological and microbiological wastes containing blood or OPIM.

**You must:**

- Discard contaminated sharps immediately, or as soon as possible, in containers that are all of the following:
  - Closable
  - Puncture resistant
  - Leakproof on sides and bottom
  - Appropriately labeled or color-coded
  - Easily accessible to personnel
  - Located as close as feasible to the immediate area where sharps are used or areas sharps can be reasonably anticipated to be found (for example, laundries)
  - Maintained upright throughout use
  - Replaced routinely and not allowed to overflow.

**Exemption:**
Work areas such as correctional facilities, psychiatric units, pediatric units, or residential homes may have difficulty placing sharps containers in the immediate use area. In such situations, alternatives such as using lockable containers or bringing containers in and out of the work area may be used.

**Note:** For additional information on placement and use of sharps containers see Selecting, Evaluating, and Using Sharps Disposal Containers, NIOSH Publication 97-111, January 1998. You can obtain a copy of this publication by calling 1-800-35-NIOSH or get an electronic version in pdf at http://www.cdc.gov/niosh/publistd.htm.

**You must:**

- Make sure when you move containers of contaminated sharps, the containers are:
  - Closed prior to removal or replacement to prevent spilling or protrusion of contents during handling, storage, transport, or shipping; and
  - Placed in a secondary container, if leaking is possible.
  - The second container must be:
    - Closable
    - Constructed to contain all contents and prevent leakage during handling, storage, transport, or shipping
    - Appropriately labeled or color-coded.
  - Make sure regulated waste other than sharps is placed in containers that are all of the following:
    - Closable
    - Constructed to contain all contents and prevent leakage of fluids during handling, storage, transport, or shipping
    - Closed prior to removal to prevent spillage or protrusion of contents during handling, storage, transport, or shipping
    - Placed in a secondary container if outside contamination of the primary regulated waste container occurs.
  - The second container must meet these requirements.
    - Appropriately labeled or color-coded.
  - Dispose of all regulated waste according to applicable state and county regulations.

[Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-12-070, § 296-823-14065, filed 6/1/04, effective 9/1/04; 03-09-110, § 296-823-14060, filed 4/22/03, effective 8/1/03.]

**WAC 296-823-14065 Handle contaminated laundry properly and safely.**

**You must:**

- Handle laundry contaminated with blood or other potentially infectious material (OPIM) as little as possible and with a minimum of agitation
  - Bag contaminated laundry or put it into a container at the location where it was used
  - Do not sort or rinse at the location of use
  - Place and transport contaminated laundry in bags or containers that are properly labeled or color-coded
  - If your facility ships contaminated laundry off-site to a second facility that doesn't use an infection control or isolation system when handling all of their soiled laundry, your facility must place the laundry in red bags or containers that are appropriately labeled.

**Note:** If your facility uses an infection control or isolation system in the handling of all soiled laundry, you can use alternative labeling or color-coding so employees recognize that the containers need to be handled using these precautions.

**Reference:** Requirements for appropriate labels and color-coding are found in WAC 296-823-14025 of this chapter.

**You must:**

- Place and transport wet contaminated laundry that is likely to soak through or leak to the outside, in bags or containers that will prevent such leakage.

**Reference:** You need to follow additional requirements to make sure that employees who have contact with contaminated laundry wear protective gloves and other personal protective equipment (PPE) as appropriate, see WAC 296-823-150, Personal protective equipment.
WAC 296-823-150 Personal protective equipment (PPE). Summary.

Your responsibility:
To provide and make sure personal protective equipment is used when work practices and controls will not fully protect your employees from the risk of exposure to blood or other potentially infectious materials.

You must:
Provide and make sure personal protective equipment is used when there is occupational exposure to bloodborne pathogens.

WAC 296-823-15005 Provide and make sure personal protective equipment is used when there is occupational exposure.

You must:
• Provide at no cost to employees, appropriate personal protective equipment such as:
  – Gloves
  – Gowns
  – Laboratory coats
  – Face shields or a combination of masks and eye protection
  – Mouthpieces
  – Resuscitation bags
  – Pocket masks
  – Other ventilation devices.

Note: • PPE is considered "appropriate" only if it does not permit blood or other potentially infectious materials (OPIM) to pass through to or reach the employee's work clothes, street clothes, undergarments, skin, eyes, mouth, or other mucous membranes under normal conditions of use and for the duration of time which the protective equipment will be used.

You must:
• Make sure that employees use appropriate PPE.
  – In rare and extraordinary circumstances, employees can briefly and temporarily choose not to use PPE. If in their professional judgment, they believe that using PPE would prevent the delivery of health care or public safety services or pose an increased hazard to themselves or coworkers.
  – If the employee makes this judgment, you must investigate and document to determine if changes can be made to prevent future occurrences of the same situation

• Make sure that appropriate PPE, in sizes to fit your employees, is readily accessible at the worksite or issued to employees
• Make sure employees remove all PPE before leaving the work area.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-110, § 296-823-15005, filed 4/22/03, effective 8/1/03.]

WAC 296-823-15010 Make sure gloves are worn.

You must:
• Make sure gloves appropriate to the situation are worn when:
  – It can be reasonably anticipated that the employee may have hand contact with blood, other potentially infectious materials (OPIM), mucous membranes, or skin that is not intact
    – Handling or touching contaminated items or surfaces
    – Performing vascular access procedures, for example, drawing blood or inserting an IV.

You must:
• Do the following when you are an employer in a volunteer blood donation center and you make the judgment that employees do not require routine use of gloves when performing phlebotomies:
  – Periodically reevaluate your decision not to require gloves
  – Make gloves available to all employees who wish to use them for phlebotomy (blood drawing)
  – Do not discourage the use of gloves for phlebotomy
  – Require that gloves be used for phlebotomy in ANY of the following circumstances:
    ■ When the employee has a cut, scratch, or other break in the skin of his or her hand or wrist
    ■ When the employee judges that hand contamination with blood may occur; for example, when performing phlebotomy on an uncooperative individual
    ■ When the employee is receiving training in phlebotomy.

You must:
• Make sure employees who are allergic to the gloves that are normally provided have ready access to at least one of the following:
  – Nonlatex gloves
  – Glove liners
  – Powderless gloves
  – Other similar alternatives.
  • Replace disposable (single use) gloves such as surgical or examination gloves:
    – As soon as practical when contaminated
    – As soon as practical if they are torn or punctured
    – When their ability to function as a barrier is compromised.

You must:
• Make sure disposable (single use) gloves are used only once
  • Discard utility gloves if they are cracked, peeling, torn, punctured, or show other signs of deterioration or when their ability to function as a barrier is compromised.
  – You may decontaminate utility gloves for reuse if they can continue to function as a barrier.
Eyes, nose, or mouth contamination can be reasonably anticipated. Infectious materials (OPIM) may be generated and splashes, spray, spatter, or droplets of blood or other potentially infectious materials (OPIM) penetrate it. The type and characteristics will depend upon the sort of work being done and how much exposure is anticipated.

Note: Examples of eye protection devices include goggles and glasses with solid side shields.

WAC 296-823-15015 Make sure appropriate masks, eye protection, and face shields are worn.

You must:
• Make sure either chin-length face shields or a combination of masks and eye protection are used, whenever splashes, spray, spatter, or droplets of blood or other potentially infectious materials (OPIM) may be generated and eyes, nose, or mouth contamination can be reasonably anticipated.

Note: Examples of eye protection devices include goggles and glasses with solid side shields.

WAC 296-823-15020 Wear appropriate protective clothing.

You must:
• Make sure appropriate protective clothing is worn when splashes to skin or clothes are reasonably anticipated. The type and characteristics will depend upon the sort of work being done and how much exposure is anticipated.

Note: Examples of protective clothing include:
– Gowns
– Aprons
– Lab coats
– Clinic jackets
– Similar outer garments
– Surgical caps or hoods
– Shoe covers or boots.

You must:
• Remove a garment as soon as feasible if blood or other potentially infectious materials (OPIM) penetrate it.

WAC 296-823-15025 Make resuscitator devices available.

You must:
• Make resuscitator (emergency ventilation) devices readily available and accessible to employees who can reasonably be expected to perform resuscitation procedures.

Note: Examples of resuscitator devices include:
– Masks
– Mouthpieces
– Resuscitation bags
– Shields/overlay barriers.

WAC 296-823-15030 Maintain personal protective equipment.

You must:
• Clean, repair, replace, launder, and dispose of personal protective equipment required by this chapter, at no cost to the employee
• Make sure when PPE is removed, it is placed in an appropriately designated area or container for storage, washing, decontamination, or disposal.

Note: Contaminated personal clothing is considered PPE for the purposes of this section.

WAC 296-823-160 Post-exposure requirements.

Summary.

Your responsibility:
To make sure employees who have been exposed to blood or other potentially infectious materials (OPIM) have appropriate post-exposure evaluation and follow-up available.

You must:
Make a confidential medical evaluation and follow-up available to employees who experience an exposure incident

WAC 296-823-16005 Make a confidential medical evaluation and follow-up available to employees who experience an exposure incident

You must:
• Make immediately available a confidential post-exposure evaluation and follow-up to all employees with occupational exposure to blood or OPIM who report an exposure incident.

Definition:
Exposure incident. Means a specific eye, mouth, other mucous membrane, nonintact skin or parenteral contact with blood or other potentially infectious materials (OPIM) that results from the performance of an employee’s duties. Examples of nonintact skin include skin with dermatitis, hangnails, cuts, abrasions, chafing, or acne.

You must:
• Make sure that the post-exposure medical evaluation and follow-up are all of the following:
  – Immediately available following an exposure incident
  – Confidential
  – At no cost to the employee
  – At a reasonable time and place
  – Administered by or under the supervision of a licensed physician or by another licensed healthcare professional
  – Provided according to recommendations of the United States Public Health Service current at the time these evaluations and procedures take place.
• Make sure that the evaluation and follow-up includes AT LEAST these elements:
  – Documentation of the routes of exposure, and the circumstances under which the exposure incident happened
  – Identification and documentation of the source individual, unless you can establish that identification is infeasible or prohibited by state or local law
  – Collection and testing of blood to detect the presence of HBV and HIV
  – Post-exposure preventive treatment, when medically indicated, as recommended by the United States Public Health Service
  – Counseling
  – Evaluation of reported illnesses.
• Make sure that all laboratory tests are conducted by a laboratory licensed by the state or Clinical Laboratory Improvement Amendments Act (CLIA).

WAC 296-823-16010 Test the blood of the source person.

Exemption: When the source individual is already known to be infected with HBV or HIV, you do not need to test their status.

You must:
• Arrange to test the source individual’s blood for HBV and HIV as soon as feasible after getting their consent.
• If you do not get consent, you must establish that legally required consent cannot be obtained
• When the law does not require the source individual’s consent, their blood, if available, must be tested and the results documented.

Note: The employer or a third-party healthcare provider identified by the employer may do the evaluation.

WAC 296-823-16020 Collect and test the blood of the exposed employee.

You must:
• Arrange to have the exposed employee’s blood collected and tested as soon as feasible after consent is obtained.
  – If the employee consents to baseline blood collection, but does not give consent at that time for HIV serologic testing, the sample must be preserved for at least ninety days. If, within ninety days of the exposure incident, the employee chooses to have the baseline sample tested, it must be done as soon as possible.

WAC 296-823-16025 Provide information to the health care professional evaluating the employee.

You must:
• Provide ALL of the following information to the health care professional evaluating an employee after an exposure incident:
  – A copy of WAC 296-823-160
  – A description of the job duties the exposed employee was performing when exposed
  – Documentation of the routes of exposure and circumstances under which exposure occurred
  – Results of the source person’s blood testing, if available
  – All medical records that you are responsible to maintain, including vaccination status, relevant to the appropriate treatment of the employee.

WAC 296-823-16030 Obtain and provide a copy of the health care professional’s written opinion on post-exposure evaluation to the employee.

You must:
• Obtain and provide to the employee a copy of the evaluating health care professional’s written opinion within fifteen days of the completion of their evaluation.

Note: If the health care professional provides the written opinion directly to the employee, you do not need to do so.
• If the employee’s personal health care professional completes the evaluation, you are not required to obtain the health care professional’s written opinion.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-12-070, § 296-823-16015, filed 6/1/04, effective 9/1/04; 03-09-110, § 296-823-16015, filed 4/22/03, effective 8/1/03.]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-12-070, § 296-823-16015, filed 6/1/04, effective 9/1/04; 03-09-110, § 296-823-16015, filed 4/22/03, effective 8/1/03.]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-12-070, § 296-823-16015, filed 6/1/04, effective 9/1/04; 03-09-110, § 296-823-16015, filed 4/22/03, effective 8/1/03.]

WAC 296-823-16030 Obtain and provide a copy of the health care professional’s written opinion on post-exposure evaluation to the employee.

You must:
• Obtain and provide to the employee a copy of the evaluating health care professional’s written opinion within fifteen days of the completion of their evaluation.

Note: If the health care professional provides the written opinion directly to the employee, you do not need to do so.
• If the employee’s personal health care professional completes the evaluation, you are not required to obtain the health care professional’s written opinion.

[Title 296 WAC—p. 2925]
• Make sure the health care professional's written opinion is limited to the following information:
  – That the employee has been informed of the results of the evaluation
  – That the employee has been told about any medical conditions resulting from exposure to blood or other potentially infectious materials (OPIM) which need further evaluation or treatment.
• Make sure that all other findings or diagnoses remain confidential and are NOT included in the written report.

Your responsibility:
To obtain and maintain required records.
You must:
Establish and maintain medical records
WAC 296-823-17005
Maintain a sharps injury log
WAC 296-823-17010.

WAC 296-823-17005 Establish and maintain medical records.
You must:
• Establish and maintain an accurate medical record for each employee with occupational exposure
• Make sure this record includes ALL of the following that apply:
  – Name and Social Security number of the employee
  – A copy of the employee's hepatitis B vaccination status, including the dates of all the hepatitis B vaccinations
  – Any medical records related to the employee's ability to receive vaccinations
  – The HBV declination statement
  – A copy of all results of examinations, medical testing, and follow-up procedures related to post-exposure evaluations
    – Your copy of the health care professional's written opinion
    – A copy of the information provided to the health care professional as required.
• Make sure that employee medical records are:
  – Kept confidential
  – Not disclosed or reported to any person, without the employee's written consent, except as required by this section or as may be required by law.

Note: • In some industries, a medical record is also known as the employee health file.
• You may contract with the medical professional responsible for hepatitis B vaccination and post-exposure evaluation to maintain employee records.

Reference: You need to follow additional requirements for medical records found in WAC 296-62-052, Access to records.

WAC 296-823-17010 Maintain a sharps injury log.
Exemption: You are exempt from the requirements to record contaminated sharps injuries if you have ten or less employees.
You must:
• Record contaminated sharps injuries on your OSHA 300 or equivalent log.

You must:
• Record and maintain contaminated sharps injury information in a way that protects the confidentiality of the injured employee
• Also record the following additional information for contaminated sharps injuries:
  – The type and brand of device involved in the incident
  – The department or work area where the exposure incident occurred
  – An explanation of how the incident occurred.
• Maintain your contaminated sharps injury records for five years.

Note: You may record the additional information in any format you choose, such as on the OSHA 300 and 301 forms. It must be retrievable and identifiable to each specific injury.

WAC 296-823-180 Additional requirements for HIV and HBV research laboratories and production facilities. Summary.
Your responsibility:
To implement and enforce these additional rules in research laboratories and production facilities engaged in the culture, production, concentration, experimentation, and manipulation of HIV and HBV.

Exemption: This section does NOT apply to clinical or diagnostic laboratories engaged solely in the analysis of blood, tissues, or organs.

Note: Production and research facilities: Hepatitis C (HCV) is the virus involved in most cases of parenterally transmitted (bloodborne) non-A, non-B hepatitis in the United States. Most individuals who contract HCV become chronically infected (85%) and develop chronic hepatitis (70%). It is recommended that you also follow these requirements for HCV production and research facilities.

You must:
Prepare, review and update a biosafety manual
WAC 296-823-18005
Follow these special practices for the work area
WAC 296-823-18010
Make sure these practices for contaminated material and waste are followed
WAC 296-823-18015
Make these special practices for personal protective equipment (PPE) and other safe guards are followed
WAC 296-823-18020
Protect vacuum lines
WAC 296-823-18025
Use and handle hypodermic needles and syringes appropriately and safely
WAC 296-823-18030
Handle all spills and accidents properly
WAC 296-823-18035

(2005 Ed.)
Post signs
WAC 296-823-18040
Provide additional training for facility employees
WAC 296-823-18045
Furnish a sink for washing hands and a readily available eye wash facility
WAC 296-823-18050
Make sure these additional criteria are followed
WAC 296-823-18055.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-110, § 296-823-180, filed 4/22/03, effective 8/1/03.]

WAC 296-823-18005 Prepare, review, and update a biosafety manual.
You must:
• Prepare or adopt a biosafety manual. This manual must be:
  – Periodically reviewed
  – Updated at least annually or more often, if necessary.
• Make sure employees are:
  – Advised of potential hazards
  – Required to read and follow instructions about practices and procedures.
  – Establish written policies and procedures where only authorized persons can enter work areas and animal rooms.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-110, § 296-823-18005, filed 4/22/03, effective 8/1/03.]

WAC 296-823-18010 Follow these special practices for the work area.
You must:
• Make sure only authorized persons are allowed to enter the work areas and animal rooms. Authorized persons must:
  – Have been advised of the potential biohazard
  – Meet any specific entry requirements
  – Comply with all entry and exit procedures.
  – Keep laboratory doors closed when work involving HIV or HBV is in progress.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-110, § 296-823-18010, filed 4/22/03, effective 8/1/03.]

WAC 296-823-18015 Make sure these practices for contaminated material and waste are followed.
You must:
• Incinerate or decontaminate all regulated waste by a method known to effectively destroy bloodborne pathogens, such as autoclaving
  – Durable
  – Leakproof
  – Appropriately labeled, or color-coded
  – Closed before being removed from the work area.
Reference: You can find additional requirements for appropriate labels and color-coding in WAC 296-823-14025.
You must:
• Incinerate or decontaminate ALL waste from work areas and from animal rooms before disposal

• Make sure an autoclave is available for decontamination of regulated waste. The autoclave must be available within or as near as possible to the work area.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-12-070, § 296-823-18015, filed 6/1/04, effective 9/1/04; 03-09-110, § 296-823-18015, filed 4/22/03, effective 8/1/03.]

WAC 296-823-18020 Make sure these special practices for personal protective equipment (PPE) and other safe guards are followed.
You must:
• Make sure appropriate personal protective clothing is used in work areas and animal rooms. Examples of appropriate personal protective clothing include:
  – Laboratory coats
  – Gowns
  – Smocks
  – Uniforms.
• Decontaminate protective clothing before it is laundered
• Make sure employees remove protective clothing before leaving their work area
• Take special care to avoid skin contact with other potentially infectious materials (OPIM)
• Wear gloves when handling infected animals and when you can not avoid making hand contact with OPIM
• Conduct all activities involving OPIM in biological safety cabinets or other physical-containment devices within the containment module. No work with OPIM must be conducted on the open bench.
  – Appropriate certified biological safety cabinets (Class I, II, or III) or personal protection or physical containment devices must be used for all activities with OPIM that pose a threat of exposure to droplets, splashes, spills, or aerosols. Appropriate personal protection and physical containment devices include:
    ■ Special protective clothing
    ■ Respirators
    ■ Centrifuge safety cups
    ■ Sealed centrifuge rotors
    ■ Containment caging for animals.
  – Biological safety cabinets must be certified when installed or moved, and at least annually.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-110, § 296-823-18020, filed 4/22/03, effective 8/1/03.]

WAC 296-823-18025 Protect vacuum lines.
You must:
• Protect vacuum lines with liquid disinfectant traps and high-efficiency particulate air (HEPA) filters or filters of same or greater efficiency. Make sure filters are checked routinely and maintained or replaced as necessary.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-09-110, § 296-823-18025, filed 4/22/03, effective 8/1/03.]

WAC 296-823-18030 Use and handle hypodermic needles and syringes appropriately and safely.
You must:
• Use hypodermic needles and syringes only for parenteral injection and aspiration of fluids from laboratory animals and diaphragm bottles.

(2005 Ed.)
– Use only needle-locking syringes or disposable syringe-needle units (when the needle is integral to the syringe) for the injection or aspiration of other potentially infectious materials (OPIM)
– Use extreme caution when handling needles and syringes
  – The needle must not be bent, sheared, replaced in the sheath or guard, or removed from the syringe after use
  – Place the needle and syringe promptly in a puncture-resistant container and autoclave or decontaminate before reuse or disposal.

WAC 296-823-18035 Handle all spills and accidents properly.
You must:
• Make sure appropriate professional staff or others, properly trained and equipped to work with concentrated potentially infectious materials, immediately contain and clean up all spills
• Make sure that employees report a spill or accident that results in an exposure incident immediately to the laboratory director or other responsible person.

WAC 296-823-18040 Post signs.
You must:
• Post signs at the entrance to work areas and all access doors when other potentially infectious materials (OPIM) or infected animals are present in the work area or containment module.
• Make sure signs:
  – Contain the following symbol and information:
    (Name of the infectious agent)
    (Special requirements for entering the area)
    (Name, telephone number of the laboratory director or other responsible person.)
  – Are all or mostly fluorescent orange-red with lettering and symbol in a contrasting color.

WAC 296-823-18045 Provide additional training for facility employees.
You must:
• Provide initial training to employees in HIV or HBV research laboratories or production facilities in addition to the training required in WAC 296-823-120
  • Make sure that employees demonstrate proficiency in the following:
    – Standard microbiological practices and techniques
    – The practices and operations specific to the facility before being allowed to work with HIV or HBV.
  • Provide a training program to employees working with HIV or HBV who have no prior experience in handling human pathogens.
    – Initial work activities must not include the handling of infectious agents
    – A progression of work activities must be assigned as techniques are learned and proficiency is developed.
    • Make sure that employees participate in work activities involving infectious agents only after proficiency has been demonstrated.

WAC 296-823-18050 Furnish a sink for washing hands and a readily available eye wash facility.
You must:
• Make sure each work area contains a sink for handwashing and an eyewash facility is readily available.
  – For HIV and HBV production facilities, the sink must be operated automatically or by foot or elbow and must be located near the exit door of the work area.

Reference:
Requirements for emergency eyewash stations can be found in WAC 296-800-15030.

WAC 296-823-18055 Make sure these additional criteria are followed.
You must:
• Separate the HIV and HBV work areas from areas that are open to unrestricted traffic flow within the building
  • Use two sets of doors to separate HIV and HBV work areas from access corridors or other contiguous areas.

Note:
You may provide a physical separation of the high-containment work area from access corridors or other areas or activities by providing:
  – A double-doored clothes-change room (showers may be included)
  – Airlock
  OR
  – Other access facilities that require passing through two sets of doors before entering the work area.

• Make sure the surfaces of doors, walls, floors, and ceilings in the work area are water resistant so they can be easily cleaned. These surfaces must be sealed or capable of being sealed to facilitate decontamination
  • Make sure access doors to the work area or containment module are self-closing
  • Provide a ducted exhaust-air ventilation system. This system must create directional airflow that draws air into the
work area through the entry area and you must verify this air-flow. The exhaust air must:
- NOT be recirculated to any other area of the building
- Be discharged to the outside
- Be dispersed away from occupied areas and air intakes.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-12-070, § 296-823-18055, filed 6/1/04, effective 9/1/04; 03-09-110, § 296-823-18055, filed 4/22/03, effective 8/1/03.]

WAC 296-823-200 Definitions.

Blood
Human blood, human blood components and products made from human blood. Also included are medications derived from blood, such as immune globulins, albumin, and factors 8 and 9.

Bloodborne pathogens
Pathogenic microorganisms that are present in human blood and can cause disease in humans. Examples of these pathogens include:
- Human immunodeficiency virus (HIV)
- Hepatitis B virus (HBV)
- Hepatitis C virus, malaria
- Syphilis
- Babesiosis
- Brucellosis
- Leptospirosis
- Arboviral infections
- Relapsing fever
- Creutzfeld-Jakob Disease
- Human T-lymphotropic virus Type I
- Viral Hemorrhagic Fever.

Clinical laboratory
A workplace where diagnostic or other screening procedures are performed on blood or other potentially infectious materials (OPIM).

Contaminated
The presence or the reasonably anticipated presence of blood or other potentially infectious materials (OPIM) on an item or surface.

Contaminated laundry
Laundry that has been soiled with blood or other potentially infectious materials (OPIM) or may contain contaminated sharps.

Contaminated sharps
Any contaminated object that can penetrate the skin including, but not limited to, needles, scalpels, broken glass, broken capillary tubes, and exposed ends of dental wires.

Decontamination
The use of physical or chemical means to remove, inactivate, or destroy bloodborne pathogens on a surface or item to the point where they are no longer capable of transmitting infectious particles and the surface or item is rendered safe for handling, use, or disposal.

Exposure incident
A specific eye, mouth, other mucous membrane, nonintact skin or parenteral contact with blood or other potentially infectious materials (OPIM) that results from the performance of an employee’s duties. Examples of nonintact skin include skin with dermatitis, hangnails, cuts, abrasions, chafing, or acne.

Handwashing facilities
A facility providing an adequate supply of running potable water, soap and single use towels or hot air drying machines.

Licensed healthcare professional
A person whose legally permitted scope of practice allows him or her to independently perform the activities required by this rule.

Needleless systems
A device that does not use needles for any of the following:
- The collection of bodily fluids or withdrawal of body fluids after initial venous or arterial access is established
- The administration of medication or fluids
- Any other procedure involving the potential for occupational exposure to bloodborne pathogens due to percutaneous injuries from contaminated sharps.

Occupational exposure
Reasonably anticipated skin, eye, mucous membrane, or parenteral contact with blood or OPIM that may result from the performance of an employee’s duties.

Other potentially infectious materials (OPIM)
Includes all of the following:
- Human body fluids: Semen, vaginal secretions, cerebrospinal fluid, synovial fluid, pleural fluid, pericardial fluid, peritoneal fluid, amniotic fluid, saliva in dental procedures, any body fluid that is visibly contaminated with blood, and all body fluids in situations where it is difficult or impossible to differentiate between body fluids;
- Any unfixed tissue or organ (other than intact skin) from a human (living or dead);
- HIV-containing cell or tissue cultures, organ cultures, and HIV- or HBV-containing culture medium or other solutions; and blood, organs, or other tissues from experimental animals infected with HIV or HBV
- Blood and tissues of experimental animals infected with bloodborne pathogens.

Parenteral contact
When mucous membranes or skin is pierced by needles, human bites, cuts, or abrasions.

Personal protective equipment (PPE)
Specialized clothing or equipment worn by an employee for protection against a hazard. General work clothes (for example, uniforms, pants, shirts, or blouses) not intended to function as protection against a hazard are not considered to be PPE.

Production facility
A facility engaged in industrial-scale, large-volume or high concentration production of HIV or HBV.

Regulated waste
Regulated waste is any of the following:
- Liquid or semisolid blood or other potentially infectious materials (OPIM)
- Contaminated items that would release blood or OPIM in a liquid or semisolid state, if compressed
- Items that are caked with dried blood or OPIM and are capable of releasing these materials during handling
- Contaminated sharps
- Pathological and microbiological wastes containing blood or OPIM.

(2005 Ed.)

[Title 296 WAC—p. 2929]
Chapter 296-824 WAC

EMERGENCY RESPONSE

WAC 296-824-100 Scope. This chapter states the minimum requirements that help you protect the safety and health of your employees during a response to a hazardous substance releases in your workplace or any other location.

This chapter applies if your employees are, or could become, involved in responding to uncontrolled releases of hazardous substances in your workplace or any other location. Use the scope flow chart, and definitions that follow, to determine if this chapter applies to your workplace(s). Defined words are italicized in the flow chart.

EXEMPTION: • This chapter does not apply to you if your workplace is a hazardous waste site. If you are not sure about your site classification, see chapter 296-62 WAC: Part P Hazardous waste operations and treatment, storage, and disposal facilities.

• If your workplace is a treatment, storage, and disposal site this chapter may apply.

Note: Requirements in other chapters may also apply to your workplace. You will find some safety and health requirements (for example, personal protective equipment) are addressed on a general level in the WISHA Safety and Health Core Rules, chapter 296-800 WAC, while being addressed for a specific application in this rule. When this happens, both requirements apply and should not conflict.

If you are uncertain which requirements to follow, you must comply with the more protective requirement. Contact your local L&I office if you need assistance in making this determination.
Definitions applicable to the flow chart. (See WAC 296-824-800 for additional definitions used in the chapter):

**Danger area**
Areas where conditions pose a serious danger to employees, such as areas where:
- Immediately dangerous to life or health (IDLH) conditions could exist
- High levels of exposure to toxic substances could exist
- There is a potential for exceeding the lower explosive limit (LEL), also known as the lower flammability limit (LFL), of a substance.

**Emergency response**
A response to an anticipated release of a hazardous substance that is, or could become, an uncontrolled release.

**Hazardous substance**
Any biological, radiological, or chemical substance that can have adverse effects on humans. (See WAC 296-824-800 for a more specific definition.)

**Immediately dangerous to life or health (IDLH)**
Any atmospheric condition that would:
- Cause an immediate threat to life
- Cause permanent or delayed adverse health effects
- Interfere with an employee's ability to escape

**Incidental release**
A release that can be safely controlled at the time of the release and does not have the potential to become an uncontrolled release.

Example of a situation that results in an incidental release:
A tanker truck is receiving a load of hazardous liquid when a leak occurs. The driver knows the only hazard from the liquid is minor skin irritation. The employer has trained the driver on procedures and provided equipment to use for a release of this quantity. The driver puts on skin protection and stops the leak. A spill kit is used to contain, absorb, and pick up the spilled material for disposal.

**Limited action**
Action necessary to:
- Secure an operation during emergency responses,
- Prevent an incident from increasing in severity.
Examples include shutting down processes and closing emergency valves.

**Release**

A spill, leak, or other type of hazardous substance discharge.

**Uncontrolled release**

A release where significant safety and health risks could be created. Releases of hazardous substances that are either incidental or could not create a safety or health hazard (i.e., fire, explosion or chemical exposure) are not considered to be uncontrolled releases.

Examples of conditions that could create a significant safety and health risk:

- Large-quantity releases
- Small-releases that could be highly toxic
- Potentially contaminated individuals arriving at hospitals
- Airborne exposures that could exceed a WISHA permissible exposure limit or a published exposure limit and employees are not adequately trained or equipped to control the release.

**Example of an uncontrolled release:**

A forklift driver knocks over a container of a solvent-based liquid, releasing the contents onto the warehouse floor. The driver has been trained to recognize the vapor is flammable and moderately toxic when inhaled. The driver has not been trained or provided appropriate equipment to address this type of spill. In this situation, it is not safe for the driver to attempt a response. The driver needs to notify someone of the release so an emergency response can be initiated.

**Workplace**

- A fixed facility
- OR
- A temporary location (such as a traffic corridor)
- OR
- Locations where employees respond to emergencies.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 02-20-034, § 296-824-100, filed 9/24/02, effective 10/1/02. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-11-14, § 296-824-100, filed 5/22/02, effective 10/1/02.]

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 02-20-034, § 296-824-11020, filed 9/24/02, effective 10/1/02. Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-11-14, § 296-824-11020, filed 5/22/02, effective 10/1/02.]
WAC 296-824-13030 Reserved.
[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 02-20-034, § 296-824-13030, filed 9/24/02, effective 10/1/02.
Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-11-141, § 296-824-13030, filed 5/22/02, effective 10/1/02.]

WAC 296-824-14010 Reserved.
[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 02-20-034, § 296-824-14010, filed 9/24/02, effective 10/1/02.
Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-11-141, § 296-824-14010, filed 5/22/02, effective 10/1/02.]

WAC 296-824-200 Planning.
Your Responsibility:
To anticipate and plan for emergency response operations.
[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 02-20-034, § 296-824-200, filed 9/24/02, effective 10/1/02.]

WAC 296-824-20005 Develop an emergency response plan.
Note: You may already have an emergency response plan, such as required by chapter 296-62 WAC, Part P. Hazardous waste operations and treatment, storage and disposal facilities or by state and locally coordinated response efforts (Section 303 of Superfund Amendments and Reauthorization Act (SARA), Title III). You may use those plans to comply with this section, if they include the items listed below.

Before a written emergency response plan can be developed, you will need to anticipate the types of uncontrollable releases that employees could encounter in your workplace(s).

You must:
(1) Make sure your plan is written and adequately addresses, as a minimum, all of the following:
• Preemergency planning and coordination with additional responders (including personnel from other employers such as: Fire departments, law enforcement agencies, emergency medical services, and state or federal agencies).
• Personnel roles, (See Table 1) and lines of authority and communications for all affected parties including responders
• Employee training (see WAC 296-824-30005 for more detail):

Note: Responders' level of training depends on the duties or roles the employer assigns.

Training for the employees' role should address the competencies specified in Tables 3 through 6.

Training on specific substances may be appropriate depending on the number and characteristics of hazardous substances expected to be encountered. For example, if employees may only respond to one substance, you could provide training (covering the knowledge and skills specified in Tables 3 through 6) on that single substance. If employees might respond to a range of hazardous substances, training may be required to cover categories of hazardous substances.

Videos and automated training methods (for example: Interactive computer-based programs) may be used in training; however, instructors must be readily available to:

• Encourage and provide responses to questions for the benefit of the group.
• Evaluate employee understanding of the material.
• Provide other instructional interaction to the group.

• Emergency recognition
• Immediate emergency procedures including:
  – Methods of alerting employees (see WAC 296-800-310, exit routes and employee alarm systems) and outside responders
  – Procedures for limited action (emergency prevention)

Note: Limited action includes shutting down processes, closing emergency valves and other critical actions to secure the operation, or prevent the incident from increasing in severity.

<table>
<thead>
<tr>
<th>Limited Action and Employee Roles</th>
<th>If . . .</th>
<th>Then employees involved would be:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Limited action could be conducted in the danger area</td>
<td>Considered emergency responders</td>
<td></td>
</tr>
<tr>
<td>Limited action will not be conducted in the danger area</td>
<td>Considered evacuees, not emergency responders</td>
<td></td>
</tr>
</tbody>
</table>

– Details of who will evacuate immediately and who will remain behind for limited action
– Evacuation routes and procedures
– How to establish safe distances and places of refuge (for example, during emergency response the incident commander (IC) decides to make changes based on new developments, i.e., changes in the wind direction).

• Methods of securing and controlling access to the site
• Emergency medical treatment and first aid
• A complete personal protective equipment (PPE) program that addresses:
  – Selection of PPE including selection criteria to be used and the identification, specified use and limitations of the PPE selected.
  – Training on proper use of PPE (including maintenance).
  – Hazards created by wearing PPE including heat stress during temperature extremes, and/or other appropriate medical considerations.
  – Criteria used for determining the proper fit of PPE.
  – Procedures covering proper use of PPE including procedures for inspection, putting it on (donning) and removing it (doffing).
  – Maintenance of PPE including procedures for decontamination, disposal and storage.
  – Methods used to evaluate the effectiveness of your PPE program.

Note: If a manufacturer's printed information or WISHA rule adequately addresses procedural requirements (such as donning or doffing for PPE), it is not necessary to rewrite this into your program; simply attach the printed information.

You may use written procedures provided by the equipment manufacturer when they meet the requirements of other chapters, including chapter 296-62 WAC, Part E, Respiratory protection.

• Emergency equipment
• Emergency response procedures
• Decontamination procedures determined by a hazardous materials specialist or other qualified individual
• Methods to critically assess the response and conduct appropriate follow-up

**You must:**

(2) Make your written emergency response plan available to employees, their representatives, and WISHA personnel for inspecting or copying.

**Table 1**
**Roles and Duties of Emergency Responders**

<table>
<thead>
<tr>
<th>If the employee’s role is:</th>
<th>Then all of the following apply. They:</th>
</tr>
</thead>
<tbody>
<tr>
<td>First responder at the awareness level</td>
<td>* Are likely to witness or discover a hazardous substance release</td>
</tr>
<tr>
<td></td>
<td>* Are trained to initiate an emergency response by notifying the proper authorities of the release</td>
</tr>
<tr>
<td></td>
<td>* Take no further action beyond notifying the authorities</td>
</tr>
<tr>
<td>First responder at the operations level</td>
<td>* Respond to actual or potential releases in order to protect nearby persons, property, and/or the environment from the effects of the release</td>
</tr>
<tr>
<td></td>
<td>* Are trained to respond defensively, without trying to stop the release</td>
</tr>
<tr>
<td></td>
<td>* May try to:</td>
</tr>
<tr>
<td></td>
<td>- Confine the release from a safe distance</td>
</tr>
<tr>
<td></td>
<td>- Keep it from spreading</td>
</tr>
<tr>
<td></td>
<td>- Protect others from hazardous exposures</td>
</tr>
<tr>
<td>Hazardous materials technician</td>
<td>* Respond to releases or potential releases, with the intent of stopping the release</td>
</tr>
<tr>
<td></td>
<td>* Are trained to approach the point of release offensively in order to, either:</td>
</tr>
<tr>
<td></td>
<td>- Plug</td>
</tr>
<tr>
<td></td>
<td>- Patch</td>
</tr>
<tr>
<td></td>
<td>- Stop the release using other methods</td>
</tr>
<tr>
<td>Hazardous materials specialist</td>
<td>* Respond along with, and provide support to, hazardous materials technicians</td>
</tr>
<tr>
<td></td>
<td>* Are required to have more specific knowledge of hazardous substances than a hazardous materials technician</td>
</tr>
<tr>
<td></td>
<td>* Act as the site activity liaison when federal, state, local, and other government authorities participate</td>
</tr>
<tr>
<td>Incident commander</td>
<td>* Have ultimate responsibility for:</td>
</tr>
<tr>
<td></td>
<td>- Direction</td>
</tr>
<tr>
<td></td>
<td>- Control</td>
</tr>
<tr>
<td></td>
<td>- Coordination of the response effort</td>
</tr>
<tr>
<td></td>
<td>- Will assume control of the incident beyond the first responder awareness level</td>
</tr>
<tr>
<td>Specialist employee</td>
<td>* Are a technical, medical, environmental, or other type of expert</td>
</tr>
<tr>
<td></td>
<td>* May represent a hazardous substance manufacturer, shipper, or a government agency</td>
</tr>
<tr>
<td></td>
<td>* May be present at the scene or may assist from an off-site location</td>
</tr>
<tr>
<td></td>
<td>* Regularly work with specific hazardous substances</td>
</tr>
<tr>
<td></td>
<td>* Are trained in the hazards of specific substances</td>
</tr>
<tr>
<td></td>
<td>* Are expected to give technical advice or assistance to the incident commander or incident safety officer, when requested</td>
</tr>
<tr>
<td>Skilled support personnel</td>
<td>* Are needed to perform an immediate, specific emergency support task at the site</td>
</tr>
<tr>
<td></td>
<td>* Are skilled in the operation of equipment including:</td>
</tr>
<tr>
<td></td>
<td>- Earth moving equipment</td>
</tr>
<tr>
<td></td>
<td>- Cranes</td>
</tr>
<tr>
<td></td>
<td>- Hoisting equipment</td>
</tr>
<tr>
<td>Incident safety officer</td>
<td>* Are designated by the incident commander</td>
</tr>
<tr>
<td></td>
<td>* Are knowledgeable in operations being implemented at the site</td>
</tr>
<tr>
<td></td>
<td>* Have specific responsibility to:</td>
</tr>
<tr>
<td></td>
<td>- Identify and evaluate hazards</td>
</tr>
<tr>
<td></td>
<td>- Provide direction on employee safety matters</td>
</tr>
</tbody>
</table>

Note: In situations where multiple employers could respond to an incident, all plans should consistently address:

• Who will be designated as the incident commander (IC) AND
• If, when, and how transfer of the incident commander (IC) position will take place.
WAC 296-824-300 Training.

Your responsibility:
To make sure employees participating in emergency response operations are appropriately trained for their assigned roles and duties.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 02-20-034, § 296-824-300, filed 9/24/02, effective 10/1/02.]

WAC 296-824-30005 Train your employees.

Note: • Use Tables 3 through 6 to identify your employees' training competencies.
• You may conduct training internally, or use outside training services to comply with this section.
  – When outside trainers are hired, you are still responsible for making sure the requirements of this section are met. For example, employers may compare the course outline to the competencies listed in Tables 3 through 6.

You must:
• Make sure employees are appropriately trained for their assigned roles and duties as follows:
  EXEMPTION: Skilled support employees are not covered by the training requirements in this section. (See WAC 296-824-50015.)

– Initial training:
• Provide initial training before the employee is allowed to participate in an actual emergency response operation.

  Note: When first responders at the awareness or operations level have sufficient experience to objectively demonstrate competencies specified in Table 3, you may accept experience instead of training.

• Make sure initial training adequately addresses the competencies in Tables 3 through 6 and the minimum training durations in Table 2.
• Certify that employees objectively demonstrate competencies specified in Tables 3, 4 and 5 (except for employees trained as first responders at the awareness level).

– Retraining (refresher) training:
• Provide retraining annually
• Make sure retraining covers necessary content
• Document training or demonstrated competency

  Note: Retraining is not required when employees demonstrate competencies annually and a record is kept of the demonstration methodology used.

– Trainer qualifications:
• Verify trainers have satisfactorily completed an instructors' training course for the subjects they teach. For example, courses offered by the United States National Academy, or equivalent courses are acceptable.

  OR
• Have the educational and instructional experience necessary for training.

– Specialist employees:
• Specialist employees who have been sent to the scene to advise or assist must receive training or demonstrate competency in their specialty, annually.

<table>

WAC 296-824-400 Medical surveillance. Summary.

Your responsibility:
To provide and document medical surveillance for your employees.

You must:
Provide medical surveillance to employees
WAC 296-824-40005
Keep records
WAC 296-824-40010.

WAC 296-824-40005 Provide medical surveillance to employees.

You must:
(1) Provide medical surveillance for employees to comply with Tables 7 and 8, and the following:
   • Make medical surveillance available at:
     – Reasonable times and places.
     – No cost to employees, including travel associated costs such as mileage, gas or bus fare if the employee is required to travel off site
   AND
     – Wages for additional time spent outside of employees normal work hours.
   • Make sure a licensed physician performs or supervises exams and procedures.
   • Give complete information to the examining physician including:
     – A copy of this chapter.
     – A description of the employee's duties that relate to hazardous substance exposure.
     – The hazardous substance exposure levels anticipated for the employee.

   – A description of the personal protective equipment (PPE) the employee could use.
   – Information available from previous medical examinations.
     • Medical exams must include, at a minimum:
       – A medical history
       – A work history (or updated history if on file)
       – A special emphasis on:
         ■ Assessment of symptoms related to handling hazardous substances
         ■ Health hazards
         ■ Evaluation of fitness for duty (including the ability to wear any personal protective equipment (PPE) or other conditions that may be expected at the workplace)
       – Other content as determined by the examining physician.

   (2) Obtain the physician's written opinion and give a copy to the employee that includes:
       • A statement of whether or not medical conditions were found which would increase the employee's risk for impairment during emergency response work or respirator use.
       – Do not include specific findings or diagnoses unrelated to occupational exposures.
       • Limitations recommended to the employee's assigned work, if any.
       • Exam and test results if the employee requests this information.
       • A statement that affirms the employee has been confidentially informed of medical exam results (including medical conditions requiring follow-up).

Table 7
Medical Surveillance for Employee Categories

<table>
<thead>
<tr>
<th>If the employee is covered by this chapter and is:</th>
<th>Then you must:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Exposed for at least 30 days a year to health hazards or hazardous substances at or above the permissible exposure limit or published exposure levels (even when respirators are used), OR • Required to wear a respirator for at least 30 days a year.*</td>
<td>• Offer standard medical surveillance as specified in Table 8,*</td>
</tr>
<tr>
<td>• A hazardous materials (HAZMAT) team member • A hazardous materials specialist</td>
<td>• Provide standard medical surveillance as specified in Table 8.</td>
</tr>
<tr>
<td>• An emergency responder who shows immediate or delayed signs or symptoms possibly resulting from exposure to hazardous substances during an incident.</td>
<td>• Provide incident-specific medical surveillance as specified in Table 8.</td>
</tr>
<tr>
<td>• Not an emergency responder and: – May be injured – Shows immediate or delayed signs or symptoms possibly resulting from exposure to hazardous substances – May have been exposed to hazardous substances at concentrations above the permissible exposure limits (PELs) or the published exposure levels without appropriate PPE.</td>
<td>• Offer incident-specific medical surveillance as specified in Table 8.</td>
</tr>
</tbody>
</table>

*Note: A medical evaluation for respirator use is required by chapter 296-62 WAC, Part E, Respiratory protection, for those employees who have not been cleared for respirator use during medical surveillance activities.
**WAC 296-824-40010** Keep records.

You must:
- Keep a record of:
  - Name and Social Security number of the employee receiving medical surveillance
  - Physicians' written opinions, recommended limitations, and results of examinations and tests
  - Any employee medical complaints regarding hazardous substance exposures
  - A copy of all information given to the examining physician (except a copy of this chapter)

**Note:** Keep records meeting the criteria specified in chapter 296-62 WAC, Part B, Access to records, for the length of time specified in that chapter.

**WAC 296-824-500** Incident requirements. Summary.

**Your responsibility:**
To conduct and manage emergency response operations so employees are protected from hazardous substances and conditions.

**You must:**
- Recognize emergencies and initiate a response
- Implement and maintain an incident command system (ICS)
- Prepare skilled support personnel

**WAC 296-824-40010** Keep records.

You must:
- Keep a record of:
  - Name and Social Security number of the employee receiving medical surveillance
  - Physicians' written opinions, recommended limitations, and results of examinations and tests
  - Any employee medical complaints regarding hazardous substance exposures
  - A copy of all information given to the examining physician (except a copy of this chapter)

**Note:** Keep records meeting the criteria specified in chapter 296-62 WAC, Part B, Access to records, for the length of time specified in that chapter.

**WAC 296-824-500** Incident requirements. Summary.

**Your responsibility:**
To conduct and manage emergency response operations so employees are protected from hazardous substances and conditions.

**You must:**
- Recognize emergencies and initiate a response
- Implement and maintain an incident command system (ICS)
- Prepare skilled support personnel

**Table 8**
**Frequency of Exams and Consultations**

<table>
<thead>
<tr>
<th>If the employee is covered by:</th>
<th>Then medical surveillance must include:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Standard medical surveillance</td>
<td>• Exams and consultations:</td>
</tr>
<tr>
<td></td>
<td>– Before assignment.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the employee is a hazardous materials (HAZMAT) team member or a hazardous materials specialist, the employee must receive a baseline physical examination.</td>
</tr>
<tr>
<td></td>
<td>– At least once every 12 months after their initial assignment unless the physician believes a shorter, or longer interval (but no more than 24 months) is appropriate.</td>
</tr>
<tr>
<td></td>
<td>– Whenever employees are reassigned to an area where they will no longer be covered by medical surveillance and they have not been examined within the past 6 months.</td>
</tr>
<tr>
<td></td>
<td>– As soon as possible after an employee reports:</td>
</tr>
<tr>
<td></td>
<td>✦ Signs or symptoms of possible overexposure to hazardous substances or health hazards</td>
</tr>
<tr>
<td></td>
<td>✦ Injury</td>
</tr>
<tr>
<td></td>
<td>✦ Exposure above the permissible exposure limits or published exposure levels</td>
</tr>
<tr>
<td></td>
<td>– At the termination of their employment unless they were examined within the past 6 months.</td>
</tr>
<tr>
<td>• Incident-specific medical surveillance</td>
<td>• Medical consultations and exams:</td>
</tr>
<tr>
<td></td>
<td>– As soon as possible following the incident or development of signs or symptoms.</td>
</tr>
<tr>
<td></td>
<td>– At additional times, if the physician determines follow-up is medically necessary.</td>
</tr>
</tbody>
</table>

**WAC 296-824-40010** Keep records.

You must:
- Keep a record of:
  - Name and Social Security number of the employee receiving medical surveillance
  - Physicians' written opinions, recommended limitations, and results of examinations and tests
  - Any employee medical complaints regarding hazardous substance exposures
  - A copy of all information given to the examining physician (except a copy of this chapter)

**Note:** Keep records meeting the criteria specified in chapter 296-62 WAC, Part B, Access to records, for the length of time specified in that chapter.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060, 02-20-034, § 296-824-40005, filed 9/24/02, effective 10/1/02.]

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060, 02-20-034, § 296-824-40010, filed 9/24/02, effective 10/1/02.]

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060, 02-20-034, § 296-824-50005, filed 9/24/02, effective 10/1/02.]
command system (ICS) and acts within their designated role and training level.

Note: • For multim employer worksites:
  – The IC has responsibility for controlling emergency response operations at the site for all employers.
  – Emergency response plans should be consistent in designating who assumes the IC position.
• If the first employee arriving at the scene is not trained as an IC (see Table 5, Competencies for Incident Commanders, WAC 296-824-30005), they may take control of the incident within their designated role and training level.

(2) Make sure all employers’ emergency responders and their communications are coordinated and controlled by the IC.

Note: The IC may delegate tasks to subordinates (within their training level).

(3) Make sure each employer at the scene has designated a representative to assist the IC.

(4) Establish security and control of the site as specified in your written emergency response plan.

WAC 296-824-50015 Prepare skilled support personnel.

Note: The duties of skilled support personnel are described in Table 1, Roles and Duties of Emergency Responders.

You must:

(1) Make sure that your skilled support personnel (including those employees who are not regularly employed by you) who could be exposed to on-scene hazards are given an initial briefing at the site before they participate in any emergency response. The initial briefing must include:
  • What chemical hazards are involved
  • What duties are to be performed
  • Instruction in the wearing of appropriate personal protective equipment

Note: Skilled support personnel do not need to comply with the other training requirements of this chapter.

(2) Make sure the safety and health precautions given to your employees are also given to skilled support personnel.

WAC 296-824-50020 Make sure the incident commander oversees activities during the response.

The employer of the incident commander (IC) must:

(1) Identify all hazardous substances and conditions present, within their training level, using site analysis and maximum exposure limits, when appropriate.

(2) Implement emergency response procedures appropriate to the hazardous substances and conditions present, such as:
  • Procedures that address the use of engineering controls, hazardous substance handling, and new technologies
  • Procedures that address decontamination
  • Procedures that address PPE
  • Procedures that limit the number of personnel to those who are actively performing emergency response operations, in areas where exposure could exist.

(3) Designate an incident safety officer (ISO).
  • Make sure the ISO demonstrates knowledge about operations being implemented at the emergency response site. They must:
    – Identify and evaluate hazards
    – Communicate with the IC about hazards, immediately informing the IC of corrective actions that must be taken when conditions are judged to be:
      ➢ An imminent danger
      ➢ OR
      ➢ Immediately dangerous to life or health (IDLH).
    – Provide direction about the safety of operations.

WAC 296-824-50025 Use the buddy system in danger areas.

You must:

• Make sure operations and tasks (including limited actions) in danger areas are conducted using the buddy system in teams of two or more.

Definition:
Danger areas are areas where conditions pose a serious danger to employees, such as areas where:
  • Immediately dangerous to life or health (IDLH) conditions could exist.
  OR
  • High levels of exposure to toxic substances could exist.
  OR
  • There is a potential for exceeding the lower explosive limit (LEL), also known as the lower flammability limit (LFL), of a hazardous substance.

WAC 296-824-50030 Provide rescue and medical assistance.

You must:

(1) Provide stand-by employees equipped with the same level of personal protective equipment (PPE) as the entrants, for assistance or rescue.

Note: • The buddy system applies to stand-by employees (see WAC 296-824-50025).
  • One of the two stand-by employees can be assigned to another task provided it does not interfere with the performance of the stand-by role.
  • Rescue equipment should be selected and provided based on the types of rescue situations that could occur.

WAC 296-824-50030 Provide rescue and medical assistance.

You must:

(2) Make sure employees trained in first aid are readily available with necessary medical equipment and have a way to transport the injured.

Note: • Employee training is covered by WAC 296-800-150, first aid. This rule requires training on the eighteen subjects listed in addition to any subjects that are specific to your workplace emergency hazards (for example: If exposure to corrosive substances could occur, training would need to include first-aid procedures for treating chemical burns).
  • Employers who designate and train their employees to provide first aid are covered by chapter 296-823 WAC, Occupational exposure to bloodborne pathogens.

(2005 Ed.)
**WAC 296-824-60005  Personal protective equipment.**

Use appropriate personal protective equipment (PPE).

Note: 
- Only properly trained employees should select PPE. Hazardous materials technicians and hazardous materials specialists can select PPE within the competencies specified in Table 4.
- Selection requirements in other PPE rules also apply, including:
  - WAC 296-800-160, Personal protective equipment.
  - Chapter 296-62 WAC, Part E, Respiratory protection.
  - WAC 296-24-58505, Fire brigades.
  - Chapter 296-305 WAC, Safety standards for fire fighting.

You must:
- Provide employees with appropriate PPE and make sure it is used properly.
  - Select PPE (such as respirators, gloves, protective suits and other PPE) based on:
    - An evaluation of the performance characteristics (such as breakthrough time and hazardous substance-specificity of the material or item) relevant to the requirements and limitations of the site.
    - Task-specific conditions and durations.
    - The hazards and potential hazards of the site (see Table 9, Selecting PPE for Specific Hazards).
  - Select totally encapsulating chemical protective (TECP) suits, as specified in Table 9, that:
    - Maintain positive air pressure.
    - Prevent inward test gas leakage of more than 0.5 percent.

Note: Follow the manufacturer's recommended procedure for testing a TECP suit's ability to maintain positive air pressure and prevent inward gas leakage. Other established test protocols for these suits, for example NFPA 1991 and ASTM F1052-97, may also be used.

</tbody>
</table>

**WAC 296-824-60010  Control hazards created by personal protective equipment (PPE).**

You must:
- Control hazards created by the use of PPE, including:
  - Heat stress due to extremely high temperatures.
  - Any other employee health hazard and consideration.

(2) Make sure employees put on (don) and remove (doff) PPE following your plan’s procedures.

(3) Make sure employees do not interchange self-contained breathing apparatus (SCBA) air cylinders from different manufacturers, unless all of the following apply:
- There is a life-saving emergency
- You need a supplemental air supply
- The cylinders are of the same capacity and pressure rating.

(4) Make sure compressed air cylinders used with SCBAs meet the testing and service life requirements of the United States Department of Transportation (USDOT). Search at: [http://www.dot.gov](http://www.dot.gov).

**WAC 296-824-60015  Use personal protective equipment (PPE) properly.**

You must:
- (1) Make sure employees inspect PPE before, during and after use, following your plan’s procedures.

(2) Make sure employees put on (don) and remove (doff) PPE following your plan’s procedures.

(3) Make sure employees do not interchange self-contained breathing apparatus (SCBA) air cylinders from different manufacturers, unless all of the following apply:
- There is a life-saving emergency
- You need a supplemental air supply
- The cylinders are of the same capacity and pressure rating.

(4) Make sure compressed air cylinders used with SCBAs meet the testing and service life requirements of the United States Department of Transportation (USDOT). Search at: [http://www.dot.gov](http://www.dot.gov).
You must:
(5) Make sure PPE is maintained in a safe and reliable condition using your plan's procedures.

PPE maintenance includes:
• Decontamination
• Cleaning
• Inspection
• Identification of damage or defects
• Parts repair or replacement
• Storage or disposal.

Note: You can also check with the cylinder manufacturers to obtain USDOT test and service life specifications.

WAC 296-824-70005 Follow the appropriate postemergency response requirements.

Important:
• Postemergency response is the stage of the emergency response where the immediate threat from the release has been stabilized or eliminated, and cleanup of the site has started.
• When cleanup is done by the employees who were part of the initial emergency response, the employees are not covered by this section (however, training, PPE and other requirements in WAC 296-824-20005 through 296-824-60015 apply to these employees).

You must:
(1) Follow Table 10 to determine which requirements apply to your postemergency response activities.
(2) Maintain clean-up equipment as specified in Table 10.

WAC 296-824-700 Postemergency response.

Your responsibility:
To protect employees during postemergency response activities by following appropriate work practices, training and other requirements.

Table 10
Rules that Apply to Postemergency Response Activities

<table>
<thead>
<tr>
<th>When postemergency response cleanup is performed by employees who were not part of the initial emergency response and:</th>
<th>The following rules or requirements apply:</th>
</tr>
</thead>
<tbody>
<tr>
<td>It is necessary to remove hazardous substances, health hazards and contaminated materials (example: soil) from the site</td>
<td>Chapter 296-62 WAC, Part P, Hazardous waste operations and treatment, storage and disposal facilities.</td>
</tr>
</tbody>
</table>
| Cleanup is done on plant property using plant or workplace employees AND It is not necessary to remove hazardous substances, health hazards and contaminated materials from the site. | For training:
  • WAC 296-24-567(1), Employee emergency action plans
  • Chapter 296-62 WAC, Part E, Respiratory protection
  • WAC 296-800-170, Employer chemical hazard communication
  • Other appropriate training requirements relevant to personal protective equipment (PPE) and decontamination
  For equipment:
  • Make sure that all equipment used for clean-up work is serviced and inspected before use. |

WAC 296-824-800 Definitions. The following definitions are specific to this chapter:

**Annually**
Any twelve-month cycle.

**Buddy system**
A system of organizing employees (who enter or stand by danger areas) into work groups, so each employee can be observed by at least one other member of the group. The purpose of this system is to provide rapid assistance to employees in an emergency.

**Clean-up operation(s)**
An operation where hazardous substances are removed, contained, incinerated, neutralized, stabilized, cleared up or, in any other manner, processed or handled with the goal of making the site safer for people or the environment.

**Danger area**
Areas where conditions pose a serious danger to employees, such as areas where:
• Immediately dangerous to life or health (IDLH) conditions could exist

• High levels of exposure to toxic substances could exist

• There is a potential for exceeding the lower explosive limit (LEL), also known as the lower flammability limit (LFL), of a substance.

**Decontamination**
Removing hazardous substances from employees and their equipment so potential adverse health effects will not occur.

**Emergency response**
An organized response to an anticipated release of a hazardous substance that is, or could become an uncontrolled release.

**Emergency response plan**
A written plan that requires coordination between emergency response participants, and contains procedures, criteria, and other information that will be applied to emergency response operations. Each employer's plan should be compatible with local and state plans.
**Engineering controls**
Methods of controlling employee exposures by modifying the source or reducing the quantity of contaminants.

**Hazardous materials team (HAZMAT team)**
A group of employees who are expected to perform responses to releases, or possible releases, of hazardous substances for the purpose of control and stabilization. As a result of their duties, HAZMAT team members may have close contact with hazardous substances.

*Note:* A HAZMAT team may be a separate component of a fire brigade or fire department.

**Hazardous substance**
Any of the following substances that could adversely affect an exposed employee’s health or safety:
- Substances defined under section 101(14) of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA) or "Superfund" Act (visit: [http://www.epa.gov](http://www.epa.gov))
- Biological or other disease-causing agents released that could reasonably be expected to cause death, disease, behavioral abnormalities, cancer, genetic mutation, physiological malfunctions (including malfunctions in reproduction) or physical deformations in a person or their offspring when the person:
  - Is directly exposed to the agent in the environment
  - Directly ingests, inhales, or assimilates the agent from the environment
  - Indirectly ingests the agent through a food chain
- Substances listed by the United States Department of Transportation as hazardous materials under Title 49 (Transportation) in the Code of Federal Regulations (CFR), Part 172, section 101 and appendices (visit: [http://www.nara.gov](http://www.nara.gov) and search for "List of CFR subjects")
- Hazardous wastes as defined in this chapter.

**Hazardous waste**
A substance designated by chapter 173-303 WAC, Dangerous waste regulations, department of ecology, as a dangerous waste or an extremely hazardous waste and any waste fitting the definition of "health hazard" in this chapter.

*Note:* For department of ecology regulations, visit: [http://www.ecy.wa.gov](http://www.ecy.wa.gov)

**Health hazard**
A chemical, a mixture of chemicals, or a pathogen for which there is statistically significant evidence, based on at least one study conducted according to established scientific principles, that acute or chronic health effects may occur in exposed employees.

The term "health hazard" includes stress due to temperature extremes and chemicals that are:
- Carcinogens
- Toxic or highly toxic agents
- Reproductive toxins, irritants, corrosives, sensitizers, hepatotoxins, nephrotoxins, or neurotoxins
- Agents acting on the hematopoietic system agents that damage lungs, skin, eyes, or mucous membranes. (Detailed definitions of these chemical terms can be found in the Safety and health core rules, WAC 296-800-170, chemical hazard communication.)

**Incident command system (ICS)**
An organized approach to control and manage operations at an emergency response incident.

**Incidental release**
A release that can be safely controlled at the time of the release and does not have the potential to become an uncontrolled release.

*Note:*

Example of a situation that results in an incidental release:
A tanker truck is receiving a load of hazardous liquid when a leak occurs. The driver knows the only hazard from the liquid is minor skin irritation. The employer has trained the driver on procedures and provided equipment to use for a release of this quantity. The driver puts on skin protection and stops the leak. A spill kit is used to contain, absorb, and pick up the spilled material for disposal.

**Immediately dangerous to life or health (IDLH)**
Any atmospheric condition that would:
- Cause an immediate threat to life
  OR
- Cause permanent or delayed adverse health effects
  OR
- Interfere with an employee’s ability to escape

**Limited action**
Action necessary to:
- Secure an operation during emergency responses,
  OR
- Prevent an incident from increasing in severity.

Examples include shutting down processes and closing emergency valves.

**Lines of authority**
A preestablished ranking of individuals, qualified to assume a commanding role during an emergency response, noted in an emergency response plan and implemented during a response. This is most important when responders from multiple employers could participate in an emergency response.

**Lower explosive limit (LEL)**
See lower flammable limit (LFL).

**Lower Flammable limit (LFL)**
The lowest concentration of a material that will propagate a flame. The LFL is usually expressed as a percent (by volume) of the material in air (or other oxidant).

**Must**
Must means mandatory.

**Permissible exposure limit (PEL)**
Means the established time-weighted-average (TWA) concentration or ceiling concentration of a contaminant that must not be exceeded. The exposure, inhalation, or dermal permissible limit specified in chapter 296-62 WAC, Part H, Air contaminants.

**Personal protective equipment (PPE)**
Protective items designed to be worn by the user to protect them against airborne, skin contact and other hazards. This includes items such as respiratory protection, protective suits, gloves, eye protection, etc.
Postemergency response
The stage of the emergency response where the immediate threat from the release has been stabilized or eliminated, and cleanup of the site has started.

Published exposure level
Exposure limits published in "National Institute for Occupational Safety and Health (NIOSH) Recommendations for Occupational Safety and Health" (DHHS publication #92-100, 1992).

If an exposure limit is not published by NIOSH, then "published exposure level" means the exposure limits published by the American Conference of Governmental Industrial Hygienists (ACGIH) in "TLVs and BEIs—Threshold Limit Values for Chemical Substances and Physical Agents" (1999 edition).

Note: Additional exposure levels published by recognized organizations such as the American Industrial Hygiene Association are not required to be observed by this rule; however, they may be a useful resource when a hazardous substance is not covered by NIOSH and ACGIH publications.

Release
A spill, leak, or other type of hazardous substance discharge.

Uncontrolled release
A release where significant safety and health risks could be created. Releases of hazardous substances that are either incidental or could not create a safety or health hazard (i.e., fire, explosion or chemical exposure) are not considered to be uncontrolled releases.

Examples of conditions that could create a significant safety and health risk:

- Large-quantity releases
- Small releases that could be highly toxic
- Potentially contaminated individuals arriving at hospitals
- Airborne exposures that could exceed a WISHA permissible exposure limit or a published exposure limit and employees are not adequately trained or equipped to control the release.

Example of an uncontrolled release:
A forklift driver knocks over a container of a solvent-based liquid, releasing the contents onto the warehouse floor. The driver has trained to recognize the vapor is flammable and moderately toxic when inhaled. The driver has not been trained or provided appropriate equipment to address this type of spill. In this situation, it is not safe for the driver to attempt a response. The driver needs to notify someone of the release so an emergency response can be initiated.

Workplace
- A fixed facility
- A temporary location (such as a traffic corridor)
- Locations where employees respond to emergencies.

You
The employer. For a complete definition of "employer" see Safety and health core rules, chapter 296-800 WAC.

Chapter 296-829 WAC
HELCIPETERS USED AS LIFTING MACHINES

WAC
296-829-100 Scope.
296-829-200 Design and installation requirements for helicopters.
296-829-20005 Follow Federal Aviation Administration (FAA) requirements.
296-829-20010 Install and test hooks on helicopters correctly.
296-829-20015 Make sure the load is handled correctly.
296-829-20020 Make sure loads are attached correctly.
296-829-20050 Definitions.
296-829-300 Maintenance.
296-829-30005 Keep landing and deposit areas safe.
296-829-30010 Follow safe refueling procedures.
296-829-400 Operating the helicopter.
296-829-40005 Hold daily briefings.
296-829-40010 Make sure employees are dressed correctly.
296-829-40015 Make sure employees are dressed correctly.
296-829-40020 Make sure employees are dressed correctly.

Exemption:
This chapter does not apply to the use of helicopters:
- In the logging industry.
- For rescue operations when a winch or hoist is used.

You must:
Follow Federal Aviation Administration (FAA) requirements.

You must:
Make sure your helicopters meet design specifications and are equipped properly.

You must:
Follow Federal Aviation Administration (FAA) requirements.

You must:
Make sure helicopter cranes and their use meet the applicable requirements of the Federal Aviation Administration (FAA).

You must:
Make sure electrically operated cargo hooks are:
- Designed and installed to prevent accidental operation.
- Equipped with an emergency mechanical control to release the load.

You must:
Make sure a competent person tests all hooks before each day's operation to make sure both the electrical and mechanical releases work properly.
WAC 296-829-300 Maintenance.

Summary:
Your responsibility:
To keep helicopters in safe operating condition.

You must:
Keep landing and deposit areas safe
WAC 296-829-30005.
Follow safe refueling procedures
WAC 296-829-30010.

WAC 296-829-30005 Keep landing and deposit areas safe.

You must:
(1) Make sure precautions are taken to prevent loose objects from being caught in the downwash and flying around.
   • Secure or remove all loose gear:
     – Within one hundred feet of lift and deposit areas.
     – In all other areas affected by rotor downwash.

(2) Make sure employees do not work under hovering craft, except where necessary to hook or unhook loads.

(3) Make sure safe access and exit, including an emergency escape route, is provided for employees who hook or unhook loads.

(4) Prohibit open fires in any area that could be affected by the rotor downwash.

(5) Make sure unauthorized people do not go within fifty feet of the helicopter when the rotor blades are turning.

(6) Make sure all employees:
   • Stay in full view of the pilot, in a crouched position, when approaching or leaving a helicopter with rotating blades.
   • Stay away from the area behind the cockpit or cabin unless the operator authorizes them to work there.

(7) Take precautions to eliminate reduced visibility.

(8) Make sure ground personnel take special care to stay clear of rotors when visibility is reduced by dust or other conditions.

Reference: For additional requirements relating to portable fire extinguishers, see WAC 296-800-300 in the safety and health core rules.

WAC 296-829-30010 Follow safe refueling procedures.

You must:
• Make sure refueling areas are safe.
  – Post "NO SMOKING" signs at all entrances to the refueling area.

Reference: For additional requirements relating to portable fire extinguishers, see WAC 296-800-300 in the safety and health core rules.
– Do NOT wear loose-fitting clothes that could snag on the hoist line.
– Wear personal protective equipment (PPE), including complete eye protection and hard hats that are secured by chin straps.

Reference: For other requirements relating to PPE, see WAC 296-800-160 in the safety and health core rules.

WAC 296-829-40015 Make sure loads are attached correctly.

You must:
• Make sure loads are properly slung so tag lines cannot be drawn up into rotors.
• Make sure precautions are taken on all freely suspended loads to keep hand splices from spinning open or cable clamps from loosening, such as using pressed sleeves or swedged eyes.
• Make sure the weight of the load does not exceed the manufacturer's load ratings.
• Make sure hoist wires and other gear are not attached to or allowed to catch on any fixed structure.

Exemption: This requirement does not apply to pulling lines or conductors that "pay out" from a container or reel.

WAC 296-829-40020 Make sure the load is handled correctly.

You must:
• Make sure signal systems, whether radio or hand signals, are checked before hoisting the load:
  – When using hand signals, use those shown in Figure 1.
• Make sure workers on the ground do either of the following before touching the suspended load:
  – Use a ground device to safely discharge any static charge;
    OR
  – Put on and wear rubber gloves.
• Make sure there are enough employees for safe loading and unloading operations.
• Make sure constant communications are maintained between the pilot and signal person:
  – The signal person must be distinctly recognizable from other ground personnel.

HELICOPTER HAND SIGNALS

MOVE RIGHT
Left arm extended horizontally; right arm sweeps upward to position over.

MOVE LEFT
Right arm extended horizontally; left sweeps upward to position over head.

MOVE FORWARD
Combination of arm and hand movement in a collecting motion pulling toward head.

HOLD HOVER
The signal "Hold" is executed by placing arms over head with clenched fists.

TAKEOFF
Right hand behind back; left hand pointing up.

LAND
Arms crossed in front of body and pointing downward.

(2005 Ed.)
WAC 296-829-500 Definitions.

Aviation gasoline
Gasoline fuel for reciprocating piston engine helicopters, also known as avgas.

Cargo hook
A device attached to a helicopter that is used to hold suspended loads.

Competent person
One who is capable of identifying existing and predictable hazards in the surroundings, or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.

Deadman controls
A control, switch or device that will automatically shut off whenever the operator releases it.

Deposit area
An area that is designated for dropping off and picking up suspended loads.

Downwash
The wind created by the rotating blades of a helicopter.

Ground device
A device used to dissipate the static electricity charge that has built up on a suspended load.

Helicopter crane
A helicopter that carries cargo or equipment suspended underneath it.

Jet A type fuel
A kerosene grade fuel suitable for helicopters with turbine engines.

Jet B type fuel
A blend of gasoline and kerosene fuel.

Powered hoist
A powered device designed to lift and lower equipment and cargo.

Tag line
A line or rope used to control suspended loads that can swing freely.

Chapter 296-832 WAC
LATE NIGHT RETAIL WORKER CRIME PREVENTION

WAC 296-832-100 Scope.
This rule applies to all retail businesses operating between the hours of 11:00 p.m. and 6:00 a.m.

Exemption: This chapter does not apply to restaurants, hotels, taverns, and lodging facilities.

WAC 296-832-200 Training.

SUMMARY
Your responsibility:
To make sure all employees receive crime prevention training as part of your accident prevention program.

You must:
Provide crime prevention training to your employees WAC 296-832-20005
Provide crime prevention retraining to your employees annually

(2005 Ed.)
WAC 296-832-20005  Provide crime prevention training to your employees.

Note: These training requirements apply only to employees working any time during the hours of 11:00 p.m. to 6:00 a.m. This training must be conducted prior to the employee working this time period.

You must:
• Provide crime prevention training as part of your accident prevention program.
  – Make sure you have instructed your employees on the purpose and function of robbery and violence prevention to provide them with the knowledge and skills required to maintain their personal safety.
  – Provide training and training materials that outline your company's:
    – Security policies
    – Safety and security procedures
    – Personal safety and crime prevention techniques.
  • Provide formal instruction about crime prevention through a training seminar or training video presentation that includes these topics:
    – How keeping the store clean, neat and uncluttered discourages potential robbers
    – Why the cash register should be kept in plain view from outside the store, if your store layout allows
    – Reasons for operating your business with only a minimum number of cash registers at night
    – Reasons for keeping cash register funds to a minimum
    – How to take extra precautions after dark such as ways to keep alert, making sure appropriate lights are on, inspecting dark corners, and identifying possible hiding places for robbers
    – Violence prevention procedures in case of a robbery.
  • Have employees sign a statement indicating the date, time, and place they received their crime prevention training.
  • Keep a record of this information readily available for review when requested by the department of labor and industries.

Note: Employers may keep electronic records of employee training and verification.

• Have a videotape or other materials about crime prevention available to all employees at their request.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 02-16-087, § 296-832-20005, filed 8/7/02, effective 10/1/02.]

WAC 296-832-20010  Provide crime prevention retraining to your employees annually.

You must:
• Provide a refresher course in crime prevention training annually.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 02-16-087, § 296-832-20010, filed 8/7/02, effective 10/1/02.]

WAC 296-832-300  Store safety.

SUMMARY
Your responsibility:

To take certain safety measures to discourage crime in your store.

You must:
• Have a safe in your store
  WAC 296-832-30005
• Post a notice about your store's safe and cash register
  WAC 296-832-30010
• Provide outside lighting
  WAC 296-832-30015.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 02-16-087, § 296-832-300, filed 8/7/02, effective 10/1/02.]

WAC 296-832-30005  Have a safe in your store.

You must:
• Have a drop-safe, limited access safe, or comparable device in your store.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 02-16-087, § 296-832-30005, filed 8/7/02, effective 10/1/02.]

WAC 296-832-30010  Post a notice about your store's safe and cash register.

You must:
• Post a notice in an obvious place on a window or door stating:
  – There is a safe in the store
  – Employees have no access to the safe
  – The cash register contains only enough cash to do business.

Notes:
• You will not be cited by WISHA for having money in the cash register over the minimal amount needed to do business.
• All displays and other materials posted in the window(s) or door(s) should be arranged to provide an unobstructed view of the cash register if it is visible from the street.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 02-16-087, § 296-832-30010, filed 8/7/02, effective 10/1/02.]

WAC 296-832-30015  Provide outside lighting.

You must:
• Light the store's approach area and parking lot during all night hours your business is open.

Note: You can do this by:
• Providing surveillance lighting to observe pedestrian and vehicle entrances
• Providing lighting of a minimum of one foot candle to comply with ANSI/IES RP7-1983. Lighting levels can be measured with a light meter; for comparison purposes 1 foot-candle = 1 lumen incident per square foot = 10.76 lux.

[Statutory Authority: RCW 49.17.010, [49.17].040, [49.17].050, and [49.17].060. 02-16-087, § 296-832-30015, filed 8/7/02, effective 10/1/02.]

Chapter 296-833 WAC

TEMPORARY HOUSING FOR WORKERS

WAC
296-833-100  Scope.
296-833-10010  Summary.
296-833-200  Shelter location and structure requirements.
296-833-20005  Provide and maintain sufficient grounds and open areas in temporary housing sites.
296-833-20010  Follow these design and equipment requirements for shelters.
296-833-300  Utilities employers must provide.
296-833-30005  Provide electricity and lighting to temporary housing areas.

[Title 296 WAC—p. 2947]
(2) Make sure the housing area is large enough to prevent the buildings from being crowded too closely together.

(3) Make sure the principal housing areas for sleeping and food preparation/eating are at least five hundred feet from livestock operations.

Note: Livestock operations include, among other things, dairy farms, corrals, slaughterhouses, feedlots, and stockyards. Operations where livestock can roam on a pasture over a distance may be treated as outside the definition.

(4) Make sure that grounds and open areas surrounding the shelters are maintained in a clean and sanitary condition.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 02-23-073, § 296-833-20005, filed 11/19/02, effective 1/1/03.]

WAC 296-833-200010 Follow these design and equipment requirements for shelters.

You must:

(1) Make sure that every shelter in the camp provides protection against the elements.

(2) Make sure each dwelling unit:
   • Has at least seventy square feet of floor space for the first occupant and at least fifty square feet of floor space for each additional occupant
   • That is designated a family unit has a separate sleeping area for children over six years old
   • With designated sleeping room(s) has at least fifty square feet of floor space in the sleeping room for each occupant
   • Has at least a seven-foot ceiling
   • Has windows:
     – Covering a total area equal to at least one-tenth of the floor area
     AND
     – At least one-half of which can be opened for ventilation
   • Has each exterior opening screened with 16-mesh material
   • Has screen doors with self-closing devices.

(3) Make sure that the floors of each shelter are constructed of wood, asphalt, or concrete.

(4) Provide beds, cots, or bunks, and suitable storage facilities such as wall lockers for clothing and personal articles in every sleeping room.

   • Beds must be at least thirty-six inches away from other beds, both side to side and end to end
   • The frame of the bed must keep mattresses at least twelve inches off the floor
   • Double-deck bunks must be spaced at least forty-eight inches away from other beds, both side to side and end to end
   • The minimum clear space between lower and upper bunks must be at least twenty-seven inches
   • Triple-deck bunks are not allowed.

(5) Provide equipment that adequately heats the living area whenever the camp is used during cold weather.

[Title 296 WAC—p. 2948]
Temporary Housing for Workers

WAC 296-833-30005 Provide electricity and lighting to temporary housing areas.
You must:
(1) Supply electricity to all:
- Dwelling units
- Kitchen facilities
- Shower/bathroom facilities
- Common areas
- Laundry facilities.

Reference:
You need to follow additional requirements for electricity and lighting. See WAC 296-800-280, Basic electrical rules, in the safety and health core rules book for more information.

(2) Provide lighting to camp buildings.
- Make sure general lighting and task lighting are adequate for normal daily activities
- Make sure living quarters have:
  - One ceiling-type light fixture
AND
  - One separate floor or wall convenience outlet.
- Make sure laundry rooms, toilet rooms, and other common areas have at least:
  - One ceiling light fixture
OR
  - A wall light fixture.

WAC 296-833-30010 Provide adequate water.
You must:
- Provide a water supply that is adequate and convenient for:
  - Drinking
  - Cooking
  - Bathing
  - Laundry purposes.
- Make sure the water supply system is:
  - Capable of delivering
  - Thirty-five gallons per person per day to the campsite
  - At a peak rate of two and one-half times the average hourly demand
- Able to supply water to all fixtures at the same time with normal operating pressures
- Approved by the appropriate health authority
- Supply water to each housing area by either:
  - Piping water directly to the shelters
  - Providing yard hydrants within one hundred feet of the shelters
- Prohibit common drinking cups
- Provide one or more drinking fountain(s) for each one hundred occupants (or fraction of that number) where water under pressure is available.

Reference:
The construction of drinking fountains must comply with ANSI standard Specifications for Drinking Fountains, Z4.2.1942.

WAC 296-833-30015 Provide toilet facilities.
You must:
(1) Provide enough toilets for the camp's capacity.
- Toilets and outhouses must be provided in a ratio of one for every fifteen people, with a minimum of two units for any facility shared by men and women.

Note:
Check with your local jurisdictions for regulations regarding outhouses.

(2) Have enough rest rooms for each sex based on the maximum number of persons the camp is designed to house at any one time.

(3) Provide separate rest rooms for each sex wherever rest rooms are in buildings shared by men and women.
- Distinctly mark the rooms "men" and "women" with:
  - Signs printed in English and in the native language of the persons occupying the camp
  - Easily understood pictures or symbols.
- If the facilities for each sex are in the same building, they must be separated by:
  - Solid walls
OR
  - Partitions extending from the floor to the roof or ceiling.

(4) Make sure:
- No one has to pass through a sleeping room to reach a rest room
- Rest rooms have a window of at least six square feet opening directly to the outside, or are satisfactorily ventilated
- All outside openings are screened with 16-mesh material
- Fixtures, toilets, chemical toilets, or urinals are not located in a room used for other than toilet purposes
- A rest room is within two hundred feet of the door of each sleeping room
Any outhouse is at least one hundred feet away from any sleeping room, dining room, lunch area, or kitchen.

(5) Provide urinals as follows:
- One urinal or two linear feet of urinal trough for each twenty-five men
- Construct the floor out of materials that are moisture proof, from the wall and out at least fifteen inches from the outer edge of the urinals
- Have an adequate water flush in urinals when water under pressure is available
- Urinal troughs in outhouses must:
  - Drain freely into the pit or vault
  - Have a drain constructed to exclude flies and rodents from the pit.

(6) Install any new toilets in a rest room.

(7) Make sure:
- There is an adequate supply of toilet paper for each rest room, outhouse, or chemical toilet
- Toilet facilities are:
  - Kept in sanitary condition
  - Cleaned at least daily.

WAC 296-833-30020 Follow local regulations for sewage disposal.
You must:
- Provide sewage disposal systems according to local health jurisdictions.

WAC 296-833-400 Service facilities: Food preparation, dining, bathing, laundry and handwashing.
Summary.
Your responsibility:
To provide facilities for your employees to cook, eat, do laundry, bathe, and wash their hands.
You must:
- Provide service buildings for laundry, handwashing and bathing
- Provide cooking, food-handling, and dining facilities

WAC 296-833-40005 Provide service buildings for laundry, handwashing and bathing.
You must:
- Make sure that every service building has equipment capable of maintaining a room temperature of at least seventy degrees Fahrenheit.
- Make sure an adequate supply of hot and cold running water is provided for bathing and laundry purposes.
- One handwash basin
  - Per family shelter

OR
- Per six persons in shared facilities
- One shower head for every ten persons
- One laundry tray or tub for every thirty persons
- One "deepwell" type sink in each building used for laundry, handwashing, and bathing.

(4) Make sure all:
- Laundry, handwashing and bathing room floors:
  - Are moisture-resistant and smooth but not slippery
  - Have coved junctions of the curbing and the floor
- Walls and partitions of shower rooms are smooth and moisture-resistant to the height where water splashes.
- Shower baths, shower rooms, or laundry rooms have floor drains to remove wastewater and facilitate cleaning.

(5) Provide facilities for drying clothes.
(6) Keep all service buildings clean.

WAC 296-833-40010 Provide cooking, food-handling, and dining facilities.
You must:
- Make sure common cooking and dining areas are of adequate size and are separated from sleeping areas by a door.
- Provide enclosed and screened cooking and food-handling facilities for all occupants. The facilities must include:
  - A working cook stove or hot plate with at least one cooking surface for every two occupants
  - A sink with hot and cold running potable water under pressure
  - Food storage areas located off the floor
  - Nonabsorbent, easily cleanable food preparation counters
  - Mechanical refrigeration capable of maintaining a temperature of forty-five degrees Fahrenheit or below, with enough space to store perishable food items for all occupants
  - Fire-resistant, nonabsorbent, nonasbestos, and easily cleanable wall coverings close to cooking areas
  - Nonabsorbent, easily cleanable floors
  - At least one ceiling or wall light fixture
  - Lighting adequate for normal food preparation activities
  - Adequate ventilation for cooking facilities.

(3) Make sure that dining halls:
- Meet the requirements of the department of health’s rules in chapter 246-215 WAC, Food service
- Have no direct openings to living or sleeping areas
- Have fire-resistant, nonabsorbent, nonasbestos, and easy-to-clean wall coverings adjacent to cooking areas
- Nonabsorbent, easy-to-clean floors
- Have at least one ceiling or wall light fixture
- Have lighting adequate for normal dining activities.

WAC 296-833-500 Waste disposal and pest control.
Summary.
Your responsibility:
To make sure your temporary housing camps are kept sanitary.

You must:
- Follow proper waste disposal procedures
  WAC 296-833-50005
- Control insects, rodents, and other pests
  WAC 296-833-50010.

WAC 296-833-50005 Follow proper waste disposal procedures.
You must:
- Provide at least one garbage container for each family shelter. Garbage containers must be:
  - Placed on a wooden, metal, or concrete pad
  - Located within one hundred feet of each shelter.
- Provide garbage containers that:
  - Are nonabsorbent
  - Are cleanable OR only used once (for example, a disposable plastic liner)
  - Can be securely closed.
- Make sure garbage containers are kept clean and emptied:
  - At least twice a week
  - When full.

WAC 296-833-50010 Control insects, rodents, and other pests.
You must:
- Take steps to effectively prevent insects, rodents, and other pests from infesting camp areas
  - Carry out a continuing and effective control program where pests have been detected.

WAC 296-833-600 Employee first aid and communicable disease reporting.
Summary.
Your responsibility:
To guard the general health of your employees by providing first-aid facilities and reporting communicable diseases.
You must:
- Provide first-aid facilities
  WAC 296-833-60005
- Report communicable diseases
  WAC 296-833-60010.

WAC 296-833-60005 Provide first-aid facilities.
You must:
- Provide and maintain adequate first-aid facilities
  AND
  - Make sure a person trained in first aid is in charge of the first-aid facilities.

Reference:
See WAC 296-800-150, First aid, in the core rules book for requirements for first-aid training and supplies.

WAC 296-833-60010 Report communicable diseases.
You must:
- Immediately report to the local health officer:
  - The name and address of any individual in the camp known to or suspected of having a communicable disease listed in the department of health's list of notifiable conditions, chapter 246-101 WAC
  - Any suspected food poisoning
  - Any unusual occurrence of:
    - Fever
    - Diarrhea
    - Sore throat
    - Vomiting
    - Jaundice.

Chapter 296-835 WAC
DIPPING AND COATING OPERATIONS (DIP TANKS)

WAC
296-835-100 Scope.
296-835-110 General requirements.

CONSTRUCTION
296-835-11005 Construct safe dip tanks.

VENTILATION
296-835-11010 Provide proper ventilation for the vapor area.
296-835-11015 Take additional precautions if you recirculate ventilation system exhaust air into the workplace.
296-835-11020 Take additional precautions when using an exhaust hood.

INSPECTION
296-835-11025 Periodically inspect your dip tanks and associated equipment and correct any deficiencies.

FIRST AID
296-835-11030 Make sure employees working near dip tanks know appropriate first-aid procedures.

CLEANING
296-835-11035 Prepare dip tanks before cleaning.

CYANIDE
296-835-11040 Safeguard cyanide tanks.

WELDING
296-835-11045 Protect employees during welding, burning, or other work using open flames.

LIQUIDS HARMFUL TO SKIN
296-835-11050 Protect employees that use liquids that may burn, irritate, or otherwise harm the skin.

296-835-12005 Include additional safeguards when constructing dip tanks.

(2005 Ed.)
296-835-100 Scope.

IMPORTANT:
A dip tank is a container holding a liquid other than plain water that is used for dipping or coating. An object may be completely or partially immersed (in a dip tank) or it may be suspended in a vapor coming from the tank.

Exemption: Dip tanks that use a molten material (molten metal, alloy, salt, etc.) are not covered by this chapter.

This chapter applies to:
• A dip tank that uses a liquid other than plain water, or the vapor of the liquid, to:
  – Clean an object
  – Coat an object
  – Alter the surface of an object
  – Change the character of an object.
  • Draining or drying an object that has been dipped or coated.

Examples of covered dipping and coating operations include, but are not limited to:
– Paint dipping
– Electroplating
– Anodizing
– Pickling
– Quenching
– Tanning
– Degreasing
– Stripping
– Cleaning
– Dyeing
– Flow coating
– Roll coating.

Reference: You have to do a hazard assessment to identify hazards or potential hazards in your workplace and determine if PPE is necessary to protect your employees. See personal protective equipment (PPE), WAC 296-800-160, in the core rules, chapter 296-800 WAC.

WAC 296-835-110 General requirements. Summary.

Your responsibility:
Safeguard employees working with dip tanks.

You must:
CONSTRUCTION
Construct safe dip tanks

VENTILATION
Provide proper ventilation for the vapor area

WELDING
Protect employees during welding, burning or other work using open flames

LIQUIDS HARMFUL TO SKIN
Provide additional protection for employees working near dip tanks that use liquid that may burn, irritate, or otherwise harm the skin

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-102, § 296-835-100, filed 7/17/02, effective 10/1/02.]
Dipping and Coating Operations (Dip Tanks)

WAC 296-835-11050.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 02-15-102, § 296-835-110, filed 7/17/02, effective 10/1/02.]

CONSTRUCTION

WAC 296-835-11005 Construct safe dip tanks.

You must:
• Make sure dip tanks, including any drain boards, are strong enough to support the expected load.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 02-15-102, § 296-835-11005, filed 7/17/02, effective 10/1/02.]

VENTILATION

WAC 296-835-11010 Provide proper ventilation for the vapor area.

You must:
• Make sure mechanical ventilation meets the requirements of one or more of the following standards:
  – NFPA 34-1995, Standard for Dipping and Coating Processes Using Flammable or Combustible Liquids

Note: Some, or all, of the consensus standards (such as ANSI and NFPA) may have been revised. If you comply with a later version of a consensus standard, you will be considered to have complied with any previous version of the same consensus standard.

You must:
• Limit the vapor area to the smallest practical space by using mechanical ventilation.
• Keep airborne concentration of any substance below twenty-five percent of its lower flammable limit (LFL).
• Make sure mechanical ventilation draws the flow of air into a hood or exhaust duct.
• Have a separate exhaust system for each dip tank if the combination of substances being removed could cause a:
  – Fire
  – Explosion
  – Potentially hazardous chemical reaction.

Reference: You need to keep employee exposure within safe levels when the liquid in a dip tank creates an exposure hazard. See Air contaminants, WAC 296-62-075 through 296-62-07515.

Note: You may use a tank cover or material that floats on the surface of the liquid to replace or assist ventilation. The method or combination of methods you choose has to maintain the airborne concentration of the hazardous material and the employee's exposure within safe limits.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 02-15-102, § 296-835-11010, filed 7/17/02, effective 10/1/02.]

WAC 296-835-11015 Take additional precautions if you recirculate ventilation system exhaust air into the workplace.

You must:

• Only recirculate air that contains no substance at a concentration that could pose a health or safety hazard to employees.
• Make sure any exhaust system that recirculates air into the workplace:
  – Passes the air through a device that removes contaminants
  – Sounds an alarm and automatically shuts down the dip tank operation, if the vapor concentration of any substance in the exhaust air exceeds twenty-five percent of its LFL
  – Monitors the concentration of vapor from flammable or combustible liquids with approved equipment.

Note: The LFL concentration in the air must be determined after the air passes through the air-cleaning device and before the air reenters the workplace.
• Most substances will pose a health hazard at a concentration far below twenty-five percent of its LFL.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 02-15-102, § 296-835-11015, filed 7/17/02, effective 10/1/02.]

WAC 296-835-11020 Take additional precautions when using an exhaust hood.

You must:
• Make sure each room with an exhaust hood has a source of outside air that:
  – Enters the room in a way that will not interfere with the function of the hood
  – Replaces at least ninety percent of the air taken in through the hood.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 02-15-102, § 296-835-11020, filed 7/17/02, effective 10/1/02.]

INSPECTION

WAC 296-835-11025 Periodically inspect your dip tanks and associated equipment and correct any deficiencies.

You must:
• Inspect or test your dip tanks and associated equipment periodically, including:
  – Covers
  – Overflow pipes
  – Bottom drains and valves
  – Electrical wiring, equipment, and grounding connections
  – Ventilating systems
  – Fire extinguishing equipment
• Inspect the hoods and ductwork of the ventilation system for corrosion and damage and make sure the airflow is adequate:
  – At least quarterly during operation
  – Prior to operation after a prolonged shutdown
• Promptly fix any deficiencies found.

Note: To assist you in tracking your inspections and actions taken from those inspections, you may want to keep a written record.
• It is recommended that inspections be at least quarterly even if the system is not operating. Depending on the chemicals in use more frequent inspection may be required.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050, 02-15-102, § 296-835-11025, filed 7/17/02, effective 10/1/02.]
FIRST AID

WAC 296-835-11030 Make sure employees working near dip tanks know appropriate first-aid procedures.

You must:

• Make sure your employees know the appropriate first-aid procedures for the hazards of your dipping and coating operations.

Note:

• First-aid procedures are contained in the Material Safety Data Sheet (MSDS) for the chemicals used in the dip tank.
• First-aid supplies appropriate for the hazards of the dipping or coating operation need to be located near the dip tank to be considered "readily available" as required by WAC 296-400-15020.

Reference: There are additional requirements that may include providing emergency washing facilities and employee training. See first aid, WAC 296-800-150, and employer chemical hazard communication, WAC 296-800-170, in the safety and health core rules, chapter 296-800 WAC.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-2005 Ed.]

CLEANING

WAC 296-835-11035 Prepare dip tanks before cleaning.

You must:

(1) Drain the contents of the tank and open any cleanout doors.
(2) Ventilate the tank to clear any accumulated hazardous vapors.

Reference: There may be requirements that apply before an employee enters a dip tank. See Permit-required confined spaces, WAC 296-62-141 and safety procedures, chapter 296-24 WAC, Part A-4.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-102, § 296-835-11030, filed 7/17/02, effective 10/1/02.]

CYANIDE

WAC 296-835-11040 Safeguard cyanide tanks.

You must:

• Provide a dike or other safeguard(s) to prevent cyanide from mixing with an acid if a dip tank fails.

Note: This would also apply to spills or other means by which cyanide could come in contact with an acid in sufficient quantity to produce a hazardous gas.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-102, § 296-835-11040, filed 7/17/02, effective 10/1/02.]

WELDING

WAC 296-835-11045 Protect employees during welding, burning, or other work using open flames.

You must:

• Make sure the dip tank and the area around it are thoroughly cleaned of solvents and vapors before performing work involving:
  – Welding
  – Burning

 OR

LIQUIDS HARMFUL TO SKIN

WAC 296-835-11050 Protect employees that use liquids that may burn, irritate, or otherwise harm the skin.

You must:

(1) Make sure washing facilities, including hot water, are available for every ten employees that work with dip tank liquids.
(2) Satisfy medical requirements:
  • Make sure an employee with any small skin abrasion, cut, rash, or open sore receives treatment by a properly designated person.
  • Make sure an employee with a sore, burn, or other skin lesion that needs medical treatment, has a physician’s approval before they perform their regular work.
  • Make sure employees who work with chromic acid receive periodic examinations of their exposed body parts, especially their nostrils.

Note:

• Periodic means on a yearly basis unless otherwise indicated.
• Any time chromic acid spills onto an employee's skin or their clothing is saturated, a physician should be responsible for evaluating and monitoring the area where chromic acid made contact with the skin.

You must:

(3) Provide lockers or other storage space to prevent contamination of street clothes.

Reference: You have to do a hazard assessment to identify hazards or potential hazards in your workplace and determine if PPE is necessary to protect your employees. See Personal protective equipment (PPE), WAC 296-800-160, in the safety and health core rules, chapter 296-800 WAC.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-102, § 296-835-11050, filed 7/17/02, effective 10/1/02.]

WAC 296-835-120 Additional requirements for dip tanks using flammable or combustible liquids. Summary.

IMPORTANT:
This section applies to:
• Flammable and combustible liquids (flashpoint below 200°F)
• Liquids that have a flashpoint of 200°F (93.3°C) or higher if you:
  – Heat the liquid
  – Dip a heated object in the tank

Reference: Store flammable and combustible liquids as required by Flammable and combustible liquids, WAC 296-24-330, in the general safety and health standards.

Your responsibility:
• Safeguard employees working with dip tanks containing flammable or combustible liquids

[Title 296 WAC—p. 2954]
You must:

**CONSTRUCTION**
Include additional safeguards when constructing dip tanks

WAC 296-835-12005
Provide overflow pipes
WAC 296-835-12010
Provide bottom drains
WAC 296-835-12015

**FIRE PROTECTION**
Provide fire protection in the vapor area
WAC 296-835-12020
Provide additional fire protection for large dip tanks
WAC 296-835-12025

**ELECTRICAL WIRING AND EQUIPMENT AND SOURCES OF IGNITION**
Prevent static electricity sparks or arcs when adding liquids to a dip tank
WAC 296-835-12035
Control ignition sources in the vapor area and adjacent area
WAC 296-835-12040
Provide safe wiring and electrical equipment where the liquid can drip or splash
WAC 296-835-12045

**HOUSEKEEPING**
Keep the area around dip tanks clear of combustible material and properly dispose of waste
WAC 296-835-12050

**HEATING LIQUID**
Make sure heating the liquid in your dip tanks does not cause a fire
WAC 296-835-12055

**HEAT DRYING**
Make sure a heating system used for drying objects does not cause a fire
WAC 296-835-12060

**CONVEYORS**
Make sure the conveyor system for dip tanks is safe
WAC 296-835-12065.

You must:

- Have more than ten square feet of liquid surface area
- Make sure the overflow pipe is:
  - Properly trapped
  - Able to prevent the dip tank from overflowing
  - Three inches or more (7.6 cm) in diameter
  - Discharged to a safe location.

**You must:**

- Make sure the bottom of the overflow pipe is at least six inches (15.2 cm) below the top of the tank.

You must:

- Make sure the bottom drain is at least six inches below the top of the tank.
- Discharged to a safe location could be a:
  - Safe location outside the building
  - Closed, properly vented salvage tank or tanks that can hold more than the dip tank.
WAC 296-835-12025 Provide additional fire protection for large dip tanks.
You must:
• Provide at least one automatic fire extinguishing system or an automatic dip tank cover if the tank:
  – Holds one hundred fifty gallons or more of liquid
  OR
  – Has four square feet or more of liquid surface area.
• Make sure automatic fire extinguishing systems or automatic dip tank covers meet the requirements of Table 1.

Exemption: An automatic fire extinguishing system or an automatic dip tank cover is not required for a hardening or tempering tank that:
• Holds less than five hundred gallons
  OR
  • Has less than twenty-five square feet of liquid surface area.

Table 1: Automatic Fire Protection System Requirements

<table>
<thead>
<tr>
<th>IF YOU PROVIDE:</th>
<th>THEN YOU MUST:</th>
</tr>
</thead>
</table>
| An automatic fire extinguishing system | • Use extinguishing materials suitable for a fire fueled by the liquid in the tank
• Make sure the system protects the:
  – Tanks
  – Drain boards
  – Stock over drain boards. |
| A dip tank cover                | • Make sure the cover is:
  – Closed by approved automatic devices in the event of fire
  – Able to be manually activated
  – Kept closed when the tank is not being used
  – Made of noncombustible material or metal-clad material with locked metal joints. |

Reference: Automatic fire extinguishing systems have specific requirements. See:
– WAC 296-24-622 for automatic dry chemical extinguishing system requirements
– WAC 296-24-623 for automatic carbon dioxide extinguishing system requirements
– WAC 296-24-627 for automatic water spray extinguishing system and automatic foam extinguishing system requirements.

WAC 296-835-12035 Prevent static electricity sparks or arcs when adding liquids to a dip tank.
You must:
• Make sure any portable container used to add liquid to the tank is:
  – Electrically bonded to the dip tank
  – Positively grounded.

WAC 296-835-12040 Control ignition sources.
You must:
(1) Make sure the vapor areas and adjacent areas do not have any:
  • Open flames.
  • Spark producing devices.
  • Heated surfaces hot enough to ignite vapors.
(2) Use explosion-proof wiring and equipment in the vapor area.

Reference: Electrical wiring and equipment has to meet the requirements of the applicable hazardous (classified) location. See Hazardous (classified) locations, WAC 296-24-95613. Electrostatic equipment has specific electrical requirements. See WAC 296-835-13010.

WAC 296-835-12045 Provide safe electrical wiring and equipment where the liquid can drip or splash.

You must:
(3) Prohibit smoking in any vapor area:
  • Post an easily seen "NO SMOKING" sign near each dip tank.

Reference: Electrical wiring and equipment has to meet the requirements of the applicable hazardous (classified) location. See Hazardous (classified) locations, WAC 296-24-95613. Electrostatic equipment has specific electrical requirements. See WAC 296-835-13010.

WAC 296-835-12050 Keep the area around dip tanks clear of combustible material and properly dispose of waste.
You must:
(1) Make sure the area surrounding dip tanks is:
  – Completely free of combustible debris
  – As free of combustible stock as possible.
(2) Provide approved metal waste cans that are:
  – Used for immediate disposal of rags and other material contaminated with liquids from dipping or coating operations
  – Emptyed and the contents properly disposed of at the end of each shift.

Reference: Electrical wiring and equipment has to meet the requirements of the applicable hazardous (classified) location. See Hazardous (classified) locations, WAC 296-24-95613. Electrostatic equipment has specific electrical requirements. See WAC 296-835-13010.

WAC 296-835-12055 Make sure heating the liquid in your dip tanks does not cause a fire.
You must:

Reference: Electrical wiring and equipment has to meet the requirements of the applicable hazardous (classified) location. See Hazardous (classified) locations, WAC 296-24-95613. Electrostatic equipment has specific electrical requirements. See WAC 296-835-13010.
• Keep the temperature of the liquid in the dip tank:
  – Below the liquid's boiling point
  – At least 100°F below the liquid's autoignition temperature.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-102, § 296-835-12055, filed 7/17/02, effective 10/1/02.]

HEAT DRYING

WAC 296-835-12060 Make sure a heating system used for drying objects does not cause a fire.
You must:
• Make sure the heating system used in a drying operation that could cause ignition:
  – Has adequate mechanical ventilation that operates before and during the drying operation
  – Shuts down automatically if a ventilating fan fails to maintain adequate ventilation

Note: Some, or all, of the consensus standards (such as ANSI and NFPA) may have been revised. If you comply with a later version of a consensus standard, you will be considered to have complied with any previous version of the same consensus standard.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-102, § 296-835-12060, filed 7/17/02, effective 10/1/02.]

CONVEYORS

WAC 296-835-12065 Make sure conveyor systems are safe.
You must:
• Make sure the conveyor system shuts down automatically if:
  – The ventilation system fails to maintain adequate ventilation
  OR
  – There is a fire.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-102, § 296-835-12065, filed 7/17/02, effective 10/1/02.]

WAC 296-835-130 Additional requirements for dip tanks used for specific processes. Summary.
Your responsibility: Safeguard employees working with dip tanks used for specific processes
You must:
HARDENING OR TEMPERING
Meet specific requirements if you use a hardening or tempering tank
WAC 296-835-13005
ELECTROSTATIC EQUIPMENT
Meet specific requirements if you use electrostatic equipment
WAC 296-835-13010
FLOW COATING
Meet specific requirements if you use flow coating
WAC 296-835-13015
ROLL COATING
Take additional precautions if your roll coating operation uses a liquid that has a flashpoint below 140°F (60°C)

(2005 Ed.)

VAPOR DEGREASING
Provide additional safeguards for vapor degreasing tanks
WAC 296-835-13025
SPRAY CLEANING OR DEGREASING
Control liquid spray over an open surface cleaning or degreasing tank
WAC 296-835-13030.

HARDENING OR TEMPERING

WAC 296-835-13005 Meet specific requirements if you use a hardening or tempering tank.
You must:
(1) Provide an automatic fire extinguishing system or an automatic dip tank cover for any hardening and tempering tank that uses flammable or combustible liquids and:
  – Holds five hundred gallons (1893 L) or more of liquid
  OR
  – Has twenty-five square feet (2.37 m²) or more of liquid surface area.
(2) Prevent fires.
  • Make sure hardening and tempering tanks are:
    – Not located on or near combustible flooring.
    – Located as far away as practical from furnaces.
    – Equipped with noncombustible hoods and vents (or equally effective devices) for venting to the outside.
  • Treat vent ducts as flues and keep them away from combustible material, particularly roofs.
(3) Make sure air under pressure is not used to:
  • Fill the tank
  OR
  • Agitate the liquid in the tank.
(4) Equip each tank with an alarm that will sound when the temperature is within 50°F (10°C) of the liquid's flashpoint (alarm set point).
(5) Make sure a limit switch shuts down conveyors supplying work to the tank when the temperature reaches the alarm setpoint, if operationally practical.
(6) Have a circulating cooling system if the temperature of the liquid can exceed the alarm set point.

Note: The bottom drain of the tank may be combined with the oil circulating system if the requirements for bottom drains in WAC 296-835-12015 are satisfied.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-102, § 296-835-13005, filed 7/17/02, effective 10/1/02.]

ELECTROSTATIC EQUIPMENT

WAC 296-835-13010 Meet specific requirements if you use electrostatic equipment.

ELECTRICAL
You must:
(1) Provide safe electrical equipment.
• Make sure electrodes in your equipment are:
  – Substantial
  – Rigidly supported
  – Permanently located
  – Effectively insulated from ground by insulators

[Title 296 WAC—p. 2957]
Make sure the insulators are:
- Nonporous
- Noncombustible
- Kept clean and dry
Make sure high voltage leads to electrodes are effectively:
- Supported on permanent, suitable insulators
- Guarded against accidental contact or grounding.

(2) Make sure transformers, powerpacks, control apparatus, and all other electrical parts of the equipment:
- Are located outside the vapor area
OR
- Meet the requirements of WAC 296-835-12040.

Exemption: High voltage grids and their connections may be located in the vapor area without meeting the requirements of WAC 296-835-12040.

PAINT DETEARING
You must:
(3) Safeguard paint detearing operations.
- Use approved electrostatic equipment in paint detearing operations.
(4) Make sure goods being paint deteared are:
  - Supported on conveyors
  - Not manually handled.
(5) Keep a minimum safe distance (twice the sparking distance) between goods being paint deteared and the electrodes or conductors of the electrostatic equipment at all times by:
  - Arranging the conveyors to provide the necessary distance
  - Supporting the goods to prevent swinging or movement, if necessary
  - Post a sign that shows the minimum safe distance (twice the sparking distance) near the equipment, where it can be easily seen.
(6) Keep paint detearing operations separate from storage areas and people by using fences, rails or guards that are:
  - Made of conducting material
  - Adequately grounded.
(7) Protect paint detearing operations from fire by installing:
  - Automatic sprinklers
OR
  - An approved automatic fire extinguishing system.
(8) Collect and remove paint deposits by:
  - Providing removable drip plates and screens
  - Cleaning these plates and screens in a safe location.

AUTOMATIC DISCONNECT REQUIREMENT
You must:
(9) Make sure electrostatic equipment has automatic controls that immediately disconnect the power supply to the high-voltage transformer and signal the operator, if:
  - Ventilating fans or equipment stop or fail for any reason
  - Conveyors do not work properly
  - A ground (or imminent ground) occurs anywhere in the high-voltage system
OR
  - Goods being paint deteared come within twice the sparking distance of the electrodes or conductors of the equipment.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-102, § 296-835-13010, filed 7/17/02, effective 10/1/02.]

FLOW COATING

WAC 296-835-13015 Meet specific requirements if you use a flow coating process.
You must:
(1) Make sure all piping is substantial and rigidly supported.
(2) Make sure the paint is supplied by a:
  - Gravity tank that does not hold more than ten gallons (38 L)
  OR
  - Direct low-pressure pumping system.
(3) Have an approved heat-actuated device that shuts down the pumping system if there is a fire.

Note: The area of the sump, and any areas on which paint flows, should be included in the area of dip tank.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-102, § 296-835-13015, filed 7/17/02, effective 10/1/02.]

ROLL COATING

WAC 296-835-13020 Take additional precautions if your roll coating operation uses a liquid that has a flashpoint below 140°F (60°C).

IMPORTANT:
This section applies to the processes of roll coating, roll spreading, or roll impregnating that use a liquid having a flashpoint below 140°F (60°C). Material may be passed directly through a tank or over the surface of a roller that revolves partially submerged in the liquid.
You must:
  - Prevent sparks from static electricity by:
    - Bonding and grounding all metallic parts (including rotating parts) and installing static collectors
    OR
    - Maintaining a conductive atmosphere (one with a high relative humidity, for example) in the vapor area.

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-102, § 296-835-13020, filed 7/17/02, effective 10/1/02.]

VAPOR DEGREASING

WAC 296-835-13025 Provide additional safeguards for vapor degreasing tanks.
You must:
(1) Make sure, if the tank has a condenser or a vapor-level thermostat, that it keeps the vapor level at least:
  - Thirty-six inches (91 cm) below the top of the tank if the width of the tank is seventy-two inches or more
  OR
  - One-half the tank width below the top of the tank if the tank is less than seventy-two inches wide.
(2) Make sure, if you use gas as a fuel to heat the tank liquid, that the combustion chamber is airtight (except for the flue opening) to prevent solvent vapors from entering the air-fuel mixture.
(3) Make sure the exhaust flue:
  - Is made of corrosion-resistant material

[Statutory Authority: RCW 49.17.010, [49.17].040, and [49.17].050. 02-15-102, § 296-835-13020, filed 7/17/02, effective 10/1/02.]
• Extends to the outside
• Has a draft diverter if mechanical exhaust is used.
(4) Take special precautions to keep solvent vapors from mixing with the combustion air of the heater if chlorinated or fluorinated hydrocarbon solvents (for example, trichloroethylene or freon) are used in the dip tank.
(5) Keep the temperature of the heating element low enough to keep a solvent or mixture from:
  • Decomposing
  OR
  • Generating excessive vapor.

Note: Mechanical baffles may be used to help prevent the discharge of spray.

WAC 296-835-140 Definitions. ACGIH: American Conference of Governmental Industrial Hygienists.

Adjacent area: Any area within twenty feet (6.1 m) of a vapor area that is not separated from the vapor area by tight partitions.

Approved: Approved or listed by a nationally recognized testing laboratory. Refer to federal regulation 29 CFR 1910.7, for definition of nationally recognized testing laboratory.

Autoignition temperature: The minimum temperature required to cause self-sustained combustion without any other source of heat.

Combustible liquid: A liquid having a flashpoint of at least 100°F (37.8°C) and below 200°F (93.3°C). Mixtures with at least ninety-nine percent of their components having flashpoints of 200°F (93.3°C) or higher are not considered combustible liquids.

Detearing: A process for removing excess wet coating material from the bottom edge of a dipped or coated object or material by passing it through an electrostatic field.

Dip tank: A container holding a liquid other than plain water that is used for dipping or coating. An object may be immersed (or partially immersed) in a dip tank or it may be suspended in a vapor coming from the tank.

Flammable liquid: Any liquid having a flashpoint below 100°F (37.8°C), except any mixture having components with flashpoints of 100°F (37.8°C) or higher, the total of which make up ninety-nine percent or more of the total volume of the mixture.

Flashpoint: The minimum temperature at which a liquid gives off a vapor in sufficient concentration to ignite when tested by any of the measurement methods described in the definition of flashpoint in the safety and health core rules, WAC 296-800-370.

Lower flammable limit: The lowest concentration of a material that will propagate a flame. The LFL is usually expressed as a percent by volume of the material in air (or other oxidant).

Vapor area: Any area in the vicinity of dip tanks, their drain boards or associated drying, conveying, or other equipment where the vapor concentration could exceed twenty-five percent of the lower flammable limit (LFL) for the liquid in the tank.

You: Means the employer. See the definition of employer in the safety and health core rules, WAC 296-800-370.

Chapter 296-839 WAC

CONTENT AND DISTRIBUTION OF MATERIAL SAFETY DATA SHEETS (MSDSs) AND LABEL INFORMATION

WAC 296-839-100 Scope.
296-839-200 Hazard evaluation.
296-839-20005 Conduct complete hazard evaluations.
296-839-20010 Provide access to hazard evaluation procedures.
296-839-300 Material safety data sheets.
296-839-30005 Develop or obtain material safety data sheets (MSDSs).
296-839-30010 Provide MSDSs for products shipped, transferred or sold over-the-counter.
296-839-30015 Follow-up if an MSDS is not provided.
296-839-400 Labeling.
296-839-40005 Label containers of hazardous chemicals.
296-839-500 Definitions.

WAC 296-839-100 Scope. This chapter sets minimum requirements for content and distribution of material safety data sheets (MSDSs) and labels for hazardous chemicals.

• This chapter applies when you do one or more of the following:
  – Import, produce, or repackage chemicals, including manufactured items (such as bricks, welding rods, and sheet metal) that are not exempt as articles
  – Sell or distribute hazardous chemicals to manufacturers, distributors or employers
  – Choose to develop material safety data sheets (MSDSs) for a product you do not import or manufacture.

Reference:
See WAC 296-800-170, the Employer chemical hazard communication rule, for MSDSs, label, and other requirements that apply when hazardous chemicals are used in your workplace.

Note: • Use Table 2 to determine which sections in this chapter apply to your workplace.
Exemptions:
- All of the following are always exempt from this chapter:
  - Ionizing and nonionizing radiation
  - Biological hazards
  - Tobacco and tobacco products
- The chemicals and items listed in Table 1 are exempt from this chapter under the conditions specified.

### Table 1 Conditional Exemptions from this Chapter

<table>
<thead>
<tr>
<th>This chapter does NOT apply to</th>
<th>When</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Alcoholic beverages</strong> OR <strong>Foods</strong></td>
<td>• Sold, used, or prepared in a retail establishment (such as a grocery store, restaurant, bar, or tavern)</td>
</tr>
<tr>
<td><strong>An article (manufactured item)</strong></td>
<td>• It is not a fluid or particle AND • It is formed to a specific shape or design during manufacture for a particular end use function AND • It releases only trace amounts of a hazardous chemical during normal use AND does not pose a physical or health risk to employees</td>
</tr>
<tr>
<td><strong>Consumer products</strong> – Produced or distributed for sale meeting the definition of &quot;consumer products&quot; in the Consumer Product Safety Act (see U.S. Code, Title 15, Chapter 47, section 2052) OR <strong>Hazardous household products</strong> – Meeting the definition of &quot;hazardous substances&quot; in the Federal Hazardous Substance Act (see U.S. Code, Title 15, Chapter 30, section 1261)</td>
<td>• Both criteria apply: – They are used in the workplace for the same purpose as intended by the manufacturer or importer – The duration and frequency of an employee's exposure is no more than the range of exposures that consumers might reasonably experience</td>
</tr>
<tr>
<td><strong>Cosmetics</strong></td>
<td>• Packaged and sold in retail establishments</td>
</tr>
<tr>
<td><strong>Drugs</strong> – Meeting the definition for &quot;drugs&quot; in the Federal Food, Drug, and Cosmetic Act (see U.S. Code, Title 21, Chapter 9, Subchapter II, section 321) OR</td>
<td>• In solid, final form (for example, tablets, or pills) for direct administration to the patient OR • Packaged and sold in retail establishments (for example, over-the-counter drugs) OR • Intended for employee consumption while in the workplace (for example, first-aid supplies)</td>
</tr>
<tr>
<td><strong>Hazardous solid wastes</strong> – Meeting the definition of &quot;hazardous wastes&quot; in the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act of 1976 (see U.S. Code, Title 42, Chapter 2, Subchapter I, section 6903)</td>
<td>• Subject to the United States Environmental Protection Agency (EPA) regulations4</td>
</tr>
<tr>
<td><strong>Hazardous substances</strong> – Released into the environment, meeting the definition of &quot;hazardous substances&quot; in the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see U.S. Code, Title 42, Chapter 103, Subchapter I, section 9601)</td>
<td>• They are the focus of remedial or removal action being conducted under CERCLA in accordance with EPA regulations (Title 40 of the Code of Federal Regulations (CFR))5</td>
</tr>
<tr>
<td><strong>Solid wood</strong> OR <strong>Wood products (for example, lumber and paper)</strong></td>
<td>• All of the following apply – The material is not treated with hazardous chemicals – The only hazard is potential flammability or combustibility – The product is not expected to be processed (for example, by sanding or sawing)</td>
</tr>
</tbody>
</table>

### Notes

1 End use is dependent in whole, or in part, upon maintaining the item's original shape or design. If the item will be significantly altered from its original form, it can no longer be considered a manufactured item.
2 This federal act is included in the United States Code. See http://www.access.gpo.gov/uscode/uscmain.html
3 EPA regulations are included in the Code of Federal Regulations (CFR). See http://www.epa.gov
4 This state act is included in the Revised Code of Washington (RCW). The RCW compiles all permanent laws of the state. See http://www.leg.wa.gov/wsladn/default.htm
5 See http://www.ecy.wa.gov

Use Table 2 to find out which sections of this chapter apply to you. For example, if you import and sell hazardous chemicals ALL sections apply. WAC 296-839-500 applies to all employers covered by the scope of this chapter.

WAC 296-839-200 Hazard evaluation.
Your responsibility:
To make sure the hazardous chemicals are identified.
You must:
Conduct complete hazard evaluations

(2005 Ed.)
WAC 296-839-20005
Produce access to hazard evaluation procedures
WAC 296-839-20010.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and
49.17.060. 03-01-096, § 296-839-200, filed 12/17/02, effective 6/1/03.]

WAC 296-839-20005 Conduct complete hazard evaluations. Important:

• Hazard evaluation is a process where hazards of chemicals are identified by reviewing available research or testing information. You are not required to perform your own laboratory research or testing to meet the requirements of this section

  – Information from hazard evaluations is used to complete material safety data sheets (MSDSs) and labels

  – MSDSs from your suppliers may be used to complete the hazard evaluation for chemicals you produce

  – MSDSs and labels are NOT required for chemicals that are determined to be nonhazardous

• Importers and manufacturers are required to develop MSDSs. If you choose to develop MSDSs for a product you do not import or manufacture, then this chapter also applies to you.

You must:

1. Describe in writing your procedures for conducting hazard evaluations.

2. Conduct a complete hazard evaluation for ALL chemicals you produce or import to determine if they are hazardous chemicals.

• Identify and consider available scientific evidence of health and physical hazards

• Evidence that meets the criteria in Table 3 must be used to establish a hazard

• Chemicals identified in a Table 4 source must be regarded as hazardous

• The scope of health hazards considered must include the categories in Tables 5 and 6

• If the chemical is a mixture, follow the additional criteria in Table 7.

  If you find evidence that meets the criteria in Table 3, use it in your hazard evaluation.

### Table 3
Criteria for Hazard Evidence

<table>
<thead>
<tr>
<th>Hazard</th>
<th>Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Health hazard</td>
<td>• Where available, use human case reports of health effects AND • One or more studies that – Are based on human populations, if available, and animal populations¹ ² AND – Report statistically significant conclusions of a hazardous effect or health hazard (as defined in this rule) AND – Have been conducted following established scientific principles</td>
</tr>
<tr>
<td>• Physical hazard</td>
<td>• Valid evidence that shows a chemical is any one of the following:¹ – A combustible liquid – A compressed gas – Explosive – Flammable – An organic peroxide – An oxidizer – Pyrophoric – Unstable (reactive) – Water-reactive</td>
</tr>
</tbody>
</table>

¹ If human data is not available, use results of tests done on animals and other available studies to predict health effects on employees (for example, effects resulting from short and long-term exposures to chemicals).

² In vitro studies alone do not generally form the basis of a finding of hazard.

³ These terms are defined in WAC 296-839-500.

Chemicals identified in the sources listed in Table 4 must be assumed to be hazardous (including carcinogens and potential carcinogens).

### Table 4
Information Sources Identifying Hazardous Chemicals

| Sources that address a broad range of hazard categories: |
| – Chapter 290-62 WAC, General Occupational Health Standards, WISHA |
| – 29 CFR Part 1910, Subpart Z, Toxic and Hazardous Substances, Occupational Safety and Health Administration (OSHA) |
| – Threshold Limit Values for Chemical Substances and Physical Agents in the Work Environment; American Conference of Governmental Industrial Hygienists (ACGIH) (latest edition). |
| • Sources that identify carcinogens or potential carcinogens: |
| – Chapter 290-62 WAC, General Occupational Health Standards, WISHA |
| – 29 CFR Part 1910, Subpart Z, Toxic and Hazardous Substances, Occupational Safety and Health Administration (OSHA) |
| – National Toxicology Program (NTP), Annual Report on Carcinogens (latest edition) |

**Note:** The Registry of Toxic Effects of Chemical Substances is published by the National Institute for Occupational Safety and Health (NIOSH) and identifies chemicals found to be potential carcinogens by the NTP and IARC.

Chemicals meeting Table 5 definitions, along with the criteria for established evidence in Table 3, must be regarded as hazardous.

**Table 5 is NOT intended to present all hazard categories or test methods.** Available scientific data involving other test methods and animal species must also be evaluated to determine a chemical’s hazards.
Categories provided in Table 6 illustrate the broad range of target organ effects that must be considered when conducting hazard evaluations. Chemicals meeting Table 6 definitions, along with the criteria for established evidence in Table 3, must be regarded as hazardous.

Examples provided in Table 6 are NOT intended to be a complete list.

### Table 5

**Standard Health Hazard Categories**

<table>
<thead>
<tr>
<th>A chemical is considered to be</th>
<th>If</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Corrosive</strong></td>
<td>It causes visible destruction of, or irreversible alterations in, living tissue (not inanimate surfaces) by chemical action at the site of contact. Example: A chemical is corrosive if tested on the intact skin of albino rabbits by a method described by the U.S. Department of Transportation (in Appendix A to 49 CFR Part 173) and it destroys or changes (irreversibly) the structure of the tissue at the contact site after a four-hour exposure period.</td>
</tr>
<tr>
<td><strong>Toxic</strong></td>
<td>It has a median lethal dose (LD50) greater than 50 milligrams per kilogram, but no more than 500 milligrams per kilogram of body weight, when administered orally to albino rats weighing between 200 - 300 grams each. OR It has a median lethal dose (LD50) greater than 200 milligrams per kilogram, but not more than 1,000 milligrams per kilogram, of body weight when administered by continuous contact for twenty-four hours (or less if death occurs within twenty-four hours) with the bare skin of albino rabbits weighing between 2 - 3 kilograms each. OR It has a median lethal concentration (LC50), in air: Greater than 200 parts per million, but not more than 2,000 parts per million (by volume of gas or vapor). OR Greater than 2 milligrams per liter, but not more than 20 milligrams per liter, of mist, fume, or dust, when administered by continuous inhalation for one hour (or less if death occurs within one hour) to albino rats weighing between 200 - 300 grams each.</td>
</tr>
<tr>
<td><strong>Highly toxic</strong></td>
<td>It has a median lethal dose (LD50) of 50 milligrams, or less, per kilogram of body weight when administered orally to albino rats weighing between 200 - 300 grams each.</td>
</tr>
</tbody>

**Table 7: Criteria for Evaluating Chemical Mixtures**

<table>
<thead>
<tr>
<th>If a mixture</th>
<th>Then</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Has been thoroughly tested as a whole for a physical or health hazard</td>
<td>• You must use those results</td>
</tr>
</tbody>
</table>

• Has NOT been tested as a whole for a health hazard
  • You must:
    – Evaluate EACH ingredient in the mixture to determine the hazards
    – Consider the mixture to have the same hazard as each ingredient determined to be hazardous

• Has NOT been tested as a whole for physical hazards
  • You must:
    – Use any scientifically valid data available to evaluate the potential physical hazards of the mixture

- Develop or obtain a complete and accurate material safety data sheet (MSDS) for each hazardous chemical or mixture according to ALL of the following:
  – ALL information in Table 8 must be completed. If there is no relevant information for a required item, this must be noted. Blank spaces are not permitted.
  - Content of MSDSs must accurately represent the available scientific evidence.
    - Your report results of scientifically valid studies that tend to refute findings of hazards.
    - MSDSs must be in English.
    - You may develop copies of MSDSs in other languages.

**WAC 296-839-20010 Provide access to hazard evaluation procedures.**
You must:
- Provide access to your written hazard evaluation procedures when requested by any of the following:
  – Employees
  – Designated representatives of employees
  – Representatives of the department of labor and industries
  – Representatives of the National Institute for Occupational Safety and Health (NIOSH).

- Revise an MSDS when you become aware of new and significant information regarding the hazards of a chemical, or how to protect against the hazards
  – Within three months after you first become aware of the information
  – Before the chemical is reintroduced into the workplace if the chemical is no longer being used, produced or imported.

**WAC 296-839-300 Material safety data sheets.**
Your responsibility:
To provide complete and accurate material safety data sheets (MSDSs).
You must:
- Develop or obtain MSDSs
  WAC 296-839-30005
- Provide MSDSs
  WAC 296-839-30010
- Follow-up if an MSDS is not provided
  WAC 296-839-30015.

**WAC 296-839-30005 Develop or obtain material safety data sheets (MSDSs).**
You must:

</tbody>
</table>

²Signs and symptoms of exposure to hazardous substances include those that:
• Can be measured such as decreased pulmonary function
  AND
• Are subjective such as feeling short of breath.

[WAC 296-839-30010] Provide MSDSs for products shipped, transferred or sold over-the-counter.

You must:
• Provide the correct MSDS to manufacturers, distributors and employers:
  – With the initial shipment or transfer of the product AND
  – With the first shipment or transfer after an MSDS is updated AND
  – Whenever one is requested.

Note:
• MSDSs may be provided separately from containers as long as they are provided before or at the same time as the containers. For example, you may fax, or e-mail the MSDS.
• You are NOT required to provide MSDSs to retailers who inform you they:
  – Do not sell the product to commercial accounts AND
  – Do not open the sealed product containers for use in their workplace.

You must:
• Follow the requirements in Table 9 for chemicals sold over-the-counter.

Table 9

<table>
<thead>
<tr>
<th>Requirements for Chemicals Sold Over-the-Counter (NOT Shipped)</th>
</tr>
</thead>
<tbody>
<tr>
<td>If you are a Retail distributor WITH commercial accounts Then</td>
</tr>
<tr>
<td>• Provide an MSDS to employers with commercial accounts when requested AND</td>
</tr>
<tr>
<td>• Post a sign, or otherwise inform employers, that MSDSs are available</td>
</tr>
<tr>
<td>If you are a Retail distributor WITHOUT commercial accounts Then</td>
</tr>
<tr>
<td>• Provide the employer, when requested, with ALL of the following:</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>If you are a Wholesale distributor selling products over-the-counter to employers Then</td>
</tr>
<tr>
<td>• Provide an MSDS to employers with commercial accounts when requested AND</td>
</tr>
<tr>
<td>• Post a sign, or otherwise inform employers, that MSDSs are available</td>
</tr>
</tbody>
</table>

[WAC 296-839-30015] Follow-up if an MSDS is not provided.

You must:
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-01-096, § 296-839-30005, filed 12/17/02, effective 6/1/03.]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-01-096, § 296-839-30010, filed 12/17/02, effective 6/1/03.]

[Title 296 WAC—p. 2964]
• Obtain an MSDS from the chemical manufacturer, distributor or importer as soon as possible, if an MSDS is not provided for a shipment labeled as a hazardous chemical.

[Wstatutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-01-096, § 296-839-50015, filed 12/17/02, effective 6/1/03.]

WAC 296-839-400 Labeling.
Your responsibility:
To provide employers with containers of hazardous chemicals that are properly labeled.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-01-096, § 296-839-400, filed 12/17/02, effective 6/1/03.]

WAC 296-839-40005 Label containers of hazardous chemicals.

Exemption:
Containers are exempt from this section if ALL hazardous contents are listed in Table 11.

You must:
• Make sure every container of hazardous chemicals leaving the workplace is properly labeled. This includes ALL of the following:
  – The identity of the hazardous chemical (the chemical or common name) that matches the identity used on the MSDS
  – An appropriate hazard warning
  – The name and address of the chemical manufacturer, importer, or other responsible party
  – Make sure labeling does not conflict with the requirements of:
    ■ The Hazardous Materials Transportation Act (49 U.S.C. 1801 et seq.)
    AND
    ■ Regulations issued under the act by the U.S. Department of Transportation (Title 49 of the Code of Federal Regulations, Parts 171 through 180). See http://www.dot.gov
  – Revise labels within three months of becoming aware of new and significant information about chemical hazards
  – Provide revised labels on containers beginning with the first shipment after a revision, to manufacturers, distributors or employers
  – Revise the label when a chemical is not currently used, produced or imported, before:
    ■ You resume shipping (or transferring) the chemical
    OR
    ■ The chemical is reintroduced in the workplace
    – Label information
    ■ Clearly written in English
    AND
    ■ Prominently displayed on the container

Reference:
Additional labeling requirements for specific hazardous chemicals (for example, asbestos, cadmium, and formaldehyde) are found in chapter 296-62 WAC, General occupational health standards (see parts F, G, I and I-1 of that chapter).

Note: When the conditions specified in Table 10 are met for the solid material products listed you are not required to provide labels for every shipment.

### WAC 296-839-500 Definitions.

The following definitions apply to this chapter:

- Article (manufactured item)
- A manufactured item that
  - Is not a fluid or particle
  - Is formed to a specific shape or design during manufacture for a particular end use function
  - Releases only trace amounts of a hazardous chemical during normal use and does not pose a physical or health risk to employees.
- Chemical
  - An element or mixture of elements
  - A compound or mixture of compounds
  - A mixture of elements and compounds
  - Included are manufactured items (such as bricks, welding rods and sheet metal) that are not exempt as an article.
- Chemical name
  - The scientific designation of a chemical developed by
    - International union of pure and applied chemistry (IUPAC)
    - Chemical abstracts service (CAS) rules of nomenclature
  - A name that clearly identifies the chemical for the purpose of conducting a hazard evaluation.
- Combustible liquid
  - Liquids with a flashpoint of at least 100°F (37.8°C) and below 200°F (93.3°C). A mixture with at least 99% of its components having flashpoints of 200°F (93.3°C), or higher, is not considered a combustible liquid.
- Commercial account
  - An arrangement where a retailer is selling hazardous chemicals to an employer
    - Generally in large quantities over time
    - At costs below regular retail price.
- Common name
  - Any designation or identification used to identify a chemical other than the chemical name, such as a
    - Code name or number
    - Trade or brand name
    - Generic name.
- Compressed gas
  - A contained gas or mixture of gases with an absolute pressure greater than:
    - 40 psi at 70°F (21.1°C)
    - 104 psi at 130°F (54.4°C) regardless of the pressure at 70°F (21.1°C)
  - A liquid with a vapor pressure greater than 40 psi at 100°F (37.8°C), as determined by ASTM D323-72.
- Container
  - A vessel, other than a pipe or piping system, that holds a hazardous chemical. Examples include:
    - Bags
    - Barrels
    - Bottles
    - Boxes
    - Cans
    - Cylinders
    - Drums
    - Reaction vessels
    - Storage tanks
    - Rail cars.
- Designated representative
  - An individual or organization with written authorization from an employee
  - A recognized or certified collective bargaining agent (not necessarily authorized by an employee)
A legal representative of a deceased or legally incapacitated employee.

**Distributor**

A business that supplies hazardous chemicals to other employers. Included are employers who conduct retail and wholesale transactions.

**Explosive**

A chemical that causes a sudden, almost instant release of pressure, gas, and heat when exposed to a sudden shock, pressure, or high temperature.

**Flammable**

A chemical in one of the following categories:

- Aerosols that, when tested using a method described in 16 CFR 1500.45, yield either a:
  - Flame projection of more than eighteen inches at full valve opening
  OR
  - A flashback (a flame extending back to the valve) at any degree of valve opening
- Gases that, at the temperature and pressure of the surrounding area, form a:
  - Flammable mixture with air at a concentration of thirteen percent, by volume, or less
  OR
  - Range of flammable mixtures with air wider than twelve percent, by volume, regardless of the lower limit
- Liquids with a flashpoint below 100°F (37.8°C). A mixture with at least ninety-nine percent of its components having flashpoints of 100°F (37.8°C), or higher, is not considered a flammable liquid
- Solids, other than blasting agents or explosives, as defined in WAC 296-52-417 or 29 CFR 1910.109(a), that:
  - Is likely to cause fire through friction, moisture, absorption, spontaneous chemical change or retained heat from manufacturing or processing
  OR
  - That can be readily ignited (and when ignited burns so vigorously and persistently that it creates a serious hazard)
  OR
  - When tested by the method described in 16 CFR 1500.44, ignite and burn with a self-sustained flame at a rate greater than 1/10th of an inch per second along its major axis.

**Flashpoint**

The minimum temperature at which a liquid gives off an ignitable concentration of vapor, when tested by any of the following measurement methods:

- Tagliabue closed tester. Use this for liquids with a viscosity less than, 45 Saybolt Universal Seconds (SUS) at 100°F (37.8°C), that do not contain suspended solids and do not tend to form a surface film under test. See American National Standard Method of Test for Flashpoint by Tag Closed Tester, Z11.24-1979 (ASTM D 56-79)
- Pensky-Martens closed tester. Use this for liquids with a viscosity equal to, or greater than, 45 SUS at 100°F (37.8°C) or for liquids that contain suspended solids or have a tendency to form a surface film under test. See American National Standard Method of Test for Flashpoint by Pensky-Martens Closed Tester, Z11.7-1979 (ASTM D 93-79)
- Setaflash closed tester. See American National Standard Method of Test for Flashpoint by Setaflash Closed Tester (ASTM D 3278-78)
- Organic peroxides, which undergo auto accelerating thermal decomposition, are excluded from any of the flashpoint measurement methods specified above.

**Hazardous chemical**

A chemical, which is a physical or health hazard.

**Hazard warning**

Words, pictures or symbols (alone or in combination) that appear on labels (or other forms of warning such as placards or tags) that communicate specific physical and health hazards (including target organ effects) associated with chemicals in a container.

**Health hazard**

A chemical that may cause health effects in short or long-term exposed employees based on statistically significant evidence from a single study conducted by using established scientific principles.

Health hazards include, but are not limited to, any of the following:

- Carcinogens
- Toxic or highly toxic substances
- Reproductive toxins
- Irritants
- Corrosives
- Sensitizers
- Hepatotoxins (liver toxins)
- Nephrotoxins (kidney toxins)
- Neurotoxins (nervous system toxins)
- Substances that act on the hematopoietic system (blood or blood forming system)
- Substances that can damage the lungs, skin, eyes, or mucous membranes.

**Identity**

A chemical or common name listed on the material safety data sheet (MSDS) and label.

**Importer**

The first business, within the Customs Territory of the United States, that receives hazardous chemicals produced in other countries and supplies them to manufacturers, distributors or employers within the United States.

**Label**

Written, printed, or graphic material displayed on, or attached to, a container of hazardous chemicals.

**Manufacturer**

An employer with a workplace where one or more chemicals (including items not exempt as "articles," see Table 1 in this chapter) are produced for use or distribution.

**Material safety data sheet (MSDS)**

Written, printed or electronic information (on paper, microfiche, or on-screen) that informs manufacturers, distributors or employers about the chemical, its hazards and protective measures as required by this rule.

**Mixture**

A combination of two or more chemicals that retain their chemical identity after being combined.

**Organic peroxide**

An organic compound containing the bivalent-O-O-structure. It may be considered a structural derivative of...
hydrogen peroxide if one or both of the hydrogen atoms has been replaced by an organic radical.

Oxidizer
A chemical, other than a blasting agent or explosive as defined in WAC 296-52-417 or 29 CFR 1910.109(a), that starts or promotes combustion in other materials, causing fire either of itself or through the release of oxygen or other gases.

Physical hazards
A chemical that has scientifically valid evidence to show it is one of the following:
- A combustible liquid
- A compressed gas
- Explosive
- Flammable
- An organic peroxide
- An oxidizer
- Pyrophoric
- Unstable (reactive)
- Water-reactive.

Produce
To do one or more of the following:
- Manufacture
- Process
- Formulate
- Blend
- Extract
- Generate
- Emit
- Repackage.

Pyrophoric
Chemicals that ignite spontaneously in the air at a temperature of 130°F (54.4°C) or below.

Responsible party
Someone who can provide more information about the hazardous chemical and appropriate emergency procedures.

Retailer
See "distributor."

Threshold limit values (TLVs)
Airborne concentrations of substances established by the American Conference of Governmental Industrial Hygienists (ACGIH), and represent conditions under which it is believed that nearly all workers may be repeatedly exposed day after day without adverse health effects.

TLVs are specified in the most recent edition of the Threshold Limit Values for Chemical Substances and Physical Agents and Biological Exposure Indices and include the following categories:
- Threshold limit value-time-weighted average (TLV-TWA)
- Threshold limit value-short-term exposure limit (TLV-STEL)
- Threshold limit value-ceiling (TLV-C).

Unstable (reactive)
A chemical in its pure state, or as produced or transported, that will vigorously polymerize, decompose, condense, or become self-reactive under conditions of shocks, pressure or temperature.

Use
To do one or more of the following:
- Package
- Handle
- React
- Emit
- Extract
- Generate as a by-product
- Transfer.

Water-reactive
A chemical that reacts with water to release a gas that is either flammable or presents a health hazard.

WAC 296-841-100 Scope. This chapter applies only if your employees:
- Are exposed to a respiratory hazard
  OR
- Could be exposed to one of the specific hazards listed below.

This chapter applies to any workplace with potential or actual employee exposure to respiratory hazards. It requires you to protect employees from respiratory hazards by applying this protection strategy:
- Evaluate employee exposures to determine if controls are needed
- Use feasible controls. For example, enclose or confine the operation, use ventilation systems, or substitute with less toxic material
- Use respirators if controls are not feasible or if they cannot completely remove the hazard.

Definition:
Exposed or exposure:
The contact an employee has with a toxic substance, harmful physical agent or oxygen deficient condition, whether or not protection is provided by respirators or other personal protective equipment (PPE). Exposure can occur through various routes of entry, such as inhalation, ingestion, skin contact, or skin absorption.

Note:
- Examples of substances that may be respiratory hazards when airborne include:
  - Chemicals listed in Table 3
  - Any substance
- Listed in the latest edition of the NIOSH Registry of Toxic Effects of Chemical Substances
- For which positive evidence of an acute or chronic health hazard exists through tests conducted by, or known to, the employer
- That may pose a hazard to human health as stated on a material safety data sheet kept by, or known to, the employer
Respiratory Hazards

49.17.060. 03-20-115, § 296-841-200, filed 10/1/03, effective 1/1/04.

Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 841-100, filed 10/1/03, effective 1/1/04.

18-079, § 296-841-100, filed 8/31/04, effective 11/1/04; 03-20-115, § 296-841-200, filed 10/1/03, effective 1/1/04.

Reference: Substances in Table 3 that are marked with an X in the "skin" column may require personal protective equipment (PPE). See WAC 296-800-160, Personal protective equipment, for additional information and requirements.

If any of the following hazards are present in your workplace, you will need both this chapter and any of the following specific rules that apply:

- Atmospheres considered oxygen deficient
- Biological agents such as harmful bacteria, viruses or fungi
- Examples include airborne TB aerosols and anthrax
- Pesticides with a label requirement for respirator use
- Chemicals used as crowd control agents such as pepper spray
- Chemicals present at clandestine drug labs.

These substances can be airborne as dusts, fibers, fogs, fumes, mists, gases, smoke, sprays, vapors, or aerosols.

You must:

- Perform your evaluation without considering the protection provided to employees by a respirator
- Determine the form of the hazard, such as dust, mist, gas, oxygen deficiency, or biological agent.
- Make sure you consider:
  - Potential emergency and rescue situations that may occur, such as equipment or power failures, uncontrolled chemical reactions, fire, explosion, or human error
  - Workplace conditions such as work processes, types of material, control methods, work practices and environmental conditions.
- Determine or reasonably estimate whether any employee is or could be exposed to any of the following:
  - Any airborne substance above a permissible exposure limit (PEL) listed in Table 3
  - A substance at or above the action level (AL) specified in the rule for that substance
  - Any other respiratory hazard.
- Use any of the following to determine employee exposure:
  - Information that would allow an estimate of the level of employee exposure, such as MSDSs or pesticide labels, observations, measurements or calculations
  - Data demonstrating that a particular product, material or activity cannot result in employee exposure at or above the AL or PEL
  - Personal air samples that represent an employee's usual or worst case exposure for the entire shift.

Note:
- Rules for specific substances may contain additional requirements for determining employee exposure.
- Use methods of sampling and analysis that have been validated by the laboratory performing the analysis.
- Samples from a representative group of employees may be used for other employees performing the same work activities when the duration and level of exposure are similar.

You must:

- Consider the atmosphere to be immediately dangerous to life or health (IDLH) when you cannot determine or reasonably estimate employee exposure
- Make sure employee exposure, to two or more substances with additive health effects, is evaluated using this formula:

\[ E_m = \frac{C_1}{L_1} + \frac{C_2}{L_2} + \ldots + \frac{C_n}{L_n} \]

The symbol Is the . . .

| E | Equivalent exposure for the mixture. When the value of E is greater than 1, a respiratory hazard is present. |
| C | Concentration of a substance. |
| L | TWA, STEL, or ceiling for that substance, from Table 3. |

WAC 296-841-200 Evaluate and control employee exposures.

Summary
Your responsibility:
To protect your employees from exposure to respiratory hazards in the workplace by identifying and controlling the hazards.

You must:

- Identify and evaluate employee exposures WAC 296-841-20005
- Control employee exposures WAC 296-841-20010
- Use respirators WAC 296-841-20015
- Notify employees WAC 296-841-20020.

WAC 296-841-20005 Identify and evaluate respiratory hazards.

You must:

- Make sure employees are protected from potentially hazardous exposure while you perform your evaluation

WAC 296-841-20010 Control employee exposures.

You must:

- Use feasible controls to protect employees from exposure to respiratory hazards by:

(2005 Ed.)
– Reducing employee exposure to a level that removes the respiratory hazard, such as to a level below the permissible exposure limits (PEL) in Table 3;

OR

– Reducing the exposure to the lowest achievable level, when the respiratory hazard cannot be removed.

IMPORTANT:
Using respirators and other PPE is not a substitute for the feasible controls required by this section.

Note: The following table gives you examples of control methods.

Table 1
Examples of Possible Controls

<table>
<thead>
<tr>
<th>Control:</th>
<th>For example:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using a different chemical (substitution)</td>
<td>• Choose a chemical with a lower evaporation rate or vapor pressure • Choose a chemical without hazardous ingredients</td>
</tr>
<tr>
<td>Changing a process to lessen emissions</td>
<td>• Use hand rolling or paint dipping instead of paint spraying • Bolt items instead of welding them</td>
</tr>
<tr>
<td>Separating employees from emissions areas and sources</td>
<td>• Use control rooms • Build an enclosure around process machinery or other emissions sources • Automate a process</td>
</tr>
<tr>
<td>Removing emissions at or near the source (local exhaust ventilation)</td>
<td>• Install exhaust hoods or slots to capture emissions • Use an exhausted enclosure (like a blasting cabinet or laboratory hood)</td>
</tr>
<tr>
<td>Diluting and removing emissions in the work area (general exhaust ventilation)</td>
<td>• Allow natural air movement to create an adequate airflow through an area • Use mechanical fans</td>
</tr>
<tr>
<td>Modify work practices</td>
<td>• Change the position of the worker relative to the work so fumes, vapors, or smoke do not go into their face</td>
</tr>
<tr>
<td>Rotate employees – Some specific rules prohibit the use of this control method</td>
<td>• Move employees to another job that is without exposure, on a schedule to keep their total exposure below the permissible exposure limit</td>
</tr>
</tbody>
</table>

Note: The notification may be provided either individually, to a group, or by posting of results in an appropriate location that is accessible to affected employees.

Table 2
Notification Requirements

<table>
<thead>
<tr>
<th>Notify employees of:</th>
<th>As follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any exposure result above a permissible exposure limit (PEL)</td>
<td>Within five business days, after the employee's exposure result is known to the employer</td>
</tr>
<tr>
<td>The corrective action being taken to reduce employee exposure to or below the PEL</td>
<td>Within fifteen business days, after the employee's exposure result is known to the employer</td>
</tr>
<tr>
<td>The schedule for completion of the corrective action and any reasons why exposures cannot be lowered to below the PEL</td>
<td>In writing, as specified in the rule specific to the substance</td>
</tr>
</tbody>
</table>

An exposure to these substances:
• Acrylonitrile
• Arsenic (inorganic)
• Asbestos
• Benzene
• Butadiene
• Cadmium
• Coke oven emissions
• Cotton dust
• 1,2-Dibromo-3-chloropropane
• Ethylene oxide
• Formaldehyde
• Lead
• Methylene chloride
• Methylenedianiline
• Vinyl chloride

WAC 296-841-20015 Use respirators.
You must:
• Require employees to use respiratory protection when respiratory hazards have not been removed using feasible controls. For example, use respirators at any of the following times:

While controls are being evaluated or put in place
When the respiratory hazard is not completely removed
When controls are NOT feasible.

Reference:
See chapter 296-842 WAC, Respirators, for respirator program requirements.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-18-079, § 296-841-20010, filed 10/1/03, effective 1/1/04.]
**WAC 296-841-20025 Permissible exposure limits of air contaminants.**

**IMPORTANT:**

The following information applies to Table 3, Permissible Exposure Limits for Air Contaminants.

- Exposure needs to be determined from personal air samples taken in the breathing zone or from monitoring representative of the employee’s breathing zone.
- Ppm refers to parts of vapor or gas per million parts of air by volume, at 25 degrees C and 760 mm Hg pressure.
- Mg/m³ refers to milligrams of substance per cubic meter of air.
- For a metal that is measured as the metal itself, only the CAS number for the metal is given. The CAS numbers for individual compounds of the metal are not provided. For more information about CAS registry numbers see the website: http://www.cas.org.
- Time weighted averages (TWA₈) represent the maximum allowed average exposure for any 8-hour time period. For work periods longer than 8-hours the TWA₈ needs to be determined using the 8 continuous hours with the highest average concentration.
- Short-term exposure limits (STEL) represent maximum allowed average exposure for any fifteen-minute period, unless another time period is noted in Table 3.

- The ceiling represents the maximum allowed exposure for the shortest time period that can feasibly be measured.
- An "X" in the "skin" column indicates the substance can be absorbed through the skin, either by airborne or direct contact.
- Requirements for the use of gloves, coveralls, goggles, and other personal protective equipment can be found in WAC 296-800-160.
- The respirable fraction of particulate is measured by sampling with a size-selector having the following characteristics:

<table>

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-18-079, § 296-841-20025, filed 8/31/04, effective 11/1/04.]

**WAC 296-841-300 Definitions.**

**Breathing zone**

The space around and in front of an employee’s nose and mouth, forming a hemisphere with a six to nine inch radius.

**Ceiling**

An exposure limit, measured over the shortest time period feasible, that must not be exceeded during any part of the employee's workday.

**Dust**

Solid particles suspended in air. Dusts are generated by handling, drilling, crushing, grinding, rapid impact, detonation, or decrepitation of organic or inorganic materials such as rock, ore, metal, coal, wood, grain, etc.

**Exposed or exposure**

The contact an employee has with a toxic substance, harmful physical agent or oxygen deficient condition, whether or not protection is provided by respirators or other personal protective equipment (PPE). Exposure can occur through various routes of entry, such as inhalation, ingestion, skin contact, or skin absorption.

**Fume**

Solid particles suspended in air, generated by condensation from the gaseous state, generally after volatilization from molten metals, etc.

**Gas**

A normally formless fluid which can be changed to the liquid or solid state by the effect of increased pressure or decreased temperature or both.

**Mist**

Liquid droplets suspended in air, generated by condensation from the gaseous to the liquid state or by breaking up a liquid into a dispersed state, such as by splashing, foaming, spraying or atomizing.

**Oxygen deficient**

An atmosphere with an oxygen content below 19.5% by volume.

**Permissible exposure limits (PEL)**

Permissible exposure limits (PELs) are employee exposures to toxic substances or harmful agents that must not be exceeded. PELs are specified in applicable WISHA rules.

**Short-term exposure limit (STEL)**

An exposure limit averaged over a short time period (usually measured for fifteen minutes) that must not be exceeded during any part of an employee’s workday.

**Time weighted average (TWA<sub>8</sub>)**

An exposure limit averaged over eight hours that must not be exceeded during an employee's workday.

**Toxic substance**

Any chemical substance or biological agent, such as bacteria, virus, and fungus, which is any of the following:

- Listed in the latest edition of the National Institute for Occupational Safety and Health (NIOSH) Registry of Toxic Effects of Chemical Substances (RTECS)
- Shows positive evidence of an acute or chronic health hazard in testing conducted by, or known to, the employer.
- The subject of a material safety data sheet kept by or known to the employer showing the material may pose a hazard to human health.

**Vapor**

The gaseous form of a substance that is normally in the solid or liquid state.

Reference: See WAC 296-800-160, Personal protective equipment (PPE) to find requirements for other types of personal protective equipment (PPE), such as eye, hand, and head protection.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-100, filed 10/1/03, effective 1/1/04.]

**WAC 296-842-105 Respirator program administrator.**

**Your responsibility:**
To make sure a capable individual is in charge of respirator program development and management.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-105, filed 10/1/03, effective 1/1/04.]

**WAC 296-842-10505 Designate a program administrator.**

**Exemption:** You do not need to designate a program administrator if employees use only filtering-facepiece respirators and do so only as voluntary use.

**Definition:** Voluntary use is respirator use that is requested by the employee and permitted by the employer when no respiratory hazard exists.

**You must:**
- Designate a program administrator who has overall responsibility for your program and has sufficient training or experience to:
  - Oversee program development and coordinate implementation
  - Conduct required evaluations of program effectiveness outlined in WAC 296-842-12005.

[Title 296 WAC—p. 2988]
Respirators

WAC 296-842-11005 Make sure voluntary use of respirators is safe.

Definition:
Voluntary use is respirator use that is requested by the employee AND permitted by the employer when NO respirator hazard exists.

IMPORTANT: If you choose to require respirator use, use is NOT voluntary and the required use sections of this chapter apply.

You must:
(1) Make sure voluntary respirator use does NOT:
• Interfere with an employee's ability to work safely, such as restricting necessary vision or radio communication
OR
• Create health hazards.

Note: Examples of health hazards include:
• Skin irritation, dermatitis, or other health effects caused by using a dirty respirator
• Illness created by sharing contaminated respirators
• Health effects caused by use of an unsafe air supply, such as carbon monoxide poisoning.

(2) Provide all voluntary respirator users with the advisory information in Table 2 at no cost to them.

Table 2
Advisory Information for Employees Who Voluntarily Use Respirators

- Respirators protect against airborne hazards when properly selected and used. WISHA recommends voluntary use of respirators when exposure to substances is below WISHA permissible exposure limits (PELs) because respirators can provide you an additional level of comfort and protection.
- If you choose to voluntarily use a respirator (whether it is provided by you or your employer) be aware that respirators can create hazards for you, the user. You can avoid these hazards if you know how to use your respirator properly AND how to keep it clean. Take these steps:
  - Read and follow all instructions provided by the manufacturer about use, maintenance (cleaning and care), and warnings regarding the respirator's limitations.
  - Choose respirators that have been certified for use to protect against the substance of concern. The National Institute for Occupational Safety and Health (NIOSH) certifies respirators. If a respirator is not certified by NIOSH, you have no guarantee that it meets minimum design and performance standards for workplace use.
    - A NIOSH approval label will appear on or in the respirator packaging. It will tell you what protection the respirator provides.
  - Keep track of your respirator so you do not mistakenly use someone else's.
  - DO NOT wear your respirator into:
    - Atmospheres containing hazards that your respirator is not designed to protect against.
      - For example, a respirator designed to filter dust particles will not protect you against solvent vapor, smoke or oxygen deficiency.
    - Situations where respirator use is required.

You must:
(3) Develop and maintain a written program that includes the following:
Exemption: If employees use only filtering-facepiece respirators and do so only voluntarily, you do not need to develop and maintain a written program.

• Medical evaluation provisions as specified in WAC 296-842-140.
• Procedures to properly clean and disinfect respirators, according to WAC 296-842-2015, if they are reused.
• How to properly store respirators, according to WAC 296-842-17010, so that using them does not create hazards.
• Procedures to make sure there is a safe air supply, according to WAC 296-842-200, when using air-line respirators and SCBAs.
• Training according to WAC 296-842-160 when necessary to ensure respirator use does NOT create a hazard.

Note:
• Pay for medical evaluations, training, travel related costs, and wages. You do NOT need to pay for respirators employees use only voluntarily.
• If you have both voluntary and required respirator users, you may choose to treat voluntary users as required users. Doing this exceeds the requirements in this section.

Use Table 2 to provide information to employees who voluntarily use any type of respirator.

WAC 296-842-11010 Keep voluntary use program records.

Exemption: If employees use only filtering-facepiece respirators voluntarily, you do not need to follow these record-keeping requirements.

You must:
• Keep copies of:
  – Your current written respirator program
  – Written recommendations from the LHCP
• Allow records required by this section to be examined and copied by affected employees and their representatives.

Reference: See chapter 296-62 WAC, Part B, Access to records for additional requirements that apply to medical records.

WAC 296-842-120 Written respirator program and recordkeeping.

Your responsibility:
To develop, implement, and maintain a written program that provides clear instruction for safe and reliable respirator use.
You must:
Develop and maintain a written program
WAC 296-842-12005
Keep respirator program records
WAC 296-842-12010.

You must:
(1) Develop a complete worksite-specific written respiratory protection program that includes the applicable elements listed in Table 3.

Note:
Pay for respirators, medical evaluations, fit testing, training, maintenance, travel costs, and wages.

You must:
(2) Keep your program current and effective by evaluating it and making corrections. Do ALL of the following:

• Make sure procedures and program specifications are followed and appropriate.
• Make sure selected respirators continue to be effective in protecting employees. For example:
  – If changes in work area conditions, level of employee exposure, or employee physical stress have occurred, you need to reevaluate your respirator selection.
  • Have supervisors periodically monitor employee respirator use to make sure employees are using them properly.
  • Regularly ask employees required to use respirators about their views concerning program effectiveness and whether they have problems with:
    – Respirator fit during use
    – Any effects of respirator use on work performance
    – Respirators being appropriate for the hazards encountered
    – Proper use under current worksite conditions
    – Proper maintenance.

When developing your written program include applicable elements listed in Table 3.

WAC 296-842-12010 Keep respirator program records.
You must:
• Keep the following records:
  – Your current respirator program
  – Each employee’s current fit test record, if fit testing is conducted. Fit test records must include:
    ■ Employee name
    ■ Test date
    ■ Type of fit-test performed
    ■ Description (type, manufacturer, model, style, and size) of the respirator tested
  ■ Results of fit tests, for example, for quantitative fit tests include the overall fit factor AND a print out, or other recording of the test.
  – Training records that include employee’s names and the dates trained
  – Written recommendations from the LHCP.
  ■ Allow records required by this section to be examined and copied by affected employees and their representatives.
Reference: See chapter 296-62 WAC, Part B, Access to records, for additional requirements that apply to medical records.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-12010, filed 10/1/03, effective 1/1/04.]

WAC 296-842-130 Respirator selection.
Your responsibility:
To select and provide respirators that are appropriate for the hazard, user, and worksite conditions.
Exemption: This section does not apply to voluntary respirator use. See WAC 296-842-110 of this chapter for voluntary use program requirements.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-130, filed 10/1/03, effective 1/1/04.]

WAC 296-842-13005 Select and provide appropriate respirators.
IMPORTANT: See chapter 296-841, Respiratory hazards, for:
• Hazard evaluation requirements. Evaluation results are necessary for respirator selection.
  • A list of substance-specific rules that may also apply to you. Those listed rules have additional respirator selection requirements.
You must:
• Select and provide, at no cost to employees, appropriate respirators for routine use, infrequent use, and reasonably foreseeable emergencies (such as escape, emergency, and spill response situations) by completing the following process:
  Respirator Selection Process
  Step 1: If your only respirator use is for escape, skip to Step 9 to select appropriate respirators.
  Step 2: If the respiratory hazard is a biological aerosol, such as TB (tuberculosis), anthrax, psittacosis (parrot fever), or hanta virus, select a respirator appropriate for nonemergency activities recognized to present a health risk to workers and skip to Step 9.
    • If respirator use will occur during emergencies, skip to Step 9 and document the analysis used to select the appropriate respirator.

Table 4
Concentration Ranges for Oxygen Deficiency

<table>
<thead>
<tr>
<th>Altitude (as ft. above sea level)</th>
<th>Oxygen Concentration Range (as percent oxygen)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Below 3,001</td>
<td>16.0 - 19.5</td>
</tr>
<tr>
<td>3,001 - 4,000</td>
<td>16.4 - 19.5</td>
</tr>
<tr>
<td>4,001 - 5,000</td>
<td>17.1 - 19.5</td>
</tr>
<tr>
<td>5,001 - 6,000</td>
<td>17.8 - 19.5</td>
</tr>
<tr>
<td>6,001 - 8,000</td>
<td>19.3 - 19.5</td>
</tr>
<tr>
<td>Above 8,000 feet</td>
<td>The exception does not apply.</td>
</tr>
</tbody>
</table>

Step 8: Identify respirator types with assigned protection factors (APFs) from Table 5 that are appropriate to protect employees from the expected exposure concentration.
Step 9: Consider hazards that could require selection of specific respirator types. For example, select full-facepiece respirators to prevent eye irritation or abrasive blasting helmets to provide particle rebound protection.

Use Centers for Disease Control (CDC) selection guidance for exposures to specific biological agents when this guidance exists. Visit http://www.cdc.gov.

Step 3: If the respiratory hazard is a pesticide, follow the respirator specification on the pesticide label AND skip to Step 10.

Step 4: Determine the expected exposure concentration for each respiratory hazard of concern. Use the results from the evaluation required by chapter 296-841 WAC, Respiratory hazards.

Step 5: Determine if the respiratory hazard is classified as IDLH; if it is NOT IDLH skip to Step 8.
  • The respiratory hazard is classified as IDLH if:
    – The atmosphere is oxygen deficient or oxygen enriched
OR
    – You CANNOT measure or estimate your expected exposure concentration
OR
    – Your measured or estimated expected exposure concentration is greater or equal to the IDLH value in the NIOSH Pocket Guide to Chemical Hazards

Note: WISHA uses the IDLH values in the 1990 edition of the NIOSH Pocket Guide to Hazardous Chemicals to determine the existence of IDLH conditions. You may use more recent editions of this guide. Visit www.cdc.gov/niosh for more information.

Step 6: Select an appropriate respirator from one of the following respirators for IDLH conditions and skip to Step 9:
• Full-facepiece, pressure demand, self-contained breathing apparatus (SCBA) certified by NIOSH for a minimum service life of thirty minutes
OR
• Full-facepiece, pressure demand air-line respirator equipped with an auxiliary self-contained air supply

Exception: If the respiratory hazard is oxygen deficiency AND you can show oxygen concentrations can be controlled within the ranges listed in Table 4 under ALL foreseeable conditions, you are allowed to select any type of SCBA or air-line respirator.

(2005 Ed.)
Step 10: Evaluate user and workplace factors that might compromise respirator performance, reliability or safety.

- If the respiratory hazard is a pesticide, follow the requirements on the pesticide label and skip to Step 12.

  Examples:
  - High humidity or temperature extremes in the workplace.
  - Necessary voice communication.
  - High traffic areas and moving machinery.
  - Time or distance for escape.

Step 11: Follow Table 6 requirements to select an air-purifying respirator.

- If Table 6 requirements cannot be met, you must select an air-line respirator or an SCBA.

Step 12: Make sure respirators you select are certified by the National Institute for Occupational Safety and Health (NIOSH).

- To maintain certification, make sure the respirator is used according to cautions and limitations specified on the NIOSH approval label.

Note: While selecting respirators, you will need to select a sufficient number of types, models or sizes to provide for fit testing. You can also consider other respirator use issues, such as accommodating facial hair with a loose fitting respirator.

Use Table 5 to identify the assigned protection factor for different types of respirators.

<table>
<thead>
<tr>
<th>If the respirator is a(n) . . .</th>
<th>Then the APF is . . .</th>

<td>10,000</td>
</tr>
</tbody>
</table>

Combination respirators:

- Find the APF for each type of respirator in the combination.
- Use the lower APF to represent the combination.

Use Table 6 to select air-purifying respirators for particle, vapor, or gas contaminants.

<table>
<thead>
<tr>
<th>If the contaminant is a . . .</th>
<th>Then . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gas OR vapor</td>
<td></td>
</tr>
<tr>
<td>- Provide a respirator with canisters or cartridges equipped with a NIOSH-certified, end-of-service-life indicator (ESLI) OR</td>
<td></td>
</tr>
<tr>
<td>- If a canister or cartridge with an ESLI is NOT available, develop a cartridge change schedule to make sure the canisters or cartridges are replaced before they are no longer effective OR</td>
<td></td>
</tr>
<tr>
<td>- Select an atmosphere-supplying respirator</td>
<td></td>
</tr>
<tr>
<td>Particle, such as a dust, spray, mist, fog, fume, or aerosol</td>
<td></td>
</tr>
<tr>
<td>- Select respirators with filters certified to be at least 95% efficient by NIOSH – For example, N95s, R99s, P100s, or High Efficiency Particulate Air filters (HEPA) OR</td>
<td></td>
</tr>
<tr>
<td>- You may select respirators NIOSH certified as &quot;dust and mist,&quot; &quot;dust, fume, or mist,&quot; or &quot;pesticides.&quot; You can only use these respirators if particles primarily have a mass median aerodynamic diameter of at least two micrometers. Note: These respirators are no longer sold for occupational use.</td>
<td></td>
</tr>
</tbody>
</table>
WAC 296-842-140 Medical evaluations.

Your responsibility:
To make sure a respirator used under your specific worksite conditions is not a health risk to employees.

Exemption: This section does not apply to employees who only:
- Filtering-facepiece respirators voluntarily. See WAC 296-842-110 of this chapter for voluntary use requirements
- Escape-only respirators that are mouthpiece, loose-fitting, or hooded respirators.

IMPORTANT:
- Using a respirator can create physical risks for an employee each time it is worn. The extent of these risks depends on these factors:
  - Type of respirator
  - Environmental conditions at the worksite
  - Physical demands of the work
  - Use of other protective clothing
  - Employee's health status.

WAC 296-842-14005 Provide medical evaluations.

IMPORANT:
If you have provided an employee with a medical evaluation addressing respirator use, as required by another chapter, that evaluation will meet the requirements of this section.

You must:
- Follow the medical evaluation process. Steps 1 through 7 in this section, to provide medical evaluations for employees at no cost to them.

Medical Evaluation Process

Step 1: Identify employees who need medical evaluations and determine the frequency of evaluations from Table 7. Include employees who:
- Are required to use respirators
- Voluntarily use respirators that are not filtering-facepiece respirators

Note: You may use a previous employer’s medical evaluation for an employee if you can:
- Show the employee’s previous work and use conditions were substantially similar to yours
- Obtain a copy of the licensed health care professional’s (LHCP’s) written recommendation approving the employee’s use of the respirator chosen by you.

Step 2: Identify a licensed health care professional (LHCP) to perform your medical evaluations.

Note: If you select a different LHCP, you do not need to have new medical evaluations done.

Step 3: Make sure your LHCP has the following information before the evaluation is completed:
- Information describing the respirators employees may use, including the weight and type.
- How the respirators will be used, including:
  - How often the respirator will be used, for example, daily, or once a month
  - The duration of respirator use, for example, a minimum of one hour, or up to twelve hours
  - The employee’s expected physical work effort
  - Additional personal protective clothing and equipment to be worn
  - Temperature and humidity extremes expected during use
  - A copy of your written respiratory protection program and this chapter.

Note: You may choose to send the questionnaire to the LHCP ahead of time, giving time to review it and add any necessary questions.
- The LHCP determines what questions to add to the questionnaire, if any; however, questions in Parts 1-3 may not be deleted or substantially altered.

Step 4: Administer the medical questionnaire in WAC 296-842-22005 to employees, or provide them a medical exam that obtains the same information.

Note: You may use on-line questionnaires if the questions are the same and requirements of this section are met.
- Administer the examination or questionnaire at no cost to employees:
  - During the employee’s normal working hours OR
  - At a time and place convenient to the employee
- Maintain employee confidentiality during examination or questionnaire administration:
  - Do not view employee’s answers on the questionnaire
  - Do not act in a manner that may be considered a breach of confidentiality

Step 5: Provide follow-up evaluation for employees when:
- The LHCP needs more information to make a final recommendation
- An employee gives any positive response to questions 1-8 in Part 2 or to questions 1-6 in Part 3 of the WISHA medical evaluation questionnaire in WAC 296-842-22005.

Note: Follow-up may include:
- Employee consultation with the LHCP such as a telephone conversation to evaluate positive questionnaire responses
- Medical exams
- Medical tests or other diagnostic procedures.

Step 6: Obtain a written recommendation from the LHCP that contains only the following medical information:
- Whether or not the employee is medically able to use the respirator
- Any limitations of respirator use for the employee
- What future medical evaluations, if any, are needed
- A statement that the employee has been provided a copy of the written recommendation.

Step 7: Provide a powered, air-purifying respirator (PAPR) when the LHCP determines the employee should not wear a negative-pressure air-purifying respirator AND is able to wear a PAPR.

(2005 Ed.)
Reference: See WAC 296-842-130 for requirements regarding selection of air-purifying respirators.

Note: • You may discontinue medical evaluations for an employee when the employee no longer uses a respirator.

If you have staff conducting your medical evaluations, they may keep completed questionnaires and findings as confidential medical records, if they are maintained separately from other records.

Use Table 7 to determine medical evaluation frequency.

Table 7

<table>
<thead>
<tr>
<th>Type of Evaluation:</th>
<th>When required:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initial medical evaluations</td>
<td>• Before respirators are fit-tested or used in the workplace.</td>
</tr>
</tbody>
</table>
| Subsequent medical evaluations | • If any of these occur:  
  – Your licensed health care professional (LHCP) recommends them; for example, periodic evaluations at specified intervals.  
  – A respirator program administrator or supervisor informs you that an employee needs reevaluation.  
  – Medical signs or symptoms (such as breathing difficulties) are:  
    ■ Observed during fit testing or program evaluation  
    OR  
    ■ Reported by the employee  
  – Changes in worksite conditions such as physical work effort, personal protective clothing, or temperature that could substantially increase the employee's physiological stress. |

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-14005, filed 10/1/03, effective 1/1/04.]

WAC 296-842-150 Fit testing.

Your responsibility:

To make sure negative and positive-pressure tight-fitting respirators can provide an adequate fit and acceptable level of comfort to employees.

Exemption: This section does NOT apply to any respirators that are:

• Voluntarily used. See WAC 296-842-110 for voluntary use requirements.  
• Mouthpiece respirators.

IMPORTANT:

• Fit testing is an activity where the seal of a respirator is tested to determine if it is adequate.  
• This section covers general requirements for fit testing. Fit testing procedures are covered in WAC 296-842-22010 of this chapter.  

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-150, filed 10/1/03, effective 1/1/04.]

WAC 296-842-15005 Conduct fit testing.

You must:

• Provide, at no cost to the employee, fit tests for ALL tight-fitting respirators on the following schedule:  
  – Before employees are assigned duties that may require the use of respirators  
  – At least every twelve months after initial testing  
  – Whenever any of the following occurs:  
    ■ A different respirator facepiece is chosen such as a different type, model, style, or size  
    ■ You become aware of a physical change in an employee that could affect respirator fit. For example, you may observe, or be told about, facial scarring, dental changes, cosmetic surgery, or obvious weight changes  
    ■ An employee notifies you, or your LHCP, that the respirator fit is unacceptable. During the retest, you must give an employee reasonable opportunity to select a different respirator facepiece (size, model, etc.).

Note: You may accept a fit test completed by a previous employer IF:

• You obtain written documentation of the fit test  
AND  
• The results of the fit test are not more than twelve months old  
AND  
• The employee will use the same respirator (the same type, model, style, and size)  
AND  
• The fit test was conducted in a way that meets the requirements of WAC 296-842-150 and 296-842-22010.

You must:  

• Select an appropriate fit-testing procedure from WAC 296-842-22010 of this chapter AND:  
  – Use quantitative fit-testing methods when a negative pressure respirator will be used in concentrations requiring a protection factor greater than 10. This includes:  
    ■ Full facepiece air-purifying respirators  
    ■ SCBAs operated in demand (negative pressure) mode  
    ■ Air-line respirators operated in demand mode.  
  – Make sure PAPRs, SCBAs, or air-line respirators are fit tested in negative-pressure mode.  
  – Make sure the person conducting fit testing is able to do ALL of the following:  
    ■ Prepare test solutions if required  
    ■ Make sure equipment works properly  
    ■ Perform tests properly  
    ■ Recognize invalid tests  
    ■ Calculate fit factors properly if required.

Note: • No specific training program or certification is required for those who conduct fit tests.  
• You should consider evaluating these individuals to determine their proficiency in the fit-testing method to be used.  
• You can use an evaluation form such as the form included in the American National Standard for Respirator Fit Testing Methods, ANSI/AIHA Z88.10-2001 to determine if the individual meets these requirements. Visit www ANSI.org or www AIHA.org.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-15005, filed 10/1/03, effective 1/1/04.]
WAC 296-842-160 Training.
Your responsibility:
To make sure employees who are required to use respirators understand and can demonstrate proper respirator use and maintenance.

IMPORTANT:
This section applies to employees who voluntarily use respirators only when training is necessary to prevent the respirator from creating a hazard. See WAC 296-842-110 for voluntary use requirements.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-20-114, § 296-842-160, filed 10/1/03, effective 1/1/04.]

WAC 296-842-16005 Provide effective training.
You must:
• Train employees, based on their duties, if they do any of the following:
  – Use respirators
  – Supervise respirator users
  – Issue, repair, or adjust respirators
• Present effective training in a way that employees understand.

Note:
• Training may be provided using audiovisuals, slide presentations, formal classroom instruction, informal discussions during safety meetings, training programs conducted by outside sources, or a combination of these methods.
• You may want to have instructors available when using video or automated training methods to:
  – Encourage and provide responses to questions for the benefit of employees
  – Evaluate employees' understanding of the material
  – Provide other instructional interaction to employees.

You must:
• Make sure a qualified instructor provides training
• Provide training, at no cost to the employee, at these times:
  – Initially, before worksite respirator use begins
  – Periodically, within twelve months of the previous training
• Additionally, when the following occur:
  ■ The employee has not retained knowledge or skills
  OR
  ■ Changes in the worksite, or type of respirator make previous training incomplete or obsolete.

Note:
• You may accept an employee's previous training, such as training provided by another employer, to satisfy the initial training requirement if:
  – You can demonstrate the employee received training within the past twelve months
  AND
  – The employee can demonstrate the knowledge and skills to use required respirators effectively.
• If you accept an employee's previous training to satisfy the initial training requirement, you are still responsible for providing periodic, and additional training when needed. Periodic training would need to be provided within twelve months of the employee's previous training.

You must:
• Make sure employees can demonstrate the following knowledge and skills as required by their duties:
  – Why the respirator is necessary. Include, for example, information identifying respiratory hazards such as hazardous chemicals, the extent of the employee's exposure, and potential health effects and symptoms
  – The respirator's capabilities and limitations. Include, for example, how the respirator provides protection and why air-purifying respirators cannot be used in oxygen-deficient conditions
  – How improper fit, use, or maintenance can compromise the respirator's effectiveness and reliability
  – How to properly inspect, put on, seal check, use, and remove the respirator
  – How to clean, disinfect, repair, and store the respirator, or how to get this done by someone else
  – How to use the respirator effectively in emergency situations; including what to do when a respirator fails and where emergency respirators are stored
  – Medical signs and symptoms that may limit or prevent the effective use of respirators such as shortness of breath or dizziness
  – The employer's general obligations under this chapter. For example, developing a written program, selecting appropriate respirators, and providing medical evaluations.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-20-114, § 296-842-16005, filed 10/1/03, effective 1/1/04.]

WAC 296-842-170 Maintenance.
Your responsibility:
To make sure respirators are maintained so they will function properly and not create health hazards such as skin irritation.

You must:
Maintain respirators in a clean and reliable condition
WAC 296-842-17005
Store respirators properly
WAC 296-842-17010
Inspect and repair respirators
WAC 296-842-17015

IMPORTANT:
This section applies to employees who voluntarily use respirators only when maintenance is necessary to prevent the respirator from creating a hazard. See WAC 296-842-110 for voluntary use requirements.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-20-114, § 296-842-170, filed 10/1/03, effective 1/1/04.]

WAC 296-842-17005 Maintain respirators in a clean and reliable condition.
You must:
• Make sure respirators are kept, at no cost to the employee, clean, sanitary and in good working order. Do at least the following:
  – Clean and disinfect respirators as often as specified in Table 8 of this section.

Note:
• Use required cleaning and disinfecting procedures in WAC 296-842-22015, or the manufacturer's procedures that:
  – Result in a clean and sanitary respirator
  – Do not damage the respirator
  – Do not harm the user
  • Automated cleaning and disinfecting are permitted
  • Cleaning and disinfecting may be done by a central facility as long as you make sure respirators provided are clean, sanitary, and function properly.

You must:
• Make sure respirators are assembled properly after cleaning or disinfecting.

(2005 Ed.)

[Title 296 WAC—p. 2995]
Use Table 8 to determine how often to clean and disinfect respirators.

Table 8
Required Frequencies for Cleaning and Disinfecting Respirators

<table>
<thead>
<tr>
<th>If, the respirator will be . . .</th>
<th>Then, clean and disinfect the respirator . . .</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Used exclusively by one employee</td>
<td>• As often as needed to:</td>
</tr>
<tr>
<td></td>
<td>– Keep it clean and functional AND</td>
</tr>
<tr>
<td></td>
<td>– To prevent health hazards such as skin irritation</td>
</tr>
<tr>
<td>• Shared for nonemergency use OR</td>
<td>• Before it is worn by another employee</td>
</tr>
<tr>
<td>• Used for fit-testing or training</td>
<td></td>
</tr>
<tr>
<td>• Shared for emergency use</td>
<td>• After each use so the respirator is immediately ready for use at all times</td>
</tr>
</tbody>
</table>

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-17005, filed 10/1/03, effective 1/1/04.]

WAC 296-842-17010 Store respirators properly.
You must:
• Store respirators to protect them from ALL of the following:
  – Deformation of the facepiece or exhalation valve
  – Sunlight or extreme temperatures or other conditions
  – Contamination such as dust or damaging chemicals
  – Excessive moisture.

Note: Use coffee cans, sealable plastic bags, or other suitable means of protection.

You must:
• Follow these additional requirements for emergency respirators:
  – Keep respirators accessible to the work area
  – Store respirators in compartments or with covers clearly marked as containing emergency respirators
  – Follow additional storage instructions from the respirator manufacturer
  – Store an adequate number of emergency respirators in each area where they may be needed.

Note: Emergency respirators include mouthpiece respirators and other respirators that are limited to escape-only use by their NIOSH certification.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-17010, filed 10/1/03, effective 1/1/04.]

WAC 296-842-17015 Inspect and repair respirators.
You must:
• Conduct respirator inspections as often as specified in Table 9.
• Make sure respirator inspections cover ALL of the following:
  – Respirator function
  – Tightness of connections
  – The condition of the facepiece, head straps, valves, connecting tubes, and cartridge, canisters or filters
  – Pliability and deterioration of elastomeric parts
  – Maintenance of air or oxygen cylinders
  – Making sure SCBA air cylinders are at ninety percent of the manufacturer's recommended pressure level
  – Proper functioning of SCBA regulators when air-flow is activated
  – Proper functioning of SCBA low-pressure warning devices when activated
  • Certify inspections for emergency respirators by documenting the following:
    – Inspection date
    – Serial number of each respirator or other identifying information
    – Inspector’s name or signature
    – Inspection findings
    – Required action, if problems are found.

Note:
• When documenting inspections you may either:
  – Provide the information on a tag or label and attach it to the respirator compartment
  OR
  – Include the information in an inspection report stored in paper or electronic files accessible to employees.

You must:
• Repair or replace any respirator that is not functioning properly before the employee returns to a situation where respirators are required.
  – If respirators fail inspection or are not functioning properly during use due to problems such as leakage, vapor or gas breakthrough, or increased breathing resistance, ALL of the following apply:
    ■ Do NOT permit such respirators to be used until properly repaired or adjusted
    ■ Use only NIOSH-certified parts
    ■ Make sure repairs and adjustments are made by appropriately trained individuals
    – Use the manufacturer or a technician trained by the manufacturer to repair or adjust reducing and admission valves, regulators, and warning devices on SCBAs or air-line respirators.
    ■ Follow the manufacturer's recommendations and specifications for the type and extent of repairs.

Use Table 9 to determine how often to inspect respirators.

Table 9
Required Frequencies for Respirator Inspections

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-17015, filed 10/1/03, effective 1/1/04.]

**WAC 296-842-180 Safe use and removal of respirators.**

**Your responsibility:**
To make sure respirator use and removal is safe.

**Exemption:** These sections do NOT apply to employees who voluntarily use any type of respirator. See WAC 296-842-110 for voluntary use requirements.

**You must:**
- Prevent sealing problems with tight-fitting respirators
- WAC 296-842-18005
  - Make sure employees leave the use area before removing respirators
    - WAC 296-842-18010.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-180, filed 10/1/03, effective 1/1/04.]

**WAC 296-842-18005 Prevent sealing problems with tight-fitting respirators.**

**You must:**
- Make sure employees use the procedure in WAC 296-842-22020 to perform a user seal check each time they put on their tight-fitting respirator.
- Make sure you do NOT permit respirator use if employees have a characteristic that interferes with the respirator facepiece seal or valve function. For example, stubble, mustaches, sideburns, bangs, hairlines, or scars between the face and the sealing surface of the respirator will affect the seal.
- Make sure corrective glasses or personal protective equipment (PPE) do NOT interfere with the facepiece seal. Examples of PPE include safety glasses, goggles, face-shields, clothing, and hard hats.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-18005, filed 10/1/03, effective 1/1/04.]

**WAC 296-842-18010 Make sure employees leave the use area before removing respirators.**

**You must:**
- Make sure employees leave the use area for any of these reasons:
  - To replace air-purifying filters, cartridges, or canisters
  - When they smell or taste (detect) vapor or gas leakage from, for example, cartridges, canister, or the facepiece seal
  - When they detect changes in breathing resistance
  - To readjust their respirators
  - To wash their faces and respirators as necessary to prevent skin or eye irritation
  - If they become ill
  - If they experience sensations of dizziness, nausea, weakness, breathing difficulty, coughing, sneezing, vomiting, fever, or chills.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-18010, filed 10/1/03, effective 1/1/04.]

**WAC 296-842-190 Standby requirements for immediately dangerous to life or health (IDLH) conditions.**

**Your responsibility:**
To provide adequate assistance to employees using respirators in conditions immediately dangerous to life or health (IDLH).

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-190, filed 10/1/03, effective 1/1/04.]

**WAC 296-842-19005 Provide standby assistance in immediately dangerous to life or health (IDLH) conditions.**

**IMPORTANT:**
WISHA currently uses the IDLH values in the 1990 NIOSH Pocket Guide to Chemical Hazards to determine the existence of IDLH conditions. You may use more recent editions of this guide. Visit www.cdc.gov/niosh for more information.

**You must:**
- Provide at least two standby employees outside the IDLH area.

**Note:** You need only one standby employee if the IDLH condition is well characterized, will remain stable and you can show one employee can adequately do ALL of the following:
  - Monitor employees in the IDLH area
  - Implement communication
  - Initiate rescue duties.
- Train and equip standby employees to provide effective emergency rescue. Equip them with:
  - A pressure-demand SCBA or a pressure-demand air-line respirator with an auxiliary SCBA, for each standby employee
  - Appropriate retrieval equipment, when it would help with the effective rescue of the entrant, or an equivalent means of rescue
  - Make sure standby employees maintain visual, voice, or signal line communication with employees in the IDLH area
  - Make sure that in the event of an emergency:
    - Standby employees notify you or your designee before they enter the IDLH area to provide emergency rescue
    - You provide necessary assistance when notified.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-19005, filed 10/1/03, effective 1/1/04.]

**WAC 296-842-200 Air quality for self-contained breathing apparatus (SCBA) and air-line respirators.**

**Your responsibility:**
To provide employees who use SCBAs or air-line respirators with an acceptable air supply.

**You must:**
- Make sure breathing air and oxygen meet established specifications
- WAC 296-842-20005 Prevent conditions that could create a hazardous breathing air supply
  - WAC 296-842-20010
  - Make sure compressors do not create a hazardous breathing air supply
  - WAC 296-842-20015.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-200, filed 10/1/03, effective 1/1/04.]

(2005 Ed.)

[Title 296 WAC—p. 2997]
WAC 296-842-20005 Make sure breathing air and oxygen meet established specifications.

You must:
- Make sure that all SCBAs and air-line respirators are provided with safe breathing air and oxygen according to the following:
  - Compressed breathing air must meet the following specifications for Grade D air:
    - Oxygen (volume/volume) within 19.5–23.5% 
    - Hydrocarbon (condensed): NO MORE than five milligrams per cubic meter of air 
    - Carbon monoxide (CO): NO MORE than ten parts per million (ppm)
    - Carbon dioxide (CO2): NO MORE than 1,000 ppm
    - No noticeable odor 
  - Compressed air leaves residues containing hydrocarbons such as oil or grease. Fire or explosion can occur if compressed oxygen makes contact with these residues.
  - Make sure the moisture content of the air supplied meets the following:
    - Air supplied to respirators from cylinders must NOT exceed a dew point of -50°F (or -45.6°C) at 1 atmospheric pressure.
  - Compressor supplied air must NOT exceed a dew point of 10°F (or 5.6°C) BELOW the use temperature at 1 atmospheric pressure.
  - Cylinders obtained from a supplier of breathing air must have a certificate of analysis that verifies each cylinder's contents meet Grade D and dew point standards.
  - Compressed and liquid oxygen must meet the United States Pharmacopoeia requirements for medical or breathing oxygen.
  - Make sure that all SCBAs and air-line respirators are tested and maintained as described in the federal Department of Transportation's (DOT) Shipping Container Specification Regulations, Title 49 CFR Parts 173 and 178.

Note:
- Use only cylinders marked (with serial number, cylinder pressure, DOT exemption number, and test dates) according to these DOT regulations

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-20005, filed 10/1/03, effective 1/1/04.]

WAC 296-842-20010 Prevent conditions that could create a hazardous breathing air supply.

You must:
- Use SCBA and air-line respirators safely:
  - Do NOT supply compressed oxygen to SCBAs or air-line respirators that previously used compressed air.
  - Use equipment specifically designed for oxygen service or distribution IF oxygen concentrations greater than 23.5% are used.

Note:
- Compressed air leaves residues containing hydrocarbons such as oil or grease. Fire or explosion can occur if compressed oxygen makes contact with these residues.
- Respiratory equipment NOT designed for oxygen service or distribution can create fire or explosion hazards in oxygen concentrations higher than 23.5%.

You must:
- Make sure breathing air from compressors does NOT exceed ten parts per million (ppm).

Note:
- You may need to reposition or extend the compressor's intake or engine exhaust pipe or outlet, especially if they are located near each other.
- Be aware that exhaust gases may not adequately disperse when the compressor is operated in:
  - An enclosed space such as a small room, a corner, or near a wall
  - In turbulent wind conditions.

You must:
- Use equipment specifically designed for oxygen service or distribution.
- Respiratory equipment must be used according to the manufacturer's instructions.
- Respirators used with ambient-air movers must be approved by NIOSH to operate within the pressure ranges of the air mover.

You must:
- Locate or modify compressor intakes so they will not pick up contaminated air or exhaust gases such as carbon monoxide from:
  - Fuel-powered vehicles
  - The internal combustion motor of the compressor
  - Other contaminant sources in the area, for example, a ventilation system discharge.

Note:
- You may need to reposition or extend the compressor's intake or engine exhaust pipe or outlet, especially if they are located near each other.
- Be aware that exhaust gases may not adequately disperse when the compressor is operated in:
  - An enclosed space such as a small room, a corner, or near a wall
  - In turbulent wind conditions.

You must:
- Periodically change or clean them according to the manufacturer or supplier's instructions.
- Keep a tag at the compressor with the following information:
  - When the sorbent and filters were last replaced or cleaned
  - The date of the most recent changes or cleaning
  - The signature of the person authorized by the employer to perform changes or cleaning.

Note:
- To be sure you are providing the recommended operating pressure for respirators, you may need to install a delivery pressure gauge at the point where the manifold where the respirator hose is attached.

You must:
- Make sure the carbon monoxide (CO) level in breathing air from compressors does NOT exceed ten parts per million (ppm).

Note:
- Use continuous and effective carbon monoxide alarms and filters
- Conduct frequent monitoring of air quality
Respirators

Follow procedures established for cleaning and disinfecting respirators
WAC 296-842-22015
Follow procedures established for seal checking respirators
WAC 296-842-22020.

WAC 296-842-22005 Use this medical questionnaire for medical evaluations.

You must:
• Use the medical questionnaire in Table 10 when conducting medical evaluations.

Note:
• You may use a physical exam instead of this questionnaire if the exam covers the same information as the questionnaire.
• You may use on-line questionnaires if the questions are the same and the requirements in WAC 296-842-140 of this chapter are met.
• You may choose to send the questionnaire to the LCHP ahead of time, giving time to review it and add any necessary questions.
• The LHCP determines what questions to add to the questionnaire, if any; however, questions in Parts 1-3 may not be deleted or substantially altered.

Table 10

WISHA Medical Evaluation Questionnaire

Employer instructions:
• You must use on-line questionnaires if the requirements in WAC 296-842-14005 are met.
• You must tell your employee how to deliver or send the completed questionnaire to the health care provider you have selected.
• You must NOT review employees’ questionnaires.

Health care provider’s instructions:
• Review the information in this questionnaire and any additional information provided to you by the employer.
• You may add questions to this questionnaire at your discretion; HOWEVER, questions in Parts 1-3 may not be deleted or substantially altered.
• Follow-up evaluation is required for any positive response to questions 1-8 in Part 2, or questions 1-6 in Part 3. This might include: Phone consultations to evaluate positive responses, medical tests, and diagnostic procedures.
• When your evaluation is complete, send a copy of your written recommendation to the employer AND employee.

Employee information and instructions:
• Your employer must allow you to answer this questionnaire during normal working hours, or at a time and place that is convenient to you.
• Your employer or supervisor must not look at or review your answers at any time.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-220, filed 10/1/03, effective 1/1/04.]

WAC 296-842-21005 Keep labels readable on respirator filters, cartridges, and canisters during use.

You must:
• Make sure the NIOSH certification labeling and color-coding on air-purifying respirator filters, cartridges, and canisters remains readable and intact during use.

Link: Color-coding specifications for manufacturers can be found in Title 42 CFR, Part 84. Visit www.cdc.gov/niosh.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-21005, filed 10/1/03, effective 1/1/04.]

WAC 296-842-220 Required procedures for respiratory protection program.

Your responsibility:
To use the procedures and questionnaire provided in this section when implementing your respiratory protection program.

You must:
• Use this medical questionnaire for medical evaluations WAC 296-842-22005
• Follow these fit-testing procedures for tight-fitting respirators WAC 296-842-22010

(2005 Ed.)
### Part 1 - Employee Background Information

1. **Today's date:**

2. **Your name:**

3. **Your age (to nearest year):**

4. **Sex (circle one):** Male / Female

5. **Your height:** __________ ft. __________ in.

6. **Your weight:** __________ lbs.

7. **Your job title:**

8. **A phone number where you can be reached by the health care professional who reviews this questionnaire (include Area Code):**

9. **The best time to call you at this number:**

10. **Has your employer told you how to contact the health care professional who will review this questionnaire?** Yes / No

11. **Check the type of respirator(s) you will be using:**
   - a. _____ N, R, or P filtering-facepiece respirator (for example, a dust mask, or an N95 filtering-facepiece respirator)
   - b. Check all that apply.
   - [ ] Half mask
   - [ ] Full facepiece mask
   - [ ] Helmet hood
   - [ ] Escape
   - [ ] Nonpowered cartridge or canister
   - [ ] Powered air-purifying cartridge respirator (PAPR)
   - [ ] Supplied-air or Air-line
   - [ ] Self contained breathing apparatus (SCBA)
   - [ ] Demand or [ ] Pressure demand
   - [ ] Other:

12. **Have you previously worn a respirator?** Yes / No

   If "yes," describe what type(s):

### Part 2 - General Health Information

1. **Do you currently smoke tobacco, or have you smoked tobacco in the last month?** Yes / No

2. **Have you ever had any of the following conditions?**
   - a. Seizures (fits):
   - b. Diabetes (sugar disease):
   - c. Allergic reactions that interfere with your breathing:
   - d. Claustrophobia (fear of closed-in places):
   - e. Trouble smelling odors:
   - f. Asthma:
   - g. Chronic bronchitis:
   - h. Emphysema:
   - i. Pneumonia:
   - j. Tuberculosis:
   - k. Silicosis:
   - l. Pneumothorax (collapsed lung):
   - m. Lung cancer:
   - n. Broken ribs:
   - o. Any chest injuries or surgeries:
   - p. Any other lung problem that you have been told about:
   - q. Do you currently have any of the following symptoms of pulmonary or lung illness?
   - r. Shortness of breath:
   - s. Shortness of breath when walking fast on level ground or walking up a slight hill or incline:
   - t. Shortness of breath when walking with other people at an ordinary pace on level ground:
   - u. Have to stop for breath when walking at your own pace on level ground:
   - v. Shortness of breath when washing or dressing yourself:
   - w. Shortness of breath that interferes with your job:
   - x. Coughing that produces phlegm (thick sputum):
   - y. Coughing that wakes you early in the morning:
   - z. Coughing that occurs mostly when you are lying down:
   - a. Coughing up blood in the last month:
   - b. Wheezing:
   - c. Wheezing that interferes with your job:
m. Chest pain when you breathe deeply: 

<table>
<thead>
<tr>
<th>Yes</th>
<th>No</th>
</tr>
</thead>
</table>

n. Any other symptoms that you think may be related to lung problems: 

<table>
<thead>
<tr>
<th>Yes</th>
<th>No</th>
</tr>
</thead>
</table>

5. Have you ever had any of the following cardiovascular or heart problems? 

| a. Heart attack: | Yes | No |
| b. Stroke: | Yes | No |
| c. Angina: | Yes | No |
| d. Heart failure: | Yes | No |

| e. Swelling in your legs or feet (not caused by walking): | Yes | No |
| f. Heart arrhythmia (heart beating irregularly): | Yes | No |
| g. High blood pressure: | Yes | No |

h. Any other heart problem that you have been told about: 

| Yes | No |

6. Have you ever had any of the following cardiovascular or heart symptoms? 

| a. Frequent pain or tightness in your chest: | Yes | No |
| b. Pain or tightness in your chest during physical activity: | Yes | No |
| c. Pain or tightness in your chest that interferes with your job: | Yes | No |
| d. In the past 2 years, have you noticed your heart skipping or missing a beat: | Yes | No |
| e. Heartburn or indigestion that is not related to eating: | Yes | No |
| f. Any other symptoms that you think may be related to heart or circulation problems: | Yes | No |

7. Do you currently take medication for any of the following problems? 

| a. Breathing or lung problems: | Yes | No |
| b. Heart trouble: | Yes | No |
| c. Blood pressure: | Yes | No |
| d. Seizures (fits): | Yes | No |

8. If you have used a respirator, have you ever had any of the following problems? (If you have never used a respirator, check the following space and go to question 9:) 

| a. Eye irritation: | Yes | No |
| b. Skin allergies or rashes: | Yes | No |
| c. Anxiety: | Yes | No |
| d. General weakness or fatigue: | Yes | No |
| e. Any other problem that interferes with your use of a respirator? | Yes | No |

9. Would you like to talk to the health care professional who will review this questionnaire about your answers? 

| Yes | No |

---

**Part 3 - Additional Questions for Users of Full-Facepiece Respirators or SCBAs**

**Please circle "Yes" or "No"**

1. Have you ever lost vision in either eye (temporarily or permanently)? 

| Yes | No |

2. Do you currently have any of these vision problems? 

| a. Need to wear contact lenses: | Yes | No |
| b. Need to wear glasses: | Yes | No |
| c. Color blindness: | Yes | No |
| d. Any other eye or vision problem: | Yes | No |

3. Have you ever had an injury to your ears, including a broken ear drum? 

| Yes | No |

4. Do you currently have any of these hearing problems? 

| a. Difficulty hearing: | Yes | No |
| b. Need to wear a hearing aid: | Yes | No |
| c. Any other hearing or ear problem: | Yes | No |

5. Have you ever had a back injury? 

| Yes | No |

6. Do you currently have any of the following musculoskeletal problems? 

| a. Weakness in any of your arms, hands, legs, or feet: | Yes | No |
| b. Back pain: | Yes | No |
| c. Difficulty fully moving your arms and legs: | Yes | No |
| d. Pain or stiffness when you lean forward or backward at the waist: | Yes | No |
| e. Difficulty fully moving your head up or down: | Yes | No |
| f. Difficulty fully moving your head side to side: | Yes | No |
| g. Difficulty bending at your knees: | Yes | No |
| h. Difficulty squatting to the ground: | Yes | No |
| i. Climbing a flight of stairs or a ladder carrying more than 25 lbs: | Yes | No |
| j. Any other muscle or skeletal problem that interferes with using a respirator: | Yes | No |

---

**Part 4 - Discretionary Questions**

**Complete questions in this part ONLY IF your employer's health care provider says they are necessary**

1. In your present job, are you working at high altitudes (over 5,000 feet) or in a place that has lower than normal amounts of oxygen? 

| Yes | No |
If "yes," do you have feelings of dizziness, shortness of breath, pounding in your chest, or other symptoms when you are working under these conditions: Yes / No

2. Have you ever been exposed (at work or home) to hazardous solvents, hazardous airborne chemicals (such as gases, fumes, or dust), or have you come into skin contact with hazardous chemicals? Yes / No

3. Have you ever worked with any of the materials, or under any of the conditions, listed below:
   a. Asbestos? Yes / No
   b. Silica (for example, in sandblasting)? Yes / No
   c. Tungsten/cobalt (for example, grinding or welding this material)? Yes / No
   d. Beryllium? Yes / No
   e. Aluminum? Yes / No
   f. Coal (for example, mining)? Yes / No
   g. Iron? Yes / No
   h. Tin? Yes / No
   i. Dusty environments? Yes / No
   j. Any other hazardous exposures? Yes / No

If "yes," describe these exposures: ____________________________

4. List any second jobs or side businesses you have: ____________________________

5. List your previous occupations: ____________________________

6. List your current and previous hobbies: ____________________________

7. Have you been in the military services? Yes / No

If "yes," were you exposed to biological or chemical agents (either in training or combat)? Yes / No

8. Have you ever worked on a HAZMAT team? Yes / No

9. Other than medications for breathing and lung problems, heart trouble, blood pressure, and seizures mentioned earlier in this questionnaire, are you taking any other medications for any reason (including over-the-counter medications)? Yes / No

If "yes," name the medications if you know them: ____________________________

10. Will you be using any of the following items with your respirator(s)?
    a. HEPA filters: Yes / No
    b. Canisters (for example, gas masks): Yes / No
    c. Cartridges: Yes / No

11. How often are you expected to use the respirator(s)?
    a. Escape-only (no rescue): Yes / No
    b. Emergency rescue only: Yes / No
    c. Less than 5 hours per week: Yes / No
    d. Less than 2 hours per day: Yes / No
    e. 2 to 4 hours per day: Yes / No
    f. Over 4 hours per day: Yes / No

12. During the period you are using the respirator(s), is your work effort:
    a. Light (less than 200 kcal per hour): Yes / No

If "yes," how long does this period last during the average shift: ______ hrs. ______ mins.

Examples of a light work effort are sitting while writing, typing, drafting, or performing light assembly work; or standing while operating a drill press (1-3 lbs.) or controlling machines.

b. Moderate (200 to 350 kcal per hour): Yes / No

If "yes," how long does this period last during the average shift: ______ hrs. ______ mins.

Examples of moderate work effort are sitting while nailing or filing; driving a truck or bus in urban traffic; standing while drilling, nailing, performing assembly work, or transferring a moderate load (about 35 lbs.) at trunk level; walking on a level surface about 2 mph or down a 5-degree grade about 3 mph; or pushing a wheelbarrow with a heavy load (about 100 lbs.) on a level surface.

c. Heavy (above 350 kcal per hour): Yes / No

If "yes," how long does this period last during the average shift: ______ hrs. ______ mins.

Examples of heavy work are lifting a heavy load (about 50 lbs.) from the floor to your waist or shoulder; working on a loading dock; shoveling; standing while bricklaying or chipping castings; walking up an 8-degree grade about 2 mph; climbing stairs with a heavy load (about 50 lbs.).

13. Will you be wearing protective clothing and/or equipment (other than the respirator) when you are using your respirator? Yes / No

If "yes," describe this protective clothing and/or equipment: ____________________________

14. Will you be working under hot conditions (temperature exceeding 77°F): Yes / No
Follow these fit-testing procedures for tight-fitting respirators.

### IMPORTANT:
- This section contains procedural requirements that apply during actual fit testing.
- See WAC 296-842-150 of this chapter for fit-testing requirements that apply to your overall program.

### Exemptions:
This section does NOT apply to employees who:
- Voluntarily use respirators
- OR
- Are required to use mouthpiece respirators.

### You must:
- Conduct fit testing according to all of the following:
  - Follow the procedure in Table 11 to choose a respirator for fit testing:

  | Prior to conducting fit tests AND |
  | Any time your employee must select a different respirator such as when a previously selected respirator fails a test Select and follow at least one of the following fit test procedures: Qualitative fit-test procedures: |
  | Isoamyl acetate vapor (IAA, banana oil) in Table 12 |
  | Saccharine aerosol in Table 13 |
  | Bitrex™ aerosol in Table 14 |
  | Irritant smoke in Table 15 |
  | Quantitative fit-test procedures: |
  | Ambient aerosol condensation nuclei counter such as the Portacount™ in Table 16 |
  | Controlled negative pressure (CNP) such as the Fit-Tester 3000™ in Table 17 |
  | Generated aerosol in Table 18 |
  | Make sure employees perform the appropriate fit-test exercises listed in Table 19. |
  | Clean and maintain equipment according to the manufacturer’s instructions. |
  | Make sure during fit testing employees wear any safety equipment that could: Interfere with respirator fit |
  | Be worn in the workplace. For example, chemical splash goggles. |
  | Check, prior to fit testing, for conditions that may interfere with the respirator seal or valve functions. If you find such conditions, do NOT conduct fit testing for that individual. |
  | Examples of conditions that may interfere with the respirator seal or valve functions include: |
  | Moustache, stubble, sideburns, bangs, hairline, and other types of facial hair in areas where the respirator facepiece seals or that interfere with valve function |
  | Temple bars of corrective eyewear or headgear that extend through the face seal area. |

### Note:
This instruction does NOT take the place of the employee's formal training since it is only a review.

### Procedure for Choosing a Respirator for Fit Testing

1. **Inform** the employee:
   - To choose the most comfortable respirator that provides an adequate fit
   - That each respirator sample represents a different size and, if more than one model is supplied, a different shape
   - That if fitted and used properly, the respirator chosen will provide adequate protection

2. **Provide** a mirror and show the employee how to:
   - Put on the respirator
   - Position the respirator on the face
   - Set strap tension.

(2005 Ed.)
Procedure for Choosing a Respirator for Fit Testing

- Choose which facepiece is most acceptable and which are less acceptable, if any.

**Note:**
- Supply as many respirator models and sizes as needed to make sure the employee finds a respirator that is acceptable and fits correctly.
- To save time later, during this step note the more acceptable facepieces in case the one chosen fails the fit test or proves unacceptable later.

5. **Have the employee wear** the most acceptable respirator for **AT LEAST** 5 minutes to evaluate comfort and fit. Do **ALL** of the following during this time:
   - Ask the employee to observe and comment about the comfort and fit:
     - Around the nose, cheeks, and other areas on the face
     - When talking or wearing eye protection
   - Have the employee put on the respirator and adjust the straps until they show proficiency
   - Evaluate the respirator's general fit by checking:
     - Proper chin placement
     - Properly tightened straps (do **NOT** over tighten)
     - Acceptable fit across the nose bridge
     - Respirator size; it must span the distance from nose to chin
     - To see if the respirator stays in position
   - Have the employee complete a successful seal check as specified in WAC 296-842-22025 of this chapter
   - Prior to the seal check they must settle the respirator on their face by taking a few slow deep breaths **WHILE SLOWLY:**
     - Moving their head from side-to-side **AND**
     - Up and down.

6. **If the employee finds the respirator unacceptable,** allow the employee to select another one and return to Step 5. Otherwise, proceed to Step 7.

7. **Before starting the fit test,** you must:
   - Describe the fit test including screening procedures, employee responsibilities, and test exercises **AND**
   - Make sure the employee wears the respirator **AT LEAST** five minutes.

### Table 12

<table>
<thead>
<tr>
<th>Isoamyl Acetate (Banana Oil) Vapor Test Procedure</th>
<th>Isoamyl Acetate (Banana Oil) Vapor Test Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Important:</strong></td>
<td>– Always use odor-free water, for example, distilled or spring water that is 25°C (77°F).</td>
</tr>
<tr>
<td>• This is a qualitative fit-test (QLFT) procedure</td>
<td>• Isoamyl acetate is also known as isopentyl acetate.</td>
</tr>
<tr>
<td>• The success of this test depends on preserving the employee's odor sensitivity to isoamyl acetate (IAA) vapor</td>
<td><strong>Screening Preparations</strong></td>
</tr>
<tr>
<td>– Vapor accumulations in ambient air can decrease odor sensitivity. To prevent this:</td>
<td><strong>Important:</strong> Odor threshold screening determines if the employee can detect weak concentrations of IAA vapor.</td>
</tr>
<tr>
<td>– Prepare <strong>ALL</strong> solutions in a location separate from screening and test areas</td>
<td>1. Choose an appropriate location to conduct screening.</td>
</tr>
<tr>
<td>– Conduct screening and tests in separate well-ventilated rooms. For example, use an exhaust fan or laboratory hood to prevent IAA vapor from accumulating in the room air</td>
<td>- Conduct screening and tests in separate well-ventilated rooms.</td>
</tr>
<tr>
<td></td>
<td>2. Prepare a stock solution <strong>AT LEAST</strong> weekly as follows:</td>
</tr>
<tr>
<td></td>
<td>- Add one milliliter (ml) of pure IAA to 800 ml of odor-free water in a one-liter glass jar with a metal lid using a measuring dropper or pipette</td>
</tr>
<tr>
<td></td>
<td>- Seal the jar with the lid and shake it for 30 seconds</td>
</tr>
<tr>
<td></td>
<td>- Clean the dropper or pipette.</td>
</tr>
<tr>
<td></td>
<td>3. Prepare the odor test solution daily as follows:</td>
</tr>
<tr>
<td></td>
<td>- Add 0.4 ml from the stock solution to 500 ml of water in a one liter glass jar with a metal lid using a clean pipette or dropper</td>
</tr>
<tr>
<td></td>
<td>- Seal the jar with the lid and shake it for 30 seconds</td>
</tr>
<tr>
<td></td>
<td>- Let this solution stand for 2-3 minutes so the IAA concentration above the liquid reaches equilibrium</td>
</tr>
</tbody>
</table>
| |   - Label this jar so you know the contents but the employee cannot know its contents, for example, "1."
| | **Note:** To maintain the integrity of the test, use labels that peel off easily **AND** periodically switch the labels. |
| | 4. Prepare a "test blank" solution as follows: |
| |   - Add 500 ml of odor-free water to a one liter glass jar with a metal lid |
| |   - Seal the jar |
| |   - Label the jar so you know the contents but the employee cannot know its contents. |
| | 5. Type or neatly print the following instructions on a card and place it on the table in front of the two test jars: |
| | "The purpose of this test is to find out if you can smell banana oil at a low concentration. While both jars contain water, one **ALSO** contains a small amount of banana oil. Make sure the lid is secure then pick up a jar and shake it for two seconds. Open the jar and sniff at the opening. Repeat this for the second jar. Tell the individual conducting the fit test which jar contains banana oil."
| **Test Preparations** |
| 6. Choose an appropriate location to conduct fit testing. |
|   - Conduct screening and tests in separate well-ventilated rooms. |
| 7. Assemble the fit test enclosure in the room. |
|   - Invert a clear 55-gallon drum liner over a circular 2-foot diameter frame made of plywood or other lightweight rigid material or construct a similar enclosure using plastic sheeting |
|   - Hang the frame with the plastic covering so the top of the enclosure is about six inches above the employee's head |
|   - Attach a small hook inside top center of the enclosure |
Isoamyl Acetate (Banana Oil) Vapor Test Procedure

• Tape a copy of the test exercises (see Table 28) to the inside of the test enclosure where the employee can read it.

8. Have organic vapor cartridges or equivalent on hand for each employee's chosen respirator.

9. Have ready a 6 x 5-inch piece of paper towel or other porous absorbent single-ply material AND 0.75 ml of pure IAA. Do NOT apply IAA yet.

Note:
As an alternative to using the paper towel, you may use an IAA test swab OR ampoule if it has been demonstrated to generate an equivalent test concentration.

Screening

10. Have the employee, while NOT wearing a respirator, follow the instructions on the card provided.

• If the employee correctly identifies the jar containing IAA, proceed to conduct testing (Step 11)
• If the employee is NOT able to correctly identify the jar containing IAA, you must STOP and use a different fit test protocol.

Test

11. BEFORE entering the fit test room, have the employee attach cartridges, put on, properly adjust, and seal check the respirator. Have the employee enter the test enclosure.

12. Wet the paper towel with 0.75 ml of pure IAA AND fold it in half.

13. Pass the paper towel to the employee inside the enclosure AND instruct the employee to hang it on the hook at the top of the enclosure.

14. Wait two minutes for the IAA vapor to fill the enclosure.

• While waiting, explain the fit test, including the purpose of the test exercises, the importance of cooperation, and that you must be informed if a banana-like odor is detected during the test.
• You may also demonstrate the test exercises.

15. Have the employee perform the appropriate fit-test exercises in Table 19.

• If the employee does NOT detect IAA while performing test exercises, the fit test has been PASSED. Proceed as follows:
  – BEFORE leaving the enclosure, have the employee break the respirator seal and inhale. If they detect IAA, the test is valid
  – When exiting the employee must remove the paper towel and give it to the individual conducting the fit test. This prevents IAA vapor from building up in the enclosure during subsequent tests
  – The individual conducting the fit test must keep used paper towels in a self-sealing plastic bag to prevent area contamination

• If the employee detects IAA during any test exercise, the fit test has FAILED. STOP and have the employee do the following:
  – Quickly return to the selection room to remove the respirator. This avoids decreasing the employee's odor sensitivity
  – Select another respirator
  – Repeat screening and testing

At this stage, if the employee fails the screening part of this procedure, the employee can repeat it AFTER waiting at least five minutes for odor sensitivity to return.

Table 13

Saccharin Aerosol Test Procedure

Screening Preparations

Important:
• This is a qualitative fit-test (QLFT) procedure
• Taste threshold screening determines whether the employee being tested can detect the taste of saccharin
  – The employee must NOT eat, smoke, chew gum or drink anything but plain water for at least fifteen minutes BEFORE the fit test. Sweet foods or drink consumed before the test may make the employee unable to detect saccharin during screening
  – Nebulizers must be thoroughly rinsed in water and shaken dry:
    ■ Each morning and afternoon
    OR
    ■ At least every four hours.
• You may use commercially prepared solutions if they meet the requirements in this procedure.

1. Obtain a test enclosure (hood) that meets the following specifications:

• Twelve inches in diameter by fourteen inches tall
• A clear front portion
• Enough space inside to allow free movement of the head when a respirator is worn
• A 3/4 inch (or 1.9 centimeter) hole to accommodate the nebulizer nozzle. The hole must line up in front of the wearer’s nose and mouth.

Note:
• An enclosure similar to the 3M hood assembly, parts #FT 14 and #FT 15 combined, meets these specifications
• This enclosure can also be used for testing.

2. Obtain and assemble two clean DeVilbiss Model 40 Inhalation Medication Nebulizers OR equivalent.

3. Prepare the screening solution as follows:

• Dissolve 830.0 milligrams of sodium saccharin USP in 100 ml of warm distilled water
  OR
• IF you have already prepared the fit-test solution, you can make the screening solution by adding 1 ml of this solution to 100 ml of distilled water.

4. Add about 1 ml of the screening solution to one of the nebulizers.

• Mark this nebulizer to distinguish it from the one to be used for fit testing.

Test Preparations

5. Prepare the fit-test solution as follows:

• Add 83.0 grams of sodium saccharin to 100 ml of warm water.

6. Add about 1 ml of the test solution to the second nebulizer.

• Mark this nebulizer to distinguish it from the one used for screening.
### Saccharin Aerosol Test Procedure

#### Screening Preparations

7. Have particulate filters ready for the employee's chosen respirator or have filtering-facepiece respirators ready.

#### Screening

8. Have the employee, while NOT wearing a respirator, put on the test enclosure.

9. Instruct the employee to:
   - Breath through a slightly open mouth with tongue extended during screening AND testing
   - Immediately report when a sweet taste is detected.

10. Insert the nebulizer into the front hole of the test enclosure AND administer saccharin as follows:
    - Direct the nozzle away from the employee's nose and mouth
    - Complete 10 squeezes in rapid succession
    - Each time firmly squeeze the bulb so it collapses completely, then release and allow it to fully expand.

11. Ask the employee if a sweet taste is detected.
    - If YES, screening is completed. Proceed to conduct testing, Step 14, AFTER you:
      - Ask the employee to remember the taste for reference during the fit test
      - Note the employee's taste threshold as "10" regardless of the number of squeezes actually completed
    - If NO, screening must continue. Proceed to Step 12.

12. Repeat with 10 more squeezes. Then follow Step 11 again; EXCEPT this time note the employee's taste threshold as "20" IF a sweet taste is reported.
    - If a sweet taste is still NOT detected, repeat with 10 more squeezes and follow Step 11 one last time; EXCEPT this time note "30" for the taste threshold IF a sweet taste is reported.

13. If NO sweet taste is reported after 30 squeezes, you must STOP and choose a different fit-test protocol for the employee.

### Test

#### Important!
- Periodically check nebulizers to make sure they do not clog during use. A test is NOT valid if the nebulizer is clogged at the end of the test.

14. Have the employee attach particulate filters, put on, properly adjust, and seal check the respirator. Have the employee put on the test enclosure (hood).

15. Instruct the employee to immediately report if a sweet taste is detected.

16. Insert the nebulizer into the front hole of the test enclosure AND administer the same number of squeezes, either 10, 20, or 30, as noted during screening.

17. Have the employee perform the appropriate fit-test exercises as described in Table 19. During this step:
   - Replenish the aerosol in the hood EVERY 30 seconds using 1/2 the number of squeezes used in Step 16, either 5, 10, or 15
   - The employee must report if a sweet taste is detected:
     - If NO saccharin is tasted, the test has been PASSED
     - If saccharin is tasted the test has FAILED, have the employee select another respirator

### Bitrex™ Aerosol Test Procedure

#### Important!
- This is a qualitative fit-test (QLFT) procedure
- Bitrex™ (denatonium benzoate) is routinely used as a taste aversion agent in household liquids that children should not drink and is endorsed by the American Medical Association, the National Safety Council, and the American Association of Poison Control Centers
- The employee must NOT eat, smoke, chew gum or drink anything but plain water for at least fifteen minutes BEFORE the fit test.

#### Screening Preparations

1. Obtain a test enclosure that meets the following specifications:
   - Twelve inches in diameter by fourteen inches tall
   - A clear front portion
   - Enough space inside the front to allow free movement of the head when a respirator is worn
   - 3/4 inch (or 1.9 centimeter) hole to accommodate the nebulizer nozzle. The hole must line up in front of the wearer's nose and mouth.

#### Note:
- An enclosure similar to the 3M hood assembly, parts #FT 14 and #FT 15 combined, meets these specifications
- This enclosure can also be used for testing.

2. Obtain and assemble two clean DeVilbiss Model 40 Inhalation Medication Nebulizers OR equivalent:

3. Prepare the screening solution as follows:
   - Make up a 5% salt solution by dissolving 5.0 grams of salt (sodium chloride) into 100 ml of distilled water
   - Dissolve 13.5 milligrams of Bitrex™ in the salt solution.

4. Add about 1 ml of the screening solution to one of the nebulizers.
   - Mark this nebulizer to distinguish it from the one to be used for fit testing.

#### Test Preparations

5. Prepare the fit test solution.
   - Dissolve 10.0 grams of salt (sodium chloride) into 200 ml of distilled water
   - Add 337.5 milligrams of Bitrex™ to the warmed salt solution.
### Bitrex™ Aerosol Test Procedure

6. Add about 1 ml of the test solution to the second nebulizer.  
   - Mark this nebulizer to distinguish it from the one used for screening.  
7. Have particulate filters ready for the employee's chosen respirator or have filtering-facepiece respirators ready.

#### Screening

**Important:**

The employee must **NOT** eat, smoke, chew gum or drink anything but plain water for at least fifteen minutes **BEFORE** the screening and test.

8. Have the employee, while **NOT** wearing a respirator, put on the test enclosure.

9. Instruct the employee to:
   - Breath through a slightly opened mouth with tongue extended during screening **AND** testing
   - Immediately report when a bitter taste is detected.

10. Insert the nebulizer into the front hole of the test enclosure **AND** administer Bitrex™ as follows:
   - Direct the nozzle away from the employee's nose and mouth
   - Complete 10 squeezes in rapid succession
   - Each time firmly squeeze the bulb so it collapses completely, then release and allow it to fully expand.

11. Ask the employee whether a bitter taste is detected.
   - **IF YES**, screening is completed. Proceed to conduct testing, Step 14, **AFTER** you:
     - Ask the employee to remember the taste for reference during the fit test
     - Note the employee's taste threshold as "10," regardless of the number of squeezes actually completed
   - **IF NO**, screening must continue. Proceed to Step 12.

12. Repeat with 10 more squeezes. Then follow Step 11 again; **EXCEPT** this time note the employee's taste threshold as "20" **IF** a bitter taste is reported.
   - **IF** a bitter taste is still **NOT** detected repeat with 10 more squeezes and follow Step 11 one last time; **EXCEPT** this time note "30" for the taste threshold **IF** a bitter taste is reported.

13. **IF NO** bitter taste is reported after 30 squeezes, you must **STOP** and choose a different fit-test protocol for the employee.

#### Test

14. Have the employee attach particulate filters, put on, properly adjust, and seal check the respirator. Have the employee put on the test enclosure.

15. Instruct the employee to:
   - Breathe through a slightly opened mouth with tongue extended during screening **AND** testing
   - Immediately report when a bitter taste is detected.

16. Insert the nebulizer into the front hole of the test enclosure **AND** administer the same number of squeezes, either 10, 20, or 30, as noted during screening.

17. Have the employee perform the appropriate fit-test exercises as described in Table 19. During this step:
   - Replenish the aerosol in the hood **EVERY** 30 seconds using 1/2 the number of squeezes used in Step 16, either 5, 10, or 15
   - The employee must report if a bitter taste is detected:

### Bitrex™ Aerosol Test Procedure

- **IF NO** Bitrex™ is tasted, the test has been **PASSED**
- **IF** Bitrex™ is tasted the test has **FAILED**. Have the employee:
  - Select another respirator
  - **AND**
  - Repeat all screening and testing steps.

### Irritant Smoke (Stannic Chloride) Test Procedure

#### Important:

**DO NOT USE A TEST ENCLOSURE OR HOOD FOR THIS FIT TEST!**

- This is a qualitative fit-test (QLFT) procedure
- **During this test an employee is exposed to irritating smoke containing hydrochloric acid produced by a stannic chloride ventilation smoke tube to detect leakage.** The smoke will irritate eyes, lungs, and nasal passages
- **Employee sensitivity varies, and certain employees may respond more intensely than others exposed to irritant smoke.** The individual conducting the fit test must take precautions to minimize the employees' exposure to irritant smoke
- Conduct fit testing in an area with adequate ventilation to prevent exposure of the individual conducting the fit test and build-up of irritant smoke in the ambient air.

#### Screening AND Test Preparations

**Important:**

Sensitivity screening is necessary to determine whether the employee can detect a weak concentration of irritant smoke **AND** whether any gross facepiece leakage is detected.

1. Obtain only stannic chloride (ventilation) smoke tubes, **AND** an aspirator squeeze bulb **OR** use a low-flow air pump set to deliver 200 milliliters of air flow per minute.

2. Equip the employee's chosen respirator with P100 series filters if a negative pressure air-purifying respirator will be tested. If a powered air-purifying respirator (PAPR) will be tested equip the respirator with high-efficiency particulate air (HEPA) filters.

#### Screening

**Important!**

When performing sensitivity screening checks use only the **MINIMUM** amount of smoke necessary to elicit a response from the employee.

3. Advise the employee that the smoke can be irritating to eyes, lungs, and nasal passages **AND** instruct the employee to keep eyes closed while exposed.

4. Break both ends of the ventilation smoke tube **AND** fit a short piece of plastic tubing, for example, two-to-six inches of tygon tubing, over one end to prevent exposure to the sharp end of the tube. Connect the other end to an aspirator bulb or a low-flow air pump set to deliver a flow of 200 ml per minute.

5. **While the employee is NOT wearing a respirator,** have the employee smell a weak concentration of irritant smoke to become familiar with its irritating properties.
   - Carefully direct a small amount of irritant smoke toward the employee.
Irritant Smoke (Stannic Chloride) Test Procedure

Test

6. Have the employee attach respirator filters, put on, adjust, and seal check the respirator without assistance. The employee must be proficient at these tasks.

7. Remind the employee to keep eyes closed during testing.

8. Direct a stream of irritant smoke toward the respirator's face seal area as follows:
   - Begin at least 12 inches from the facepiece AND move the smoke around the whole perimeter of the mask
   - Gradually make two more passes around the perimeter of the facepiece, moving to within 6 inches of the respirator
   - STOP at any time the employee detects smoke in the facepiece. If this occurs a different respirator will need to be chosen and tested, beginning with sensitivity screening.

9. Have the employee perform appropriate fit-test exercises in Table 19 IF the employee has NOT had an involuntary response such as evidence of coughing, flinching, or other response, OR detect smoke in the facepiece.
   - Continue to direct smoke from a distance of 6 inches around the facepiece perimeter
   - If smoke is detected at any time the test has FAILED. A different respirator must be chosen and tested, starting with sensitivity screening
   - If NO smoke is detected proceed to Step 10.

10. Have the employee remove the respirator AND perform another sensitivity screening check as follows:
    - Continue to use the smoke tube used for fit testing
    - Carefully direct a SMALL amount of irritant smoke toward the employee
    - The test has been PASSED IF the employee responds to the smoke
    - The fit test is VOIED IF the employee does NOT respond to the smoke.

Note:
- A probed respirator has a special fitting installed on the facepiece designed to connect with the end of the test instrument's plastic sampling tube so that air samples can be taken inside the facepiece. Probed respirators can be obtained from the respirator manufacturer, or distributor, AND can only be used for fit-testing purposes
- Contact TSI Inc., OR the respirator's manufacturer to obtain probed respirators or facepiece sampling adapters.

3. Follow the test instrument manufacturer's instructions for test preparation, including particle, zero, and system checks. Make sure the instrument's pass OR fail criterion is programmed to the following MINIMUM performance levels:
   - For half-facepiece respirators, an overall minimum fit factor of 100 as a passing level
   - For full-facepiece respirators, an overall minimum fit factor of 500 as a passing level

4. Have high-efficiency particulate air (HEPA) filters, OR other respirator filters available that are capable of preventing significant penetration by particles generated by the test instrument such as, P100 or N95 series filters.
   - If you will use a sampling adapter instead of probed respirators be sure to have the correct type for the respirators chosen.

5. Properly attach the sampling line to the facepiece probe or sampling adapter.

6. Have the employee attach respirator filters, put on, properly adjust, and wear the respirator five minutes BEFORE the fit test. During this time you and the employee must evaluate the respirator's general fit by checking:
   - Proper chin placement
   - Properly tightened straps (do NOT over tighten)
   - Acceptable fit across the nose bridge
   - Respirator size. It must span the distance from nose to chin
   - To see if the respirator stays in position.

Note:
Wearing the respirator for five minutes permits the employee to make certain the respirator is comfortable AND allows for purging of ambient particles trapped inside the facepiece.

7. Have the employee perform a seal check. Make sure the sampling line is crimped to avoid leakage during the seal check. If NO leakage is detected, proceed to Step 8. If leakage is detected:
   - Determine the cause
   - If leakage is due to a poorly fitting facepiece, have the employee:
     - Choose another respirator size or model
     - Start again at Step 6.

8. Start the fit test cycle
   - Follow the manufacturer's instructions for operating the test instrument
   - Have the employee perform the appropriate fit-test exercises in Table 19

Table 16

Ambient Aerosol Condensation Nuclei Counter (Portacount™) Test Procedure

Important:
- This is a quantitative (QNFT) fit-test procedure
- This method uses a particle counting instrument that measures and compares the particle concentration both inside and outside the respirator facepiece while the employee performs a series of test exercises
- Particles in the ambient air are used as the test aerosol.

Test Preparations

1. Obtain a test instrument such as a Portacount™.
2. Have probed respirators available for each respirator model and size the employer uses, OR have a sampling adapter available if the employee's actual or chosen respirator will be tested.
Controlled Negative Pressure (CNP) Test Procedure

Important!
- This is a quantitative fit-test (QNFT) procedure
- This method determines respirator fit by measuring how much the facepiece leaks when it is subject to a slight negative pressure AFTER various premeasurement activities
- Measurements occur while employees remain still AND hold their breath for 10 seconds
- No test aerosols are used. Respirator cartridges are not needed for this test.

Test Preparations
1. Make sure the individual conducting the fit test is thoroughly trained to perform this test.
2. Obtain a CNP test instrument such as a FitTester 3000™. Make sure:
   - Defaults are set at:
     - -15mm (-0.58 inches) of water test pressure
     AND
     - A modeled inspiratory flow rate of 53.8 liters per minute
   - It has an effective audio warning device that signals when employees fail to hold their breath.
   Note:
   - You are not required to obtain test recording and printing equipment such as computers OR printers.
   - Hand recording results is acceptable
   - To see default settings, check the instrument's "REDON protocol."
3. Obtain facepiece adapters appropriate for each test respirator.
   Note:
   - Adapters are either a one-piece (for SCBA facepieces), OR two-piece (for dual cartridge facepieces) device providing a manifold and breathing valve system. For positive pressure respirators, you will need to obtain an additional fitting, available from the respirator manufacturer, to convert the facepiece to negative pressure
   - To obtain adapters, contact the CNP instrument’s distributor, Occupational Health Dynamics, OR the respirator manufacturer.

Table 17

<tr>
<td></td>
<td>8. Turn on the instrument AND have the employee stand and perform the fit-test exercises in Table 19.</td>
</tr>
<tr>
<td></td>
<td>9. Interpret the test results:</td>
</tr>
<tr>
<td></td>
<td>• The test is PASSED IF the overall fit factor obtained is at least 100 for a half facepiece, or at least 500 for a full facepiece</td>
</tr>
<tr>
<td></td>
<td>• The test has FAILED IF the fit factor is less than 100 for a half facepiece; 500 for a full facepiece</td>
</tr>
<tr>
<td></td>
<td>– If the test has FAILED you must have the employee select another respirator model or size following the steps in Table 11 AND repeat this procedure, starting at Step 6.</td>
</tr>
</tbody>
</table>

---

Note:
If the test has failed, have the employee select another respirator model or size following Table 11 AND repeat this procedure.
# Generated Aerosol Test Procedure

## Important:
- This is a quantitative (QNFT) fit-test procedure
- In this method, a test aerosol is used to challenge the facepiece seal while aerosol concentrations inside and outside the facepiece are measured during test exercises
- Special equipment is needed to generate, disperse, detect, and measure test aerosols.

## Test Preparations

### 1. Test aerosol.
- Use a particulate, for example, corn oil, polyethylene glycol 400, di-2-ethyl hexyl sebacate, or sodium chloride.

### 2. Instrumentation.
- **Do ALL** the following:
  - Obtain and use aerosol generation, dilution, and measurement systems appropriate for particulates
  - Use an aerosol-generating instrument that will maintain test concentrations within a 10% variation
  - Select a sampling instrument that allows for a computer record or strip chart record to be created
    - The record must show the rise and fall of test agent concentration during each inhalation and exhalation at fit factors of at least 2000.
      - **Note:** Integrators, or computers that integrate the amount of test agent penetration leakage into the respirator for each exercise, may be used if a record of the readings is made.
  - Minimize the time interval between the activity and the recording of the activity so you can clearly connect what you see to what is being recorded. For example, use a small diameter and length of sampling line.

### 3. Test enclosure.
- **Do ALL** the following:
  - Make sure the enclosure is equipped and constructed to effectively:
    - Maintain a uniform concentration of the test agent inside the enclosure. For example, the enclosure must be large enough to allow ALL employees freedom of movement during testing **WITHOUT** disturbing the test concentration or measurement instrument
    - Keep the test agent from contaminating the air outside the enclosure. For example, use a HEPA filter to purify exhausted air
    - Allow the individual conducting the fit test to view the employee during the test
  - Make sure the tubing used to collect samples from the enclosure **AND** respirator is the same material, diameter, **AND** length. This makes the effect of aerosol loss caused by deposition in each sample line equal
  - If sodium chloride is used, relative humidity inside the enclosure must be kept below 50%.

### 4. Prepare test respirators.
- **Do ALL** the following:
  - Inspect test respirators regularly for missing parts **AND** damage
  - Keep test respirators in proper working order
  - Make sure in-mask sampling probes are:
    - Designed and installed so the air sample will be drawn from the employee's breathing zone; midway between the nose and mouth
    - The probe extends inside the facepiece at least 1/4 inch
  - Make sure sampling ports such as probes, or adapters on respirators are constructed and installed so they do **NOT**:
    - Block air flow into the sampling line
    - Leak
    - Interfere with the respirator's fit or performance
  - Have high efficiency particulate air (HEPA) filters **OR** P100 series filter available
    - Replace filters when increased breathing resistance is detected **OR** when the test agent has altered the filter material's integrity.

## Test

### Important!
- Throughout the test, maintain the employee's exposure to any test agent below the established exposure limit. Exposures allowed must be based on exposure time and exposure limit duration
- If a single peak penetration exceeds 5% for half facepieces **OR** 1% for full facepieces:
  - **STOP** the test
  - Have the employee select another respirator for testing.

### 5. Have the employee attach filters, put on, adjust, and seal check the respirator.
- Be sure to crimp the sampling line to avoid pressure leaks during the seal check
- **Have the employee adjust the respirator straps, without assistance, so the fit is comfortable. Do **NOT** over tighten.**
### Generated Aerosol Test Procedure

6. **OPTIONAL Step.** To save time conduct a screening test to quickly identify poorly fitting respirators.  
   **Note:**  
   You may use a qualitative screening test **OR** an ambient aerosol condensation nuclei counter instrument in the count mode.

7. Make sure test aerosol concentration is reasonably stable.  
   - If a canopy or shower curtain enclosure is used, determine stability of the test aerosol concentration **AFTER** the employee enters the enclosure.

8. Have the employee enter the test enclosure and connect the respirator to the sample lines.

9. Immediately after entering the enclosure measure test aerosol concentration inside the respirator.  
   - Make sure the peak penetration does **NOT** exceed 5% for half facepieces, **OR** 1% for full facepieces.

10. Have employee perform the appropriate fit-test exercises in Table 19.  
    - **Do NOT** adjust the respirator once exercises begin.

11. Calculate the overall fit factor as specified in Steps 12-13. The fit test is:  
    - **PASSED IF** the minimum fit factor of 100 for half facepieces **OR** 500 for full facepieces is obtained  
    - **OR**  
    - **IF** a passing fit factor is **NOT** obtained, the test has **FAILED** and you must have the employee select and test another respirator.

### Calculations

**Important!**  
- **Do NOT** count the grimace exercise measurements during these calculations  
- Take into account the limitations of instrument detection when determining fit factors.

12. Calculate individual fit factors for **EACH** exercise by applying the following:  
   **Exercise fit factor** (ffE) = Average test enclosure concentration  
   - To determine the average test enclosure concentration use one of the following methods:  
     - Arithmetic average of the concentration before and after each test (an average of two values per entire test)  
     - Arithmetic average of concentration before and after each exercise (an average of two values per exercise)  
     - True average measured continuously during the respirator sample  
   - Determine the test aerosol concentration inside the respirator in one of the following ways:  
     - Average peak penetration values. Determine aerosol penetration for each exercise by:  
       - Using integrators or computers that calculate the actual test agent penetration **OR**  
       - Average the peak heights shown on the strip chart recording, graph, or by computer integration  
     - Maximum peak penetration. Use strip chart recordings to determine the highest peak penetration for each exercise and use this value  
     - Area under the peaks. Use computerized integration or other appropriate calculations to integrate the area under individual peaks for each exercise.

13. Using individual exercise fit factors (ffE) calculate the **overall fit factor** by doing **ALL** of the following:  
   - Convert each exercise fit factor to a penetration value  
   - **Determine** the average penetration value  
   - Convert the average penetration value back to a fit factor  
   **OR**  
   Use this equation to calculate the **overall fit factor**:
   \[
   \text{Overall fit factor} = \frac{n}{1/\text{ffE}_1 + 1/\text{ffE}_2 + 1/\text{ffE}_3 \ldots + 1/\text{ffE}_n}
   \]

### Table 19

**Fit-Test Exercises**

**Important:**  
- This list applies when you use any fit test  
- Employees tested must perform **ALL** exercises marked with an "X" as described for the fit-test procedure used  
  - Once exercises begin, any adjustments made void the test **AND** you must begin again  
  - After test exercises are completed, you must ask the employee about the comfort of the respirator. If it has become unacceptable, have the employee choose another one for testing  
- **When** the controlled negative pressure procedure is used, **STOP and repeat** the test if the employee adjusts the respirator **OR** takes a breath and fails to hold it for 10 seconds
Controlled negative pressure tests conducted according to the method published in 29 CFR 1910.134, Appendix A are an acceptable alternative to the method outlined below.

</tbody>
</table>
1 The Rainbow Passage:
"When the sunlight strikes raindrops in the air, they act like a prism and form a rainbow. The rainbow is a division of white light into many beautiful colors. These take the shape of a long round arch, with its path high above, and its two ends apparently beyond the horizon. There is, according to legend, a boiling pot of gold at one end. People look, but no one ever finds it. When a man looks for something beyond reach, his friends say he is looking for the pot of gold at the end of the rainbow."

296-842-22010  Follow procedures established for cleaning and disinfecting respirators.
You must:
• Follow the procedure in Table 20 for cleaning and disinfecting respirators.

Table 20
Respirator Cleaning Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
</tr>
</thead>
</table>
| 1.   | Remove filters, cartridges, canisters, speaking diaphragms, demand and pressure valve assemblies, hoses, or any components recommended by the manufacturer.  
• Discard or repair any defective parts. |
| 2.   | Wash components in warm (43°C [110°F] maximum) water with a mild detergent or with a cleaner recommended by the manufacturer  
• A stiff bristle (not wire) brush may be used to help remove the dirt  
• If the detergent or cleaner does not contain a disinfecting agent, respirator components should be immersed for two minutes in one of the following:  
  – A bleach solution (concentration of 50 parts per million of chlorine). Make this by adding approximately one milliliter of laundry bleach to one liter of water at 43°C (110°F)  
  – A solution of iodine (50 parts per million iodine). Make this in two steps:  
    ■ First, make a tincture of iodine by adding 6-8 grams of solid ammonium iodide and/or potassium iodide to 100 cc of 45% alcohol approximately  
    ■ Second, add 0.8 milliliters of the tincture to one liter of water at 43°C (110°F) to get the final solution  
  – Other commercially available cleansers of equivalent disinfectant quality when used as directed, if their use is recommended or approved by the respirator manufacturer. |
| 3.   | Rinse components thoroughly in clean, warm (43°C [110°F] maximum), preferably, running water.  
Note:  The importance of thorough rinsing cannot be overemphasized. Detergents or disinfectants that dry on facepieces could cause dermatitis. In addition, some disinfectants may cause deterioration of rubber or corrosion of metal parts, if not completely removed. |
| 4.   | Drain components. |
| 5.   | Air-dry components or hand dry components with a clean, lint-free cloth. |
| 6.   | Reassemble the facepiece components.  
• Replace filters, cartridges, and canisters, if necessary (for testing). |
| 7.   | Test the respirator to make sure all components work properly. |

[Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 03-20-114, § 296-842-22010, filed 10/1/03, effective 1/1/04.]

Reviser's note: RCW 34.05.395 requires the use of underlining and deletion marks to indicate amendments to existing rules, and deems ineffectual changes not filed by the agency in this manner. The bracketed material in the above section does not appear to conform to the statutory requirement.

WAC 296-842-22020  Follow procedures established for seal checking respirators.
IMPORTANT:
• User seal checks are NOT a substitute for fit tests. See WAC 296-842-22010 for fit test procedures.

• You may use a seal check procedure recommended by the respirator manufacturer INSTEAD of the procedure outlined in Table 21 if you can demonstrate the procedure is based on a scientific study that, for example, demonstrates the procedure effectively identifies respirators that fit poorly when put on or adjusted.

(2005 Ed.)
You must:
- Make sure employees perform a user seal check as outlined in Table 21, EACH TIME the respirator is worn, to make sure the seal is adequate.

| Table 21
User Seal Check Procedure

<table>
<thead>
<tr>
<th>Important information for employees:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• You need to conduct a seal check each time you put your respirator on BEFORE you enter the respirator use area. The purpose of a seal check is to make sure your respirator (which has been previously fit tested by your employer) is properly positioned on your face to prevent leakage during use and to detect functional problems.</td>
</tr>
<tr>
<td>• The procedure below has two parts; a positive pressure check and a negative pressure check. You must complete both parts each time. It should only take a few seconds to perform, once you learn it.</td>
</tr>
<tr>
<td>✦ If you cannot pass both parts, your respirator is NOT functioning properly, see your supervisor for further instruction.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Positive pressure check:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Remove exhalation valve cover, if removable.</td>
</tr>
<tr>
<td>2. Cover the exhalation valve completely with the palm of your hand WHILE exhaling gently to inflate the facepiece slightly.</td>
</tr>
<tr>
<td>3. The respirator facepiece should remain inflated (indicating a build-up of positive pressure and NO outward leakage).</td>
</tr>
<tr>
<td>• If you detect NO leakage, replace the exhalation valve cover (if removed), and proceed to conduct the negative pressure check.</td>
</tr>
<tr>
<td>• If you detect evidence of leakage, reposition the respirator (after removing and inspecting it), and try the positive pressure check again.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Negative pressure check:</th>
</tr>
</thead>
<tbody>
<tr>
<td>4. Completely cover the inhalation opening(s) on the cartridges or canister with the palm(s) of your hands WHILE inhaling gently to collapse the facepiece slightly.</td>
</tr>
<tr>
<td>• If you cannot use the palm(s) of your hands to effectively cover the inhalation openings on cartridges or canisters, you may use:</td>
</tr>
<tr>
<td>- Filter seal(s) (if available)</td>
</tr>
<tr>
<td>OR</td>
</tr>
<tr>
<td>- Thin rubber gloves.</td>
</tr>
<tr>
<td>5. Once the facepiece is collapsed, hold your breath for 10 seconds WHILE keeping the inhalation openings covered.</td>
</tr>
<tr>
<td>6. The facepiece should remain slightly collapsed (indicating negative pressure and NO inward leakage).</td>
</tr>
<tr>
<td>• If you detect NO evidence of leakage, the tightness of the facepiece is considered adequate, the procedure is completed, and you may now use the respirator.</td>
</tr>
<tr>
<td>• If you detect leakage, reposition the respirator (after removing and inspecting it) and repeat BOTH the positive and negative fit checks.</td>
</tr>
</tbody>
</table>

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 03-20-114, § 296-842-22020, filed 10/1/03, effective 1/1/04.]

WAC 296-842-300 Definitions.

Air-purifying respirator (APR)
A respirator equipped with an air-purifying element such as a filter, cartridge, or canister, OR having a filtering facepiece, for example, a dust mask.

The element or filtering facepiece is designed to remove specific contaminants, such as particles, vapors, or gases, from air that passes through it.

Air-line respirator
An atmosphere-supplying respirator for which breathing air is drawn from a source separate from and not worn by the user, such as:
- A cylinder or a tank
- A compressor
- An uncontaminated environment.

Air supplied respirator (see air-line respirator)
 Assigned protection factor (APF)
Indicates the expected level of workplace respiratory protection WHEN the respirator is:
- Functioning properly AND
- Fitted to the user AND
- Worn by trained individuals AND
- Used with the limitations specified on the NIOSH approval label.

Atmosphere-supplying respirator
A respirator that supplies the user with breathing air from separate sources, such as:
- A cylinder or a tank
- A compressor
- An uncontaminated environment.

Breathing air
Air supplied to an atmosphere-supplying respirator. This air meets the specifications found in WAC 296-842-200.

Canister or cartridge (air-purifying)
Part of an air-purifying respirator that consists of a container holding materials such as fiber, treated charcoal, or a combination of the two, that removes contaminants from the air passing through the cartridge or canister.

Cartridge respirator (see also air-purifying respirator)
An air-purifying respirator equipped with one or more cartridges. These respirators have a facepiece made from silicone, rubber OR other plastic-like materials.

Demand respirator
An atmosphere-supplying respirator that sends breathing air to the facepiece only when suction (negative pressure) is created inside the facepiece by inhalation. Demand respirators are "negative pressure" respirators.

Dust mask
A name used to refer to filtering-facepiece respirators. Dust masks may or may not be NIOSH certified. See filtering facepiece.

Emergency respirator
Respirators suitable for rescue, escape, or other activities during emergency situations.

Emergency situation
Any occurrence that could OR does result in a significant uncontrolled release of an airborne contaminant. Causes of
emergency situations include, but are not limited to, equipment failure, rupture of containers, or failure of control equipment.

**End-of-service-life indicator (ESLI)**
A system that warns the air-purifying respirator user that cartridges or canisters must be changed. An example of an ESLI is a dot on the respirator cartridge that changes color.

**Escape-only respirator**
A respirator that can only be used to exit during emergencies. Look for this use limitation on the respirator's NIOSH approval label.

**Exposed, or exposure**
The contact an employee has with a toxic substance, harmful physical agent, or oxygen deficient condition. Exposure can occur through various routes of entry, such as inhalation, ingestion, skin contact, or skin absorption.

**Filter**
Fibrous material that removes dust, spray, mist, fume, fog, smoke particles, OR other aerosols from the air.

**Filtering-facepiece respirator**
A tight-fitting, half-facepiece, negative-pressure, particulate air-purifying respirator with the facepiece MAINLY composed of filter material. These respirators do not use cartridges or canisters and may have sealing surfaces composed of rubber, silicone or other plastic-like materials. They are sometimes referred to as “dust masks.”

**Fit factor**
A number providing an estimate of fit for a particular respiratory inlet covering to a specific individual during quantitative fit testing.

**Fit test** (see also qualitative fit test and quantitative fit test)
Fit testing is an activity where the facepiece seal of a respirator is challenged, using a WISHA accepted procedure, to determine if the respirator provides an adequate seal.

**Full-facepiece respirator**
A tight-fitting respirator that covers the wearer's nose, mouth, and eyes.

**Gas mask**
An air-purifying respirator equipped with one or more canisters. These respirators have a facepiece made from silicone, rubber OR other plastic-like materials.

**Half-facepiece respirator**
A tight-fitting respirator that only covers the wearer's nose and mouth.

**Helmet**
The rigid part of a respirator that covers the wearer's head AND also provides head protection against impact or penetration.

**High-efficiency particulate air filter (HEPA)**
A powered air purifying respirator (PAPR) filter that removes at least 99.97% of monodisperse diocyl phthalate (DOP) particles with a mean particle diameter of 0.3 micrometer from contaminated air.

**Hood**
The part of a respirator that completely covers the wearer's head and neck AND may also cover some or all of the shoulders and torso.

**Immediately dangerous to life or health (IDLH)**
An atmospheric condition that would:
- Cause an immediate threat to life
OR
- Cause permanent or delayed adverse health effects
OR
- Interfere with an employee's ability to escape.

**Licensed health care professional (LHCP)**
An individual whose legally permitted scope of medical practice allows him or her to provide SOME OR ALL of the health care services required for respirator users' medical evaluations.

**Loose-fitting facepiece**
A respiratory inlet covering that is designed to form a partial seal with the face.

**Negative-pressure respirator**
Any tight-fitting respirator in which the air pressure inside the facepiece is less than the air pressure outside the respirator during inhalation.

**NIOSH**
The National Institute for Occupational Safety and Health. NIOSH is the federal agency that certifies respirators for occupational use.

**Oxygen deficient**
An atmosphere with an oxygen content below 19.5% by volume.

**Permissible exposure limit (PEL)**
Permissible exposure limits (PELs) are employee exposures to toxic substances or harmful agents that must not be exceeded. PELs are specified in applicable WISHA chapters.

**Positive-pressure respirator**
A respirator in which the air pressure inside the respiratory-inlet covering is greater than the air pressure outside the respirator.

**Powered air-purifying respirators (PAPRs)**
An air-purifying respirator equipped with a blower that draws ambient air through cartridges or canisters. These respirators, as a group, are NOT classified as positive pressure respirators and must not be used as such.

**Pressure-demand respirator**
A positive-pressure atmosphere-supplying respirator that sends breathing air to the respiratory inlet covering when the positive pressure is reduced inside the facepiece by inhalation or leakage.

**Qualitative fit test (QLFT)**
A test that determines the adequacy of respirator fit for an individual. The test relies on the employee's ability to detect a test substance. Test results are either "pass" or "fail."

**Quantitative fit test (QNFT)**
A test that determines the adequacy of respirator fit for an individual. The test relies on specialized equipment that performs numeric measurements of leakage into the respiratory inlet covering. Test results are used to calculate a "fit factor."

**Respiratory hazard**
Harmful airborne hazards and oxygen deficiency that are addressed in chapter 296-841 WAC, Respiratory hazards.

**Required use**
Respirator use:
- That is necessary to protect employees from respiratory hazards

(2005 Ed.)
Chapter 296-843 WAC: Labor and Industries, Department of

OR
• That the employer decides to require for his or her own reasons. For example, the employer decides to follow more rigorous exposure limits

Respirator
A type of personal protective equipment designed to protect the wearer from harmful airborne hazards, oxygen deficiency, or both.

Respiratory inlet covering
The part of a respirator that forms the protective barrier between the user’s respiratory tract and an air-purifying device or breathing air source or both. The respiratory inlet covering may be a facepiece, helmet, hood, suit, or mouthpiece respirator with nose clamp.

Seal check
Actions conducted by the respirator user each time the respirator is put on, to determine if the respirator is properly seated on the face.

Self-contained breathing apparatus (SCBA)
An atmosphere-supplying respirator designed for the breathing air source, to be carried by the user.

Service-life
The period of time that a respirator, filter or sorbent, or other respiratory equipment provides adequate protection to the wearer. For example, the period of time that sorbent cartridge is effective for removing a harmful substance from the air.

Sorbent
Rigid, porous material, such as charcoal, used to remove vapor or gas from the air.

Supplied-air respirator (see air-line respirator)

Tight-fitting facepiece
A respiratory inlet covering forming a complete seal with the face or neck. Mouthpiece respirators are not tight-fitting facepieces.

Voluntary use
Respirator use that is requested by the employee and permitted by the employer when no respiratory hazard exists.

Chapter 296-843 WAC
HAZARDOUS WASTE OPERATIONS

WAC
296-843-100 Scope.
296-843-110 Evaluations and inspections.
296-843-11005 Complete a preliminary site evaluation before allowing employees to enter the site.
296-843-11010 Conduct ongoing evaluations of safety and health hazards.
296-843-120 Health and safety plan (HASP).
296-843-12005 Develop and maintain a written site-specific health and safety plan (HASP).
296-843-130 Sampling and monitoring.
296-843-13005 Conduct monitoring for health and safety hazards during initial site entry.
296-843-13010 Evaluate employee exposure to hazardous substances during clean-up operations.
296-843-140 Site control.
296-843-14005 Establish site control.
296-843-150 Worker and equipment decontamination.
296-843-15005 Establish and implement decontamination procedures before any worker or equipment enters a contaminated area.
296-843-15010 Provide showers and changing rooms.
296-843-15015 Provide washing facilities.

WAC 296-843-100 Scope. This chapter applies if you have any of the following:
• Employees working in operations involving hazardous waste at a treatment, storage, and disposal (TSD) facility required to have a permit or interim status and regulated by any of the following:
  – Agencies implementing RCRA through agreements with the United States Environmental Protection Agency (U.S.E.P.A.);
  – Chapter 173-303 WAC, Dangerous waste regulations;
OR
• Employees conducting initial investigations of government-identified sites before determining whether hazardous substances are present;
OR
• Corrective actions, involving clean-up operations, at sites covered by the Resource Conservation and Recovery Act of 1976 (RCRA) as amended (42 U.S.C. 6901 et seq.) or chapter 70.105 RCW, Hazardous waste management;
OR
• Employees performing clean-up operations at an uncontrolled hazardous waste site. Sites include, but are not limited to:
  – The Environmental Protection Agency’s (EPA) National Priority Site List (NPL); see http://www.epa.gov/superfund/sites/npl/wa.htm;
  – Sites recommended for inclusion on the EPA NPL;
  – State priority site lists, for example those listed under chapter 173-340 WAC, Model Toxics Control Act (MTCA); see http://www.ecy.wa.gov/programs/tcp/cscs/CSCSpage-HTM;
– Unlisted sites recognized by a federal, state or local government as an uncontrolled hazardous waste site. Examples of such sites include:
  ■ Sites that do not meet clean-up goals established by the MTCA and that pose a threat or potential threat to human health or the environment;
  ■ Clandestine drug lab sites designated for cleanup;

– Postemergency response cleanup at the site of a hazardous substance release regulated by chapter 296-824 WAC, Emergency response.

IMPORTANT:
This chapter applies to hazardous waste sites until cleanup at the site is determined to be complete by the governing regulatory agency.

Other rules that may apply to hazardous waste operations:
You will find safety and health requirements (for example, personal protective equipment) are addressed in other rules and also in this chapter. If you find a conflict in requirements, you need to meet the more protective requirement. Contact your local L&I office if you need assistance in making this determination.

Examples of other rules that may apply:
• Chapter 296-800 WAC, Safety and health core rules:
  – WAC 296-800-140, Accident prevention program;
  – WAC 296-800-210, Lighting;
• Chapter 296-800-230, Drinking water, bathrooms, washing facilities and waste disposal.
• Chapter 296-24 WAC, Safety standards for general safety.
• Chapter 296-833 WAC, Temporary housing for workers.
• Chapter 296-62 WAC, General occupational health.
• Chapter 296-155 WAC, Safety standards for construction work.
• Chapter 296-824 WAC, Emergency response.
• Chapter 296-841 WAC, Respiratory hazards.
• Chapter 296-842 WAC, Respirators.
WAC 296-843-110 Evaluations and inspections.
Your responsibility:
To conduct evaluations before entering the site and periodically throughout the hazardous waste operations.
You must:
Complete a preliminary site evaluation before allowing employees to enter the site
WAC 296-843-11005.
Conduct ongoing evaluations of safety and health hazards
WAC 296-843-11010.

WAC 296-843-11005 Complete a preliminary site evaluation before allowing employees to enter the site.
You must:
- Complete a preliminary site evaluation by doing all the following:

<table>
<thead>
<tr>
<th>Collect or develop the following information to the extent available:</th>
<th>Have a qualified person evaluate the preliminary site information to identify:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- The site location and approximate size</td>
<td>- Potential site hazards and risks</td>
</tr>
<tr>
<td>- A description of the response activity and the job tasks to be performed</td>
<td>- The most appropriate methods to protect employees</td>
</tr>
<tr>
<td>- The time needed to cover all planned activities</td>
<td>- Conditions that have the potential to cause death or serious harm, including potential inhalation or skin absorption hazards that are immediately dangerous to life or health (IDLH)</td>
</tr>
<tr>
<td>- The site's topography and all ways to access the site</td>
<td></td>
</tr>
<tr>
<td>- The current status and capabilities of any emergency response team assisting during an emergency</td>
<td>- Examples include:</td>
</tr>
<tr>
<td>- The safety and health hazards expected at the site</td>
<td>- Confined space entry</td>
</tr>
<tr>
<td>- The hazardous substances and health hazards at the site, including their chemical and physical properties</td>
<td>- Potentially explosive or flammable environments</td>
</tr>
<tr>
<td>- All hazardous substance dispersion pathways</td>
<td>- Visible vapor clouds</td>
</tr>
<tr>
<td>- An emergency response plan</td>
<td>- Areas where plants or animals have died</td>
</tr>
</tbody>
</table>

Have a qualified person prepare an initial site characterization and analysis for the site to:
- Identify known and suspected health and safety hazards for the site
- Aid in selecting control methods to protect employees from site hazards
- Brief employees on site conditions before any work starts
- Initiate the site-specific health and safety plan (HASP)

Note: Characterization and analysis of site hazards is an ongoing process for work on the hazardous waste site.

WAC 296-843-11010 Conduct ongoing evaluations of safety and health hazards.
You must:
1. Have a qualified person complete further evaluation of health and safety hazards at the site immediately after initial entry to:
   - Identify site hazards in more detail.
   - Help select appropriate:
     - Control methods to protect employees from site hazards.
     - Personal protective equipment (PPE) for site operations.
2. Correct any deficiencies.

WAC 296-843-120 Health and safety plan (HASP).
Your responsibility:
To establish a written health and safety plan (HASP).
You must:
- Develop and maintain a written site-specific health and safety plan (HASP)
  WAC 296-843-12005.

WAC 296-843-12005 Develop and maintain a written site-specific health and safety plan (HASP).
Reference: If your overall program required under WAC 296-800-140, Accident prevention program (APP), meets requirements of this chapter, you do not need to duplicate those portions of your APP in the site-specific health and safety plan (HASP).
You must:
- Develop a written HASP for each hazardous waste site, BEFORE beginning hazardous waste operations, that includes at least the following:

  Hazard analysis:
  - Identification and evaluation of on-site safety and health hazards.
    - A safety and health risk (hazard) analysis for each site task and operation that is identified in the comprehensive work plan.
Organization chart:
– An organizational structure that reflects current site operations, including the following:
  ■ Establish and identify the chain of command.
  ■ Identify the site safety and health supervisor and other personnel responsible for employee safety and health.
  ■ Specify the overall responsibilities of supervisors and employees.
  ■ Include the name and title of the person with responsibility and authority to direct all hazardous waste operations.
  ■ Include a site safety and health supervisor responsible for developing and implementing the HASP and verifying compliance.
  ■ Identify the functions and responsibilities of all personnel needed for hazardous waste operations and emergency response.
  ■ Identify site specific lines of authority, responsibility, and communication.
Comprehensive work plan:
– A written comprehensive work plan of tasks, objectives, logistics, and resources for site operations, including the following:
  ■ Addresses anticipated clean-up activities and normal operating procedures unless that information is already available in another document.
  ■ Defines work tasks and objectives.
  ■ Describes how the work tasks and objectives will be accomplished.
  ■ Establishes the personnel requirements to implement the work plan.
  ■ Provides for implementation of training, briefings, and information as required by WAC 296-843-200.
Site control plan:
– An up-to-date site control plan before clean-up operations begin to minimize employee exposure to hazardous substances and including the following (unless it’s available in another document):
  ■ A site map.
  ■ Establish site work zones.
  ■ How the "buddy system" is used.
  ■ The site communications plan, including how employees are alerted during emergencies.
  ■ The site’s standard operating procedures (SOPs) or safe work practices.
  ■ Identification of the nearest medical assistance.
Personal protective equipment:
– A PPE plan that addresses all of the following:
  ■ Site hazards and activities.
  ■ Methods to evaluate the effectiveness of the PPE plan.
  ■ Criteria for selecting and fitting PPE, including work duration, use limitations of particular PPE, and medical considerations such as temperature extremes and heat stress.
  ■ Training on PPE use.
  ■ Procedures for putting on and taking off PPE.
  ■ PPE inspection procedures prior to, during, and after use.
  ■ Decontamination and disposal of PPE.
  ■ Maintenance and storage of PPE.
Additional elements:
– A sampling and monitoring plan (see WAC 296-843-130) that includes sampling of drums and containers.
– Site control measures (see WAC 296-843-140).
– Decontamination procedures (see WAC 296-843-150).
– Spill containment procedures (see WAC 296-843-180, Drum and container handling).
– Standard operating procedures for sampling, managing, and handling drums and containers (see WAC 296-843-180).
– Entry procedures for tanks or vaults (see WAC 296-62-141, Confined spaces).
– A training, briefings, and information plan (see WAC 296-843-200).
– A medical surveillance plan (see WAC 296-843-210), that includes site-specific medical surveillance requirements.
– Sanitation (see WAC 296-155-140).
– Lighting (see WAC 296-800-210).
– Excavations (see chapter 296-155 WAC, Part N, Excavation, trenching and shoring).
– Any relationship or interaction between other programs and the site-specific program.
You must:
• Keep a copy of your HASP on site.
Reference: For more information, see WAC 296-843-220, Recordkeeping and information access.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-12005, filed 1/5/04, effective 5/1/04.]

WAC 296-843-130 Sampling and monitoring.
Your responsibility:
To conduct monitoring for health and safety hazards to protect employees.
You must:
• Conduct monitoring for health and safety hazards during initial site entry
WAC 296-843-13005.
• Evaluate employee exposure to hazardous substances during clean-up operations
WAC 296-843-13010.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-130, filed 1/5/04, effective 5/1/04.]

WAC 296-843-13005 Conduct monitoring for health and safety hazards during initial site entry.
You must:
• Make visual observations of the site to detect signs of actual or potential immediately dangerous to life or health (IDLH) or other dangerous conditions.
  • Conduct representative air monitoring with direct reading test equipment, when the preliminary site evaluation does not eliminate the potential for ionizing radiation or IDLH conditions.
  • Assess the following:
    – Potential IDLH conditions.
    – Exposure over radioactive material dose limits.
    – Potential exposure over permissible exposure limits (PELs) or other published exposure levels.
    – Other dangerous conditions, such as the presence of flammable or oxygen-deficient atmospheres.
WAC 296-843-13010 Evaluate employee exposure to hazardous substances during clean-up operations.

**IMPORTANT:**
The clean-up operation begins when soil, surface water, or containers are moved or disturbed.

**You must:**
- Identify the type of personnel monitoring and environmental sampling you plan to use, including instrumentation.
- Include requirements for maintaining and calibrating the monitoring and sampling instruments used.
- Monitor whenever employees may be exposed to concentrations exceeding PELs or other published exposure levels.
- Evaluate employees who are likely to have the highest exposure:
  - Monitor all employees who are likely to have the highest exposure to hazardous substances or health hazards above the PEL or published exposure limit.
  - Use personal sampling frequently enough to characterize the exposures of these employees.
- When results indicate exposure is over the PEL or other published exposure limit, identify all employees likely to be above the PEL or published exposure limit.

**Note:** You may use a representative sampling approach by documenting that the employees and chemicals chosen for monitoring are representative of both:
- Employee exposure to hazardous substances;
- AND
- Employees not sampled.

**You must:**
- Conduct monitoring when the possibility of one of the following exists:
  - An atmosphere that is immediately dangerous to life or health (IDLH);
  - A flammable atmosphere;
  - Employee exposures exceeding PELs or other published exposure levels.

Examples of situations where these possibilities may exist:
- Work begins on a different portion of the site.
- Contaminants other than those previously monitored are being handled.
- A different type of site operation starts, such as moving from drum opening to exploratory well drilling.
- Handling leaking drums or containers.
- Working in areas with obvious liquid contamination such as a spill or lagoon.
- Time has passed and employee exposure levels may have significantly increased.

**WAC 296-843-140 Site control.**

**Your responsibility:**
To establish a plan to control access to the site.

---

**You must:**
- Establish a site control plan WAC 296-843-14005.

**WAC 296-843-14005 Establish site control.**

**You must:**
- Maintain site work zones and site control as required by Table 1, Site Work Zone Requirements.
- Control access to the exclusion and contamination reduction zones.
- Make sure people wear personal protective equipment (PPE) appropriate to their work zone.

**Table 1 Site Work Zone Requirements**

<table>
<thead>
<tr>
<th>For this type of work zone:</th>
<th>You must:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exclusion zone</td>
<td>• Establish entry and exit checkpoints on the zone's boundary&lt;br&gt; • Regulate the flow of people and equipment into and out of the zone&lt;br&gt; • Make sure exits go through a contamination reduction corridor</td>
</tr>
<tr>
<td>Contamination reduction zone with a contamination reduction corridor</td>
<td>• Enter through a control point from the clean zone&lt;br&gt; • Provide a transition or buffer between the exclusion zone and the clean zone&lt;br&gt; • Perform all decontamination procedures&lt;br&gt; • Establish separate decontamination routes for people and equipment, if practical&lt;br&gt; • Remove all PPE worn in the contamination reduction or exclusion zones before entering the clean zone</td>
</tr>
<tr>
<td>Clean zone or support zone</td>
<td>Have no employee exposure to hazardous substances or health hazards</td>
</tr>
</tbody>
</table>

**Note:** See Illustration 2 for an example of site work zones.
WAC 296-843-150 Worker and equipment decontamination.

Your responsibility: To make sure the necessary facilities and equipment for effective decontamination are available and used.

You must:

- Establish and implement decontamination procedures before any worker or equipment enters a contaminated area.
- Provide showers and changing rooms.

WAC 296-843-15005 Establish and implement decontamination procedures before any worker or equipment enters a contaminated area.

You must:

- Establish, implement, and communicate decontamination procedures to all workers, to include the following:
  - Standard operating procedures to minimize worker contact with:
    - Hazardous substances.
    - Contaminated equipment.
  - Decontaminating all:
    - Workers leaving a contaminated area.
    - Equipment leaving a contaminated area.
  - Decontaminating, cleaning, laundering, repairing, or replacing protective clothing or equipment (PPE) as needed to maintain effectiveness.
  - Immediate removal of clothing, such as cotton coveralls, wet with hazardous substances and use of the nearest shower.
  - Decontaminate or dispose of clothing before removal from the work zone.
  - Periodically monitoring procedures for effectiveness by the site safety and health supervisor.
  - Correct your procedures when found ineffective.

Provide washing facilities.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-15015, filed 1/5/04, effective 5/1/04.]

[2005 Ed.]
– Establish decontamination areas to minimize contact of contaminated employees and equipment with uncontaminated employees or equipment.
– Make sure only authorized employees remove protective clothing or equipment from changing rooms.
– Inform commercial laundries or cleaning establishments about the potentially harmful effects from exposure to hazardous substances.
– Properly decontaminate or dispose of decontamination equipment and solvents.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-15005, filed 1/5/04, effective 5/1/04.]

WAC 296-843-15010 Provide showers and changing rooms.

You must:
• Provide changing areas and showers outside a contaminated area, when needed for worker decontamination, that include at least the following:
  – Separate changing areas:
    ■ One to provide a clean area where employees can remove, store, and put on street clothing with an exit leading off the work site.
    ■ Another where employees can put on, remove, store, and dispose of work clothing and PPE with an exit leading to the work site.
  – A shower area separating the changing areas.
    • Prevent clean areas from being contaminated by hazardous substances.
    • Provide and use other effective means for worker cleansing, if temperature conditions prevent the effective use of water.
    • Locate showers and change rooms where worker exposures are below permissible exposure limits (PELs) or other published exposure levels.
    – If this cannot be accomplished, use a ventilation system to supply air that is below the PELs or published exposure levels.
    • Make sure all workers shower at the end of their work shift or before they leave the site, when needed for worker decontamination.

Illustration 3 is a sample diagram of a change room layout.

WAC 296-843-15015 Provide washing facilities.

You must:
• Provide adequate washing facilities to employees working in hazardous waste operations that are:
  – Close and convenient to the work area.
  – Located in areas where employee exposure is below PELs or other published exposure levels.
  – Equipped so an employee can remove hazardous substances from themselves without assistance.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-15015, filed 1/5/04, effective 5/1/04.]

WAC 296-843-160 Emergency response for hazardous waste sites.

Your responsibility:
To establish an emergency response plan for emergencies at the hazardous waste site.

You must:
Establish an emergency response plan for anticipated emergencies before beginning hazardous waste operations

WAC 296-843-16005 Establish an emergency response plan for anticipated emergencies before beginning hazardous waste operations.

Exemption:
Employers are exempt from preparing an emergency response plan if they do ALL of the following:
• Evacuate all employees from the danger area during an emergency.
• Prohibit employees from assisting in the emergency response.
• Prepare an emergency action plan that complies with WAC 296-24-567(1), Evacuation plan.

IMPORTANT:
Treatment, storage, and disposal (TSD) employers are not required to duplicate subjects fully addressed in the contingency plan required by permits when the contingency plan is part of their emergency response plan. Examples of permits would be those issued by the department of ecology.

You must:
(1) Establish and maintain the plan to reflect current site conditions, information, and personnel:
• Include policies or procedures for at least the following:
  – Preemergency planning.
  – Coordination with outside organizations.
  – Current site topography, layout, and weather conditions.
  – Personnel roles.
– Lines of authority.
– Communication.
– Reporting incidents to local, state, and federal government agencies.
– Emergency recognition and prevention.
– Safe distances and places of refuge.
– Site security and control.
– Evacuation routes.
– Decontamination not covered by the site-specific HASP.
– Emergency medical treatment and first aid.
– Emergency alert and response.
– Personal protective equipment and emergency equipment.
– Employee training.
– Critique of the response effort and appropriate followup.

Use available information at the time of the emergency to:
– Evaluate the incident and site response capabilities.
– Proceed with appropriate steps to implement your emergency response plan.

Make sure the emergency response plan is:
– Kept as a separate section of your site-specific health and safety plan (HASP);

AND
– Integrated and compatible with, local, state, and federal plans for disasters, fires, and emergency responses.

(2) Establish an alarm system to alert employees to all of the following:
– An on-site emergency incident:
  – To stop work activities, if necessary.
  – To lower background noise to assist communication.
  – To begin emergency procedures.

(3) Rehearse the plan as part of site operations training.

You must:
– Use employee rotation to reduce exposure below ionizing radiation PELs or dose limits, when that is the only feasible means of protecting employees.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-170, filed 1/5/04, effective 5/1/04.]

WAC 296-843-180 Drum and container handling.

Your responsibility:
To handle drums and containers in ways that minimize the hazard to employees.

You must:
– Handle drums and containers safely WAC 296-843-18005.
– Handle drums and containers suspected of containing shock-sensitive (explosive) wastes safely WAC 296-843-18010.
– Maintain worker safety in drum and container opening areas WAC 296-843-18015.
– Ship and transport drums and containers safely WAC 296-843-18020.

IMPORTANT:
– Containers or drums containing shock-sensitive (explosive) or potentially shock-sensitive wastes require special handling precautions.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-180, filed 1/5/04, effective 5/1/04.]
WAC 296-843-18005 Handle drums and containers safely.

Preparation for moving drums and containers:
You must:
• Assess hazards to employees, such as radioactive waste, before handling drums and containers.
• Consider unlabeled drums and containers to contain hazardous substances and handle them accordingly, until the contents are positively identified, labeled, and assessed for hazards.
• Inspect and make sure drums and containers are sound before moving them.
  – If it is not practical to inspect drums without moving them, move drums and containers to an accessible location and inspect prior to further handling.
• Remove soil or other materials covering drums or containers with caution to prevent rupture.
• Use ground-penetrating systems or other types of detection systems or devices to estimate the location and depth of buried drums or containers.
• Use the sampling plan and procedures included in the site-specific HASP to sample the contents of containers and drums.

Moving drums and containers:
You must:
• Warn all employees exposed to drum movement operations about the potential hazards associated with the contents of the drums or containers prior to moving them.
• Minimize movement of drums or containers.
• Select, position, and operate tools and material handling equipment to prevent the ignition of flammable vapors.
• Handle tanks and vaults containing hazardous substances with the same precautions as for drums and containers, taking into account the size of tank or vault.

Handling spills and leaks:
You must:
• Contain and isolate the entire volume of a hazardous substance in a drum or container when a spill occurs.
  • Have available and use both of the following in areas where spills, leaks, or ruptures may occur:
    – United States Department of Transportation (DOT) specified salvage drums or containers.
    – Suitable quantities of proper absorbent materials.
    – Empty drums and containers that cannot be moved without rupturing, leaking, or spilling, into a sound container.
  • Use a pump or other device classified for the material being transferred.
• Have fire-extinguishing equipment on-hand to control fires in their initial stage.

Reference: For further information, see the safety and health core rules, WAC 296-800-300, Portable fire extinguishers.

WAC 296-843-18010 Handle drums and containers suspected of containing shock-sensitive (explosive) wastes safely.

You must:
• Allow only essential employees in the transfer area.
• Communicate as follows:
  – Signal the beginning and end of shock-sensitive (explosive) waste handling activities with an alarm system that is capable of being perceived above background light and noise.
  – Maintain continuous communications throughout the handing operation:
    ■ Between the employee-in-charge of the immediate handling area AND the site safety and health supervisor AND the command post.
    ■ Using portable radios, hand signals, or telephones, as appropriate.
  – Prevent the use of communication equipment or methods that could cause shock-sensitive (explosive) materials to explode.
    • Provide material handling equipment with explosive containment devices or shields to protect equipment operators from exploding containers.
    • Do not move bulging or swollen drums or containers until the cause for excess pressure is determined and you can move the drum or container safely.
    • Consider packaged laboratory wastes or laboratory waste packs shock-sensitive or explosive until the contents have been characterized.
    – Make sure laboratory waste packs are opened only:
      ■ When necessary.
      ■ By a person knowledgeable in the inspection, classification, and segregation of the containers within the pack.

Reference: The shipment of shock-sensitive (explosive) waste may be prohibited under United States Department of Transportation (DOT) regulations. You and your shipper should refer to title 49 CFR.

WAC 296-843-18015 Maintain worker safety in drum and container opening areas.

You must:
• Keep employees who are not involved in opening drums or containers a safe distance from the opening area.
• Use appropriate shielding between the employee and the drums or containers, when excess interior pressure cannot be relieved from a remote location.
• Provide an explosion-resistant barrier that does not interfere with the work to protect employees working near or adjacent to drum or container opening operations from accidental explosions.
• Position controls for drum or container opening equipment, monitoring equipment, and fire suppression equipment behind the explosion-resistant barrier. Prohibit employees from standing on or working from drums or containers.

Reference: The shipment of shock-sensitive (explosive) waste may be prohibited under United States Department of Transportation (DOT) regulations. You and your shipper should refer to title 49 CFR.

WAC 296-843-18020 Ship and transport drums and containers safely.

You must:
(1) Identify and classify drum and container contents prior to packaging for shipment.
(2) Provide staging areas:
  • Each staging area must have adequate entry and exit routes.

[Title 296 WAC—p. 3024]
• The number of drum or container staging areas must be kept to the minimum needed to identify and classify materials safely and prepare them for transport.

(3) Permit bulking of hazardous wastes only after a thorough characterization of the wastes has been completed.

Note: Handle, transport, label, and dispose of drums and containers according to this chapter and other United States Department of Transportation (DOT), WISHA, EPA, and Washington department of ecology regulations for:
• Drums.
• Containers.
• Hazardous substances.
• Contaminated soils.

[WAC 296-843-18020, filed 1/5/04, effective 5/1/04.]

296-843-190 Personal protective equipment (PPE).

Your responsibility:
To use PPE to protect employees when feasible controls do not remove the hazardous exposure.

You must:
Provide and use appropriate PPE
WAC 296-843-19005.

Reference: For additional information about developing a PPE plan, see the PPE user guide found at http://www.lni.wa.gov/wisha/publications/PPEGuide/PPEload.htm.

Note: The manufacturer’s information on PPE may be used to meet your PPE plan requirements. For example, the manufacturer’s procedures for putting on and taking off PPE may be attached to the site-specific health and safety plan (HASP).

[WAC 296-843-19005, filed 1/5/04, effective 5/1/04.]

296-843-19005 Provide and use appropriate PPE.

Reference: See WAC 296-843-110, Evaluations and inspections, found in this chapter, for more information about how to identify hazards and complete your preliminary site evaluation.

You must:
(1) Make sure the PPE you provide and use for initial entry protects employees from known or suspected safety and health hazards identified during the preliminary site evaluation as follows:

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
</tr>
</thead>
<tbody>
<tr>
<td>The need for atmosphere supplying respirators and chemical protective clothing has NOT been eliminated</td>
<td>Provide atmosphere supplying respirators and protective clothing</td>
</tr>
<tr>
<td>Employees use respiratory protection other than a positive-pressure SCBA for initial entry</td>
<td>Include an escape self-contained breathing apparatus (SCBA) with enough air to reach a safe location and always at least five minutes of air</td>
</tr>
</tbody>
</table>

• Use Table 2, Selecting PPE in Various Exposure Situations, to determine the level of PPE to provide during initial entry:

You must:
(2) Make sure the PPE you select provides employee protection based on:

• Actual and potential hazards identified during the site characterization and analysis (see WAC 296-843-110, Evaluations and inspections).
• Hazards likely to be encountered.
• Required tasks and their duration.
• Site requirements and limitations.
• Use Table 2 to identify the type of PPE that is required for various exposure situations.

Table 2
Selecting PPE in Various Exposure Situations

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changing site conditions indicate a change in employee exposure</td>
<td>Review and adjust the level of protection as appropriate</td>
</tr>
</tbody>
</table>

Note:
You may decrease the level of protection when information indicates this will not increase employee exposure to safety or health hazards.

There is a substantial possibility that skin absorption or contact with a hazardous substance may:
• Impair an employee's ability to escape
• Cause immediate serious illness or injury
• Is an IDLH or immediate death hazard

Use totally encapsulating chemical protective (TECP) suits and make sure they will protect employees from the hazards

• Use, decontaminate, inspect, and remove TECP suits from service according to the manufacturer's recommendations
• Perform any TECP integrity tests recommended by the manufacturer and make sure all TECP suits are capable of:
  – Maintaining positive air pressure
  – Preventing inward test gas leakage of more than 0.5%

Note:
Follow the manufacturer's recommended procedures for testing a TECP suit's ability to maintain positive air pressure and prevent inward gas leakage. Other established test protocols for these suits, for example, NFPA 1991 and ASTM F1052-97, may also be used.

There is a substantial possibility that employee exposure to hazardous substances will either:

Use a positive-pressure SCBA or an airline respirator with an escape SCBA
WAC 296-843-200 Training, briefings, and information.

Your responsibility:
To make sure employees and subcontractors have the training and information needed to work safely.

You must:
- Inform workers and employers about the hazardous waste site WAC 296-843-2005.
- Train workers, supervisors and managers before work begins on the site WAC 296-843-20010.
- Provide additional training to your managers and supervisors WAC 296-843-20015.
- Training for postemergency response WAC 296-843-20020.
- Make sure your employees receive written documentation of training WAC 296-843-20025.
- Provide refresher training to employees WAC 296-843-20030.
- Use qualified trainers WAC 296-843-20035.

IMPORTANT:
If law enforcement personnel participate in clean-up activities, they must receive appropriate hazardous waste clean-up training as described in this chapter.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-20005, filed 1/5/04, effective 5/1/04.]

WAC 296-843-20005 Inform workers, contractors and subcontractors about the hazardous waste site.

You must:
- Inform employees, contractors, and subcontractors or their representatives, about:
  - The nature, level, and degree of exposure to hazardous substances they're likely to encounter.
  - All site-related emergency response procedures.
  - Any identified potential fire, explosion, health, safety, or other hazards.
  - Conduct briefings for employees, contractors, and subcontractors, or their representatives as follows:
    - A preentry briefing before any site activity is started.
    - Additional briefings, as needed, to make sure that the site-specific HASP is followed.
    - Make sure all employees working on the site are:
      - Informed of any risks identified.
      - Trained on how to protect themselves and other workers against the site hazards and risks.
    - Update all information to reflect current site activities and hazards.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-20005, filed 1/5/04, effective 5/1/04.]

WAC 296-843-20010 Train workers, supervisors and managers before work begins on the site.

IMPORTANT:
- The eighty-hour training requirement does NOT apply to law enforcement personnel entering illicit drug labs, securing the premises, and obtaining evidence. Attendance at a forty-hour training course, such as presented by the criminal justice training commission, is acceptable.
- These training requirements do not apply to workers engaged in limited postemergency response activities provided they meet the conditions described in WAC 296-843-2020.

You must:
- Make sure workers have received twenty-four-, forty- or eighty-hour training as required by Table 3 before participating in hazardous waste operations.
- Make sure workers also receive site-specific training that thoroughly covers at least the following:
  - The personnel responsible for employee safety and health.
  - Safety, health, and other hazards known or suspected at the site.
  - Use of personal protective equipment.
  - Work practices to minimize worker's risk from the hazards.
  - Use of engineering and other controls and equipment on the site.
  - Medical surveillance provided.
  - Recognition of signs and symptoms that might indicate overexposure to site hazards.
  - The contents of the site-specific health and safety plan (HASP) required by this chapter.

Note: The site-specific training can be provided as part of the twenty-four-, forty- or eighty-hour training or as part of the employee briefings provided all training and information requirements of WAC 296-843-200 are met.

Table 3  
Training Requirements

<table>
<thead>
<tr>
<th>If Work and exposures require use of atmosphere supplying respirators</th>
<th>Then Provide eighty hours of training and three days of supervised on-site field experience</th>
<th>Notes Eighty-hour training may be fulfilled as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Immediately cause death, serious illness, or serious injury</td>
<td>Protect air supply from contamination and the entire respirator system from physical damage</td>
<td></td>
</tr>
</tbody>
</table>

Note: If there is not a permissible exposure limit (PEL) or other published exposure level for a hazardous substance, you may use published studies and information as a guide for selecting appropriate PPE.
### Hazardous Waste Operations

#### WAC 296-843-20020 Training for postemergency response.

**You must:**
- Provide workers who participate only in limited postemergency response clean-up operations with a minimum of eight hours of training, when these conditions are met:

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workers are at TSD facilities under normal operations (this does not include corrective actions cleanup at these facilities)</td>
<td>Provide twenty-four hours of training and one day of supervised on-site field experience</td>
<td></td>
</tr>
</tbody>
</table>

#### WAC 296-843-20025 Provide additional training to your managers and supervisors.

**You must:**
- Make sure the following receive appropriate training:
  - On-site managers.
  - Supervisors responsible for hazardous waste operations.
  - Supervisors who directly supervise employees in hazardous waste operations.

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Employees perform emergency response activities</td>
<td>Train workers to a level of competence in site emergencies, consistent with their assigned duties, to protect themselves and other employees</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workers qualify for limited postemergency response clean-up training</td>
<td>Provide at least eight hours of training</td>
<td>See WAC 296-843-20020, Training for postemergency response, for detailed training information</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>If</th>
<th>Then</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Workers have been previously trained (includes equivalent training)</td>
<td>Provide site-specific training, briefings and information required by this chapter and supervised field experience on the site of one day for twenty-four-hour and three days for forty- or eighty-hour trained workers</td>
<td>Document equivalent training and work experience as required by WAC 296-843-20025</td>
</tr>
</tbody>
</table>

**Note:** When calculating "training hours," WISHA assumes a "normal" workday of eight hours with sufficient time for lunch and other breaks.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-20010, filed 1/5/04, effective 5/1/04.]

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-20015, filed 1/5/04, effective 5/1/04.]
WAC 296-843-20025 Make sure your employees receive written documentation of training.

You must:
- Certify and document annually that each manager, supervisor, and worker has either:
  - Attended and successfully completed the training required by this section;
  - Demonstrated their competency.
- Record and maintain the method used to demonstrate competency.
- Make sure your employees and supervisors who complete required training and field experience receive written training documentation authenticated by the responsible trainer.
- Provide a copy of the certification or documentation to your employee upon request.

Reference: For additional information, see WAC 296-843-160, Emergency response, and WAC 296-800-170, Employer chemical hazard communication.

Note: Equivalent training may include academic or work-related training that covers subjects required by this chapter.

WAC 296-843-20030 Provide refresher training to employees.

You must:
- Make sure all certified employees, supervisors, and managers receive eight hours of refresher training at least every twelve months that covers:
  - The topics specified in WAC 296-843-200.
  - Assessments or evaluations of work-related incidents.
  - Any other relevant topics.

WAC 296-843-20035 Use qualified trainers.

You must:
- Use trainers that:
  - Have demonstrated competent instructional skills.
  - Demonstrate knowledge of the subject matter and have either:
    - Satisfactorily completed a training program in the subject;
    - Have the academic credentials and instructional experience needed for teaching the subject.

WAC 296-843-210 Medical surveillance.

Your responsibility:
To provide medical surveillance for employees that work in hazardous waste operations.

You must:
- Provide medical surveillance for your employees WAC 296-843-21005.

WAC 296-843-21005 Provide medical surveillance for your employees.

You must:
- Establish a medical surveillance plan for all employees who meet any of the following:
  - Are or may be exposed to hazardous substances or health hazards for at least thirty days a year, at or above the permissible exposure limits (PELs) or other published exposure levels.
  - Wear a respirator for at least thirty days a year.
  - Are injured, become ill, or develop signs or symptoms of possible overexposure to hazardous substances or health hazards.
- Are hazardous materials team (HAZMAT) members.

Reference: Employees who use respirators less than thirty days a year are required to have a respirator medical evaluation as outlined by chapter 296-842 WAC. Respirators. Completion of a medical examination required by this section will meet the requirement for a respirator medical evaluation.

You must:
- Make sure medical examinations, consultations, and procedures are:
– Scheduled according to Table 4, Medical Examination Schedule.
– Performed or supervised by a licensed physician.
– Available:
  ■ At a reasonable time and place.
  ■ Without loss of pay.
  ■ Without cost to employees.

Note: Examples of costs include: Mileage, gas, bus fare, and time spent outside normal work hours.

Note:
Examples of costs include: Mileage, gas, bus fare, and time spent outside normal work hours.

**Table 4**
Medical Examination Schedule

<table>
<thead>
<tr>
<th>If a worker</th>
<th>Then provide an examination</th>
</tr>
</thead>
<tbody>
<tr>
<td>Is assigned to work that is covered by this chapter</td>
<td>Before work assignment begins</td>
</tr>
<tr>
<td>Continues to work in hazardous waste operations</td>
<td>At least once every twelve months, unless the attending physician decides a different interval, up to twenty-four months or less than twelve months, is appropriate</td>
</tr>
<tr>
<td>Needs to be examined more frequently based on the examining physician’s medical judgment</td>
<td>At an interval less than twelve months</td>
</tr>
<tr>
<td>Is reassigned to an area where their work is not covered OR Employment is terminated</td>
<td>As soon as possible, unless he or she was examined within the past six months</td>
</tr>
<tr>
<td>Has an incident that results in injury or illness OR Develops signs or symptoms of possible overexposure to hazardous substances and health hazards OR Has been exposed above the permissible exposure limits or published exposure levels</td>
<td>As soon as possible</td>
</tr>
<tr>
<td>Requires follow-up examinations or consultations because of medical necessity for an exposure incident or injury</td>
<td>When determined by the examining physician</td>
</tr>
</tbody>
</table>

You must:
• Provide complete information to the examining physician, including:
  – Medical evaluation information required by chapter 296-842 WAC, Respirators.
  – A description of the employee’s duties that relate to hazardous substance exposure.
  – The actual or anticipated hazardous substance exposure levels for the employee.
  – A description of the PPE the employee uses or could use.
  – Information available from previous medical examinations.
  – Instruction to the physician that the physician’s written opinion NOT include specific findings or diagnoses that are not related to occupational exposures.

Note: You are NOT required to send duplicate information to the physician for each employee.

You must:
• Obtain the physician’s written medical opinion that includes the following information:
  – Whether medical conditions were found that would increase the employee’s risk for impairment during emergency response work or respirator use.
  – Limitations of the employee’s assigned work, if any.
  – Examination and test results, if the employee requests this information.
  – A statement that the employee has been confidentially informed of medical examination results (including medical conditions requiring followup required by WAC 296-843-210).
• Provide the employee with a copy of the physician evaluation.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-21005, filed 1/5/04, effective 5/1/04.]

**WAC 296-843-220** Recordkeeping and information access.

Your responsibility:
To keep records and make them accessible to employees.

**WAC 296-843-22005** Make your records accessible.

You must:
• Allow your written health and safety plan (HASP) and all other written plans required by this chapter to be inspected and copied by:
  – Employees or their designated representative.
  – Site contractors or their designated representatives.
  – Subcontractors or their designated representatives.
  – Personnel of any federal, state, or local agency with regulatory authority over the site.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 04-02-053, § 296-843-22005, filed 1/5/04, effective 5/1/04.]
Title 296 WAC: Labor and Industries, Department of

WAC 296-843-22010 Keep medical surveillance records for your employees.

You must:

- Keep medical surveillance records for each affected employee that include:
  - The employee's name and Social Security number.
  - Physicians' written opinions including recommended limitations and results of examinations and tests.
  - Any employee medical complaints regarding hazardous substance exposures.
  - A copy of all information given to the examining physician (except a copy of this chapter).
- Keep each employee's records for at least the duration of his or her employment plus thirty years.

Reference: For additional requirements on medical and exposure records, see chapter 296-62 WAC, Part B, Access to records.

WAC 296-843-300 Definitions.

Buddy system
A system of organizing employees into work groups so that each employee is assigned to observe another employee in the same work group. The purpose of this system is to provide rapid assistance to employees in the event of an emergency.

Clean-up operation
An operation where hazardous substances are removed, contained, incinerated, neutralized, stabilized, cleared up, or in any other manner processed or handled with the goal of making the site safer for people or the environment.

Contamination reduction zone
The buffer zone between the exclusion and the clean zone.

Decontamination
The removal of hazardous substances from employees and equipment, to the extent necessary, to avoid foreseeable adverse health effects.

Emergency response or responding to emergencies
An organized response to an anticipated release of a hazardous substance that is, or could become, an uncontrolled release.

Exclusion zone
A controlled area at a site, where contamination occurs, that is a risk to human health or the environment.

Exposure or exposed
Employee contact with a toxic substance, harmful physical agent, or oxygen deficient condition. Exposure can occur through various routes of entry, such as inhalation, ingestion, skin contact, or skin absorption.

Facility
Any building structure, installation, equipment, pipe, or pipeline (including any pipe into a sewer or publicly owned treatment works), well, pit, pond, lagoon, impoundment, ditch, storage container, motor vehicle, rolling stock, or aircraft.

OR

Any site or area where a hazardous substance has been deposited, stored, disposed of, placed, or otherwise located (not including any boat, ship or barge).

Hazardous substance
Any of the following substances that could adversely affect an exposed employee's health or safety:

- Biological or other disease-causing agents released that could reasonably be expected to cause death, disease, behavioral abnormalities, cancer, genetic mutation, physiological malfunctions, including malfunctions in reproduction, or physical deformations in a person or their offspring when the person:
  - Is directly exposed to the agent in the environment.
  - Directly ingests, inhales, or assimilates the agent from the environment.
- Indirectly ingests the agent through a food chain.
- Substances listed by the United States Department of Transportation as hazardous materials under Title 49 (Transportation) in the Code of Federal Regulations (CFR), Part 172, section 101 and appendices (found at: http://www.nara.gov, search for "List of CFR subjects").
- Hazardous wastes as defined in this chapter.

Hazardous waste
Any substance designated by the department of ecology as a dangerous or extremely hazardous waste by chapter 173-303 WAC, Dangerous waste regulations.

Hazardous waste site
A hazardous waste site is any facility or location within the scope of this chapter.

Hazardous materials team (HAZMAT team)
A group of employees who are expected to perform responses to releases, or possible releases, of hazardous substances for the purpose of control and stabilization. As a result of their duties, HAZMAT team members may have close contact with hazardous substances.

Health hazard
A chemical, mixture, biological agent, or physical agent that may cause health effects in short- or long-term exposed employees based on statistically significant evidence from at least one study conducted using established scientific principles. Health hazards include:
- Carcinogens.
- Toxic or highly toxic agents.
- Reproductive toxins.
- Irritants.
- Corrosives.
- Sensitizers.
- Hepatotoxins (liver toxins).
- Nephrotoxins (kidney toxins).
- Neurotoxins (nervous system toxins).
- Substances that act on the hematopoietic system (blood or blood-forming system).
- Substances that can damage the lungs, skin, eyes, or mucous membranes.

IDLH or immediately dangerous to life or health
Any atmospheric condition that would:
Uncontrolled hazardous waste site
An area where an accumulation of hazardous substances creates a threat to the health and safety of individuals or the environment or both. Examples include: Former municipal, county, or state landfills, locations where illegal or poorly managed waste disposal has taken place, or property of generators or former generators of hazardous substance waste (surface impoundments, landfills, dumps, and tank or drum farms).

Uncontrolled release
A release where significant safety and health risks could be created. Releases of hazardous substances that are either incidental or couldn’t create a safety or health hazard (i.e., fire, explosion, or chemical exposure) aren’t considered to be uncontrolled releases.

Examples of conditions that could create a significant safety and health risk:
• Large-quantity releases.
• Small releases that could be highly toxic.
• Potentially contaminated individuals arriving at hospitals.
• Airborne exposures that could exceed a WISHA permissible exposure limit or a published exposure limit and employees aren’t adequately trained or equipped to control the release.

Example of an uncontrolled release:
A forklift driver knocks over a container of a solvent-based liquid, releasing the contents onto the warehouse floor. The driver has been trained to recognize the vapor is flammable and moderately toxic when inhaled. The driver hasn’t been trained or provided appropriate equipment to address this type of spill. In this situation, it isn’t safe for the driver to attempt a response. The driver needs to notify someone of the release so an emergency response can be initiated.

296-848-40045 Respirators.
296-848-500 Definitions.

WAC 296-848-100 Scope. This chapter applies to all occupational exposure to inorganic arsenic.

Definitions:

(2005 Ed.)
Inorganic arsenic means elemental arsenic (As), copper aceto-arsenite, and inorganic compounds containing arsenic (measured as As), except arsine. Inorganic compounds do not contain the element carbon.

Exposure is the contact an employee has with inorganic arsenic, whether or not protection is provided by respirators or other personal protective equipment (PPE). Exposure can occur through various routes of entry such as inhalation, ingestion, skin contact, or skin absorption.

**Helpful tool:**
Arsenic contamination in soil; information and guidance for employers.

Use this tool if you have employees who work with soil. It will help you find out if this rule is applicable to your employee's exposure to soil.

**Exemptions:**
- Exposures during agricultural operations.
- Pesticide applications, including the treatment of wood with preservatives.
- Use of wood treated with inorganic arsenic.
- Arsine, a gas identified by Chemical Abstract Service (CAS) Registry No. 7784-42-1.
- Laboratories subject to the requirements found in another chapter:
  - Go to the General occupational health standards, chapter 296-62 WAC;
  - Find the section, Hazardous chemicals in laboratories, WAC 296-62-400.
- Inorganic arsenic present in a form and handled in such a way that airborne exposures could not occur. For example, inorganic arsenic present in glass is fused in the material. Due to the fused form, airborne exposure can not occur when the glass is scored and subsequently broken.

All requirements in this chapter will not apply to every workplace with an occupational exposure. The following steps will show you which requirements apply to your workplace.

**Step 1:** Follow requirements in the basic rules sections, WAC 296-848-20010 through 296-848-20090.
- This chapter does not apply to any of the following:
  - Exposures during agricultural operations.
  - Pesticide applications, including the treatment of wood with preservatives.
  - Use of wood treated with inorganic arsenic.
  - Arsine, a gas identified by Chemical Abstract Service (CAS) Registry No. 7784-42-1.
  - Laboratories subject to the requirements found in another chapter:
    - Go to the General occupational health standards, chapter 296-62 WAC;
    - Find the section, Hazardous chemicals in laboratories, WAC 296-62-400.
  - Inorganic arsenic present in a form and handled in such a way that airborne exposures could not occur. For example, inorganic arsenic present in glass is fused in the material. Due to the fused form, airborne exposure can not occur when the glass is scored and subsequently broken.

**Step 2:** Use employee exposure monitoring results from Step 1 and follow Table 1 to find out which additional sections of this chapter apply to your workplace.

**WAC 296-848-200 Basic rules.**

**Summary:**

**Your responsibility:**

To measure and minimize employee exposure to inorganic arsenic.

**IMPORTANT:**

The sections listed in basic rules apply to all employers covered by the scope of this chapter, WAC 296-848-100. To find additional sections that may apply to you, go to the Scope, WAC 296-848-100, and follow Table 1.

### Table 1

**Sections That Apply To Your Workplace**

<table>
<thead>
<tr>
<th>If:</th>
<th>Then continue to follow the Basic Rules, and these additional requirements:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Employee exposure monitoring results are above the TWA&lt;sub&gt;8&lt;/sub&gt;</td>
<td>• Training, exposure monitoring, and medical monitoring, WAC 296-848-30005 through 296-848-30080; AND</td>
</tr>
<tr>
<td>• Employee exposure monitoring results are below the TWA&lt;sub&gt;8&lt;/sub&gt;</td>
<td>• No additional requirements apply if exposures remain stable.</td>
</tr>
<tr>
<td>• Employee exposure monitoring results are at or above AL</td>
<td>• Training in WAC 296-848-30005.</td>
</tr>
</tbody>
</table>

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-200, filed 12/21/04, effective 5/1/05.]

(2005 Ed.)
WAC 296-848-20010 Preventive practices.  
You must:  
(1) Effectively communicate the hazards of inorganic arsenic by doing both of the following:  
• Keep container labels free of statements that contradict or detract from the labels' hazard warning.  

You must:

• Make sure shipping containers, storage containers, and products containing inorganic arsenic are labeled, tagged, or marked with this warning:

```
<table>
<thead>
<tr>
<th>Warning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contains Inorganic Arsenic</td>
</tr>
<tr>
<td>Cancer Hazard</td>
</tr>
<tr>
<td>Harmful if Inhaled or Swallowed</td>
</tr>
<tr>
<td>Use Only with Adequate Ventilation</td>
</tr>
<tr>
<td>or</td>
</tr>
<tr>
<td>Respiratory Protection</td>
</tr>
</tbody>
</table>
```

Note:  You should keep containers tightly covered when not in use to help prevent unnecessary exposure and accidental spills.  
• Contaminated items should be handled and disposed of to prevent further exposure in the workplace. For example, vacuuming or wet wiping contaminated equipment helps prevent the release of dust into the air.

Reference:  Additional requirements are found in other chapters:  
• For spills, leaks, or other releases, go to Emergency response, chapter 296-824 WAC.  
• For labeling go to:  
• The Safety and health core rules, chapter 296-800 WAC, and find the section, Label containers holding hazardous chemicals, WAC 296-800-17025;  
AND  
• Material safety data sheet and label preparation, chapter 296-839 WAC.

You must:  
(2) Establish safe and effective housekeeping and maintenance practices by doing all the following:  
• Develop and keep a written housekeeping and maintenance plan that lists appropriate frequencies for:  
  – Housekeeping operations;  
  AND  
  – Cleaning and maintaining dust collection equipment.  
• Keep surfaces free of accumulations of inorganic arsenic, to the degree feasible.  
• When cleaning floors and other accessible surfaces:  
  – Use vacuuming or other cleaning methods that minimize the release of inorganic arsenic into the air.  
  – Do not use compressed air.  
  – Select vacuum that have high efficiency particulate air (HEPA) filters.  
  – Use and empty vacuums in a way that minimizes the release of inorganic arsenic back into the workplace.  

Note:  Shoveling or brushing may be used only when vacuuming or other cleaning methods have not been effective.  
• Using non-HEPA vacuums will increase inorganic arsenic contamination in air and on area surfaces.

You must:  
• Maintain ventilation systems, including dust collection equipment, to make sure they are effective. Do all of the following:  
  – Perform periodic inspections for effectiveness.  
  – Periodically clean the equipment.  
  – Keep a note of the most recent inspection for effectiveness, and cleaning or maintenance.  
• Prevent eye or skin contact with:  
  • Arsenic trichloride;  
  AND  
  • Liquid or particulate forms of inorganic arsenic when contact could cause eye or skin irritation.  

Note:  Arsenic trichloride is corrosive and can be quickly absorbed through skin.

[Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-20010, filed 12/21/04, effective 5/1/05.]

WAC 296-848-20025 Washing facilities.  
You must:  
• Provide washing facilities for employees exposed to inorganic arsenic.  

References:  For additional washing facility requirements, go to another chapter, the Safety and health core rules, chapter 296-800 WAC, and find the section titled, Provide convenient and clean washing facilities, WAC 296-800-23025.

[Statutory Authority:  RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-20025, filed 12/21/04, effective 5/1/05.]

WAC 296-848-20060 Exposure evaluations.  
IMPORTANT:  
• This section applies when workplace operations create potential airborne exposure to inorganic arsenic.  
• When you conduct an exposure evaluation in a workplace where an employee uses a respirator, the protection provided by the respirator is not considered.  
• Following this section will fulfill the requirements to identify and evaluate respiratory hazards found in another chapter, Respiratory hazards, chapter 296-841 WAC.

You must:  
(1) Conduct an employee exposure evaluation to accurately determine airborne concentrations of inorganic arsenic by completing Steps 1 through 5 of the Exposure Evaluation Process, each time any of the following apply:  
• No evaluation has been conducted.  
• Changes have occurred in any of the following areas that may result in new or increased exposures:  
  – Production.  
  – Processes.  
  – Exposure controls such as ventilation systems or work practices.  
  – Personnel.  
• You have any reason to suspect new or increased exposure may occur.

(2) Provide affected employees and their designated representatives an opportunity to observe exposure monitoring during Step 4 of the Exposure Evaluation Process.  
• Make sure observers do not interfere with exposure measurements.  
• Make sure observers are entitled to:  
  – An explanation of your exposure measurement and monitoring procedures;  
  – Observe all tasks of exposure measurement performed at the workplace;  
  AND

(2005 Ed.)
- Receive a copy of the exposure measurement results when you obtain them; or are allowed to record the exposure measurement results, if made during observations.
- Make sure observers who enter areas with inorganic arsenic exposure:
- Are provided with and use the same protective clothing, respirators, and other personal protective equipment (PPE) that employees working in the area are required to use; AND
- Follow safety and health requirements that apply.

**Exposure Evaluation Process**

**IMPORTANT:**

Following the Exposure Evaluation Process is not necessary when you have documentation conclusively demonstrating inorganic arsenic exposures for a particular operation and material, cannot exceed the action level (AL) during any conditions reasonably anticipated. Documentation can be based on quantitative information such as soil test results or qualitative information such as observations of how inorganic arsenic-containing materials are handled.

- Retain this documentation for as long as you rely on it.

**Step 1:** Identify all employees who have potential airborne exposure to inorganic arsenic in your workplace.

**Step 2:** Select employees from those identified in Step 1 who will have their eight-hour exposures monitored.

- Make sure the exposures of the employees selected represent eight-hour exposures for all employees identified in Step 1, including each job classification, work area, and shift.

**Note:**

- A written description of the procedure used for obtaining representative employee exposure monitoring results needs to be kept as part of your exposure records required by this chapter in Exposure records, WAC 296-848-20090.

**Step 3:** Determine how you’ll obtain employee exposure monitoring results.

- Select and use a method that meets the following criteria for accuracy:
  - ±25%, with a confidence level of 95%, when concentrations are potentially at or above an eight-hour time-weighted average of 10 micrograms per cubic meter (µg/m³); OR
  - ±35%, with a confidence level of 95%, when concentrations are potentially between the eight-hour time-weighted averages of 5 µg/m³ and 10 µg/m³.

**Note:**

- Here are examples of methods that meet this accuracy requirement:

**Step 4:** Obtain employee exposure monitoring results by collecting air samples representing employees identified in Step 1.

- Sample at least one shift representative of the eight-hour exposure, for each employee selected in Step 2.
- Make sure samples are collected from each selected employee's breathing zone.

**Note:**

- You may use any sampling method that meets the accuracies specified in Step 3. Examples of these methods include:
  - Real-time monitors that provide immediate exposure monitoring results.
  - Equipment that collects samples that are sent to a laboratory for analysis.
  - The following are examples of methods for collecting samples representative of eight-hour exposures.
  - Collect one or more continuous samples, for example, a single eight-hour sample or four two-hour samples.
  - Take a minimum of 4 to 7 brief samples, such as fifteen-minute samples, during the work shift and at times selected randomly.
  - For work shifts longer than eight hours, monitor the continuous eight-hour portion of the shift expected to have the highest average exposure concentration.

**Step 5:** Have the samples you collected analyzed to obtain monitoring results representing eight-hour exposures.

- Go to the Scope of this chapter, WAC 296-848-100, and compare employee exposure monitoring results to the values found in Step 1 and follow Step 2 to determine if additional sections of this chapter apply.

**Note:**

- You may contact your local WISHA consultant for help:
  - Interpreting data or other information.
  - Determining eight-hour employee exposure monitoring results.
  - To contact a WISHA consultant:
  - Go to the Safety and health core rules, chapter 296-800 WAC;
  - AND
  - Find the Resources section, and under “Other Resources,” find Service Locations for Labor and Industries.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-20060, filed 12/21/04, effective 5/1/05.]

**WAC 296-848-20070 Notification.**

**You must:**

- Provide written notification of exposure monitoring results, including notification about whether exposures exceed the permissible exposure limit (PEL), to employees represented by your exposure evaluation, within five business days after the monitoring results become known to you.

- In addition, when employee exposure monitoring results are above the permissible exposure limit (PEL), provide written notification of all the following within fifteen business days after these exposure monitoring results become known to you.
  - Corrective actions being taken and a schedule for completion;
  AND
  - Any reason why exposures cannot be lowered to below the PEL.

**Note:**

- You can notify affected employees either individually or post the notifications in areas readily accessible to affected employees.
- When notifying employees about corrective actions, your notification may refer them to a separate document that is available and provides the required information.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-20070, filed 12/21/04, effective 5/1/05.]

**WAC 296-848-20090 Exposure records.**

**You must:**

- Establish and keep complete and accurate records for all exposure monitoring conducted under this chapter. Make sure the record includes, at least:
  - The name, Social Security number or other unique identifier, and job classification of the employee sampled and all other employees represented by the sampled employee.
- A description of the methods used to obtain exposure monitoring results and evidence of the method's accuracy.
- A description of the procedure used to obtain representative employee exposure monitoring results.
- The date, number, duration, location, and the result of each sample taken.
- Any environmental conditions that could affect exposure concentration measurements.

**Note:** It's useful to record any personal protective equipment worn by the employee in addition to the type of respirator worn.

**You must:**
- Keep exposure monitoring records for at least thirty years.

**Reference:**
- To see additional requirements for employee exposure records including access and transfer requirements, go to another chapter, Employee medical and exposure records, chapter 296-802 WAC.

Exposure monitoring records need to be kept longer than thirty years for employees participating in medical monitoring. Go to Medical records, WAC 296-848-30080, found within this chapter.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-20090, filed 12/21/04, effective 5/1/05.]

**296-848-30005 Training.**

**You must:**
- Train employees:
  - Who are exposed above the action level (AL) of 5 micrograms per cubic meter (µg/m³) for inorganic arsenic;
  OR
  - Above the permissible exposure limit (PEL) of 10 µg/m³ for inorganic arsenic.
- Provide training:
  - At the time of initial assignment;

(2005 Ed.)

- At least every twelve months after initial training.
- Make sure training and information includes all of the following:
  - A review of this chapter.
  - The information found in another chapter:
    - Go to the General occupational health standards, chapter 296-62 WAC;
    - Find Appendix A-Inorganic Arsenic Substance Information Sheet, WAC 296-62-07354(1).
  - The purpose for medical evaluations and a description of how you are fulfilling the medical evaluation requirements of this chapter found in Medical evaluations, WAC 296-848-30030.
  - Make a copy of each of the following readily available to all employees required to be trained under this section:
    - This chapter;
    - These appendices found in another chapter, the General occupational health standards, chapter 296-62 WAC:
      - Appendix A-Inorganic Arsenic Substance Information Sheet, WAC 296-62-07354(1).
      - Appendix C-Medical Surveillance Guidelines, WAC 296-62-07354(3).

**Reference:**
- To see additional training and information requirements in other chapters, go to the:
  - Respirators rule, chapter 296-842 WAC.
  - Safety and health core rules, chapter 296-800 WAC, and find the section titled, Inform and train your employees about hazardous chemicals in your workplace, WAC 296-800-17030.
  - When following these requirements, include specific information about potential exposures to inorganic arsenic, such as the types of operations, locations, quantities, exposure sources, exposure controls, inorganic arsenic use, and storage.
Title 296 WAC: Labor and Industries, Department of

296-848-30030 Medical evaluations.

**IMPORTANT:**
- Medical evaluations conducted under this section will satisfy the medical evaluation requirement found in another chapter, Respirators, chapter 296-842 WAC.

**You must:**
- Make medical evaluations available to current employees who have been, are, or will be exposed to inorganic arsenic concentrations above the AL:
  - At least thirty days in any twelve-month period;
  - A total of ten years or more of combined employment with you or previous employers with at least thirty days of exposure per year.
- Make medical evaluations available at no cost to employees.
- Pay all costs, including travel costs and wages associated with any time spent outside of the employee’s normal work hours.
- Make medical evaluations available at reasonable times and places.
- Make medical evaluations available by completing Steps 1 through 6 of the Medical Evaluation Process for each employee covered.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-30010, filed 12/21/04, effective 5/1/05.]

### Table 2

**Periodic Exposure Evaluation Frequencies**

<table>
<thead>
<tr>
<th>If 8-hour employee exposure monitoring results:</th>
<th>Then:</th>
</tr>
</thead>
</table>
| Are between the:  
  - Action level (AL) of 5 micrograms per cubic meter (µg/m³);  
  - Permissible exposure limit (PEL) of 10 µg/m³  
  AND  
  - The decrease is demonstrated by two consecutive exposure evaluations made at least seven days apart  
  - The decrease is demonstrated by two consecutive exposure evaluations made at least seven days apart | Conduct additional exposure evaluations at least every six months for the employees represented by the monitoring results. |
| Are above the PEL | Conduct additional exposure evaluations at least every three months for the employees represented by the monitoring results. |
| For employees previously above the PEL, have decreased:  
  - To a concentration between the PEL and AL;  
  - The decrease is demonstrated by two consecutive exposure evaluations made at least seven days apart | You may decrease your evaluation frequency to every six months for the employees represented by the monitoring results. |
| Have decreased to below the AL;  
  AND  
  The decrease is demonstrated by two consecutive exposure evaluations made at least seven days apart | You may stop periodic employee exposure evaluations for employees represented by the monitoring results. |

[Note: Employees who wear respirators need to be medically evaluated to make sure the respirator will not harm them, before they are assigned work in areas requiring respirators. Employees who decline to receive medical examination and testing to monitor for health effects caused by inorganic arsenic are not excluded from receiving a separate medical evaluation for a respirator use. If employers discourage participation in medical monitoring for health effects caused by inorganic arsenic, or in any way interfere with an employee’s decision to continue with this program, this interference may represent unlawful discrimination under RCW 49.17.160, Discrimination against employee filing, instituting proceeding, or testifying prohibited—Procedure—Remedy.

Helpful tool: Declination form for nonemergency related medical evaluations.

You may use this optional form to document employee decisions to decline participation in the medical evaluation process for exposure to inorganic arsenic. To see this form, go to the Resources section within this chapter.

**Medical Evaluation Process**

**Step 1:** Identify employees who qualify, as stated above, for medical evaluations.

**Step 2a:** Make medical evaluations available for employees identified in Step 1 at the following times:
- Initially, when employees are assigned to work in an area where exposure monitoring results are, or will likely be, above the action level for at least thirty days in a twelve-month period.
- Periodically as specified in Table 3.
- When employment with exposure ends, if the employee has not had an evaluation within the six-month period before exposure ends. Include in these evaluations the same content as specified in Table 4 for initial evaluations, excluding a chest X ray.

**Step 2b:** Provide appropriate medical examination and emergency treatment when an employee identified in Step 1 develops signs or symptoms commonly associated with inorganic arsenic exposure.

**Step 3:** Select a licensed health care professional (LHCP) who will conduct or supervise examinations and procedures.

**Step 4:** Make sure the LHCP receives all of the following before the medical evaluation is performed:

[Title 296 WAC—p. 3036]
A copy of:
– This chapter;
AND
– The following information found in the General occupational health standards, chapter 296-62 WAC:
  ■ Appendix A-Inorganic Arsenic Substance Information Sheet, WAC 296-62-07354(1).
  ■ Appendix B-Substance Technical Guidelines, WAC 296-62-07354(2).
  ■ Appendix C-Medical Surveillance Guidelines, WAC 296-62-07354(3).
• A description of the duties of the employee being evaluated and how these duties relate to inorganic arsenic exposure.
• The anticipated or representative exposure monitoring results for the employee being evaluated.
• A description of the personal protective equipment (PPE) each employee being evaluated uses or will use.
• Information from previous employment-related examinations when this information is not available to the examining LHCP.
• Instructions that the written opinions the LHCP provides you be limited to the following information:
  – Results from examinations and tests.
  – The LHCP’s opinion about whether or not medical conditions were found that would increase the employee’s risk for impairment from exposure to inorganic arsenic.
  – Any recommended limitations for:
    ■ Inorganic arsenic exposure;
    AND
    ■ Use of respirators or other PPE.
• A statement that the employee has been informed of medical results and medical conditions caused by inorganic arsenic exposure requiring further examination or treatment.

Step 5: Make the medical evaluation available to the employee. Make sure it includes the content listed in Table 4, Content of Medical Evaluations.

Step 6: Obtain the LHCP’s written opinion for the employee’s medical evaluation and give a copy to the employee.
• Make sure the written opinion is limited to the information specified for written opinions in Step 4.

Note: If the written opinion contains specific findings or diagnoses unrelated to occupational exposure, send it back and obtain a revised version without the additional information.

Table 4  Content of Medical Evaluations

<table>
<thead>
<tr>
<th>When conducting:</th>
<th>Include:</th>
</tr>
</thead>
</table>
| An initial evaluation    | • A work history and medical history including:
                                   – Smoking history.
                                   – The presence and degree of respiratory symptoms such as breathlessness, cough, sputum production, and wheezing.
                                   • A physical examination that includes: |
| Periodic evaluations for employees less than forty-five years old with less than ten years of exposure above the action level (AL) | • The same content as specified for initial evaluations repeated every twelve months. |
| Periodic evaluations for employees:  • Forty-five or older; OR • With more than ten years of exposure above the AL | • The following content repeated every six months:
                                   – A work history and medical history including:
                                   ■ Smoking history.
                                   ■ The presence and degree of respiratory symptoms such as breathlessness, cough, sputum production, and wheezing.
                                   – A physical examination that includes a nasal and skin examination.
                                   – Additional examinations the LHCP believes appropriate based on the employee's exposure to inorganic arsenic or respirator use.
                                   • A physical examination, repeated every twelve months, that obtains a fourteen by seventeen-inch posterior-anterior chest X ray and the International Labor Office UICC/Cincinnati (ILO U/C) rating. |

(2005 Ed.)
– A copy of the licensed health care professional’s (LHCP’s) written opinions.
– The anticipated or representative employee exposure monitoring results provided to the LHCP for the employee.
– Maintain medical evaluation records for the duration of employment plus thirty years.

**Note:**
- Your medical provider may keep these records for you.
- Other medical records, such as the employee’s medical history or X ray, need to be kept as a confidential record by the medical provider and accessed only with the employee’s consent.

**Reference:**
To see additional requirements for employee medical records, including access and transfer requirements, go to Employee medical and exposure records, chapter 296-802 WAC.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-30080, filed 12/21/04, effective 5/1/05.]

**WAC 296-848-400 Exposure control areas.**

**Summary:**
Your responsibility:
To protect employees from exposure to inorganic arsenic by using feasible exposure controls and appropriate respirators.

**IMPORTANT:**
These sections apply when employee exposure monitoring results are above the permissible exposure limit (PEL) of 10 micrograms per cubic meter (µg/m³) of air.

**Contents**
- Exposure control plan WAC 296-848-40005.
- Exposure controls WAC 296-848-40020.
- Exposure control areas WAC 296-848-40025.
- Clean-up facilities and lunchrooms WAC 296-848-40030.
- Personal protective equipment WAC 296-848-40040.
- Respirators WAC 296-848-40045.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-40005, filed 12/21/04, effective 5/1/05.]

**WAC 296-848-40005 Exposure control plan.**

**IMPORTANT:**
Use of employee rotation to control exposures is not advisable since inorganic arsenic is a known carcinogen.

**You must:**
- Establish and implement a complete written exposure control plan that includes at least the following, for exposure control areas:
  - A description of each operation releasing inorganic arsenic, for example:
    - Crew size.
    - Current exposure controls.
    - Materials processed.
    - Machinery used.
    - Operating procedures.
    - Maintenance practices.
  - Exposure evaluation data.
  - A report of the technology considered for exposure controls.
  - Engineering plans and studies used as a basis for selecting exposure controls.
  - A detailed schedule for implementing:
    - Feasible exposure controls, if immediate implementation is not possible.
    - Changes to enhance current exposure controls, when necessary.
  - An analysis of the effectiveness of the exposure controls considered, when controls will not reduce exposures to or below the permissible exposure limit (PEL).
  - Other relevant information.
  - Review and update your exposure control plan at least every six months to keep it current.
  - Implement exposure controls on the quickest schedule feasible if controls will not reduce exposure to or below the PEL.
  - Provide a copy of your exposure control plan to affected employees and their designated representatives, when they ask to review or copy it.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-40005, filed 12/21/04, effective 5/1/05.]

**WAC 296-848-40020 Exposure controls.**

**IMPORTANT:**
Respirators and other personal protective equipment (PPE) do not substitute for feasible exposure controls.

**You must:**
- Use feasible exposure controls to reduce exposures to or below the permissible exposure limit (PEL), or as low as achievable.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-40020, filed 12/21/04, effective 5/1/05.]

**WAC 296-848-40025 Exposure control areas.**

**You must:**
- Establish temporary or permanent exposure control areas where airborne concentrations of inorganic arsenic are above the permissible exposure limit (PEL) by doing all the following:
  - Distinguish the boundaries of exposure control areas from the rest of the workplace in any way that minimizes employee access.
  - Allow only authorized personnel to enter exposure control areas.
  - Post signs at access points to exposure control areas that include this warning:

<table>
<thead>
<tr>
<th>DANGER</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inorganic Arsenic</td>
</tr>
<tr>
<td>Cancer Hazard</td>
</tr>
<tr>
<td>Authorized Personnel Only</td>
</tr>
<tr>
<td>No Smoking or Eating</td>
</tr>
<tr>
<td>Respirator Required</td>
</tr>
</tbody>
</table>

- Make sure signs are kept clean and well lit so they are easy to read.

[Title 296 WAC—p. 3038] (2005 Ed.)
– Keep signs and areas near them free of statements that contradict or detract from their message.

**Note:** This requirement does not prevent you from posting signs required by other laws, rules, or ordinances.

**You must:**
– Make sure employees entering exposure control areas have an appropriate respirator.
– Prevent all of the following activities from occurring in exposure control areas unless they are conducted in required lunchrooms, change rooms, or showers:
  ■ Eating food or drinking beverages.
  ■ Smoking.
  ■ Chewing tobacco or gum.
  ■ Applying cosmetics.

**Note:**
• You may use permanent or temporary enclosures, caution tape, ropes, painted lines on surfaces, or other materials to visibly distinguish exposure control areas or separate them from the rest of the workplace.
• When distinguishing exposure control areas, you should consider factors such as:
  – The level and duration of airborne exposure.
  – Whether the area is permanent or temporary.
  – The number of employees in adjacent areas.

**Reference:** To see other requirements for respirators within this chapter, go to Respirators, WAC 296-848-40045.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-40030, filed 12/21/04, effective 5/1/05.]

**WAC 296-848-40030 Clean-up facilities and lunchrooms.**

**You must:**
• Provide the following facilities for employees who could experience eye or skin irritation from exposure to inorganic arsenic or who work in exposure control areas:
  – Clean change rooms with separate storage for street clothes and personal protective equipment (PPE).
  – Shower facilities.
• Make sure employees who could experience eye or skin irritation from exposure to inorganic arsenic or who work in exposure control areas:
  – Shower at the end of the work shift;
  AND
  – Wash their hands and face before eating.
• Provide lunchrooms for employees working in exposure control areas that are:
  – Located so they are readily accessible to the employees.
  – Temperature controlled.
  – Under positive pressure compared to surrounding areas.
  – Provided with a filtered air supply.

**Note:** Lunchrooms may be located within exposure control areas, but are considered separate from the exposure control area.

• Do the following when exposures in exposure control areas exceed an eight-hour time-weighted average of 100 micrograms of arsenic per cubic meter of air (µg/m³):
  – Provide facilities for employees working in exposure control areas where they can remove excess contamination from protective clothing and shoes.
  – Make sure employees vacuum protective clothing and clean or change shoes before entering showers, change rooms, or lunchrooms.

**Reference:** To see additional requirements for hygiene facilities:
• Go to the Safety and health core rules, chapter 296-800 WAC.
• Find Drinking water, bathrooms, washing facilities, and waste disposal, WAC 296-800-230.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-40030, filed 12/21/04, effective 5/1/05.]

**WAC 296-848-40040 Personal protective equipment (PPE).**

**You must:**
• Provide, make sure employees use, and maintain PPE as follows:
  – Provide clean and dry protective clothing to employees who could experience eye or skin irritation from exposure to inorganic arsenic or who work in exposure control areas.
  – Provide impervious protective clothing to employees exposed to arsenic trichloride.

**Note:**
• Arsenic trichloride is corrosive and can be rapidly absorbed through skin.
• Examples of protective clothing appropriate for inorganic arsenic exposures include:
  – Coveralls or similar full-body work clothing.
  – Gloves, and shoes or coverlets.
  – Face shields or vented goggles when necessary to prevent eye irritation.

**You must:**
– Make sure employees do not remove inorganic arsenic from PPE by blowing or shaking.
– Make sure protective clothing is removed:
  ■ In change rooms;
  AND
  ■ At the end of the work shift.
– Make sure contaminated protective clothing that will be cleaned, laundered, or disposed of, is placed in a closed container located in the change room.
– Make sure the container prevents the release of inorganic arsenic.
  ■ Launder protective clothing:
  ■ At least weekly if employees work in areas where exposure monitoring results of inorganic arsenic are below an eight-hour time-weighted average concentration of 100 micrograms per cubic meter (µg/m³);
  OR
  ■ Daily if employees work in areas where either exposure monitoring results of inorganic arsenic are above an eight-hour time-weighted average concentration of 100 µg/m³ or when more frequent washing is needed to prevent skin irritation.
  – Maintain the effectiveness of PPE by repairing or replacing it, as needed:
  ■ Dispose of protective clothing if it will not be repaired.
  • Inform individuals who clean or launder protective clothing about the possible health effects associated with inorganic arsenic, including carcinogenic effects, by doing the following:
  – Provide the information in writing;
  AND
  – Label containers of contaminated PPE with the following warning:

(2005 Ed.)
CAUTION: Clothing contaminated with inorganic arsenic
Do not remove dust by blowing or shaking
Dispose of inorganic arsenic contaminated wash water as applicable local, state, or federal regulations require

Reference: To see additional Personal protective equipment requirements go to the Safety and health core rules, chapter 296-800 WAC, and find the section titled, PPE, WAC 296-800-160.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-40040, filed 12/21/04, effective 5/1/05.]

WAC 296-848-40045 Respirators.
IMPORTANT:
• The requirements in this section are in addition to the requirements found in other chapters:
  – Respiratory hazards, chapter 296-841 WAC.
  – Respirators, chapter 296-842 WAC.
You must:
• Provide respirators and require that employees use them in circumstances where exposure is above the permissible exposure limit (PEL), including any of the following circumstances:
  – Employees are in an exposure control area.
  – Feasible exposure controls are being put in place.
  – Where you determine that exposure controls are not feasible.
  – Feasible exposure controls do not reduce exposures to, or below, the PEL.
  – Emergencies.
• Make sure air-purifying respirators selected have high-efficiency particulate air (HEPA) filters or N-, R-, or P-100 filters.
• Provide an employee a powered air-purifying respirator (PAPR) when this type of respirator will provide proper protection and:
  – A licensed health care professional (LHCP) allows this type of respirator in their written opinion.
OR
• The employee chooses to use this type of respirator.
• Prohibit the use of half-facepiece respirators for protection against arsenic trichloride.

Note: Arsenic trichloride is corrosive and can be rapidly absorbed through skin.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-173, § 296-848-40045, filed 12/21/04, effective 5/1/05.]

WAC 296-848-500 Definitions.
Action level
An airborne concentration of inorganic arsenic of 5 micrograms per cubic meter (µg/m³) of air calculated as an eight-hour time-weighted average.

Authorized personnel
Individuals specifically permitted by the employer to enter the exposure control area to perform duties, or to observe employee exposure evaluations as a designated representative.

Chapter 296-849 WAC
BENZENE

WAC
296-849-100 Scope.
296-849-110 Basic rules.
296-849-11010 Preventive practices.
296-849-11020 Exposure control areas.
296-849-11030 Exposure evaluations.
296-849-11040 Personal protective equipment (PPE).
296-849-11050 Training.
296-849-11065 Exposure monitoring observation.
296-849-11070 Notification.

(2005 Ed.)
WAC 296-849-100 Scope. This chapter applies to all occupational exposure to benzene.

Definition:

Exposure is the contact an employee has with benzene, whether or not protection is provided by respirators or other personal protective equipment (PPE). Exposure can occur through various routes of entry such as inhalation, ingestion, skin contact, or skin absorption.

Exemptions: This chapter does not apply to any of the following:

- Liquids, vapors, mixtures in containers or pipelines, and gas in natural gas processing plants when benzene content is 0.1% or less.
- Gasoline and other fuels containing benzene once they leave the final bulk wholesale facility and are:
  - Transported;
  - Sold;
  - Distributed;
  - Stored;
  - Dispensed either:
    - Outdoors;
    - Indoors four hours or less a day.
- Laboratories subject to the requirements in hazardous chemicals in laboratories, WAC 296-62-400, the General occupational health standards, chapter 296-62 WAC.
- Oil and gas drilling, production, and servicing operations.
- Solid materials that contain only trace amounts of benzene.
- Coke ovens.

All requirements in this chapter will not apply to every workplace with an occupational exposure to benzene.

Step 1: If any of your work tasks are listed in Table 1, follow Table 1.

- Go to Step 2a if you have additional work tasks or other exposures that are not covered in Table 1.

Table 1

<table>
<thead>
<tr>
<th>Requirements that Apply to Specific Tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>If employees do any of the following:</td>
</tr>
<tr>
<td>Load and unload benzene at bulk storage facilities that use vapor control systems for all loading and unloading operations.</td>
</tr>
</tbody>
</table>

Table 2

<table>
<thead>
<tr>
<th>Section Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>If employee exposure monitoring results are:</td>
</tr>
<tr>
<td>• Above the TWA₈ or STEL</td>
</tr>
</tbody>
</table>

Step 2a: Follow requirements in the basic rules sections, WAC 296-849-11010 through 296-849-11090, for tasks not listed in Table 1.

- This includes completing an exposure evaluation, as specified in Exposure evaluations, WAC 296-849-11060, to:
  - Obtain employee fifteen-minute and eight-hour exposure monitoring results of airborne benzene;
  - Make sure training and information includes specific information on benzene for each hazard communication training topic.
  - Go to the Safety and health core rules, chapter 296-800 WAC, and find Inform and train your employees about hazardous chemicals in your workplace, WAC 296-800-17030.

Step 2b: Use employee exposure monitoring results from Step 2a and follow Table 2 to find out which additional sections of this chapter to your workplace.

(2005 Ed.)
### WAC 296-849-110 Basic rules.

**Summary:**
To measure and minimize employee exposure to benzene.

**IMPORTANT:**
To determine which requirements to follow for your work tasks, go to Table 1 in the scope of this chapter, WAC 296-849-100.

**Contents:**
- Preventive practices
- Exposure control areas
- Exposure evaluations
- Personal protective equipment (PPE)
- Training
- Exposure monitoring observation
- Notification
- Exposure records

### WAC 296-849-11010 Preventive practices.

**You must:**
- Make sure containers of benzene in the workplace are labeled, tagged, or marked with this warning:

  **DANGER**
  CONTAINS BENZENE
  CANCER HAZARD

  **Note:** You should keep containers tightly covered when not in use to prevent unnecessary exposure and accidental spills.

**References:**
Additional requirements are found in other chapters as follows:
- For spills, leaks, or other releases of benzene, go to Emergency response, chapter 296-824 WAC.
- For labeling go to:
  - The Safety and health core rules, chapter 296-800 WAC, and find the section Label containers holding hazardous chemicals, WAC 296-800-17025;
  - Material safety data sheet and label preparation, chapter 296-839 WAC.

### WAC 296-849-11020 Exposure control areas.

**You must:**
- Establish temporary or permanent exposure control areas where airborne concentrations of benzene are above, or can be reasonably expected to be above, the permissible exposure limits (PELs) for benzene by doing all the following:
  - Post signs at access points to exposure control areas that include this warning:

    **DANGER**
    Benzene
    Cancer Hazard
    Flammable - No Smoking
    Authorized Personnel Only
    Respirator Required
  - Distinguish the boundaries of exposure control areas from the rest of the workplace in any way that minimizes employee access.
  - Allow only authorized personnel to enter exposure control areas.

**Reference:**
If exposure control areas are established, go to Respirators, WAC 296-849-13045.

### WAC 296-849-11030 Exposure evaluations.

**IMPORTANT:**
When you conduct an exposure evaluation in a workplace where an employee uses a respirator, the protection provided by the respirator is not considered. Following this section will fulfill the requirements to identify and evaluate respiratory hazards found in another chapter, Respiratory hazards, chapter 296-841 WAC.

**You must:**
- Conduct an employee exposure evaluation to accurately determine airborne concentrations of benzene by completing Steps 1 through 7 of the exposure evaluation process, each time any of the following apply:
  - No evaluation has been conducted.
  - You have up to thirty days to complete an evaluation once benzene is introduced into your workplace.
  - Changes have occurred in any of the following areas that may result in new or increased exposures:
    - Production.
    - Processes.
    - Exposure controls such as ventilation systems or work practices.
    - Personnel.
  - You have any reason to suspect new or increased exposure may occur.

**Note:**
- You may use permanent or temporary enclosures, caution tape, ropes, painted lines on surfaces, or other materials to visibly distinguish exposure control areas or separate them from the rest of the workplace.
- When distinguishing exposure control areas you should consider factors such as:
  - The level and duration of airborne exposure.
  - Whether the area is permanent or temporary.
  - The number of employees in adjacent areas.

**Reference:**
If exposure control areas are established, go to Respirators, WAC 296-849-13045.
– Spills, leaks, or other releases have been cleaned up.

**Note:** As part of your exposure evaluation after cleanup, you will make sure exposure monitoring results have returned to prerelease levels.

**Exposure evaluation process.**

**IMPORTANT:**
- If you are evaluating employee exposures during cleaning and repair of barges and tankers that contained benzene:
  - Collect samples that effectively measure benzene concentrations that employees may be exposed to;

  **AND**
  - Skip to Step 7.
  - Following the exposure evaluation process is not necessary when you have documentation conclusively demonstrating benzene exposures for a particular operation and material cannot exceed the action level (AL) during any conditions reasonably anticipated.
  - Documentation can be based on data or qualitative information, such as information about:
    - The material.
    - How the material is handled.
    - The work conditions.
  - Retain this documentation for as long as you rely on it.

**Step 1:** Identify all employees who have potential airborne exposure to benzene in your workplace.

**Step 2:** Identify operations where fifteen-minute exposures could exceed benzene’s short-term exposure limit (STEL) of 5 parts per million (ppm).
- Include operations where it is reasonable to expect high, fifteen-minute exposures, such as operations where:
  - Tanks are opened, filled, unloaded, or gauged.
  - Containers or process equipment are opened.
  - Benzene is used as a solvent for cleaning.

**Note:** You may use monitoring devices such as colorimetric indicator tubes or real-time monitors to screen for activities where employee exposure monitoring results could be high.

**Step 3:** Select employees from those working in the operations you identified in Step 2 who will have their fifteen-minute exposures measured.

**Step 4:** Select employees from those identified in Step 1 who will have their eight-hour exposures monitored.
- Make sure the exposures of the employees selected represent eight-hour exposures for all employees identified at Step 1, including each job classification, work area, and shift.

**Note:** A written description of the procedure used for obtaining representative employee exposure monitoring results needs to be kept as part of your exposure records required by this chapter in Exposure records, WAC 296-849-11090. This description can be created while completing Steps 3 through 6 of this exposure evaluation process.

**Step 5:** Determine how you will obtain employee monitoring results.
- Select and use a method that is accurate to ±25%, with a confidence level of 95%.

**Note:** Here are examples of methods that meet this accuracy requirement:
- OSHA Method 12 for air samples, found by going to http://www.osha.gov/dts/ltc/methods/toc.html.
- NIOSH Method 1500, found by going to http://www.cdc.gov/niosh/homepage.html and link to the NIOSH Manual of Analytical Methods.

**Step 6:** Obtain employee exposure monitoring results by collecting air samples representing employees identified at Step 1.

- Collect fifteen-minute samples from employees selected at Step 3.
- Sample at least one shift representative of the eight-hour exposure for each employee selected at Step 4.
  - Make sure samples are collected from each selected employee’s breathing zone.
  - Collecting area samples is permitted after emergency releases.

**Note:** You may use any sampling method that meets the accuracy specified in Step 5. Examples of these methods include:
- Real-time monitors that provide immediate exposure monitoring results.
- Equipment that collects samples that are sent to a laboratory for analysis.
- The following are examples of methods of monitoring representative of eight-hour exposures:
  - Collect one or more continuous samples, for example, a single eight-hour sample or four two-hour samples.
  - Take a minimum of five brief samples, such as fifteen-minute samples, during the work shift and at times selected randomly.
  - For work shifts longer than eight hours, monitor the continuous eight-hour portion of the shift expected to have the highest average exposure concentration.

**Step 7:** Have the samples you collected analyzed to obtain monitoring results representing eight-hour and fifteen-minute exposures.
- Go to the scope of this chapter, WAC 296-849-100, and compare employee exposure monitoring results to the values found in Step 2a and follow Step 2b to determine if additional sections of this chapter apply.

**Note:** You may contact your local WISHA consultant for help:
- Interpreting data or other information.
- Obtaining eight-hour or fifteen-minute employee exposure monitoring results.
- To contact a WISHA consultant:
  - Go to another chapter, the Safety and health core rules, chapter 296-800 WAC, and find the resources section, and under “other resources,” find service location for labor and industries.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-172, § 296-849-11030, filed 12/21/04, effective 3/1/05.]

**WAC 296-849-11040 Personal protective equipment (PPE).**

**You must:**
- Make sure employees use appropriate PPE as protection from skin or eye contact with liquid benzene.

**Note:** Harmful amounts of benzene can enter the body through skin and eye contact.

**Reference:** To see additional personal protective equipment requirements, go to the Safety and health core rules, chapter 296-800 WAC.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-172, § 296-849-11040, filed 12/21/04, effective 3/1/05.]

**WAC 296-849-11050 Training.**

**You must:**
- Provide training and information to employees:
  - At the time of initial assignment to a work area where benzene is present;

  **AND**
  - At least every twelve months after initial training for employees exposed to airborne concentrations at or above the action level (AL) of 0.5 parts per million (ppm).
  - Make sure training and information includes all of the following:

[Title 296 WAC—p. 3043]
– Specific information on benzene for each hazard communication training topic. For the list of hazard communication training topics, go to the Safety and health core rules, chapter 296-800 WAC, and find Inform and train your employees about hazardous chemicals in your workplace, WAC 296-800-17030;

AND

– An explanation of the contents of each of the following and guidance about where to find a copy:
  ■ This chapter.
  ■ The following found in another chapter, the General occupational health standards, chapter 296-62 WAC:
    ✦ The substance safety data sheet—benzene, found in WAC 296-62-07525, Appendix A.
    ✦ The substance technical guidelines—benzene, found in WAC 296-62-07527, Appendix B.
    ✦ The medical surveillance guidelines for benzene, found in WAC 296-62-07529, Appendix C;

AND

– A description of the medical evaluation requirements of this chapter found in:
  ■ Medical evaluations, WAC 296-849-12030;

AND

■ Medical removal, WAC 296-849-12050.

Reference: To see additional training and information requirements in other chapters, go to the:

• Respirators rule, chapter 296-842 WAC, and find the training section, WAC 296-842-16005.
• Safety and health core rules, chapter 296-800 WAC, and find the section titled, Inform and train your employees about hazardous chemicals in your workplace, WAC 296-800-17030.

Note:

You can notify employees either individually or post the notifications in areas readily accessible to affected employees. Posted notification may need specific information that allows affected employees to determine which monitoring results apply to them. Notification may be in any written form, such as handwritten or e-mail. Notification may be limited to the required information, such as exposure monitoring results. When notifying employees about corrective actions, your notification may refer them to a separate document that’s available and provides the required information.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-172, § 296-849-11070, filed 12/21/04, effective 3/1/05.]

WAC 296-849-11065 Exposure monitoring observation.

You must:

1. Provide affected employees and their designated representatives an opportunity to observe exposure monitoring during Step 6 of the exposure evaluation process found in Exposure evaluations, WAC 296-849-11030.

2. Make sure observers who enter areas with benzene exposure:
   • Are provided with and use the same protective clothing, respirators, and other personal protective equipment (PPE) that employees working in the area are required to use;

AND

• Follow safety and health requirements that apply.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-172, § 296-849-11065, filed 12/21/04, effective 3/1/05.]

WAC 296-849-11070 Notification.

You must:

• Provide written notification of exposure monitoring results to the employees represented by your exposure evaluation within five business days after the monitoring results become known to you.

   – In addition, when employee exposure monitoring results are above a permissible exposure limit (PEL), provide written notification of all of the following within fifteen business days after these exposure monitoring results become known to you:
     ■ Corrective actions being taken and a schedule for completion;
     ■ Any reason why exposures cannot be lowered to below the PELs for benzene.

Note:

You can notify employees either individually or post the notifications in areas readily accessible to affected employees. Posted notification may need specific information that allows affected employees to determine which monitoring results apply to them. Notification may be in any written form, such as handwritten or e-mail. Notification may be limited to the required information, such as exposure monitoring results. When notifying employees about corrective actions, your notification may refer them to a separate document that’s available and provides the required information.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-172, § 296-849-11070, filed 12/21/04, effective 3/1/05.]

WAC 296-849-11090 Exposure records.

You must:

1. Establish and keep complete and accurate records for all exposure monitoring conducted under this chapter. Make sure the record includes at least:
   • The name, Social Security number, or other unique identifier, and job classification of the employee sampled and all other employees represented by the sampled employee.
   • The type of respirator worn, if any.
   • A description of the methods used to obtain exposure monitoring results.
   • A description of the procedure used to obtain representative employee exposure monitoring results.
   • The date, number, duration, and the result of each sample taken.

Note:

It is useful to record any personal protective equipment worn by the employee, in addition to the type of respirator worn.

You must:

• Keep exposure monitoring records for at least thirty years.

Reference:

To see additional requirements for employee exposure records including access, and transfer requirements, go to another chapter, Employee medical and exposure records, chapter 296-802 WAC.

• Exposure monitoring records need to be kept longer than thirty years for employees participating in medical monitoring, go to Medical records, WAC 296-849-30080, found within this chapter.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-172, § 296-849-11090, filed 12/21/04, effective 3/1/05.]

WAC 296-849-1200 Exposure and medical monitoring.

Summary:

Your responsibility:

To detect any significant changes in employee health and exposure monitoring results.

IMPORTANT:

These sections apply when employee exposure monitoring results are either:

• At or above the action level (AL) of 0.5 parts per million (ppm) for benzene;
OR
• Above either of the permissible exposure limits for benzene.

Contents
Periodic exposure evaluations
WAC 296-849-12010.
Medical evaluations

Medical records
WAC 296-849-12080.

WAC 296-849-12010 Periodic exposure evaluations.
Exemption: Periodic exposure evaluations aren't required if exposure monitoring results conducted to fulfill requirements in Exposure evaluation, WAC 296-849-11030, are below the action level (AL) and short-term exposure limit (STEL).

You must:
• Obtain employee exposure monitoring results as specified in Table 3, by repeating Steps 3, 4, 6, and 7 of the exposure evaluation process found within this chapter, in Exposure evaluations, WAC 296-849-11030.

Note: If you document that one work shift consistently has higher exposure monitoring results than another for a particular operation, then you can limit sample collection to the work shift with higher exposures and use results to represent all employees performing the operation on other shifts.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-172, § 296-849-12010, filed 12/21/04, effective 3/1/05.]

WAC 296-849-12030 Medical evaluations.
IMPORTANT:
Medical evaluations conducted under this section will satisfy the medical evaluation requirement found in Respirators, chapter 296-842 WAC.

You must:
• Provide the relevant medical follow-up specified in Tables 4 and 5 to any employee exposed to benzene during an emergency.
• Make medical evaluations available to current employees who meet the following criteria:
  – Potential or actual exposure to benzene at or above the action level (AL) for at least thirty days in any twelve-month period.
  – Potential or actual exposure to benzene at or above either permissible exposure limit (PEL) for at least ten days in a twelve-month period.
  – Past exposure to concentrations above 10 ppm benzene for at least thirty days in a twelve-month period before November 11, 1988.
  – Current or past work as a tire building machine operator using solvents containing more than 0.1% benzene during tire building operations.

You must:
• Make medical evaluations available at no cost to employees.
  – Pay all costs, including travel costs and wages associated with any time spent outside of the employee’s normal work hours;
  – Make medical evaluations available at reasonable times and places;
  – Make medical evaluations available by completing Steps 1 through 6 of the medical evaluation process for each employee covered.

Note:• Employees who wear respirators need to be medically evaluated to make sure the respirator will not harm them, before they are assigned work in areas requiring respirators. Employees who decline to receive medical examination and testing to monitor for health effects caused by benzene are not excluded from receiving a separate medical evaluation for a respirator use.
  • If employers discourage participation in medical monitoring for health effects caused by benzene, or in any way interfere with an employee’s decision to continue with this program, this interference may represent unlawful discrimination under RCW 49.17.160, Discrimination against employee filing, instituting proceeding, or testifying prohibited—Procedure—Remedy.

Helpful tool: Declination form for nonemergency related medical evaluations.
• You may use this optional form to document employee decisions to decline participation in the medical evaluation process for exposure to benzene.

(2005 Ed.)

[Title 296 WAC—p. 3045]
Medical evaluation process:

**Step 1:** Identify employees who qualify, as stated above, for medical evaluations.

**Step 2:** Make medical evaluations available for employees identified in Step 1 at the following times:
- Initially, before the employee starts a job or task assignment where benzene exposure will occur.
- Every twelve months from the initial medical evaluation.
- Whenever the employee develops signs or symptoms commonly associated with toxic benzene exposure.
- After benzene exposure from an emergency.

**Step 3:** Select a licensed health care professional (LHCP) who will conduct or supervise medical evaluations and make sure:
- Individuals who conduct pulmonary function tests have completed a training course in spirometry sponsored by an appropriate governmental, academic, or professional institution, if they are not licensed physicians;
- AND
- Your LHCP uses an accredited laboratory, such as one accredited by a nationally or state-recognized organization, to conduct laboratory tests.

**Step 4:** Make sure the LHCP receives all of the following before the medical evaluation is performed:
- A copy of:
  - This chapter.
  - The following information found in the General occupational health standards, chapter 296-62 WAC:
    - Appendix A, the substance safety data sheet—benzene, found in WAC 296-62-07525.
    - Appendix B, the substance technical guidelines—benzene, found in WAC 296-62-07527.
    - Appendix C, the medical surveillance guidelines for benzene, found in WAC 296-62-07529.
- A description of the duties of the employee being evaluated and how these duties relate to benzene exposure.
- The anticipated or representative exposure monitoring results for the employee being evaluated.
- A description of the personal protective equipment (PPE) each employee being evaluated uses or will use.
- Information from previous employment-related examinations when this information is not available to the examining LHCP.
- Instructions that the written opinions the LHCP provides, be limited to the following information:
  - Specific records, findings, or diagnosis relevant to the employee's ability to work around benzene.
  - The occupationally relevant results from examinations and tests.
  - A statement about whether or not medical conditions were found that would increase the employee's risk for impairment from exposure to benzene.
  - Any recommended limitations for benzene exposure.
  - Whether or not the employee can use respirators and any recommended limitations for respirator or other PPE use.
  - A statement that the employee has been informed of medical results and medical conditions caused by benzene exposure requiring further explanation or treatment.

**Step 5:** Provide the medical evaluation to the employee. Make sure it includes the content listed in Table 4, Content of medical evaluations, and Table 5, Medical follow-up requirements.

**Step 6:** Obtain the LHCP's written opinion for each employee's medical evaluation and give a copy to the employee within fifteen days of the evaluation date.
- Make sure the written opinion is limited to the information specified for written opinions in Step 4.

**Note:** If the written opinion contains specific findings or diagnoses unrelated to occupational exposure, send it back and obtain a revised version without the additional information.

**IMPORTANT:**
These tables apply when conducting medical evaluations, including medical follow-up for employees exposed to benzene during emergencies.

### Table 4
Content of Medical Evaluations

<table>

<tbody>
<tr>
<td>Additional tests the examining LHCP determines are necessary based on alterations in the components of the blood or other signs that may be related to benzene exposure.</td>
<td><strong>Medical follow-up as required in Table 5.</strong></td>
</tr>
<tr>
<td>An updated medical history covering:</td>
<td></td>
</tr>
<tr>
<td>- Any new exposure to potential marrow toxins;</td>
<td></td>
</tr>
<tr>
<td>- Changes in medication use;</td>
<td></td>
</tr>
<tr>
<td>- Any physical signs associated with blood disorders.</td>
<td></td>
</tr>
<tr>
<td>A complete blood count including a:</td>
<td></td>
</tr>
<tr>
<td>- Leukocyte count with differential;</td>
<td></td>
</tr>
<tr>
<td>- Quantitative thrombocyte count;</td>
<td></td>
</tr>
<tr>
<td>- Hematocrit;</td>
<td></td>
</tr>
<tr>
<td>- Hemoglobin;</td>
<td></td>
</tr>
<tr>
<td>- Erythrocyte count and indices (MCV, MCH, MCHC).</td>
<td></td>
</tr>
<tr>
<td>Additional tests that the examining LHCP determines necessary, based on alterations in the components of the blood or other signs that may be related to benzene exposure.</td>
<td></td>
</tr>
<tr>
<td>A pulmonary function test and specific evaluation of the cardiopulmonary system every three years if the employee is required to use a respirator for at least thirty days a year.</td>
<td></td>
</tr>
<tr>
<td>Medical follow-up as required in Table 5.</td>
<td></td>
</tr>
<tr>
<td>Other medical / occupational conditions which the employee is aware of that may be due to exposure to benzene.</td>
<td><strong>Medical follow-up as required in Table 5.</strong></td>
</tr>
<tr>
<td>Any other relevant information which the employee chooses to disclose.</td>
<td></td>
</tr>
</tbody>
</table>

#### If Then

<table>
<thead>
<tr>
<th>Test</th>
<th>Result</th>
<th>Follow-up</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete blood count test</td>
<td>Normal</td>
<td>No further evaluation is required.</td>
</tr>
<tr>
<td>Complete blood count test</td>
<td>Shows any of the following abnormal conditions:</td>
<td>Repeat the complete blood count within two weeks:</td>
</tr>
<tr>
<td>- Leukocyte count less than 4,000 per mm$^3$</td>
<td></td>
<td>- If the abnormal condition persists, refer the employee to a hematologist or an internist for follow-up medical examination and evaluation, unless the LHCP has good reason to believe it is unnecessary:</td>
</tr>
<tr>
<td>OR</td>
<td></td>
<td>- The hematologist or internist will determine what follow-up tests are necessary:</td>
</tr>
<tr>
<td>- Thrombocyte (platelet) count that is either:</td>
<td></td>
<td>AND</td>
</tr>
<tr>
<td>- More than 20% below the employee's most recent values:</td>
<td></td>
<td>- Follow the requirements found in Medical removal, WAC 296-849-12050.</td>
</tr>
<tr>
<td>- Outside the normal limit (95% C.I.) according to the laboratory:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- The hematocrit or hemoglobin level is either of the following, and can not be explained by other medical reasons:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>- Below the normal limit (outside the 95% C.I.), as determined by the laboratory for the particular geographical area:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OR</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Reference:

Employees who are not covered by medical evaluation requirements in this chapter may be covered by medical evaluation requirements in other chapters such as Emergency response, chapter 296-824 WAC.
WAC 296-849-12050  Medical removal.

IMPORTANT:
This section applies when an employee is referred to a hematologist or an internist for follow-up medical examination and evaluation required in Table 5, Medical follow-up requirements found in Medical evaluations, WAC 296-849-12030.

You must:
(1) Remove the employee from areas where benzene exposure is above the action level (AL) by doing either of the following:
• Transfer the employee to a job currently available that:
   - The employee qualifies for, or could be trained for in a short period of time; AND
   - Will keep the employee's exposure to benzene as low as possible and never above the AL;
   OR
   • Remove the employee from the workplace until either:
     • A job becomes available that:
       ■ The employee qualifies for, or could be trained for in a short period of time; AND
       ■ Will keep the employee's exposure to benzene as low as possible and never above the AL;
   OR
   • The employee is returned to work or permanently removed from benzene exposure as determined by completing the medical evaluation process for removed employees.
   (2) Maintain the employee's current pay rate, seniority, and other benefits.

Note: If you must provide medical removal benefits and the employee will receive compensation for lost pay from other sources, you may reduce your medical removal benefit obligation to offset the amount provided by these sources. Examples of other sources are:
• Public or employer-funded compensation programs;
• Employment by another employer, made possible by the employee's removal.

You must:
(3) Complete Steps 1 through 4 of the medical evaluation process for removed employees, within six months of the date the licensed health care professional (LHCP) refers an employee to a hematologist or internist for follow-up.

• Make sure all examinations and evaluations are provided at no cost to the employee.
• Make examinations and evaluations available at reasonable times and places;
• Pay for travel costs and wages, including any time spent outside of the employee's normal work hours.

Medical evaluation process for removed employees:
Step 1: Make sure the following is provided to the hematologist or internist:
• The information you provided to the LHCP in Step 4 of Medical evaluations, WAC 296-849-12030;
• The employee's medical record as described in Medical records, WAC 296-849-12080.

Note: The examining LHCP may provide this information for you.

Step 2: Provide the employee an examination and evaluation by a hematologist or internist.
• When the examination and evaluation is completed, you and the employee must be informed, in writing, of the referring LHCP's decision to continue or end the employee's removal from benzene exposure.
• Include the following in the LHCP's decision if removal of the employee continues:
  • The expected time period for removal to continue; AND
  • Requirements for future medical examinations to review the decision.
• If the LHCP recommends the employee end removal and return to the usual job with benzene exposure, skip Steps 3 and 4.
Step 3: Provide further medical examination and evaluation to the employee when the LHCP's decision from Step 2 informs you that medical removal must continue.

Note:  
- During this step the LHCP, in consultation with the hematologist or internist, decides whether the employee:  
  - May return to their usual job;  
  OR  
  - Should be permanently removed from exposures that exceed the AL.  
- If the LHCP recommends the employee return to their usual job, skip Step 4.

Step 4: When the LHCP recommends permanent removal for the employee, make sure all the following conditions are met:  
- The employee has an opportunity to transfer to another job that is currently available (or will become available);  
- The job is one the employee qualifies for, or could be trained for in a short period of time;  
- There is no reduction in the employee's current pay rate, seniority, and other benefits;  
- The employee's benzene exposures will be as low as possible, but never more than the AL.

IMPORTANT:  
These sections apply when existing or potential employee exposure monitoring results are above either of the following permissible exposure limits (PELs):  
- The eight-hour time-weighted average (TWA₈) of 1 part per million (ppm);  
OR  
- The fifteen-minute short-term exposure limit (STEL) of 5 ppm.

Contents:  
- Exposure control plan  
  WAC 296-849-13005.  
- Exposure controls  
  WAC 296-849-13020.  
- Respirators  
  WAC 296-849-13045.

WAC 296-849-13005 Exposure control plan.

Exemption:  This section does not apply to the cleaning and repair of barges and tankers that contained benzene.

You must:  
- Establish and implement a written exposure control plan for exposure control areas that include a schedule for developing and implementing feasible exposure controls to reduce benzene exposure to, or below, the PELs.

Reference:  To see examples of exposure controls, go to Respiratory hazards, chapter 296-841 WAC, and find Table 1 in Control employee exposure, WAC 296-841-20010.

Note:  Respirators and other personal protective equipment (PPE) help protect employees from exposures, but are not substitutes for feasible exposure controls.

You must:  
- Review and update your exposure control plan as needed, based on the most recent exposure evaluation results.  
- Provide a copy of your exposure control plan to affected employees and their designated representatives when they ask to review or copy it.

Reference:  To see examples of exposure controls, go to Respiratory hazards, chapter 296-841 WAC, and find Table 1 in Control employee exposures, WAC 296-841-20010.

WAC 296-849-13020 Exposure controls.

IMPORTANT:  
Respirators and other personal protective equipment (PPE) do not substitute for feasible exposure controls.

You must:  
- Use feasible exposure controls to reduce exposures, as specified in Table 6.

Reference:  To see examples of exposure controls, go to Respiratory hazards, chapter 296-841 WAC, and find Table 1 in Control employee exposures, WAC 296-841-20010.

Table 6 Exposure Control Requirements

<table>
<thead>
<tr>
<th>If:</th>
<th>Then you must use feasible controls to:</th>
</tr>
</thead>
<tbody>
<tr>
<td>You have operations where</td>
<td>Keep all employee exposure concentrations below 10</td>
</tr>
<tr>
<td>employees clean and repair</td>
<td>parts per million (ppm).</td>
</tr>
<tr>
<td>barges or tankers which</td>
<td></td>
</tr>
<tr>
<td>have contained benzene</td>
<td></td>
</tr>
</tbody>
</table>

(2005 Ed.)
WAC 296-849-13045 Respirators.

IMPORTANT:
These requirements are in addition to the requirements found in other chapters:
- Respiratory hazards, chapter 296-841 WAC;
- Respirators, chapter 296-842 WAC.

You must:
- Provide respirators and require that employees use them in circumstances where exposure is above either permissible exposure limit (PEL) for benzene, including any of the following circumstances:
  - Employees are in an exposure control area;
  - Feasible exposure controls are being put in place;
  - Where you determine that exposure controls are not feasible;
  - Feasible exposure controls do not reduce exposures to, or below, a PEL.
- Emergencies.
- Meet these requirements to protect employees from benzene exposure above a PEL:
  - Limit selection of escape respirators to either:
    - A full-facepiece organic vapor gas mask;
    - OR
    - A full-facepiece self-contained breathing apparatus (SCBA);
    - OR
    - A hood-style SCBA that operates in positive-pressure mode.
  - Make sure respirator cartridges or canisters are replaced at the beginning of each work shift, or sooner if their service life has expired.
  - Make sure canisters on gas masks and powered air-purifying respirators (PAPRs) have a minimum service life of four hours when tested under these conditions:
    - A benzene concentration of 150 ppm;
    - A temperature of 25°C;
    - A relative humidity of 85%;
    - A flow rate of one of the following:
      - 64 liters per minute (lpm) for nonpowered air-purifying respirators;
      - 115 lpm for tight-fitting PAPRs;
      - 170 lpm for loose-fitting PAPRs.
- Provide an employee a respirator with low breathing resistance, such as a PAPR or an air-line respirator when the:
  - Employee cannot use a negative-pressure respirator;
  - A licensed health care professional's (LHCP's) written opinion allows this type of respirator.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-172, § 296-849-13045, filed 12/21/04, effective 3/1/05.]
Exposure the contact an employee has with benzene, whether or not protection is provided by respirators or other personal protective equipment (PPE). Contact can occur through various routes of entry such as inhalation, ingestion, skin contact, or skin absorption.

Licensed health care professional (LHCP) an individual whose legally permitted scope of practice allows him or her to provide some or all of the health care services required for medical evaluations.

Permissible exposure limits (PELs) PELs are employee exposures to toxic substances or harmful physical agents that must not be exceeded. PELs are also specified in various WISHA rules found in other chapters. The PELs for benzene are the:
- Eight-hour time-weighted average (TWA₈) of 1 part per million (ppm);
  AND
- Fifteen-minute short-term exposure limit (STEL) of 5 ppm.

Short-term exposure limit (STEL) an exposure limit averaged over a fifteen-minute period that must not be exceeded during any part of an employee's workday.

Time-weighted average (TWA₈) an exposure limit averaged over an eight-hour period that must not be exceeded during an employee's workday.

Vapor control systems equipment that controls the vapor displaced when chemicals are loaded and unloaded from truck or storage tanks. It also processes or balances the vapor back into the truck or storage tanks.

Chapter 296-860 WAC
RAILROAD CLEARANCES AND WALKWAYS IN PRIVATE RAIL YARDS AND PLANTS
(Formerly chapter 296-28 WAC)

WAC
296-860-100 Scope.
296-860-200 Maintain safe clearances and walkways.
296-860-20010 Post warning signs and train employees about clearances approved before April 3, 1961.
296-860-20020 Construct and maintain rail yard walkways for employee safety.
296-860-20030 Install radiation detectors according to manufacturer's specifications.
296-860-20040 Maintain overhead clearances.
296-860-20050 Maintain side clearances.
296-860-20060 Maintain clearances between tracks.
296-860-20070 Move excessive height or width rail car loads with care.
296-860-20080 Follow these requirements to conduct narrow gauge rail operations.
296-860-300 Definitions.

WAC 296-860-100 Scope.
IMPORTANT:
This chapter applies to all railroad clearances and walkways in rail yards and plants including logging railroad yards such as mill yards, maintenance yards and sorting yards.
If you are uncertain about which WISHA requirements to follow, you must comply with those that best protect employees' safety and health. Contact your local L&I office if you need assistance in making this decision.

Exemptions:
- These exemptions apply to chapter 296-860 WAC. Railroad clearances and walkways in private rail yards and plants, and do not require a department variance:
  - You may move the following equipment, using less than the minimum standard clearances, if the situation is unavoidable and you have taken all reasonable steps to protect your employees:
    ■ Track construction or maintenance materials
    ■ Special work equipment used for railroad construction, maintenance or operations
    ■ Any railroad equipment during emergencies.
  - You may have overhead or side clearances less than the minimum standard clearances required in this chapter if they were legally created before April 3, 1961.

  Note: If a building, structure, or facility constructed before April 3, 1961, is relocated or reconstructed, the clearance requirements in this chapter apply unless the department grants a variance.
  - Tracks built before April 3, 1961:
    ■ May be extended according to the legal track clearance requirements in effect when they were originally constructed
    ■ Are exempt from the track clearance requirements in WAC 296-860-10050, Table 5.
  - Chapter 296-54 WAC, Safety standards—Logging operations, regulates all logging railroads or any rail operations related to logging, except for yard clearances.

Other rules that may apply to your workplace
The WISHA Safety & Health Core Rules book, chapter 296-800 WAC, contains the basic requirements that apply to employers in Washington. It also contains:
- An introduction that lists important information you should know, including a section on building, fire and electrical codes
- A resource section that includes a complete list of all WISHA rules

Other WISHA rules may apply to you, depending upon the activities and operations of your workplace. Contact your local L&I office if you are uncertain about which WISHA requirements pertain to you.

To access the Safety & Health Core Rules book online: http://www.lni.wa.gov/wisha/corerules/default.htm
- For a CD or paper copy contact us:
  Labor and Industries

  Olympia, WA 98504-4620
  Telephone: 1-800-4be-safe (1-800-423-7233)

WAC 296-860-200 Maintain safe clearances and walkways.
SUMMARY
Your responsibility:
To prevent injuries and fatalities to employees by maintaining safe railroad clearances and walkways in your rail yards and plants.
You must:
- Post warning signs and train employees about clearances approved before April 3, 1961

WAC 296-860-20010 [Title 296 WAC—p. 3051]
Construct and maintain rail yard walkways for employee safety

WAC 296-860-20020
Install radiation detectors according to manufacturer’s specifications

WAC 296-860-20030
Maintain overhead clearances

WAC 296-860-20040
Maintain side clearances

WAC 296-860-20050
Maintain clearances between tracks

WAC 296-860-20060
Move excessive height and/or width rail car loads with care

WAC 296-860-20070
Conduct narrow gauge rail operations according to the requirements of this section

WAC 296-860-20080.

WAC 296-860-20010 Post warning signs and train employees about clearances approved before April 3, 1961.

You must:
(1) Post warning signs near tracks with clearances approved before April 3, 1961, so employees are aware of the minimal clearances and their potential hazards. The signs must:
– Be highly visible
– Be easy to read
– Alert employees to the danger of railway equipment operating on your yard and plant tracks.

(2) Include in your employee safety and health training information about:
– Any minimal clearances and their location
– Potential hazards associated with them
– The location of any clearance warning signs.

WAC 296-860-20020 Construct and maintain rail yard walkways for employee safety.

Important:
• You have two years from October 01, 2002, (the effective date of this rule), to comply with the construction requirements of this section, unless the department determines during an inspection that your walkways create a serious safety hazard.
• If you are not sure a serious safety hazard exists in your workplace, you can request a free consultation from the department by calling your local L&I office.

Construction of walkways
You must:
• Build walkways in rail yard areas where employees regularly work on the ground.
• Construct rail yard walkways that can be maintained in a safe condition:
  – With reasonably smooth walking surfaces
  – That will not interfere with track drainage.

• Use any of the following materials when constructing your walkway:
  – Crushed material that does not exceed 1 1/2 inches in size. For this rule, “1 1/2 inches in size” means one of the following (percentages refer to weight measurement and sieve size standard in the industry):

<table>
<thead>
<tr>
<th>Percentage of material passing through a sieve opening</th>
<th>Sieve opening size</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>1 1/2 inch square</td>
</tr>
<tr>
<td>90 - 100</td>
<td>1 inch square</td>
</tr>
<tr>
<td>40 - 80</td>
<td>3/4 inch square</td>
</tr>
<tr>
<td>15 - 60</td>
<td>1/2 inch square</td>
</tr>
<tr>
<td>0 - 30</td>
<td>3/8 inch square</td>
</tr>
<tr>
<td>0 - 10</td>
<td>#4</td>
</tr>
<tr>
<td>0 - 5</td>
<td>#8</td>
</tr>
<tr>
<td>0 - 0.5</td>
<td>#200</td>
</tr>
</tbody>
</table>

Smaller crushed material is preferred and should be used where drainage and durability is not an issue. Crushed material that is 3/4 inch or less in size is recommended for switching leads in yards.
• Asphalt, concrete, planking, grating, or other similar material.
• Natural materials such as gravel or dirt.

You must:
• Construct walkways wide enough for employees to safely perform their duties
• Construct walkways with a grade or slope in any direction with not more than one inch of elevation for each eight inches of horizontal length, unless it is geographically impractical.

Maintenance of walkways
You must:
• Keep all walkways clear of vegetation, debris, mud, or other obstructions that create a potential hazard for employees.
• Remove all standing water from all walkways as soon as reasonably possible.
• Reopen walkways temporarily closed for a construction project within thirty days after the project is completed.

You must:
• Repair walkways that have been damaged and temporarily closed because of an emergency within thirty days after the emergency ends.

Definition:
Emergency: Any unforeseen occurrence endangering life, limb, or property.
• Obtain a department variance before permanently removing any bridge or trestle walkway from use after October 1, 2002 (the effective date of this rule).

WAC 296-860-20030 Install radiation detectors according to manufacturer’s specifications.

IMPORTANT.
This section applies only to those private yards and plants where the installation of radiation detectors beside railroad tracks is required due to the nature of the business; for example, scrap metal yards.

You must:
- Install radiation detectors beside the railroad tracks in your yard and/or plant according to the manufacturer's specifications.
- Post signs on each radiation detector installed less than eight feet six inches from the centerline of the track:
  - Warning employees that the side clearances between the detector and the track centerline are less than the required standard minimum side clearances found in this chapter
  - Prohibiting employees from riding on the side of any rail car passing through the detector.

[Statutory Authority: RCW 49.17.010, 49.17.040, and 49.17.050. 02-17-106, § 296-860-20030, filed 8/21/02, effective 10/1/02.]

WAC 296-860-20040  Maintain overhead clearances.

Exemption:
Engine houses and car shops are exempt from the overhead clearance requirements of this section.

You must:
- Make sure overhead railroad clearances are at least twenty-two feet six inches unless a clearance requirement found in Table 1 applies.

Note:
- Clearance requirements are based on the assumption that generally used rail equipment in private yards and plants is no more than ten feet ten inches wide by fifteen feet six inches high.
- WAC 296-860-10060 regulates the use of any rail equipment that exceeds the above dimensions.
- Minimum vertical clearances for all overhead wires are specified in Parts 1, 2, and 3 of the National Electrical Safety Code (NESC) as referenced in WAC 296-45-045, electrical workers safety rules, NESC applicable. See NESC 231 and 232.

### Table 1 - Minimum Overhead Clearances for Buildings, Structures, Tunnels, and Bridges

<table>
<thead>
<tr>
<th>If your overhead clearance involves:</th>
<th>Then the minimum overhead clearance requirements are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>An entirely enclosed building</td>
<td>18 feet when tracks end inside an entirely enclosed building. Also:</td>
</tr>
<tr>
<td></td>
<td>• The department must approve any reduction from 22 feet 6 inches before the reduction takes place.</td>
</tr>
<tr>
<td></td>
<td>• If an overhead clearance is less than 22 feet 6 inches, all cars, locomotives or other equipment must come to a full stop before entering the building.</td>
</tr>
<tr>
<td></td>
<td>• See Illustration 1.</td>
</tr>
<tr>
<td>All other structures</td>
<td>Defined by the half-circumference of a circle whose:</td>
</tr>
<tr>
<td></td>
<td>• Radius is 8 feet 6 inches</td>
</tr>
<tr>
<td></td>
<td>• Center is located on a line perpendicular to the track's centerline and 14 feet above the top of the highest rail.</td>
</tr>
<tr>
<td></td>
<td>• See Illustration 1.</td>
</tr>
<tr>
<td>Tunnels, over-crossings, and bridges</td>
<td>Defined by the half-circumference of a circle whose:</td>
</tr>
<tr>
<td></td>
<td>• Radius is 8 feet</td>
</tr>
<tr>
<td></td>
<td>• Center is located on a line perpendicular to the track's centerline and 14 feet 6 inches above the top of the highest rail.</td>
</tr>
<tr>
<td></td>
<td>• See Illustration 1.</td>
</tr>
</tbody>
</table>
WAC 296-860-20050 Maintain side clearances.
You must:
* Make sure side clearances are at least eight feet six inches from the track centerline unless clearance requirements found in Tables 2, 3, or 4 apply.

Note: All side clearances in Tables 2, 3, and 4 that reference "the track centerline" are based on the assumption that private rail operations generally use track that is standard gauge width (4 feet 8 1/2 inches).
### Table 2 - Minimum Side Clearance for Platforms

<table>
<thead>
<tr>
<th>If Your Platform Type is:</th>
<th>Then the Minimum Clearance Requirements Between the Track Centerline and a Platform Edge are:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type 1</strong> Platforms with heights of 8 inches or less above the top of the rail.</td>
<td>4 feet 8 inches&lt;br&gt;See Illustration 2.</td>
</tr>
<tr>
<td><strong>Type 2</strong> Platforms with heights of 4 feet or less above the top of the rail.</td>
<td>7 feet 3 inches&lt;br&gt;See Illustration 2.</td>
</tr>
<tr>
<td><strong>Type 3</strong> Platforms with heights of 4 feet 6 inches or less above the top of the rail and the platforms are used primarily for loading and/or unloading refrigerator cars.</td>
<td>8 feet&lt;br&gt;See Illustration 2.</td>
</tr>
<tr>
<td><strong>Type 4</strong> Icing platforms and supports.</td>
<td>7 feet 3 inches&lt;br&gt;See Illustration 2.</td>
</tr>
<tr>
<td><strong>Type 5</strong> Retractable platforms attached to permanent structures.</td>
<td>When not in use, use the clearance requirements for a platform of its height.</td>
</tr>
<tr>
<td><strong>Type 6 Platforms that are a combination</strong> of Types 1 through 3. (Only Types 1 through 3 platforms can be combined.)</td>
<td>Platforms may be combined if the Type 1 platform has a level surface no more than 4 feet 8 inches from the track centerline to the face of the platform wall with which it is combined.</td>
</tr>
</tbody>
</table>
Table 3 - Minimum Side Clearances for Bridges, Tunnels and Related Structures

| Exemption: | • Except for handrail and water barrel clearances, the clearance requirements in Table 3 do not apply to bridge decks where railroad employees couple or uncouple cars on a switching lead unless the department approves them. |
| Note: | • The requirements for filing a variance are located in the Safety and health core rules, chapter 296-350 WAC, and WISHA appeals, penalties and other procedural rules. |

| If your side clearance requirement involves: | Then the minimum side clearance requirements between the track centerline and the bridge, tunnel or related structure are: |
| Bridge and tunnel sides - lower section | 8 feet |
| Bridge and tunnel sides - upper section | Defined by the half-circumference of a circle whose: |
| | • Radius is 8 feet |

[Title 296 WAC—p. 3056] (2005 Ed.)
<table>
<thead>
<tr>
<th>If your side clearance requirement involves:</th>
<th>Then the minimum side clearance requirements between the track centerline and the bridge, tunnel or related structure are:</th>
</tr>
</thead>
</table>
| Related structures on bridges and in tunnels - lower section structures (or portions of them) that are no more than 4 feet above the top of the rail. For example:  
  • Refuge platforms on bridges and trestles.  
  • Water columns, oil columns, and block signals.  
  • Cattle chutes. | • Center is located on a line perpendicular to the track’s centerline and 14 feet 6 inches above the top of the highest rail.  
  • See Illustration 3.  

  Defined by lines extending:  
  • 5 feet laterally from the track centerline to a point level with the top of the rail and then diagonally upward to another point 4 feet above the top of the rail  
  • 8 feet laterally from the track centerline to a point 4 feet above the top of the rail  
  • See Illustration 3A. The shaded portion of the illustration designates the area that must be free of refuge platforms, water columns, oil columns, block signals and cattle chutes. |
| Hand rails and water barrels                                    | 7 feet 6 inches |
| Fences of cattle guards                                         | 6 feet 9 inches |

Illustration 3A - Minimum Side Clearance for Certain Structures in or on the Lower Sections of Bridges and Tunnels
Table 4 - Other Minimum Side Clearance Requirements*

<table>
<thead>
<tr>
<th>If your side clearance requirement involves:</th>
<th>Then the minimum side clearance requirements from the track centerline are:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type A</strong> Engine house and car repair shop doors.</td>
<td>7 feet 6 inches</td>
</tr>
<tr>
<td><strong>Type B</strong> Interlocking mechanism, switch boxes, and other similar devices projecting no more than 4 feet above the top of the rail.</td>
<td>3 feet</td>
</tr>
<tr>
<td><strong>Type C</strong> Poles supporting trolley contact.</td>
<td>8 feet 3 inches</td>
</tr>
<tr>
<td><strong>Type D</strong> Signals and switch stands no more than 3 feet high and located between tracks where it is not possible to allow other clearances required in this chapter.</td>
<td>6 feet</td>
</tr>
<tr>
<td><strong>Type E</strong> Signals and switch stands other than those described in Type B and Type D.</td>
<td>8 feet</td>
</tr>
<tr>
<td><strong>Type F</strong> Material, merchandise, inventory, storage bins or equipment stacked or stored on ground or platforms adjacent to tracks.</td>
<td>8 feet 6 inches</td>
</tr>
</tbody>
</table>

*Table 4 does not have an accompanying illustration.

Note: The requirement does not apply to:
- Railroad maintenance operations
- Emergency situations
- Local conditions that make compliance impossible.

Type G Space adjacent to curved track. Increased to equal tangent track clearances. As a general rule, side clearances on curved track should be increased 1-1/2” for each degree of curvature.

WAC 296-860-20060 Maintain clearances between tracks.
You must:
- Comply with the track clearance requirements in Table 5.

Table 5 - Minimum Standard Gauge Track Clearances

<table>
<thead>
<tr>
<th>If your track clearance involves:</th>
<th>Then the minimum clearance requirements between centerlines of standard gauge parallel tracks are:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main or passing tracks used for transporting cars, locomotives, motors, or like equipment</td>
<td>14 feet</td>
</tr>
<tr>
<td>Any tracks adjacent to main or passing tracks</td>
<td>15 feet</td>
</tr>
<tr>
<td>Team, house, or industry tracks</td>
<td>13 feet</td>
</tr>
<tr>
<td>Yard tracks</td>
<td>14 feet</td>
</tr>
<tr>
<td>Ladder and other tracks</td>
<td>20 feet</td>
</tr>
</tbody>
</table>

Note: This requirement does not apply to:
- Railroad maintenance operations
- Emergency situations
- Local conditions that make compliance impossible.

The following illustration will help you understand the track clearance requirements discussed in this section and WAC 296-860-20060 regulating narrow gauge rail operations.
Clearances and Walkways—Railroads

STANDARD GAUGE TRACK CLEARANCES

WAC 296-860-20070  Move excessive height or width rail car loads with care.

Note: This section regulates rail cars whose dimensions exceed ten feet ten inches wide by fifteen feet six inches high.

You must:
- Make sure your yard supervisor is given advanced notice regarding the arrival of any excess height or width cars so they can safeguard any employees working in the yard.
- Make sure no one is allowed to ride on the:
  - Roof of any excessive height car
  - Side of any excessive width car
  - Side of any car with a load extending more than five feet five inches from the car's centerline.

(2005 Ed.)

WAC 296-860-20080  Follow these requirements to conduct narrow gauge rail operations.

You must:
- Base your clearance measurements upon your widest narrow gauge cars.
- Make sure the distance between the cars and objects on narrow gauge track is equal to or greater than the distance required between ten foot ten inch wide cars and other cars or objects on standard gauge track.

(Title 296 WAC—p. 3061)
WAC 296-860-300 Definitions. The following definitions apply to this chapter.

**Car width** - Twice the distance from the centerline of a railroad car to its extreme outside part.

**Common carrier** - All railroads, railroad companies, street railroads, street railroad companies, corporations, partnerships, persons, cities or towns that own, operate, manage, or control any public use enterprise within Washington state that transports people or property for hire.

**Department** - The Washington state department of labor and industries.

**Emergency** - Any unforeseen occurrence that endangers life, limb, or property.

**Icing platforms** - Structures used to ice, precool, heat, ventilate or service private railroad cars that handle commodities requiring these services.

**Over-crossing** - Any point or place where a highway, road, or ramp carrying vehicular traffic crosses a private rail yard or track by passing above it.

**Overhead clearance** - The perpendicular distance between the top of the highest rail and the lowest point of an overhead structure or obstruction.

**Private rail operation** - A nonrailroad company operating railroad facilities, structures, tracks and equipment in the company’s yard or plant. Chapter 296-860 WAC applies to:

- Any equipment, facility or structure owned or operated by the company

**AND**

- The construction and reconstruction of tracks or structures adjacent to any facility or structure owned or operated by the company.

**Railroad** - Every public use railroad, other than street railroads, operated to transport people or property for hire. This definition also includes all bridges, ferries, tunnels, equipment, switches, spurs, tracks, stations, and terminal facilities of every kind that are used, operated, controlled, or owned by or in connection with any such public use railroad.

**Side clearance** - The shortest distance between the centerline of a track and a structure or other track side obstruction such as downspouts, ladders, equipment, piles of material or inventory, etc.

**Track clearance** - The shortest distance between the centerlines of adjacent railroad tracks.

**Walkways** - Pathways located alongside or in the vicinity of a railroad track, or on a trestle or bridge, providing space so a private railroad employee can perform duties associated with the track, trestle, or bridge.

WAC 296-863-10005 Scope. This chapter applies to powered industrial trucks that use electric motors or internal combustion engines. This includes, but is not limited to:

- Fork trucks.
- Forklifts.
- Tractors.
- Platform lift trucks.
- Motorized hand trucks.
- Other specialized industrial trucks.

**Definition:**

A powered industrial truck (PIT) is a mobile, power-driven vehicle used to carry, push, pull, lift, stack, or tier material.

**Exemption:**

This chapter does not apply to:

- Compressed air-powered industrial trucks.
- Nonflammable compressed gas-operated industrial trucks.
- Vehicles covered by chapter 296-307 WAC, Safety standards for agriculture.
- Vehicles intended primarily for earth moving or over-the-road hauling.

Chapter 296-863 WAC

**FORKLIFTS AND OTHER POWERED INDUSTRIAL TRUCKS**

**WAC**

296-863-10005 Scope.

[Title 296 WAC—p. 3062]
FORKLIFTS AND OTHER POWERED INDUSTRIAL TRUCKS

WAC 296-863-200  Design, construction, and equipment.

Summary:
Your responsibility:
To make sure PITs are properly designed, constructed, and equipped.

You must:
Design and construction
Make sure PITs meet design and construction requirements
WAC 296-863-20005.
Meet these requirements when modifying or altering PITs
WAC 296-863-20010.
Labeling
Make sure PITs are properly labeled
WAC 296-863-20015.
Equipment
Protect operators from falling objects
WAC 296-863-20020.
Provide fall protection on order pickers
WAC 296-863-20025.
Provide directional lights when required
WAC 296-863-20030.
Liquefied petroleum gas (LPG) PITs
Make sure liquefied petroleum gas (LPG) fueled PITs meet these requirements
WAC 296-863-20035.
Meet these requirements when converting gasoline fuel PITs to liquefied petroleum gas (LPG) fuel
WAC 296-863-20040.

WAC 296-863-20005  Make sure PITs meet design and construction requirements.

You must:
- Make sure PITs meet American National Standards Institute (ANSI) design and construction requirements.
  - Make sure PITs manufactured before March 1, 2000, meet the requirements of ANSI B56.1-1969, Safety Standards for Powered Industrial Trucks.
  - Make sure PITs manufactured on or after March 1, 2000, meet the requirements of ANSI B56.1-1993, Safety Standards for Powered Industrial Trucks.
  - Make sure rough terrain forklift trucks manufactured on or after January 1, 2005, meet the design and construction requirements of ANSI B56.6-1992, Safety Standard for Rough Terrain Forklift Trucks.

Note: There may be a nameplate on the PIT or a statement in the instruction manual indicating that the PIT meets the requirement of the appropriate ANSI standard. If in doubt, check with the manufacturer.

ANSI B56.1-1993 and B56.6-1992 are available by:
- Purchasing copies by writing:
  American National Standards Institute
  11 West 42nd Street
  New York, NY 10036
  OR
- Contacting the ANSI website at www.ansi.org.

WAC 296-863-20010 Meet these requirements when modifying or altering PITs.

You must:
Have written approval from the PIT manufacturer before making any modifications to the PIT that:
- Change the relative position of the various parts of the PIT from what they were when originally received from the manufacturer.
- Add extra parts not provided by the PIT manufacturer.
- Eliminate any parts.
- Affect capacity or safe operation.

Exemption: This does not apply to converting PITs from gasoline to LPG fuel.

You must:
- Make sure any modifications or additions to the PIT are shown on the plates, tags, or decals to reflect any changes in the PITs:
  - Capacity.
  - Operation.
  - Maintenance instructions.

WAC 296-863-20015  Make sure PITs are properly labeled.

You must:
- Make sure all PIT nameplates as well as any stickers, stencils or marks that relate to the stability and safety of the PIT are:
  - In place.
  - Legible.

Note: PITs should have a nameplate installed by the manufacturer that contains at least the following information:
- Model and serial number.
- Approximate weight of the PIT.
- Certification that the manufacturer has met the mandatory requirements of ANSI B56.1 Safety Standards for Powered Industrial Trucks.
- Type designation to show the PIT meets the applicable requirements of a nationally recognized testing laboratory.

You must:
- Make sure PITs approved for hazardous (classified) locations have a label or some other identifying mark indicating acceptance by a nationally recognized testing laboratory.
- Make sure PITs with front-end attachments, including fork extensions, are marked to:
  - Identify the attachment.
  - Show the approximate combined weight of the PIT and attachment.
  - Show the maximum capacity of the PIT with attachments at their highest elevation and the load laterally centered.

WAC 296-863-20020  Protect operators from falling objects.

You must:
- Use an overhead guard to protect operators from falling objects such as small packages, boxes, and bagged material.

Exemption: A high lift rider truck may be operated without the guard, providing all of the following conditions are met:
• Vertical movement of the lifting mechanism is restricted to seventy-two inches (1800 mm) or less from the
ground.
• The high lift rider truck will operate only in an area where:
  – The top of a tiered load will not be more than one hundred twenty inches (3000 mm) high.
  – The bottom of a tiered load will not be more than seventy-two inches (1800 mm) high.
  – Only stable loads are handled.
  – The operator is protected from objects falling from high stack areas.

Note: The overhead guard is not intended to withstand the impact of a maximum capacity load of the PIT.

You must:
• Equip all high lift rider trucks with overhead guards that meet the design and construction requirements of American National Standards Institute (ANSI) B56.1-1993, Safety Standards for Powered Industrial Trucks.
• Use a vertical load backrest extension to keep all or any part of the load from falling backwards towards the operator if the load presents a hazard.

[WAC 296-863-20025 Provide fall protection on order pickers.
You must:
• Make sure order pickers have either:
  – Standard guardrails on all open sides;
  OR
  – A safety harness and lanyard that are connected to a tie-off point that has been approved by the PIT manufacturer.
• Make sure personal fall arrest equipment meets the requirements of WAC 296-24-87035, Appendix C—Personal fall arrest systems.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-19-051, § 296-863-20023, filed 9/14/04, effective 2/1/05.]

WAC 296-863-20020 Provide directional lights on PITs when required.
You must:
• Provide PITs with directional lighting if the general lighting is less than two lumens per square foot.

Note:
• Lighting levels can be measured with a light meter.
• Conversion information: One foot-candle = one lumen incident per square foot = 10.76 lux.

[WAC 296-863-20030 Provide directional lights on PITs when required.
You must:
• Provide directional lighting if the general lighting is less than two lumens per square foot.

Note:
• Lighting levels can be measured with a light meter.
• Conversion information: One foot-candle = one lumen incident per square foot = 10.76 lux.

[WAC 296-863-20023, filed 9/14/04, effective 2/1/05.]

WAC 296-863-20035 Make sure liquefied petroleum gas (LPG) fueled PITs meet these requirements.
You must:
• Use fuel containers that meet either of the following minimum requirements:
  – A U.S. Department of Transportation (USDOT) approved container authorized for LP-gas service that has a minimum service pressure of two hundred forty pounds per square inch gage (psig);
  OR
  – A container Type 250 that has a design pressure of 312.5 psig.
• Make sure fuel containers do not use variable liquid-level gages that require venting fuel to the atmosphere.
• Make sure the fuel system of PITs used inside buildings:
  – Has an approved automatic shutoff valve, located ahead of the inlet of the gas-air mixer, that will stop the flow of fuel to the mixer if the engine stops;
  AND
  – Use not more than two LP-gas fuel containers.
• Make sure the fuel system of PITs used outdoors has an approved automatic shutoff valve, located ahead of the inlet of the gas-air mixer, that will stop the flow of fuel to the mixer if both:
  – The ignition is OFF.
  – The engine is not running.

Note: You may use an atmospheric type regulator (zero governor) as a shutoff valve if the PIT is used outdoors.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-19-051, § 296-863-20025, filed 9/14/04, effective 2/1/05.]

WAC 296-863-20040 Meet these requirements when converting gasoline fuel PITs to liquefied petroleum gas (LPG) fuel.
You must:
• Make sure PITs originally approved to use gasoline for fuel that are then converted to LPG fuel:
  – Meet the requirements for LP or LPS designated PITs;
  AND
  – Are converted using only approved equipment.

Definitions:
• LP refers to liquefied petroleum gas-powered trucks that, in addition to meeting all the requirements for type G trucks, have minimum acceptable safeguards against inherent fire hazards.
• LPS refers to liquefied petroleum gas powered trucks that in addition to meeting the requirements for LP type trucks, have additional exhaust, fuel, and electrical systems safeguards.

Note: Tables 1, 2, and 3 list the types of PITs and the locations where they can be used safely.
• The description of the component parts of the conversion system and the recommended method of installation on specific PITs are contained in the "Listed by Report system and the recommended method of installation on specific PITs are contained in the "Listed by Report" provided by the testing laboratory.

[WAC 296-863-20040, filed 9/14/04, effective 2/1/05.]

WAC 296-863-300 Inspection, repair, maintenance, and servicing.
Summary:
Your responsibility:
To make sure PITs are kept in safe condition and properly serviced.

References:
• Appropriate respiratory protection may need to be used when operating PITs. See chapter 296-841 WAC, Respiratory hazards, for more information.
• Appropriate PPE may need to be worn. See WAC 296-800-160 in the Safety and Health Core Rules for more information.

You must:
• Inspect, repair and maintain PITs
Make sure PITs are in safe working condition
WAC 296-863-30005.
Inspect your PITs
WAC 296-863-30010.
Meet these requirements when repairing PITs
WAC 296-863-30015.

Maintain your PITs properly
WAC 296-863-30020.

Service your PITs
Service gasoline fueled PITs safely
WAC 296-863-30025.
Service liquefied petroleum gas (LPG) fueled PITs safely
WAC 296-863-30030.

Make sure battery charging areas are safe
WAC 296-863-30035.

Service batteries for electric PITs safely
WAC 296-863-30040.

Definitions:
Class I locations are areas where flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitable mixtures.
Class II locations are areas where the presence of combustible dust could be sufficient to produce explosions.
Class III locations are areas where the presence of easily ignitable fibers are suspended in the air but are not in large enough quantities to produce ignitable mixtures.

You must:
• Make sure fuel and ignition system repairs that involve fire hazards are made only in locations designated for such repairs.
• Disconnect the battery before starting repairs to a PIT electrical system.
• Close the fuel container shutoff valve before repairing an LP-gas fueled PIT in a garage.

Exemption: The container shutoff valve may be left open if it is necessary to run the engine.

You must:
• Make sure fuel and ignition system repairs that involve fire hazards are made only in locations designated for such repairs.
• Disconnect the battery before starting repairs to a PIT electrical system.
• Close the fuel container shutoff valve before repairing an LP-gas fueled PIT in a garage.

WAC 296-863-30005 Make sure PITs are in safe working condition.

You must:
• Remove any PIT from service that is not in safe operating condition.
• Immediately remove PITs from service that have any of the following problems, and do not return them to service until the cause of the problem has been eliminated:
  – A leak in the fuel system.
  – A clogged water muffler screen or other muffler part.
  – An exhaust system that is emitting hazardous sparks or flames.
  – A part that is hotter than its normal operating temperature thus creating a hazardous condition.

WAC 296-863-30010 Inspect your PITs.

You must:
• Inspect PITs according to the manufacturer’s instructions.
• Inspect PITs at these times:
  – Daily before being put into service;
  AND
  – After each shift, if the PIT is used on a continuous (twenty-four-hour) basis.

Note: You can designate someone on the off-going shift, on-coming shift, or some other person to do the inspection.

You must:
• Report and correct any deficiencies noted during the inspection.

WAC 296-863-30015 Meet these requirements when repairing PITs.

You must:
• Make sure repairs are made by authorized persons.
• Make sure replacement parts are equivalent to the parts used in the original design.
• Make sure repairs are not made in Class I, II, or III locations. See Tables 1, 2, and 3 for more information.
WAC 296-863-30030 Service liquefied petroleum gas (LPG) fueled PITs safely.
You must:
• Handle and store liquefied petroleum gas fuel according to the National Fire Protection Association Storage and Handling of Liquefied Petroleum Gases (NFPA No. 58-1998).
• Shut down the engine while fueling.
• Fuel PITs equipped with permanently mounted fuel containers outdoors.
• Make sure filling fuel containers from industrial bulk storage containers is done at least:
  – Ten feet from the nearest masonry-walled building.
  – Twenty-five feet from the nearest building or other construction.
  – Twenty-five feet from any building opening.
• Make sure PITs are stored or serviced inside garages only when:
  – There are no leaks in the fuel system;
  AND
  – The fuel tanks are not filled beyond the maximum filling density specified in WAC 296-24-47505 (12)(a), Storage and handling of liquefied petroleum gases.

Reference: See chapter 296-24 WAC, Part F-1, for LPG charging equipment requirements and maximum filling density and LPG service stations.

WAC 296-863-30035 Make sure battery charging areas are safe.
You must:
• Make sure battery charging areas are designated and provided with all of the following:
  – Means to flush and neutralize spilled electrolyte.
  – Fire protection.
  – Ventilation that is adequate to disperse fumes from gassing batteries.
• Prohibit smoking in battery charging areas.
• Take precautions to prevent open flames, sparks, or electric arcs in battery charging areas.
• Protect battery charging equipment from being damaged by PITs.
• Provide at least one of the following to handle batteries:
  – Conveyor.
  – Overhead hoist.
  – Other equivalent material handling equipment.

WAC 296-863-30040 Service batteries for electric PITs safely.
You must:
• Make sure PITs are properly positioned with the brake on before charging or changing batteries.
• Make sure you do not use open flames to check the electrolyte level in storage batteries.
• Do the following when charging batteries:
  – Make sure vent caps are functioning.
  – Open the battery or compartment covers to dissipate heat.
  – Pour acid into water, never pour water into acid.
  • Provide a carboy tilter or siphon to handle electrolyte.
  • Keep tools and other metallic objects away from the top of uncovered batteries.
  • Make sure reinstalled batteries are properly positioned and secured.
WAC 296-863-40005  Protect employees around PITs.
You must:
• Make sure operators use restraint devices, such as seat-belts or lap-bars, when they are provided on the PIT.
• Make sure you do not allow people:
  – Under the elevated part of any PIT, whether it is loaded or empty;
  – To put any part of their body between the uprights of the mast;
  OR
  – Outside the running lines of the PIT.
• Make sure you do not allow unauthorized people to ride on PITs.
• Make sure people riding on PITs have a safe place to ride.
• Make sure you do not allow stunt driving or horseplay.
• Make sure PITs are not driven up to anyone in front of a bench or other fixed object.
• Make sure access to fire aisles, stairways, and fire equipment is kept clear.
• Make sure there is sufficient headroom under overhead installations such as lights, pipes, and sprinkler systems to safely operate PITs.

Reference: PIT operations may cause the airborne concentration levels of carbon monoxide gas to increase. You have to keep the concentration levels below the levels specified in chapter 296-841 WAC, Respiratory hazards.

WAC 296-863-40010  Operate PITs safely.
You must:
• Operate PITs according to the manufacturer's instructions.
• Make sure PIT operators do all of the following:
  – Obey all traffic regulations, including authorized workplace speed limits.
  – Yield the right of way to ambulances, fire trucks, and other vehicles in emergency situations.
  – Keep a safe distance of approximately three truck lengths from the PIT ahead.
  – Look in the direction they are going and keep a clear view of their path of travel.
  – Slow down and sound the horn at cross aisles and other locations where vision is obstructed.
  – Do not pass other PITs traveling in the same direction at intersections, blind spots, or other dangerous locations.
  – Keep a safe distance from the edge of ramps or platforms while on any of the following:
    ■ Elevated docks.
    ■ Elevated platforms.
    ■ Freight cars.
• Make sure operators keep PITs under control at all times, including doing all of the following:
  – Drive at a speed that allows the PIT to be stopped safely.
  – Drive more slowly on wet or slippery floors.
  – Reduce speed to a safe level while turning.
  – Avoid driving over loose objects.

WAC 296-863-40015  Make sure PIT loads are carried safely.
You must:
(1) Make sure loads are stable, safe and within the rated load capacity of the PIT.
(2) Do both of the following when picking up a load:
  • Place the load engaging means under the load as far as possible.
  • Tilt the mast carefully backwards to stabilize the load.
(3) Make sure not to tilt the load engaging means forward when it is elevated unless:
  • Picking up a load;
  OR
  • Depositing a load on a rack or stack.
(4) Do both of the following when traveling with a load:
  • Keep the load trailing if it obstructs the operator's forward view.
  • Travel with the load upslope when climbing or descending slopes of more than ten percent.
(5) Do both of the following when climbing a slope:
  • Tilt the load and load engagement means backwards if necessary to stabilize the load;
    AND
  • Raise the load and load engagement means only as far as necessary to clear the surface.
(6) Make sure PITs with attachments are operated as partially loaded trucks, even if they are not carrying a load.

WAC 296-863-40020  Meet these requirements when the operator leaves the normal operating position.
You must:
• Make sure operators do the following when getting off the PIT:
  – Fully lower the load engaging means.
  – Neutralize the controls.
  – Set the brakes.
• Make sure operators do the following when leaving a PIT unattended:
  – Fully lower the load engaging means.
  – Neutralize the controls.
  – Shut off power.
  – Set the brakes.
  – Block the wheels, if parked on an incline.

Note: A PIT is unattended when the operator:
• Is more than twenty-five feet away;
  OR
• Can not see the PIT.

WAC 296-863-40025  Meet these requirements when operating near railroad tracks.
You must:
• Make sure PITs are driven diagonally across railroad tracks, whenever possible.
• Make sure PITs are parked eight feet six inches or more from the center of any railroad tracks.
WAC 296-863-40030 Meet this requirement when using motorized hand trucks.
You must:
- Make sure motorized hand trucks enter elevators and other confining areas with the load end forward.

WAC 296-863-40035 Meet these requirements when using elevators.
You must:
- Do both of the following when driving PITs onto an elevator:
  - Approach slowly.
  - Enter the elevator squarely after the elevator car is leveled.
- Do all the following after the PIT is positioned on the elevator:
  - Neutralize the controls.
  - Shut off the power.
  - Set the brakes.

WAC 296-863-40040 Meet these requirements when using dockboards (bridge plates).
You must:
- Make sure dockboards are not overloaded:
  - Make sure they are strong enough to carry the load imposed on them.
  - Make sure loads do not exceed the dockboard's rated capacity.
- Do the following when using dockboards:
  - Drive slowly and carefully over dockboards.
  - Properly secure dockboards before driving on them.
- Make sure powered dockboards meet the design and construction requirements of U.S. Department of Commerce Commercial Standard CS 202-56 (1961) "Industrial Lifts and Hinged Loading Ramps."
  - Do the following when using portable dockboards:
    - Use anchors or other devices that will prevent slipping.
    - Make sure they have handholds or other effective means for safe handling.

WAC 296-863-40045 Meet these requirements when loading or unloading railroad cars with a PIT.
You must:
- Check the railroad car flooring for breaks or weakness before driving on it.
- Set the brakes and use wheel stops or other recognized positive protection to keep railcars from moving:
  - During loading or unloading operations;
  - While dockboards (bridge plates) are in position.
- Meet these requirements when using PITs to open or close freight car doors:
  - The PIT has to have an approved device specifically designed to open and close doors.
  - The device has to be designed so that force will be applied to the door parallel to door travel.
  - The PIT operator has to be trained to use the device and have full view of the operation.
  - People must be kept clear while the door is being moved.

WAC 296-863-40050 Meet these requirements when loading or unloading highway trucks with PITs.
You must:
- Check the truck or trailer flooring for breaks or weakness before driving on it.
- Prevent movement of trucks or trailers during loading or unloading by:
  - Setting the brakes;
  - Chocking or blocking the wheels.

Exemptions:
- You can use mechanical means instead of wheel chocks or blocks to secure the trailer to the loading dock.
  - Wheel chocks or blocks are not required when:
    - The mechanical means prevents the trailer from moving away from the dock.
    - The mechanical equipment is used and maintained as recommended by the manufacturer.
    - Damaged mechanical equipment is immediately removed from service.

Note:
- You may need to use fixed jacks to keep a semi-trailer that is not coupled to a tractor from up ending during loading or unloading.

WAC 296-863-40055 Meet these additional requirements when operating liquefied petroleum gas (LPG) fueled PITs.
You must:
- Make sure you do not park PITs near:
  - Sources of heat, open flames, or similar ignition sources;
  - Open pits, such as service pits, that do not have adequate ventilation.
- Make sure PITs stored inside a garage do not have:
  - A leak in the fuel system.
  - Fuel containers filled beyond the maximum filling capacity.

Reference:
- See WAC 296-24-47505(12), Storage and handling of liquefied petroleum gases, for maximum filling capacities.

WAC 296-863-40060 Make sure work platforms and PITs used to lift people meet these requirements.
You must:
- Make sure work platforms:
  - Are securely fastened to the lifting carriage or forks.
  - Have standard guardrails and toeboards on all sides.
  - Guard the area between the platform and the PIT mast to prevent employee contact with chains or other shear points.
Forklifts and Other Powered Industrial Trucks 296-863-50005

• Make sure PITS used to elevate a work platform have a lift mechanism that can not drop faster than one hundred thirty five feet per minute in the event of a system failure.
• Make sure the lifting carriage or forks are prevented from tilting.

Note: Examples of how this may be accomplished are the use of:
• A control lever that prevents the inadvertent movement;
or
• Use of a strap or other device to hold the control lever in position.

You must:
• Make sure PITS with controls (vertical only or horizontal and vertical) that can be elevated with the lifting carriage or forks, have a way for people on the platform to shut off power to the PIT.

Note: You can find the minimum requirements for standard railings of various types of construction in WAC 296-24-75011, Railings, toeboards and cover specifications.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060.04-19-051, § 296-863-40065, filed 9/14/04, effective 2/1/05.]

WAC 296-863-40065 Operate PITS using elevated work platforms safely.

You must:
• Make sure the PIT operator:
  – Is attending the lift equipment when workers are on the platform.
  – Is in the normal operating position while raising or lowering the platform.

Note: A PIT is unattended when the operator:
• Is more than twenty-five feet away;
  OR
• Cannot see the PIT.

You must:
• Make sure the operator does not move the PIT from one point to another while workers are on the platform.
  – The operator may inch or maneuver the PIT at very low speed with workers on the platform.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060.04-19-051, § 296-863-40065, filed 9/14/04, effective 2/1/05.]

WAC 296-863-5000 Hazardous (classified) locations.

Summary:
Your responsibility:
To use PITS safely in hazardous (classified) locations.

You must:
Use the appropriate approved PITS in hazardous (classified) locations
WAC 296-863-50005.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060.04-19-051, § 296-863-50005, filed 9/14/04, effective 2/1/05.]

WAC 296-863-50005 Use the appropriate PITS in hazardous (classified) locations.

You must:
• Make sure PITS are used in hazardous (classified) locations as follows:
  – PITS authorized to be used in Class 1 locations are shown in Table 1, Approved PIT Use in Class 1 Locations.
  – PITS authorized to be used in Class 2 locations are shown in Table 2, Approved PIT Use in Class 2 Locations.
  – PITS authorized to be used in Class 3 locations are shown in Table 3, Approved PIT Use in Class 3 Locations.
  – PITS authorized to be used in unclassified locations are:
    – Approved PITS designated as Type D, E, G, or LP;
    AND
    – PITS that meet the requirements of a Type D, E, G, or LP PIT.

Definitions:
• An unclassified location is an area that is not designated as a Class 1, 2, or 3 location.
• Designations means a code used to show the different types of hazardous (classified) locations where PITS can be safely used:
  - D refers to trucks that are diesel engine powered that have minimum safeguards against inherent fire hazards.
  - DS refers to diesel powered trucks that, in addition to meeting all the requirements for type D trucks, are provided with additional safeguards to the exhaust, fuel and electrical systems.
  - DY refers to diesel powered trucks that have all the safeguards of the DS trucks and, in addition, any electrical equipment is completely enclosed. They are equipped with temperature limitation features.
  - E refers to electrically powered trucks that have minimum acceptable safeguards against inherent fire hazards.
  - ES refers to electrically powered trucks that, in addition to all of the requirements for the E trucks, have additional safeguards to the electrical system to prevent emission of hazardous sparks and to limit surface temperatures.
  - EE refers to electrically powered trucks that have, in addition to all of the requirements for the E and ES type trucks, have their electric motors and all other electrical equipment completely enclosed.
  - EX refers to electrically powered trucks that differ from E, ES, or EE type trucks in that the electrical fittings and equipment are designed, constructed and assembled to be used in atmospheres containing flammable vapors or dusts.
  - G refers to gasoline powered trucks that have minimum acceptable safeguards against inherent fire hazards.
  - GS refers to gasoline powered trucks that are provided with additional exhaust, fuel, and electrical systems safeguards.
  - GP refers to liquefied petroleum gas-powered trucks that, in addition to meeting all the requirements for type G trucks, have minimum acceptable safeguards against inherent fire hazards.
  - LPS refers to liquefied petroleum gas-powered trucks that in addition to meeting the requirements for LP type trucks, have additional exhaust, fuel, and electrical systems safeguards.

Note: Tables 1, 2, and 3 show the type of approved PITS that can be used in the appropriate divisions and groups.
• PITS cannot be used in divisions and groups that do not have a PIT designation listed.
• Approved PITS will be marked or labeled with the designation of the PIT. See WAC 296-863-20010, Make sure PITS are properly labeled.

(2005 Ed.)

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-19-051, § 296-863-60005, filed 9/14/04, effective 2/1/05.]

### WAC 296-863-60010 Retrain PIT operators as required.

**You must:**
- Provide PIT operators refresher training if any of the following occur:
  - The operator is involved in an accident or near-miss incident.
  - The operator is seen operating the PIT in an unsafe manner.
  - An evaluation shows the operator is not operating the PIT safely.
  - The operator is assigned to drive a different type or modified PIT.
  - Conditions in the workplace change that could affect safe operation of the PIT.

**Note:** Refresher training is required only in those topics where the operator has been found deficient.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-19-051, § 296-863-60010, filed 9/14/04, effective 2/1/05.]

### WAC 296-863-60015 Evaluate PIT operators performance.

**You must:**
- Evaluate PIT operators performance at each of these times:
  - As part of their initial training program.
  - After refresher training to determine the effectiveness of the training.
  - At least once every three years.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-19-051, § 296-863-60015, filed 9/14/04, effective 2/1/05.]

### WAC 296-863-700 Definitions.

**ANSI** is an acronym for the American National Standards Institute.

**Authorized person (maintenance)** means a person who has been designated to perform maintenance on a PIT.

**Authorized person (training)** means a person approved or assigned by the employer to perform training for powered industrial truck operators.

**Approved** means listed or approved by a nationally recognized testing laboratory or a federal agency that issues approvals for equipment such as the Mine Safety and Health Administration (MSHA); the National Institute for Occupational Safety and Health (NIOSH); Department of Transportation; or U.S. Coast Guard, which issue approvals for such equipment.

**Bridge plate (dockboard)** means a device used to span the distance between rail cars or highway vehicles and loading platforms.

**Classified location or hazardous location** means areas that could be hazardous because of explosive or flammable atmospheres. These locations are broken down into the following categories:
- **Class I locations** are areas where flammable gases or vapors are or may be present in the air in quantities sufficient to produce explosive or ignitible mixtures.
- **Class II locations** are areas where the presence of combustible dust could be sufficient to produce explosions.
- **Class III locations** are areas where the presence of easily ignitable fibers are suspended in the air but are not in large enough quantities to produce ignitible mixtures.

**Counterweight** means a weight used to counteract or the load being carried by the truck, or to increase the load carrying capacity of a truck.

**Designations** means a code used to show the different types of hazardous (classified) locations where PITs can be safely used:
- **D** refers to trucks that are diesel engine powered that have minimum safeguards against inherent fire hazards.
- **DS** refers to diesel powered trucks that, in addition to meeting all the requirements for type D trucks, are provided with additional safeguards to the exhaust, fuel and electrical systems.
- **DY** refers to diesel powered trucks that have all the safeguards of the DS trucks and, in addition, any electrical equipment is completely enclosed. They are equipped with temperature limitation features.
- **E** refers to electrically powered trucks that have minimum acceptable safeguards against inherent fire hazards.
- **ES** refers to electrically powered trucks that, in addition to all of the requirements for the E trucks, have additional safeguards to the electrical system to prevent emission of hazardous sparks and to limit surface temperatures.
- **EE** refers to electrically powered trucks that have, in addition to all of the requirements for the E and ES type trucks, have their electric motors and all other electrical equipment completely enclosed.
- **EX** refers to electrically powered trucks that differ from E, ES, or EE type trucks in that the electrical fittings and equipment are designed, constructed and assembled to be used in atmospheres containing flammable vapors or dusts.
- **G** refers to gasoline powered trucks that have minimum acceptable safeguards against inherent fire hazards.
- **GS** refers to gasoline powered trucks that are provided with additional exhaust, fuel, and electrical systems safeguards.
- **LP** refers to liquefied petroleum gas-powered trucks that, in addition to meeting all the requirements for type G trucks, have minimum acceptable safeguards against inherent fire hazards.
• LPS refers to liquefied petroleum gas powered trucks that in addition to meeting the requirements for LP type trucks, have additional exhaust, fuel, and electrical systems safeguards.

Electrolyte means a chemical, usually acid, that is mixed with water to produce electricity.

Flammable liquid means any liquid having a flashpoint below 100°F (37.8°C), except any mixture having components with flashpoints of 100°F (37.8°C) or higher, the total of which make up 99% or more of the total volume of the mixture.

Flashpoint means the minimum temperature at which a liquid gives off enough vapor to ignite.

Front-end attachment means a device that is attached to the forks or lifting device of the truck.

Lanyard means a flexible line of webbing, rope, or cable used to secure a harness to an anchor point.

Listed by report means a reporting listing the field assembly, installation procedures, or both, for a UL listed product that does not have generally recognized installation requirements.

Liquefied petroleum gas means any gas that is composed predominantly of the following hydrocarbons, or mixtures of them; propane, propylene, butanes (normal butane or isobutane), and butylenes.

Load engaging means a device attached to a powered industrial truck and used to manipulate or carry a load.

Motorized hand truck means a powered truck with wheeled forks designed to go under or between pallets and is controlled by a walking or riding operator.

Nationally recognized testing laboratory means an organization recognized by the Occupational Safety and Health Administration that conducts safety tests on equipment and materials.

Order picker means a truck controlled by an operator who is stationed on a platform that moves with the load engaging means.

Powered industrial truck (PIT) means a mobile, power-driven vehicle used to carry, push, pull, lift, stack, or tier material.

Rough terrain forklift truck means a truck intended to be used on unimproved natural terrain and at construction sites.

Safety harness (full body harness) means a configuration of connected straps to distribute a full arresting force over at least the thighs, shoulders and pelvis, with provisions for attaching a lanyard, lifeline, or deceleration devices.

Tie-off point (anchorage) means a secure point to attach a lanyard that meets the requirements of WAC 296-24-87035, Appendix—C Personal fall arrest systems.

Vertical load backrest extension means a device that extends vertically from the fork carriage frame.

Chapter 296-864 WAC

SPLIT (MULTIPIECE) RIM AND SINGLE-PIECE RIM WHEELS

WAC
296-864-100 Scope.

(2005 Ed.)

296-864-200 Wheel components.
296-864-20005 Make sure wheel components are compatible.
296-864-20010 Make sure rim wheels are serviced safely.
296-864-20015 Make sure damaged wheel components are not used.

SPLIT (MULTIPIECE) RIM AND SINGLE-PIECE RIM WHEELS

296-864-300 Restraint devices.
296-864-30005 Use a restraining device.
296-864-30010 Make sure the restraint device meets these requirements.
296-864-30015 Provide charts or rim manuals.
296-864-400 Service split rim wheels safely.
296-864-40005 Establish a safe operating procedure for split rim wheels.
296-864-40010 Follow these procedures for demounting split rim wheels.
296-864-40015 Follow these procedures when working on split rim wheels and components.
296-864-40020 Follow these procedures for inflating split rim wheels.
296-864-500 Service single-piece rim wheels safely.
296-864-50005 Establish a safe operating procedure for single-piece rim wheels.
296-864-50010 Follow these procedures for demounting single-piece rim wheels.
296-864-50015 Follow these procedures when working on single-piece rim wheels and components.
296-864-50020 Follow these procedures for inflating single-piece rim wheels.
296-864-600 Employee training.
296-864-60005 Train employees who service rim wheels.
296-864-60010 Make sure employees demonstrate and retain the ability to service rim wheels safely.
296-864-700 Definitions.

WAC 296-864-100 Scope.

Note: This rule is intended to protect employees from hazards associated with the exploding separation of rim wheel components.

This chapter applies to the protection of employees who service split rim wheels and single-piece rim wheels used on large vehicles. For example:

• Trucks;
• Tractors;
• Trailers;
• Buses;
• Off-road machines.

Exemption: This chapter does not apply to the servicing of rim wheels used on:

• Automobiles; OR
• Tires designated as light truck (LT).

Note: The tire designation can be found on the sidewall of the tire.

Definition:

Split rim wheel or multipiece rim wheel, means a wheel made up of two or more parts. One of the parts is a side ring or locking ring that holds the tire on the wheel when the tire is inflated.

Single-piece rim wheel means a single part holds the tire, forms part of the air chamber and is the point where the wheel is attached to the vehicle axle.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-20-079, § 296-864-100, filed 10/5/04, effective 2/1/05.]

WAC 296-864-200 Wheel components.

Summary:

Your responsibility:
To make sure rim wheels are serviced safely.

You must:
Make sure wheel components are compatible
WAC 296-864-20005.
Make sure rim wheels are serviced safely
WAC 296-864-20010.
Make sure damaged wheel components are not used
WAC 296-864-20015.
WAC 296-864-20005 Make sure wheel components are compatible.
You must:
• Make sure tires and rim wheels are compatible before assembly.
• Make sure split rim wheel components are not interchanged, except as provided in:
  – The Occupational Safety and Health Administration (OSHA) and National Highway Traffic Safety Administration (NHTSA) charts, "Demounting and Mounting Procedures for Truck/Bus Tires" and "Multi-Piece Rim Matching Chart."
OR
– The rim manual for that component.

Note: Reprints of these charts, "Demounting and Mounting Procedures for Truck/Bus Tires" and "Multi-Piece Rim Matching Chart," are available:
• Through the WISHA Training and Outreach office at 360-902-5638.
• Through the OSHA area offices. The address and telephone number of the nearest OSHA area office can be obtained by looking in the local telephone directory under U.S. Government, U.S. Department of Labor, Occupational Safety and Health Administration.
• From the OSHA website at http://www.osha.gov/pls/publications/pubindex.continue.

WAC 296-864-20010 Make sure rim wheels are serviced safely.
You must:
• Inspect split rim wheel components and single-piece wheels prior to assembly.
• Make sure the following are free of any dirt, surface rust, scale or loose or flaked rubber build-up prior to mounting and inflation:
  – Rim flanges;
  – Rim gutters;
  – Rings;
  – Bead seating surfaces;
AND
– The bead areas of tires.
• Make sure you do not heat any rim wheels at any time.
• Make sure you do not repair any rim wheel that is:
  – Cracked;
  – Broken;
  – Bent;
OR
– Damaged.

Note: Repair includes activities such as striking with a hammer and heating rim wheel components.
• Provide and make sure that an air line assembly consisting of the following components is used for inflating tires:
  – A clip-on chuck;
  – An in-line valve with a pressure gauge or a presettable regulator;
  – A sufficient length of hose between the clip-on chuck and the in-line valve, if one is used, to allow the employee to stand outside the trajectory.

Reference: For additional requirements relating to compressed air tools, see WAC 296-807-140, Compressed air tools, in portable power tools.

WAC 296-864-20015 Make sure damaged wheel components are not used.
You must:
• Make sure any wheel or wheel component that is bent out of shape, pitted from corrosion, broken or cracked is:
  – Not used;
  – Marked or tagged unserviceable;
AND
– Removed from the service area.
• Replace damaged or leaky valves.

WAC 296-864-300 Restraint devices.
Your responsibility:
To make sure your restraint devices are safe.
You must:
Use a restraining device WAC 296-864-3005.
Make sure the restraint device meets these requirements WAC 296-864-30010.
Provide charts or rim manuals WAC 296-864-30015.

WAC 296-864-30005 Use a restraining device.
You must:
• Use a restraining device for inflating tires on split rim wheels.
• Use a restraining device or barrier for inflating tires on single-piece wheels.

Exemption: A restraining device or barrier is not required for single-piece rim wheels, if the rim wheel will be bolted onto a vehicle during inflation.

WAC 296-864-30010 Make sure the restraint device meets these requirements.
You must:
• Make sure the restraining device or barrier can withstand a rim wheel separation that occurs at one hundred fifty percent of the maximum tire pressure specified.
• Make sure the restraining devices and barriers will contain any components that may be thrown out during a wheel separation of any rim wheel.
Make sure restraining devices and barriers are visually inspected:
- Prior to each day’s use;
AND
- After any separation of the rim wheel components or sudden release of air.
• Make sure any restraining device or barrier that shows damage is immediately removed from service. Examples of damage include:
  – Cracks at welds;
  – Cracked or broken components;
  – Bent or sprung components caused by mishandling, abuse, tire explosion or rim wheel separation;
  – Pitting of components due to corrosion;
OR
  – Other structural damage that would decrease its effectiveness.
• Make sure restraining devices or barriers removed from service are not used until they are repaired and reinspected.
• Make sure restraining devices or barriers that need structural repair are not used until they are certified by either:
  – The manufacturer;
OR
  – A registered professional engineer.

Note: The certification needs to show that the barrier can withstand a force of one hundred fifty percent of the maximum tire pressure in the event of wheel separation.

WAC 296-864-30015 Provide charts or rim manuals.
You must:
• Provide current charts or rim manuals containing instructions for the types of wheels being serviced in the service area.
• Provide and use only tools recommended in the rim manual for the specific type of rim wheel being serviced.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-20-079, § 296-864-30015, filed 10/5/04, effective 2/1/05.]

WAC 296-864-400 Service split rim wheels safely.
Your responsibility:
To establish and use procedures to service split rim wheels safely.
You must:
• Establish a safe operating procedure for servicing split rim wheels that includes the procedures in WAC 296-864-40020.
• Instruct employees in that procedure.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-20-079, § 296-864-40005, filed 10/5/04, effective 2/1/05.]

WAC 296-864-40010 Follow these procedures for demounting split rim wheels.
You must:
• Follow the relevant procedures in Table 1, Procedures for Deflating Split Rim Wheels.

Table 1

<table>
<thead>
<tr>
<th>Procedures for Demounting Split Rim Wheels</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>During these times</strong></td>

Follow these procedures for inflating split rim wheels.

You must:

- Follow the relevant procedures in Table 3, Procedures for Inflating Split Rim Wheels.

### Table 3

**Procedures for Inflating Split Rim Wheels**

<table>
<thead>
<tr>
<th>During these times</th>
<th>Then</th>
</tr>
</thead>
<tbody>
<tr>
<td>Split rim wheels are being inflated.</td>
<td>Make sure employees stay out of the trajectory.</td>
</tr>
<tr>
<td>When all of the following occur:</td>
<td>The tire may be inflated while the rim wheel is on the vehicle.</td>
</tr>
<tr>
<td>A tire on a vehicle has more than eighty percent of the recommended pressure; AND Remote control inflation equipment is used; AND No employees are in the trajectory during inflation.</td>
<td>Apply rubber lubricant to bead and rim mating surfaces, unless the tire or wheel manufacturer recommends against it.</td>
</tr>
<tr>
<td>Assembly of the wheel and inflation of the tire.</td>
<td>Make sure you do not exceed 5 psi (pounds per square inch) to seat the bead.</td>
</tr>
<tr>
<td>Inflating tires outside of a restraining device.</td>
<td>Make sure you don't correct the seating of side and lock rings by hammering, striking or forcing the components.</td>
</tr>
<tr>
<td>The tire is pressurized.</td>
<td></td>
</tr>
</tbody>
</table>

Note:

- Employees should stay out of the trajectory as much as possible while installing the split rim wheel onto the vehicle.
- The trajectory may deviate from its expected path.

Establish a safe operating procedure for single-piece rim wheels

WAC 296-864-50005

Follow these procedures for demounting single-piece rim wheels

WAC 296-864-50010

Follow these procedures when working on single-piece rim wheel components

WAC 296-864-50015

Follow these procedures for inflating single-piece rim wheels

WAC 296-864-50020

Establish a safe operating procedure for single-piece rim wheels

WAC 296-864-50005

Follow these procedures for demounting single-piece rim wheels

WAC 296-864-50010

Follow these procedures when working on single-piece rim wheel components

WAC 296-864-50015

Follow these procedures for inflating single-piece rim wheels

WAC 296-864-50020

Make sure that they are properly seated and locked.

When adjusting the tire or wheel components.

Deflate the tire by removal of the valve core before the adjustment is made.

</tr>
</tbody>
</table>
| When using a bead expander. | Make sure it is removed:  
  – Before the valve core is installed;  
  AND  
  – As soon as the rim wheel becomes airtight (the tire bead slips onto the bead seat). |

Note: You should not inflate tires above 40 psi to seat the bead.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-20-079, § 296-864-50010, filed 10/5/04, effective 2/1/05.]

WAC 296-864-50020  Follow these procedures for inflating single-piece rim wheels.

You must:
• Inflating tires only when contained within a restraining device or bolted on the vehicle with the lug nuts fully tightened.
• Make sure tires are not inflated when any flat, solid surface is in the trajectory and within one foot of the sidewall.
• Make sure employees stay out of the trajectory when inflating a tire.
• Make sure, when inflating tires, that the inflation pressure stamped in the sidewall isn’t exceeded unless the manufacturer recommends a higher pressure.
• Make sure tires aren’t inflated above the maximum pressure recommended by the manufacturer to seat the tire bead firmly against the rim flange.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-20-079, § 296-864-50020, filed 10/5/04, effective 2/1/05.]

WAC 296-864-60005  Train employees who service rim wheels.

You must:
• Train all employees who service rim wheels.
• Make sure that employees do not service any rim wheel until they have been trained and instructed in:
  – Correct procedures of servicing the type of wheel being worked on;
  AND
  – The safe operating procedures described in:
    ■ WAC 296-864-400, Service split rim wheels safely;
    AND
    ■ WAC 296-864-500, Service single-piece rim wheels safely.
• Make sure the training program explains the hazards involved in servicing those rim wheels and the safety procedures to be followed.
• Make sure the training program includes, at a minimum, the applicable data from:
  – Charts;
  – Rim manuals;
  AND
  – Contents of this standard.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-20-079, § 296-864-60005, filed 10/5/04, effective 2/1/05.]

WAC 296-864-60010  Make sure employees demonstrate and retain the ability to service rim wheels safely.

You must:
• Make sure that each employee demonstrates the ability to service rim wheels safely, including performing the following tasks for the specified type of rim wheel in Table 6.

You must:

- Make sure any employee that is unable to read the charts or rim manual is effectively trained on their contents.
- Evaluate each employee’s ability to perform these tasks and to service rim wheels safely.
- Provide additional training as necessary to make sure that each employee maintains his or her proficiency.

Helpful tool:

Training checklist

The optional training checklist can help you monitor the training status of your employees. You can find this checklist in the resources section of this chapter.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-20-079, § 296-864-700, filed 10/5/04, effective 2/1/05.]

WAC 296-864-700 Definitions.

**Barrier** means a fence, wall or other object placed between a single-piece rim wheel and an employee during tire inflation that will contain the components if the air in the tire is suddenly released.

**Charts** means:

- The United States Department of Labor, Occupational Safety and Health Administration publications entitled "Demounting and Mounting Procedures for Truck/Bus Tires" and "Multi-Piece Rim Matching Chart";
- The National Highway Traffic Safety Administration (NHTSA) publications entitled "Demounting and Mounting Procedures for Truck/Bus Tires" and "Multi-Piece Rim Matching Chart";
- OR
- Any other poster that contains at least the same instructions, safety precautions and other information contained in the charts applicable to the types of wheels being serviced.

**Demounting** means deflating and taking apart a tire and rim wheel.

**Installing a rim wheel** means the transfer and attachment of an assembled rim wheel onto a vehicle axle hub.

**Mounting a tire** means the putting together of the wheel and tire components to form a rim wheel, including inflation.

**Restraint device** is a cage or rack that will hold all rim wheel components during an explosive separation of a multipiece rim wheel or during the sudden release of air in a single-piece rim wheel.

**Rim manual** is a publication containing instructions from the manufacturer or other qualified organization for correct mounting, demounting, maintenance, and safety precautions for the type of wheel being serviced.

**Service or servicing** means the mounting and demounting of rim wheels, and related activities such as inflating, deflating, installing, removing, and handling.

**Service area** means any place where an employee services rim wheels.

**Single-piece rim wheel** means a single part holds the tire, forms part of the air chamber and is the point where the wheel is attached to the vehicle axle.

**Split rim wheel or multipiece rim wheel** means a wheel made up of two or more parts. One of the parts is a side ring or locking ring that holds the tire on the wheel when the tire is inflated.

**Trajectory** means the path that a rim wheel component may travel during an explosive separation or the sudden release of air.

**Wheel** means that portion of a rim wheel that attaches to the axle of a vehicle and also contains the inflated tire or tire and tube.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 04-20-079, § 296-864-700, filed 10/5/04, effective 2/1/05.]

296-874-20000 Meet these requirements when using step, platform and trestle ladder scaffolds.

(2005 Ed.)

WAC 296-874-100 Scope. This chapter applies to suspended and supported scaffolds, including their supporting structure and anchorage points.

Exemption: This chapter does not apply to:
- Manually propelled elevating work platforms;
- Self-propelled elevating work platforms;
- Boom-supported elevating work platforms;
- Aerial lifts;
- Crane or derrick suspended personnel platforms;
- Personnel platforms supported by powered industrial trucks (PITs).

Reference: Additional requirements for the following types of platforms are found in the general safety and health standards, chapter 296-24 WAC. Go to the following sections:
- For elevating work platforms and aerial lifts, go to elevating work platforms, WAC 296-24-875;
- For crane or derrick suspended personnel platforms, go to WAC 296-24-23533;
- For personnel platforms supported by powered industrial trucks (PITs), go to WAC 296-24-230.

Definition:
A scaffold is a temporary elevated platform, including its supporting structure and anchorage points, used for supporting employees or materials.

A suspended scaffold is one or more platforms suspended from an overhead structure by ropes or other nonrigid means.

A supported scaffold is one or more platforms supported by rigid means such as outrigger beams, brackets, poles, legs, uprights, posts, or frames.

Section contents:
Your responsibility:
To make sure all scaffolds meet these requirements.
Make sure scaffolds are properly designed and constructed
WAC 296-874-20002.
Make sure scaffolds are erected, moved, altered, or dismantled by appropriate persons
WAC 296-874-20004.
Maintain structural integrity when intermixing scaffold components
WAC 296-874-20006.
Make sure platforms are properly planked or decked
WAC 296-874-20008.
Make sure platforms meet minimum width requirements
WAC 296-874-20010.
Meet these requirements when shorter platforms are used to create a longer platform
WAC 296-874-20012.
Lay platform planks properly when the platform changes direction
WAC 296-874-20014.
Stabilize the ends of platforms
WAC 296-874-20016.
Keep platform sag within acceptable limits
WAC 296-874-20018.
Provide safe access to scaffolds

[Title 296 WAC—p. 3079]
WAC 296-874-20020. Make sure portable, hook-on, and attachable ladders meet these requirements.

WAC 296-874-20022. Make sure stairway-type ladders meet these requirements.

WAC 296-874-20024. Make sure stair towers meet these requirements.

WAC 296-874-20026. Make sure stair rails and handrails meet these requirements.

WAC 296-874-20028. Make sure ramps and walkways used to access scaffolds meet these requirements.

WAC 296-874-20030. Make sure surfaces used to access scaffolds are close enough to use safely.

WAC 296-874-20032. Inspect scaffolds and scaffold components.

WAC 296-874-20034. Make sure damaged or weakened scaffolds meet minimum strength requirements.

WAC 296-874-20036. Make sure scaffolds are properly loaded.

WAC 296-874-20038. Protect employees when moving scaffolds.

WAC 296-874-20040. Increase employee working level height on scaffolds safely.

WAC 296-874-20042. Control loads being hoisted near scaffolds.

WAC 296-874-20044. Protect employees from energized power lines.

WAC 296-874-20046. Protect employees from weather hazards.

WAC 296-874-20048. Protect employees from slipping and tripping hazards.

WAC 296-874-20050. Provide fall protection for employees on scaffolds.

WAC 296-874-20052. Provide fall protection if the scaffold is too far from the work face.

WAC 296-874-20054. Provide specific fall protection for specific types of scaffolds.

WAC 296-874-20056. Make sure personal fall arrest systems meet these requirements.

WAC 296-874-20058. Make sure vertical lifelines used with personal fall arrest systems meet these requirements.

WAC 296-874-20060. Make sure horizontal lifelines used with personal fall arrest systems meet these requirements.

WAC 296-874-20062. Make sure guardrail systems meet these requirements.

WAC 296-874-20064. Provide falling object protection.

WAC 296-874-20066. Provide additional support lines on suspended scaffolds using a canopy for falling object protection.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20002, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20002 Make sure scaffolds are properly designed and constructed.

You must:

- Make sure scaffolds are:
  - Designed by a qualified person;
  - Constructed according to that design.

Definition:

A qualified person is one who has demonstrated the ability to solve problems related to the subject matter, work, or project. This can be done by having either:

- A recognized degree, certificate, or professional standing;
  OR
- Extensive knowledge, training, and experience.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20002, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20004 Make sure scaffolds are erected, moved, altered, or dismantled by appropriate persons.

You must:

- Make sure scaffolds are erected, moved, altered, or dismantled only when the work is:
  - Supervised and directed by a competent person qualified in scaffold erection, moving, dismantling, or alteration;
  - Done by experienced and trained employees selected by the competent person.

Definition:

A competent person is someone who:

- Is capable of identifying existing and predictable hazards in the surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees;

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20004, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20006 Maintain structural integrity when intermixing scaffold components.

You must:

- Make sure intermixed scaffold components:
  - Fit together without force;

[Title 296 WAC—p. 3080]
– Maintain the scaffold’s structural integrity.

- Make sure a qualified person determines that modifying components in order to intermix them will result in a structurally sound scaffold.

- Make sure scaffold components made of different metals are not used together.

**Exemption:** Different types of metals may be used together if a competent person determines that galvanic action will not reduce the strength of any component to less than the minimum strength required.

**Reference:** The minimum strength requirements are found in the following sections:

- Suspended scaffolds, WAC 296-874-30002.
- Supported scaffolds, WAC 296-874-40002.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20006, filed 12/7/04, effective 3/1/05.]

### WAC 296-874-20008 Make sure platforms are properly planked or decked.

**You must:**

- Fully plank or deck each platform between the front uprights and the guardrail supports on all working levels of a scaffold so that there is no more than one inch (2.5 cm):
  - Between adjacent units;
  AND
  - Between the platform and the uprights.

**Exemption:** There may be more than one inch between platform units if all of the following are met:

- You can demonstrate that a wider space is necessary, such as to fit around uprights when side brackets are used to extend the platform width;
- The platform is planked or decked as fully as possible;
- The open space between the platform and the guardrail supports is nine and one-half inches (24.1 cm) or less.
- Platforms used solely as walkways or only by employees erecting or dismantling scaffolds do not have to be fully decked or planked if:
  - The planking provided makes for safe working conditions;
  AND
  - Employees on those platforms are protected from falling.

**Reference:**

- Make sure, when platforms are butted together to create a longer platform, that each abutted platform end rests on a separate support surface.
- OR
- Overlapped by at least twelve inches (30 cm);
- Employees on those platforms or walkways are protected from falling by using guardrails or personal fall arrest systems.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20008, filed 12/7/04, effective 3/1/05.]

### WAC 296-874-20010 Make sure platforms meet minimum width requirements.

**You must:**

- Make sure scaffold platforms meet the minimum width requirements of Table 1, Minimum Platform Width.

<table>
<thead>
<tr>
<th>Type of Scaffold</th>
<th>Minimum Platform Width Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ladder jack scaffold</td>
<td>12 inches (20 cm)</td>
</tr>
<tr>
<td>Pump jack scaffold</td>
<td></td>
</tr>
<tr>
<td>Roof bracket scaffold</td>
<td>18 inches (46 cm)</td>
</tr>
<tr>
<td>Top plate bracket scaffold</td>
<td></td>
</tr>
<tr>
<td>Boatswain's chair</td>
<td>No minimum width</td>
</tr>
<tr>
<td>All other scaffolds</td>
<td>18 inches (46 cm)</td>
</tr>
</tbody>
</table>

**Exemption:** Platforms may be coated periodically with wood preservatives, fire-retardant finishes, or slip-resistant finishes if the coating does not obscure the top or bottom wood surfaces.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20008, filed 12/7/04, effective 3/1/05.]

### WAC 296-874-20012 Meet these requirements when using shorter platforms to create a longer platform.

**You must:**

- Make sure, when platforms are overlapped to create a longer platform, that:
  - The overlap is over a support;
  AND
  - The platforms are either:
    - Overlapped by at least twelve inches (30 cm);
    OR
    - Are nailed together or otherwise prevented from moving.

**Note:** Platforms may butt together on a common support member if the member is designed to support abutting platforms, such as either:

(2005 Ed.)
WAC 296-874-20014 Lay platform planks properly when the platform changes direction.

You must:
- Do the following whenever platforms overlap to change direction:
  - First lay the platform that rests on a bearer at an angle other than a right angle;
  THEN
  - Lay the platform that is perpendicular to the bearer.

WAC 296-874-20016 Stabilize the ends of platforms.

You must:
- Make sure each end of a platform:
  - Is cleated or restrained by hooks or equivalent means;
  OR
  - Extends over the centerline of its support at least six inches (15 cm).
- Make sure the cantilevered portion of a platform meets at least one of the following:
  - Is designed and installed to support employees or material without tipping;
  - Has guardrails which block employee access to the cantilevered end;
  - Extends over its support not more than:
    ■ Twelve inches (30 cm) if the platform length is ten feet or less;
    OR
    ■ Eighteen inches (46 cm) if the platform length is greater than ten feet.

Note: The cantilevered portion of a platform is the portion that is not supported on one end.

WAC 296-874-20018 Keep platform sag within acceptable limits.

You must:
- Make sure a loaded platform does not sag more than one-sixtieth of the span.

WAC 296-874-20020 Provide safe access to scaffolds.

You must:
- Provide scaffold platforms more than two feet (0.6 m) above or below a point of access with at least one of the following means of access:
  - Portable, hook-on, or attachable ladder;
  - Stairway-type ladder;
  - Ladder stand;
  - Stair tower (scaffold stairway or tower);
  - Ramp;
  - Walkway;
  - Integral prefabricated scaffold access;
  - Direct access from another scaffold, structure, personnel hoist, or similar surface.
- Make sure crossbraces are not used as a means of access.

Reference: For requirements about integral prefabricated scaffold access, go to WAC 296-874-40020.

WAC 296-874-20022 Make sure portable, hook-on, and attachable ladders meet these requirements.

You must:
- Position portable, hook-on, and attachable ladders so they do not tip the scaffold.
- Make sure hook-on and attachable ladders meet all of the following:
  - Specifically designed and used for that type of scaffold;
  - Have rungs that are:
    ■ Uniformly spaced;
    ■ Not more than sixteen and three-quarters inches apart;
    ■ At least eleven and one-half inches (29 cm) long;
    ■ Lined up vertically between rest platforms.
  - Position the bottom rung not more than twenty-four inches (61 cm) above the scaffold supporting level.
  - Have rest platforms at vertical intervals not greater than twenty-four feet (7.3 m) on supported scaffolds.

Definition:
A ladder stand is a mobile, fixed-size, self-supporting ladder consisting of a wide flat tread ladder in the form of stairs.

WAC 296-874-20024 Make sure stairway-type ladders meet these requirements.

You must:
- Make sure stairway-type ladders meet all of the following:
  - Position the bottom step not more than twenty-four inches (61 cm) above the scaffold supporting level;
  - Have rest platforms not more than twelve feet (3.7 m) apart vertically;
  - Have slip-resistant surfaces on treads and landings;
  - Have steps that:
    ■ Are at least sixteen inches (41 cm) wide;
    AND
    ■ Line up vertically between rest platforms.
  - Make sure mobile ladder stands have steps that are at least eleven and one-half inches (30 cm) wide.

WAC 296-874-20026 Make sure stair towers meet these requirements.

You must:
- Make sure stair towers (scaffold stairways or towers) meet all of the following:
Scaffolds

WAC 296-874-20036 Make sure ramps and walkways are not inclined at a slope steeper than one vertical in three horizontal (1:3 or twenty degrees from the horizontal).

You must:
- Make sure ramps and walkways that are inclined at a slope steeper than one vertical in eight horizontal (1:8) have cleats to provide footing which are:
  - Securely fastened to the planks;
  AND
  - Spaced not more than fourteen inches (35 cm) apart.

Reference: Ramps and walkways that are four feet (1.2 m) or more above a lower level need to have a guardrail system. Those requirements are found in other chapters.
- For general industry activities, go to:
  ■ Working surfaces, guarding floors and wall openings, ladders, Part J-1, in the general safety and health standards, chapter 296-24 WAC;
- For construction activities, go to:
  ■ Floor openings, wall openings, and stairways, Part K, in the safety standards for construction work, chapter 296-155 WAC.

WAC 296-874-20032 Make sure surfaces used to access scaffolds are close enough to use safely.

You must:
- Make sure a surface used to provide access to or from a scaffold is not further from the scaffold than:
  - Fourteen inches (36 cm) horizontally;
  - Twenty-four inches (61 cm) vertically.

Reference: For information on minimum strength requirements for suspended and supported scaffolds, go to the following sections within this chapter:
- Make sure suspended scaffolds and scaffold components meet these strength requirements, WAC 296-874-30002;
- Make sure supported scaffolds and scaffold components meet these strength requirements, WAC 296-874-40002.

WAC 296-874-20034 Inspect scaffolds and scaffold components.

You must:
- Make sure scaffolds and scaffold components are inspected for visible defects by a competent person:
  - Before each work shift;
  AND
  - After anything occurs that could affect the scaffold's structural integrity.

WAC 296-874-20036 Make sure damaged or weakened scaffolds meet minimum strength requirements.

You must:
- Make sure any scaffold or scaffold component that has been damaged or weakened so that it no longer meets the minimum strength requirements of this chapter, is immediately either:
  - Repaired, replaced, or braced to meet the minimum strength requirements;
  OR
  - Removed from service until repaired.

Reference: For information on minimum strength requirements for suspended and supported scaffolds, go to the following sections within this chapter:
- Make sure suspended scaffolds and scaffold components meet these strength requirements, WAC 296-874-30002;
- Make sure supported scaffolds and scaffold components meet these strength requirements, WAC 296-874-40002.

WAC 296-874-20028 Make sure stair rails and handrails meet these requirements.

You must:
- Provide a stair rail that meets all of the following on each side of a scaffold stairway:
  - Has a toprail and midrail;
  - Has a toprail that can serve as a handrail if a separate handrail is not provided;
  - Is at least twenty-eight inches (71 cm) but not more than thirty-seven inches (94 cm) high.

Reference: Stair rail height is measured from the upper surface of the stair rail to the surface of the tread, in line with the face of the riser at the forward edge of the tread.

You must:
- Make sure stair rail systems and handrails have:
  ■ A surface that prevents employees from:
    - Being injured by punctures or lacerations;
    OR
    ■ Snagging their clothing;
    - Ends that do not create a projection hazard.
  - Make sure handrails, and top rails that are used as handrails:
    - Provide an adequate handhold for employees to grasp to avoid falling;
    AND
    - Are at least three inches (7.6 cm) from other objects.

Note: Riser height may have larger variations at the top step and bottom step of the entire stair system, but not at the top and bottom steps within each flight of stairs.

WAC 296-874-20030 Make sure ramps and walkways used to access scaffolds meet these requirements.

You must:
- Make sure ramps and walkways are not inclined at a slope steeper than one vertical in three horizontal (1:3 or twenty degrees from the horizontal).

Note: For requirements about guardrails, go to WAC 296-874-20064.

You must:
- Make sure steps meet all of the following requirements:
  - Line up vertically between rest platforms;
  - Have uniform tread depth, within one-quarter inch (0.6 cm), for each flight of stairs;
  - Have uniform riser height, within one-quarter inch (0.6 cm), for each flight of stairs.

Note: Riser height may have larger variations at the top step and bottom step of the entire stair system, but not at the top and bottom steps within each flight of stairs.

WAC 296-874-20026 Make sure stair rails and handrails meet these requirements.

You must:
- Are positioned so the bottom step is not more than twenty-four inches (61 cm) above the scaffold supporting level;
- Are at least eighteen inches (45.7 cm) wide between stair rails;
- Have slip-resistant surfaces on treads and landings;
- Are installed at an angle of forty to sixty degrees from the horizontal.
- Provide a landing platform at least eighteen inches (45.7 cm) wide by eighteen inches (45.7 cm) long at each level.
- Provide guardrails on the open sides and ends of each landing.

Reference: For requirements about guardrails, go to WAC 296-874-20064.

You must:
- Make sure steps meet all of the following requirements:
  - Are at least three inches (7.6 cm) from other objects.
  - Are installed at an angle of forty to sixty degrees from the horizontal.
  - Have slip-resistant surfaces on treads and landings.
  - Are positioned so the bottom step is not more than twenty-four inches (61 cm) above the scaffold supporting level.

You must:
- Make sure ramps and walkways are not inclined at a slope steeper than one vertical in three horizontal (1:3 or twenty degrees from the horizontal).

Note: For requirements about guardrails, go to WAC 296-874-20064.

You must:
- Make sure steps meet all of the following requirements:
  - Are at least eighteen inches (45.7 cm) wide between stair rails;
  - Have slip-resistant surfaces on treads and landings;
  - Are installed at an angle of forty to sixty degrees from the horizontal.
- Provide a landing platform at least eighteen inches (45.7 cm) wide by eighteen inches (45.7 cm) long at each level.
- Provide guardrails on the open sides and ends of each landing.

Reference: For requirements about guardrails, go to WAC 296-874-20064.

You must:
- Make sure ramps and walkways are not inclined at a slope steeper than one vertical in three horizontal (1:3 or twenty degrees from the horizontal).

Note: For requirements about guardrails, go to WAC 296-874-20064.

You must:
- Make sure steps meet all of the following requirements:
  - Are at least eighteen inches (45.7 cm) wide between stair rails;
  - Have slip-resistant surfaces on treads and landings;
  - Are installed at an angle of forty to sixty degrees from the horizontal.
- Provide a landing platform at least eighteen inches (45.7 cm) wide by eighteen inches (45.7 cm) long at each level.
- Provide guardrails on the open sides and ends of each landing.

Reference: For requirements about guardrails, go to WAC 296-874-20064.

You must:
- Make sure ramps and walkways are not inclined at a slope steeper than one vertical in three horizontal (1:3 or twenty degrees from the horizontal).

Note: For requirements about guardrails, go to WAC 296-874-20064.

You must:
- Make sure steps meet all of the following requirements:
  - Are at least eighteen inches (45.7 cm) wide between stair rails;
  - Have slip-resistant surfaces on treads and landings;
  - Are installed at an angle of forty to sixty degrees from the horizontal.
- Provide a landing platform at least eighteen inches (45.7 cm) wide by eighteen inches (45.7 cm) long at each level.
- Provide guardrails on the open sides and ends of each landing.

Reference: For requirements about guardrails, go to WAC 296-874-20064.

You must:
- Make sure ramps and walkways are not inclined at a slope steeper than one vertical in three horizontal (1:3 or twenty degrees from the horizontal).

Reference: Ramps and walkways that are four feet (1.2 m) or more above a lower level need to have a guardrail system. Those requirements are found in other chapters.
- For general industry activities, go to:
  ■ Working surfaces, guarding floors and wall openings, ladders, Part J-1, in the general safety and health standards, chapter 296-24 WAC;
- For construction activities, go to:
  ■ Floor openings, wall openings, and stairways, Part K, in the safety standards for construction work, chapter 296-155 WAC.

Reference: For information on minimum strength requirements for suspended and supported scaffolds, go to the following sections within this chapter:
- Make sure suspended scaffolds and scaffold components meet these strength requirements, WAC 296-874-30002;
- Make sure supported scaffolds and scaffold components meet these strength requirements, WAC 296-874-40002.
WAC 296-874-20038 Make sure scaffolds are properly loaded. You must:
- Load scaffolds as specified in the:
  - Manufacturer’s instructions;
  OR
  - Design of the qualified person.
- Make sure scaffolds and scaffold components do not exceed their maximum intended load or rated load, whichever is less.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20038, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20040 Protect employees when moving scaffolds.

You must:
- Make sure scaffolds are not moved horizontally while employees are on them.

Exemption: A scaffold may be moved horizontally with employees on it if the scaffold:
- Has been specifically designed for such movement by a registered professional engineer;
  OR
- Is a mobile scaffold that meets the requirements of the section, Meet these requirements when moving mobile scaffolds, WAC 296-874-40012.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20040, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20042 Increase employee working level height on scaffolds safely.

You must:
- Make sure makeshift devices, such as boxes and barrels, are not used on scaffold platforms to increase the working level height for employees.
  - Meet all of the following when using stilts on scaffolds:
    - Use stilts only on large area scaffolds;
    - Increase the height of a guardrail system used for fall protection by an amount equal to the height of the stilts being used;
    - Make sure scaffold platforms where stilts are used are flat and free of:
      ■ Pits, holes, and obstructions such as debris;
      AND
      ■ Other tripping or falling hazards.
        - Make sure stilts are:
        ■ Properly maintained;
        AND
        ■ The original equipment is not altered without the manufacturer’s approval.
  - Meet all of the following when using ladders on scaffolds:
    - Use ladders only on large area scaffolds;
    - Secure the platform units to the scaffold to prevent movement;
    - Secure the scaffold against the sideways thrust exerted by the ladder if the ladder is placed against a structure that’s not part of the scaffold;
    - Make sure the ladder legs are:
      ■ Secured to prevent them from slipping or being pushed off the platform;
      AND
      ■ On the same scaffold platform, or use other means, to stabilize the ladder against uneven platform deflection.

[Title 296 WAC—p. 3084]

WAC 296-874-20044 Control loads being hoisted near scaffolds.

You must:
- Use a tag line or equivalent measures to control loads being hoisted onto or near a scaffold if the load could swing and contact the scaffold.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20044, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20046 Protect employees from energized power lines.

You must:
- Make sure scaffolds are erected, moved, altered, or dismantled so that they, and any conductive material handled on them, are kept at least as far from exposed and energized power lines as shown in Table 2, Minimum Separation Distance from Energized Power Lines.

Table 2
Minimum Separation Distance from Energized Power Lines

<table>
<thead>
<tr>
<th>Voltage</th>
<th>Minimum Separation Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 300 volts (insulated lines)</td>
<td>3 feet (0.9 m)</td>
</tr>
<tr>
<td>Less than 300 volts ( uninsulated lines)</td>
<td>10 feet (3.1 m)</td>
</tr>
<tr>
<td>300 volts to 50 kv</td>
<td>10 feet (3.1 m) + 0.4 inches (1.0 cm) for each 1 kv over 50 kv</td>
</tr>
<tr>
<td>More than 50 kv</td>
<td>Note: You may use an alternative minimum separation distance of 2 times the length of the line insulator, but never less than 10 feet (3.1 m).</td>
</tr>
</tbody>
</table>

Exemption: Scaffolds and conductive materials handled on scaffolds may be closer to power lines than the minimum separation distance specified in Table 2 if all of the following are met:
- Less clearance is necessary to do the work;
- The utility company or electrical system operator has been notified of the need to work closer to the power lines;
- The utility company or electrical system operator has done at least one of the following:
  - Deenergized the lines;
  - Relocated the lines to meet the minimum separation distance requirement;
  - Installed protective coverings over the lines to prevent accidental contact.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20046, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20048 Protect employees from weather hazards.

You must:
- Prohibit work on or from scaffolds during storms or high winds unless both of the following are met:
  - A competent person has determined that it is safe for employees to be on the scaffold;
WAC 296-874-20050 Protect employees from slipping and tripping hazards.

You must:
- Make sure wind screens are not used unless the scaffold is secured against the anticipated wind forces.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20048, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20052 Provide fall protection for employees on scaffolds.

You must:
- Protect each employee on a scaffold more than ten feet (3.1 m) above a lower level, from falling to the lower level, by providing either:
  - A personal fall arrest system;
  - Guardrails.

You must:
- Make sure employees erecting the scaffold install the guardrail system, if required, before the scaffold is used by any other employees.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20052, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20054 Provide fall protection if a scaffold is too far from the work face.

You must:
- Provide a guardrail system along the front edge of the platform, or have employees use a personal fall arrest system, if the distance from the front edge of the platform to the work face is greater than:
  - Eighteen inches (46 cm) for scaffolds used for plastering and lathing operations;
  - Fourteen inches (36 cm) for all other scaffolds.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20054, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20056 Provide specific fall protection for specific types of scaffolds.

You must:
- Use a personal fall arrest system to protect employees on the following scaffolds:
  - Boatswain’s chair;
  - Catenary scaffold;
  - Float scaffold;
  - Ladder jack scaffold;
  - Needle beam scaffold.
- Use a personal fall arrest system and a guardrail system to protect employees on:
  - Single-point adjustable suspension scaffolds;
  - Two-point adjustable suspension scaffolds.
- Protect employees working on a crawling board (chicken ladder) by using at least one of the following:
  - A personal fall arrest system;
  - A guardrail system with a minimum two hundred pound top rail capacity;
  - A three-quarter inch (1.9 cm) diameter grabline or equivalent handhold securely fastened beside each crawling board.
- Protect employees working on a self-contained adjustable scaffold that has the platform:
  - Supported by the frame structure, using a guardrail system with a minimum two hundred pound top rail capacity.
  - Suspended by ropes, using:
    - A guardrail system with a minimum two hundred pound top rail capacity;

AND
- A personal fall arrest system.
- Protect employees on walkways located within a scaffold by using a guardrail system that meets all of the following:
  - Has a minimum two hundred pound top rail capacity;
  - Is installed within nine and one-half inches (24.1 cm) of the walkway;
  - Is installed along at least one side of the walkway.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20056, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20058 Make sure personal fall arrest systems meet these requirements.

You must:
- Make sure personal fall arrest systems used on scaffolds for general industry activities, meet the requirements of personal fall arrest system, Appendix C, Part 1, WAC 296-24-88050, in powered platforms, Part J-3, found in the general safety and health standards, chapter 296-24 WAC.
- Make sure personal fall arrest systems are attached by a lanyard to one of the following:
  - Vertical lifeline;
WAC 296-874-20060 Make sure vertical lifelines used with personal fall arrest systems meet these requirements.

You must:
- Make sure vertical lifelines are all of the following:
  - Fastened to a fixed, safe point of anchorage;
  - Independent of the scaffold;
  - Protected from sharp edges and abrasion.

Note: Safe points of anchorage include structural members of buildings, but do not include:
- Standpipes, vents, or other piping systems;
- Electrical conduit;
- Outrigger beams;
- Counterweights.

You must:
- Make sure vertical lifelines, independent support lines, and suspension ropes are not attached to any of the following:
  - Each other;
  - The same point of anchorage;
  - The same point on the scaffold.
- Make sure vertical lifelines, independent support lines, and suspension ropes do not use the same point of anchorage.
- Make sure independent support lines and suspension ropes are not attached to a personal fall arrest system.
- Make sure vertical lifelines are not used with single-point or two-point adjustable suspension scaffolds that have overhead components such as overhead protection or additional platform levels.

WAC 296-874-20064 Make sure guardrail systems meet these requirements.

You must:
- Make sure guardrails, if required, are installed along all open sides and ends of platforms.

Exemption: For employees doing overhand bricklaying operations from a supported scaffold, a guardrail is not required on the side next to the wall.

Definition:
Overhand bricklaying is the process of laying bricks and masonry units so that the surface of the wall is on the opposite side of the wall from the mason, requiring the mason to lean over the wall to complete the work. It includes mason tending and electrical installation incorporated into the brick wall.

You must:
- Make sure the height of the toprail top edge, or the equivalent member, of supported scaffolds is:
  - At least thirty-six inches (0.9 m) and not more than forty-five inches (1.2 m) above the platform surface before January 1, 2000;
  - At least thirty-eight inches (0.97 m) and not more than forty-five inches (1.2 m) above the platform surface after January 1, 2000.
- Make sure the height of the toprail top edge, or the equivalent member, of suspended scaffolds that require guardrails and personal fall arrest systems, is at least thirty-six inches (0.9 m) and not more than forty-five inches (1.2 m) above the platform surface.

Exemption: When conditions warrant, the height of the top edge of the toprail may be greater than forty-five inches if the guardrail system meets all other criteria of this chapter.

You must:
- Make sure the top edge of the toprail doesn't drop below the required height when the minimum load, shown in Table 3, Minimum Toprail and Midrail Strength Requirements, is used.
  - Each toprail and midrail, or equivalent member, of a guardrail system must be able to withstand, without failure, the force shown in Table 3, Minimum Toprail and Midrail Strength Requirements, when the force is applied as follows:
    - To the toprail in a downward or horizontal direction at any point along its top edge;
    - To the midrail in a downward or horizontal direction at any point.
Note: Midrail includes screens, mesh, intermediate vertical members, solid panels, and equivalent structural members of the guardrail system.

Table 3
Minimum Toprail and Midrail Strength Requirements

<table>
<thead>
<tr>
<th>Type of Scaffold</th>
<th>Toprail Capacity</th>
<th>Midrail Capacity</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Single-point adjustable suspension scaffolds</td>
<td>100 pounds (445 n)</td>
<td>75 pounds (333 n)</td>
</tr>
<tr>
<td>• Two-point adjustable suspension scaffolds</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• All other scaffolds</td>
<td>200 pounds (890 n)</td>
<td>150 pounds (666 n)</td>
</tr>
</tbody>
</table>

You must:
• Install midrails, screens, mesh, intermediate vertical members, solid panels, or equivalent structural members as follows:
  – Midrails at a height approximately midway between the top edge of the guardrail system and the platform surface;
  – Screens and mesh:
    ■ From the top edge of the guardrail system to the scaffold platform;
    ■ Along the entire opening between the supports;
  – Intermediate members, such as balusters or additional rails, not more than nineteen inches (48 cm) apart.
• Make sure steel or plastic banding is not used as a toprail or midrail.
• Have a competent person inspect manila rope and plastic or other synthetic rope that is used as a toprail or midrail as frequently as necessary to make sure it continues to meet the strength requirements for a toprail or midrail.

Note: Crossbraces may be used as a toprail or midrail in a guardrail system if they meet the following requirements:
• The crossing point of the two braces is between:
  – 20” and 30” above the work platform when used as a midrail.
  – 38” and 48” above the work platform when used as a toprail.
• The end points at each upright are not more than 48” apart.

You must:
• Make sure gruardrails have a surface that prevents:
  – Puncture and laceration injuries;
  – Snagging clothing.

You must:
• Protect employees from being struck by tools, materials, or equipment falling from a scaffold by doing one or more of the following:
  – Use a barricade to keep employees out of the area where falling objects could be a hazard;
  – Install a barricade along the edge of the platform anywhere an object could fall on an employee below;
  – Install paneling or screening that covers from the top of the guardrail to the toeboard or platform anywhere the toeboard is not high enough to keep objects from falling off the platform;
  – Install a guardrail system with openings small enough to keep potential falling objects from passing through;
  – Erect a canopy structure, debris net, or catch platform over employees that does all of the following:
    ■ Will contain or deflect falling objects;
    ■ Is strong enough to withstand the impact forces;
    ■ Is installed between the falling object hazard and the employees.
• Make sure potential falling objects that are too large or heavy to be contained or deflected by the falling object protection you are using are:
  – Moved away from the edge of the surface they could fall from;
  – Secured, as necessary, to prevent falling.

WAC 296-874-20068 Provide additional support lines on suspended scaffolds using a canopy for falling object protection.

You must:
• Equip suspended scaffolds, that use a canopy for falling object protection, with additional independent support lines that meet all of the following:
  – Have the same number of support lines as there are suspension ropes;
  – Are equivalent in strength to the suspension ropes;
  – Are not attached to the same point of anchorage as the suspension ropes.

WAC 296-874-20070 Make sure toeboards meet these requirements.

You must:
• Make sure toeboards, when used, are:
  – At least three and one-half inches (9 cm) high from the top edge of the toeboard to the platform;
  – Securely fastened along the outer edge of the platform;
  – Installed for enough distance along the platform to protect employees below;
  – Installed so the gap between the bottom of the toeboard and the platform is one-quarter inch (0.7 cm) or less;
  – Solid or with openings that are one inch (2.5 cm) or less in the largest dimension;
  – Able to withstand, without failing, a force of at least fifty pounds (222 n) applied in a downward or horizontal direction anywhere along the toeboard.

Reference: Hardhats and possibly other personal protective equipment has to be used to protect employees exposed to overhead hazards.
• Those requirements are found in the safety and health core rules, chapter 296-800 WAC.
  – Go to Personal protective equipment (PPE), WAC 296-800-160.
Exemption: On float (ship) scaffolds, an edging of three-quarters by one and one-half inch (2 x 4 cm) wood or the equivalent may be used instead of a toeboard.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20070, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20072 Train employees who work on a scaffold. You must:
- Have a qualified person train each employee who works on a scaffold to:
  - Recognize the hazards associated with the type of scaffold they are using;
  - Understand the procedures to control or minimize the hazards.
- Include the following subjects in your training:
  - Hazards in the work area and how to deal with them, including:
    - Electrical hazards;
    - Fall hazards;
    - Falling object hazards;
    - How to erect, maintain, and disassemble the fall protection and falling object protection systems being used;
    - How to:
      - Use the scaffold;
      - Handle materials on the scaffold;
      - The load-carrying capacity and maximum intended load of the scaffold;
    - Any other requirements of this chapter that apply.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20072, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20074 Train employees who erect, dismantle, operate or maintain scaffolds.
You must:
- Have a competent person train each employee who erects, disassembles, moves, operates, repairs, maintains, or inspects scaffolds to recognize any hazards associated with the work.
- Make sure the training includes at least the following subjects:
  - Hazards in the work area and how to deal with them;
  - The correct procedures for erecting, disassembling, moving, operating, repairing, inspecting, and maintaining the type of scaffold being used;
  - The design criteria, maximum intended load-carrying capacity and intended use of the scaffold;
  - Any other requirements of this chapter that apply.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20074, filed 12/7/04, effective 3/1/05.]

WAC 296-874-20076 Retrain employees when necessary.
You must:
- Retrain employees to reestablish proficiency if you believe they lack the skill or understanding to safely erect, use, or dismantle a scaffold.
- Retraining is required in at least the following situations:
  - An employee’s work involving scaffolds is inadequate and indicates they lack the necessary proficiency;
  - A change in any of the following that presents a hazard the employee has not been trained for:
    - Worksite;
    - Type of scaffold;
    - Fall protection;
    - Falling object protection;
    - Other equipment.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-20076, filed 12/7/04, effective 3/1/05.]

Make sure wire rope clips are used properly
WAC 296-874-30020.
Prevent swaying of two-point and multipoint suspension scaffolds
WAC 296-874-30022.
Use emergency escape and rescue devices appropriately
WAC 296-874-30024.
Protect suspension ropes from heat or corrosive substances
WAC 296-874-30026.
Take precautions while welding
WAC 296-874-30028.
Prohibit use of gasoline-powered equipment on suspended scaffolds
WAC 296-874-30030.
Meet these requirements when using catenary scaffolds
WAC 296-874-30032.
Meet these requirements when using float (ship) scaffolds
WAC 296-874-30034.
Meet these requirements when using interior hung scaffolds
WAC 296-874-30036.

[Title 296 WAC—p. 3088]
Meet these requirements when using multilevel suspended scaffolds
WAC 296-874-30038.
Meet these requirements when using multipoint adjustable suspension scaffolds
WAC 296-874-30040.
Meet these requirements when using needle beam scaffolds
WAC 296-874-30042.
Meet these requirements when using single-point adjustable suspension scaffolds
WAC 296-874-30044.
Meet these requirements when using two-point adjustable suspension scaffolds (swing stages)
WAC 296-874-30046.

WAC 296-874-30002 Make sure suspended scaffolds and scaffold components meet these strength requirements.

You must:
• Meet the following strength requirements:
  – Suspended scaffolds must support, without failure, the total of their own weight plus four times the maximum intended load;
  – Suspended scaffold components must meet the requirements contained in Table 4, Suspended Scaffold Strength Requirements.
• Surfaces that support scaffold support devices must withstand four times the rated load of the hoist.

Note: Scaffold support devices include outrigger beams, cornice hooks, parapet clamps, and similar devices.

Table 4 Suspended Scaffold Strength Requirements

<table>
<thead>
<tr>
<th>These scaffold components:</th>
<th>Must meet these strength requirements:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjustable scaffold</td>
<td>Support six times the rated load of the hoist.</td>
</tr>
<tr>
<td>– Suspension ropes, includ ing connecting hardware</td>
<td></td>
</tr>
<tr>
<td>Adjustable scaffold</td>
<td>Resist four times the tipping moment with the scaffold operating at the rated load of the hoist.</td>
</tr>
<tr>
<td>– Direct connections to roofs and floors</td>
<td></td>
</tr>
<tr>
<td>– Counterweights used to balance the scaffold</td>
<td></td>
</tr>
<tr>
<td>Nonadjustable scaffold</td>
<td>Support six times the maximum intended load applied or transmitted to the rope.</td>
</tr>
<tr>
<td>– Suspension ropes, includ ing connecting hardware</td>
<td></td>
</tr>
<tr>
<td>All other scaffold compo nents</td>
<td>Support its own weight plus four times the maximum intended load.</td>
</tr>
</tbody>
</table>

WAC 296-874-30004 Make sure suspended scaffold outrigger beams meet these requirements.

You must:
• Make sure outrigger beams are made of structural metal or equivalent strength material.

• Stabilize the inboard ends of outrigger beams by using either:
  – Bolts or other direct connections to the floor or roof deck;
  OR
  – Counterweights and tiebacks.

Exemption: Masons’ multipoint adjustable scaffold outrigger beams cannot be stabilized by counterweights.

You must:
• Make sure, before the scaffold is used, that a competent person:
  – Evaluates the direct connections;
  AND
  – Confirms that the supporting surfaces can support the loads placed on them.
• Make sure suspended scaffold outrigger beams are all of the following:
  – Restained to prevent moving;
  – Provided with stop bolts or shackles at both ends;
  – Securely fastened together with the flanges turned out when channel iron beams are used in place of I-beams;
  – Set and maintained with the web in a vertical position;
  – Placed so the suspension rope is centered over the stirrup.
• Place outrigger beams at a right angle (perpendicular) to their bearing support.

Exemption: Outrigger beams can be placed at other than a right angle (perpendicular) if:
  • You can demonstrate that immovable obstructions make it impossible to place the beams at a right angle (perpendicular) to their bearing support;
  AND
  • Opposing angle tiebacks are used.

Note: The angle between the outrigger beam and the bearing support is usually the same as the angle between the outrigger beam and the face of the building or structure.

WAC 296-874-30006 Make sure counterweights are safe and used properly.

You must:
• Make sure counterweights:
  – Are made of material that cannot flow;
  AND
  – Have been specifically designed to be used as counterweights.

Note: The following cannot be used as counterweights:
  • Sand, gravel and similar materials that can be easily dislocated;
  • Construction material such as masonry units and roofing felt.

You must:
• Secure counterweights to outrigger beams by mechanical means to prevent them from being accidentally detached.
• Leave counterweights attached to the outrigger beams until after the scaffold has been disassembled.

WAC 296-874-30008 Make sure tiebacks meet these requirements.

You must:

(2005 Ed.)
• Make sure tiebacks are equivalent in strength to the suspension ropes.
• Make sure tiebacks are secured to a structurally sound anchorage on the building or structure:
  – At a right angle (perpendicular) to the face of the building or structure;
  OR
  – As opposing angle tiebacks.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-30008, filed 12/7/04, effective 3/1/05.]

WAC 296-874-30010 Make sure suspended scaffold support devices meet these requirements.

You must:
• Make sure suspended scaffold support devices, such as cornice hooks, roof hooks, roof irons, parapet clamps, or similar devices, are:
  – Made of steel, wrought iron, or other material of equivalent strength;
  – Supported by bearing blocks;
  – Prevented from moving by using tiebacks.

Reference: • For outrigger beam requirements, go to WAC 296-874-30004;
• For tieback requirements go to WAC 296-874-30008.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-30010, filed 12/7/04, effective 3/1/05.]

WAC 296-874-30012 Make sure scaffold hoists meet these requirements.

You must:
• Make sure the stall load of any scaffold hoist is not more than three times its rated load.
• Make sure the design of scaffold hoists has been tested by an independent nationally recognized testing laboratory.
• Make sure scaffold hoists have both a:
  – Normal operating brake;
AND
  – Braking device or locking pawl which automatically engages when the hoist has an uncontrolled:
  ▪ Instantaneous change in momentum;
  OR
  ▪ An accelerated overspeed.
• Prohibit use of gasoline-powered hoists on suspended scaffolds.
• Enclose the gears and brakes of power-operated hoists used on suspended scaffolds.
• Make sure manually operated hoists need a positive crank force to descend.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-30012, filed 12/7/04, effective 3/1/05.]

WAC 296-874-30014 Make sure scaffold hoists retain enough suspension rope.

You must:
• Make sure the suspension rope on winding drum hoists is long enough to allow the scaffold to be lowered to the level below without the rope end passing through the hoist;
  OR
  – Has the rope end configured, or uses other means, to prevent it from passing through the hoist.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-30014, filed 12/7/04, effective 3/1/05.]

WAC 296-874-30016 Make sure wire rope is in good condition. You must:
• Make sure a competent person inspects each rope for defects:
  – Before each work shift;
  AND
  – After anything happens that could affect the rope's integrity.
• Replace a rope if it has any of the following:
  – Physical damage which impairs the function and strength of the rope;
  – Kinks that could impair the tracking or wrapping of the rope around a drum or sheave;
  – Six randomly distributed broken wires in one rope lay;
  – Three broken wires in one strand of one rope lay;
  – Loss of more than one-third of the original diameter of the outside wires caused by abrasion, corrosion, scrubbing, flattening or peening;
  – Heat damage caused by a torch;
  – Any damage caused by contact with electrical wires;
  – Evidence that the secondary brake has been activated during an overspeed condition and has engaged the suspension rope.
• Prohibit the use of repaired wire rope as suspension rope.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-30016, filed 12/7/04, effective 3/1/05.]

WAC 296-874-30018 Make sure wire suspension rope connections meet these requirements.

You must:
• Only use eye splice thimbles connected with shackles or cover plates and bolts to join wire suspension ropes together.
• Make sure the load ends of wire suspension ropes are:
  – Equipped with proper size thimbles;
  AND
  – Secured by eye splicing or an equivalent means.
• Make sure all swaged attachments or spliced eyes on wire suspension rope have been made by either:
  – The wire rope manufacturer;
  OR
  – A qualified person.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-30018, filed 12/7/04, effective 3/1/05.]

WAC 296-874-30020 Make sure wire rope clips are used properly.

You must:
• Make sure, if wire rope clips are used on suspended scaffolds, such as on the suspension ropes or support lines, that:
  – A minimum of three clips are installed;
  – The distance between clips is at least six rope diameters;
  – Clips are installed according to the manufacturer’s recommendations.
• Retighten the clips to the manufacturer’s recommendations after the initial loading.
• Inspect the clips and retighten them to the manufacturer’s recommendations at the start of each work shift.
• Make sure U-bolt clips are not used at the point of suspension for any scaffold hoist.
• Make sure, if U-bolt clips are used, that:
  – The U-bolt is placed over the dead end of the rope;
  AND
  – The saddle is placed over the live end of the rope.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-30020, filed 12/7/04, effective 3/1/05.]

WAC 296-874-30022 Prevent swaying of two-point and multipoint suspension scaffolds.

You must:
• Tie or use other means to keep two-point and multipoint suspension scaffolds from swaying, if an evaluation by a competent person determines it is necessary.

Note: Window cleaners’ anchors cannot be used to secure scaffolds since they are not designed to withstand the load.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-30022, filed 12/7/04, effective 3/1/05.]

WAC 296-874-30024 Use emergency escape and rescue devices appropriately.

You must:
• Make sure devices whose sole function is to provide emergency escape and rescue are not used as working platforms.

Note: Systems which are designed to function both as suspended scaffolds and emergency systems may be used as working platforms.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-30024, filed 12/7/04, effective 3/1/05.]

WAC 296-874-30026 Protect suspension ropes from heat or corrosive substances.

You must:
• Shield suspension ropes from heat-producing processes.
• Make sure, when acids or other corrosive substances are used on a scaffold, that the suspension ropes are protected by at least one of the following:
  – Shielding;
  – Treating to protect the rope from the corrosive substances;
  – Making the rope of material that the corrosive substance will not damage.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-30026, filed 12/7/04, effective 3/1/05.]

WAC 296-874-30028 Take precautions while welding.

You must:
• Do the following to protect employees while welding on suspended scaffolds:
  – Use an insulated thimble to attach each suspension wire rope to its hanging support, such as a cornice hook or outrigger;
  – Insulate excess suspension wire rope and any additional independent lines to prevent grounding;
  – Cover the wire suspension rope with insulating material that extends at least four feet (1.2 m) above the hoist;
  – Make sure any tail line that extends below the hoist is:
    • Insulated to prevent contact with the platform;
    AND
    • Guided or retained so it does not become grounded.
    – Cover each hoist with an insulated protective cover;
    – Connect the scaffold to the structure using a grounding conductor that:
      • Is at least the size of the welding process work lead;
      AND
      • Is not in series with the welding process or the work piece.
      – Shut off the welding machine if the scaffold grounding lead becomes disconnected;
      – Make sure an active welding rod or an uninsulated welding lead is not allowed to contact the:
        • Scaffold;
        OR
        • Scaffold suspension system.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-30028, filed 12/7/04, effective 3/1/05.]

WAC 296-874-30030 Prohibit use of gasoline-powered equipment on suspended scaffolds.

You must:
• Make sure gasoline-powered equipment is not used on suspended scaffolds.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-30030, filed 12/7/04, effective 3/1/05.]

WAC 296-874-30032 Meet these requirements when using catenary scaffolds.

You must:
• Make sure catenary scaffolds have:
  – No more than one platform between consecutive vertical pickups;
  AND
  – No more than two platforms per scaffold.
• Make sure any platform that’s supported by wire ropes has hook-shaped stops placed at each end of the platform that will prevent it from falling if one of the horizontal wire ropes breaks.
• Make sure wire ropes are:
  – Continuous and without splices between anchors;
  AND
  – Not tightened to the point that putting a load on the scaffold will overstress them.

[Title 296 WAC—p. 3091]
WAC 296-874-30034 Meet these requirements when using float (ship) scaffolds.

You must:
- Support the platform with at least two bearers.
- Make sure each bearer:
  - Projects at least six inches (15.2 cm) beyond the platform on both sides;
  - Is securely fastened to the platform.
- Make sure rope connections won’t allow the platform to shift or slip.
- Make sure scaffolds that only have two ropes used with each float meet all of the following:
  - There are four rope ends that are securely fastened to overhead supports;
  - Each supporting rope is hitched around one end of the bearer, passed under the platform to the other end of the bearer, and hitched again;
  - There is enough rope at each end for the supporting ties.

Reference: For specific fall protection requirements for employees on float (ship) scaffolds, go to WAC 296-874-20056.

WAC 296-874-30036 Meet these requirements when using interior hung scaffolds.

You must:
- Suspend the scaffold only from the roof structure or other structural member, such as ceiling beams.
- Inspect the overhead supporting members and check to make sure they’re strong enough before erecting the scaffold.
- Connect suspension ropes and cables to the overhead supporting members by:
  - Shackles, clips, or thimbles;
  - Other means that meet equivalent criteria, such as strength and durability.

Reference: For specific fall protection requirements for employees on float (ship) scaffolds, go to WAC 296-874-20056.

WAC 296-874-30038 Meet these requirements when using multilevel suspended scaffolds.

You must:
- Equip scaffolds with additional independent support lines that meet all of the following:
  - There are the same number of support lines as there are connection points for the suspension ropes;
  - The support lines are equivalent in strength to the suspension ropes;
  - The support lines are rigged to support the scaffold if the suspension ropes fail.
- Make sure the independent support lines and the suspension ropes are not attached to the same points of anchorage.

Reference: For specific fall protection requirements for employees on needle beam scaffolds, go to WAC 296-874-20056.

WAC 296-874-30040 Meet these requirements when using multipoint adjustable suspension scaffolds.

IMPORTANT:
This requirement applies when using multipoint adjustable suspension scaffolds, stonersetters’ multipoint adjustable suspension scaffolds, and masons’ multipoint adjustable suspension scaffolds.

You must:
- Make sure masons’ multipoint adjustable suspension scaffold connections are designed by an engineer experienced in designing this type of scaffold.
- Make sure bridges between two or more scaffolds meet all of the following:
  - The scaffolds were designed to be bridged;
  - The bridges are articulated;
  - The hoists are properly sized.
- Make sure passage from one platform to another, without using bridges, is done only when the platforms are:
  - At the same height;
  - Abutting.
- Suspend scaffolds from:
  - Metal outriggers, brackets, wire rope slings, or hooks;
  - Other means that meet equivalent criteria, such as strength and durability.

Reference: For specific fall protection requirements for employees on needle beam scaffolds, go to WAC 296-874-20056.

WAC 296-874-30042 Meet these requirements when using needle beam scaffolds.

You must:
- Install scaffold support beams on edge.
- Use ropes or hangers for scaffold supports:
  - One end of a needle beam scaffold may be supported by a permanent structural member.
- Securely attach ropes to the needle beams.
- Arrange the support connection to prevent the needle beam from rolling or becoming displaced.
- Securely attach platform units to the needle beams with bolts or equivalent means.

Note: Cleats and overhang are not adequate means of attachment.

Reference: For specific fall protection requirements for employees on needle beam scaffolds, go to WAC 296-874-20056.

WAC 296-874-30044 Meet these requirements when using single-point adjustable suspension scaffolds.

You must:
- Make sure two scaffolds that have been combined to form a two-point adjustable suspension scaffold meet the requirements of the section. Make sure two-point adjustable suspension scaffolds (swing stages) meet these requirements, WAC 296-874-30046.
- Make sure scaffolds, where the suspension rope between the scaffold and the suspension device is not vertical, meet all of the following:
  - The rigging has been designed by a qualified person;
  - The scaffold is accessible to rescuers;
  - The suspension rope is protected from chafing at any point where it changes direction;
  - The scaffold is positioned so that swinging cannot bring the scaffold into contact with another surface.
- Make sure boatswain’s chair tackle meets all of the following:
  - It consists of correct size ball bearing blocks or bushed blocks;
  - The blocks contain safety hooks;
  - The rope is properly eye spliced;
  - The rope is either:
    - First-grade manila rope that has a diameter of at least five-eighths inch (1.6 cm);
    - Other rope that has equivalent characteristics, such as strength and durability.
- Make sure boatswain’s chair seat slings meet all of the following:
  - Are reeved through four corner holes in the seat;
  - Cross each other on the underside of the seat;
  - Are rigged to prevent slipping which could cause the seat to become out-of-level;
  - Are made from fiber, synthetic, or other rope which have:
    - A diameter of at least five-eighths inch (1.6 cm);
    - Characteristics equivalent to first grade manila rope, such as strength, slip resistance, and durability.
- Make sure the seat sling of boatswain’s chairs used when a heat-producing process, such as gas or arc welding, is being conducted is at least three-eighths inch (1.0 cm) wire rope.
- Securely fasten cleats to the underside of noncross-laminated wood boatswain’s chairs to prevent the board from splitting.

Reference: For specific fall protection requirements for employees on single-point adjustable suspension scaffolds, go to WAC 296-874-20056.

WAC 296-874-30046 Meet these requirements when using two-point adjustable suspension scaffolds (swing stages).

IMPORTANT:
This section does not apply to two-point adjustable suspension scaffolds used as masons’ or stonesetters’ scaffolds. You must:
- Make sure platforms more than thirty-six inches (0.9 m) wide have been designed by a qualified person to prevent unstable conditions.
- Make sure platforms are one of the following:
  - Ladder-type;
  - Plank-type;
  - Beam-type;
  - Light-metal type.
- Make sure the design of light-metal type platforms have been tested and listed by a nationally recognized testing laboratory if they:
  - Have a rated capacity of seven hundred fifty pounds or less;
- Make sure fibers or synthetic ropes are used with blocks that:
  - Consist of at least one double and one single block;
  - Have sheaves that fit the size of the rope used.
- Make sure employees move from one platform to another only when all of the following are met:
  - The platforms are at the same height;
  - The platforms are abutting;
  - Walk-through stirrups are used that have been specifically designed to allow employee passage.
- Make sure two-point scaffolds that are bridged or otherwise connected together when being raised or lowered meet both of the following:
  - The bridge connections are articulated;
  - The hoists are properly sized.

Reference: For specific fall protection requirements for employees on two-point adjustable suspension scaffolds, go to WAC 296-874-20056.

WAC 296-874-400 Supported scaffolds.

Section contents:
Your responsibility:
To meet these requirements when using supported scaffolds.

- Make sure supported scaffolds and scaffold components meet strength requirements WAC 296-874-40002.
- Prevent supported scaffolds from tipping WAC 296-874-40004.
- Make sure supported scaffolds are properly supported WAC 296-874-40006.
- Provide safe access for persons erecting or dismantling supported scaffolds WAC 296-874-40008.
- Provide fall protection for persons erecting or dismantling supported scaffolds WAC 296-874-40010.
- Meet these requirements when moving mobile scaffolds WAC 296-874-40012.
- Meet these requirements when using bricklayers’ square scaffolds (squares) WAC 296-874-40014.
- Meet these requirements when using crawling boards (chicken ladders) WAC 296-874-40016.
Meet these requirements when using fabricated frame scaffolds (tubular welded frame scaffolds) WAC 296-874-40018.

Meet these requirements when using integral prefabricated scaffold access frames WAC 296-874-40020.

Meet these requirements when using form scaffolds and carpenter’s bracket scaffolds WAC 296-874-40022.

Meet these requirements when using horse scaffolds WAC 296-874-40024.

Meet these requirements when using ladder jack scaffolds WAC 296-874-40026.

Meet these requirements when using outrigger scaffolds WAC 296-874-40028.

Meet these requirements when using pole scaffolds WAC 296-874-40030.

Meet these requirements when using pump jack scaffolds WAC 296-874-40032.

Meet these requirements when using repair bracket scaffolds WAC 296-874-40034.

Meet these requirements when using roof bracket scaffolds WAC 296-874-40036.

Meet these requirements when using step, platform, and trestle ladder scaffolds WAC 296-874-40038.

Meet these requirements when using tube and coupler scaffolds WAC 296-874-40040.

Meet these requirements when using window jack scaffolds WAC 296-874-40042.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-40002, filed 12/7/04, effective 3/1/05.]

WAC 296-874-40004 Prevent supported scaffolds from tipping.

You must:
• Make sure supported scaffolds with a height to least base dimension ratio of greater than four to one are prevented from tipping by one or more of the following:
  – Guying;
  – Tying;
  – Bracing;
  – Other equivalent means.

Note: The least base dimension includes outriggers, if used.

WAC 296-874-40006 Make sure supported scaffolds are properly supported.

You must:
• Make sure supported scaffold poles, legs, posts, frames, and uprights are:
  – Plumb;
  AND
  – Braced to prevent swaying or displacement.
• Make sure supported scaffold poles, legs, posts, frames, and uprights, bear on base plates that rest on:
  – Mudsills;
  OR
  – Other firm foundations such as concrete or dry, compacted soil.
• Make sure foundations are all of the following:
  – Level;
  – Sound;
  – Rigid;
  – Capable of supporting the loaded scaffold without settling or displacement.

Note: The condition of the foundation may change due to weather or other factors. If changes occur, the foundation needs to be evaluated by a competent person to make sure it will safely support the scaffold.
• Make sure unstable objects are not used:
  – To support scaffolds or platform units;
  OR
  – As working platforms.
• Make sure mobile scaffolds meet these additional requirements:
  – Wheel and caster stems are pinned or otherwise secured in the scaffold legs or adjustment screws;
  – Wheels and casters are locked, or equivalent means are used, to prevent movement when the scaffold is being used;
  – Screw jacks or other equivalent means are used if it's necessary to level the work platform.
• Make sure front-end loaders and similar equipment used to support scaffold platforms have been specifically designed for such use by the manufacturer.

Reference: For requirements about powered industrial trucks, including forklifts that are used to support scaffold platforms, go to Powered industrial trucks, chapter 296-863 WAC.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-40006, filed 12/7/04, effective 3/1/05.]

**WAC 296-874-40008 Provide safe access for persons erecting or dismantling supported scaffolds.**

**You must:**
• Provide a safe means of access for persons erecting or dismantling scaffolds if it is:
  – Feasible;
  AND
  – Does not create a greater hazard.
• Have a competent person determine the feasibility of providing safe access.
• Make sure the determination is based on site conditions and the type of scaffold being erected or dismantled.
• Install a hook-on or attachable ladder as soon as scaffold erection has progressed to a point where it can be safely installed and used.
• Make sure crossbraces on tubular welded frame scaffolds are not used to access or egress from the scaffold.
• Make sure the frames of tubular welded frame scaffolds that are used as climbing devices meet all of the following:
  – Create a usable ladder;
  – Provide good hand holds and foot space;
  – Have horizontal members that are all of the following:
    ■ Parallel;
    ■ Level;
    ■ Spaced not more than twenty two inches apart vertically.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-40008, filed 12/7/04, effective 3/1/05.]

**WAC 296-874-40010 Provide fall protection for persons erecting or dismantling supported scaffolds.**

**You must:**
• Have a competent person determine the feasibility of providing fall protection for persons erecting or dismantling supported scaffolds.
• Provide fall protection if the installation and use of fall protection is:
  – Feasible;
  AND

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-40010, filed 12/7/04, effective 3/1/05.]

**WAC 296-874-40012 Meet these requirements when moving mobile scaffolds.**

**You must:**
• Make sure, before a scaffold is moved, that employees on the scaffold are made aware of the move.
• Apply manual force being used to move a scaffold:
  – As close to the base as practicable;
  AND
  – Within five feet (1.5 m) of the supporting surface.
• Make sure power systems used to propel mobile scaffolds have been designed for such use.
• Make sure forklifts, trucks, similar motor vehicles, or add-on motors are not used to propel scaffolds unless the scaffold has been designed to be used with that type of propulsion system.
• Stabilize scaffolds to prevent tipping when they're being moved.
• Make sure a scaffold is not moved with employees riding on it unless all of the following are met:
  – The surface on which the scaffold is being moved is:
    ■ Within three degrees of level;
    ■ Free of pits, holes, and obstructions;
    – No employee is on any part of the scaffold which extends out beyond the wheels, casters, or other supports;
    – Outrigger frames, when used, are installed on both sides of the scaffold;
    – The power system, if used:
      ■ Applies the propelling force directly to the wheels;
      AND
      ■ Produces a speed of one foot per second (.3 mps) or less;
  – The height of the scaffold:
    ■ Is not more than two times the least base dimension;
    OR
    ■ The scaffold is designed and constructed to meet or exceed nationally recognized stability test requirements, such as those listed in ANSI/SIA A92.5, Boom-Supported Elevating Work Platforms, and ANSI/SIA A92.6, Self-Propelled Elevating Work Platforms.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-40012, filed 12/7/04, effective 3/1/05.]

**WAC 296-874-40014 Meet these requirements when using bricklayers' square scaffolds (squares).**

**You must:**
• Reinforce wood scaffolds with gussets on both sides of each corner.
• Make sure diagonal braces are installed:
  – On all sides of each square;
  – Between squares on the front and back sides of the scaffold;
  – Extending from the bottom of each square to the top of the next square.
• Make sure scaffolds meet all of the following:
  – Are no more than three tiers high;

[Title 296 WAC—p. 3095]
– Are constructed and arranged so that each square rests
directly above another square;
– The upper tiers:
  ■ Stand on a continuous row of planks laid across the
  next lower tier;
  AND
  ■ Are nailed down or otherwise secured to prevent dis-
  placement.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-
01-054, § 296-874-40014, filed 12/7/04, effective 3/1/05.]

WAC 296-874-40016 Meet these requirements when
using crawling boards (chicken ladders).

You must:
• Make sure crawling boards (chicken ladders) extend
from the roof peak to the eaves when used for roof construc-
tion, repair, or maintenance.
• Secure crawling boards (chicken ladders) to the roof by
using either:
  – Ridge hooks;
  OR
  – Means that meet equivalent criteria, such as strength
  and durability.

Reference: There are specific fall protection requirements for
employees using crawling boards (chicken ladders). Go
to WAC 296-874-20058.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-
01-054, § 296-874-40016, filed 12/7/04, effective 3/1/05.]

WAC 296-874-40018 Meet these requirements when
using fabricated frame scaffolds (tubular welded frame
scaffolds).

You must:
• Make sure scaffolds over one hundred twenty-five feet
(38.0 m) high above their base plates are:
  – Designed by a registered professional engineer;
  AND
  – Constructed and loaded as specified in the design.
• Brace frames and panels using crossbraces, horizontal
braces, diagonal braces, or a combination thereof to secure
vertical members together laterally.
  • Make sure the length of the crossbraces will:
    – Automatically square and align the vertical members;
    AND
    – Make the scaffold plumb, level, and square.
• Secure all brace connections.
• Join frames and panels together vertically by using one
of the following:
  – Coupling pins;
  – Stacking pins;
  – Equivalent means.
• Use pins or other equivalent means to lock scaffold
frames or panels together vertically where uplift may occur.
• Make sure brackets used to support cantilevered loads
are all of the following:
  – Seated with side-brackets parallel to the frames and
end-brackets at ninety degrees to the frames;
  – Not bent or twisted from these positions;
  – Used only to support persons.

Exemption: Brackets may be used to support cantilevered loads
other than personnel if the scaffold has been:
• Designed for other loads by a qualified engineer;
  AND
• Built to withstand the tipping forces caused by
  those loads.

You must:
• Leave existing platforms undisturbed until new frames
have been set in place and braced, then move the platforms to
the next level.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-
01-054, § 296-874-40018, filed 12/7/04, effective 3/1/05.]

WAC 296-874-40020 Meet these requirements when
using integral prefabricated scaffold access frames.

You must:
• Make sure integral prefabricated scaffold access frames
meet all of the following:
  – Have been specifically designed and constructed to be
  used as ladder rungs;
  – Have a rung length of at least eight inches (20 cm);
  – Have a maximum spacing between rungs of sixteen
and three quarters inches (43 cm);
  – Are uniformly spaced within each frame section;
  – Have rest platforms at least every twenty feet (6.1 m)
on all supported scaffolds more than twenty-four feet (7.3 m)
high.

Note: Nonuniform rung spacing caused by joining end frames
together is allowed, provided the resulting spacing does not
exceed sixteen and three quarters inches (43 cm).

You must:
• Make sure, when panels with rungs that are less than
eleven and one-half inches long are used as work platforms,
that employees use either:
  – A positioning device;
  OR
  – A personal fall arrest system.

Reference: For personal fall arrest system requirements in this chap-
ter, go to WAC 296-874-20058.
For construction activities, go to fall restraint and fall
arrest, Part C-1, in safety standards for construction
work, chapter 296-155 WAC.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-
01-054, § 296-874-40020, filed 12/7/04, effective 3/1/05.]

WAC 296-874-40022 Meet these requirements when
using form scaffolds and carpenter's bracket scaffolds.

You must:
• Secure folding-type metal brackets that have been
extended for use, with:
  – Bolts;
  OR
  – Locking-type pins.
• Make sure wooden-bracket form scaffolds are an inte-
gral part of the form panel.
• Attach each bracket, other than those for wooden
bracket-form scaffolds, to the supporting formwork or struc-
ture by using one or more of the following:
  – Nails;
  – A metal stud attachment device;
  – Welding;
  – Hooking over a secured structural supporting member,
with the form wales either:
  ■ Bolted to the form;
  OR
Scaffolds

WAC 296-874-40024 Meet these requirements when using horse scaffolds.
You must:
• Make sure horse scaffolds are not constructed or arranged higher than two tiers or ten feet (3.0 m), whichever is less.
• Do all of the following if horses are arranged in tiers:
  – Place each horse directly over the horse in the tier below;
  – Nail down or otherwise secure the legs of each horse to prevent displacement;
  – Crossbrace each tier.

WAC 296-874-40026 Meet these requirements when using ladder jack scaffolds.
You must:
• Make sure the platform height is not higher than twenty feet (6.1 m).
• Make sure ladder jacks are designed and constructed so they rest:
  – On the side rails and ladder rungs together;
  – Only on the rungs.
• Make sure ladder jacks that rest on rungs only have a bearing area that includes a length of at least ten inches (25.4 cm) on each rung.
• Make sure ladders used to support ladder jacks are:
  – Type I (two hundred fifty pound rated capacity) or Type IA (300 pound rated capacity);
  – Only on the rungs.
  – Type I or Type IA ladder.
  – Designed by a registered professional engineer;
  – Constructed and loaded as specified in the design.
  – Crossbracing in both directions across the entire outside face of the scaffold;
  – Diagonal bracing in both directions across the entire outside face of the scaffold;
  – Designed to support loads equivalent to a uniformly distributed load of fifty pounds (222 kg) or more per square foot (929 square cm).

WAC 296-874-40028 Meet these requirements when using outrigger scaffolds.
You must:
• Make sure outrigger scaffolds and scaffold components are:
  – Designed by a registered professional engineer;
  – Constructed and loaded as specified in the design.
  – Made of materials that will not support the load.
  – Nail, bolt, or otherwise secure platform units to the outboard end (farthest point of anchorage) is at least one and one-half times longer than the part from fulcrum point to the outboard end (the platform side).
  – Place I-beam or channel shaped outrigger beams so that the web section is vertical.
  – Securely anchor the inboard ends of outrigger beams so that the web section is vertical.
  – Make sure the fulcrum point of outrigger beams rests on secure bearings at least six inches (15.2 cm) in each horizontal dimension.
  – Braced struts bearing against sills that are in contact with the overhead beams or ceiling.
  – Make sure outrigger beams are:
    – Secured in place to prevent movement;
    – Tension members secured to the floor joists below.
    – Braced struts bearing against sills that are in contact with the overhead beams or ceiling;
  – Crossbracing between the inner and outer sets of poles;
  – Diagonal bracing in both directions across the entire outside face of the scaffold;
  – Designed to support loads equivalent to a uniformly distributed load of fifty pounds (222 kg) or more per square foot (929 square cm).

WAC 296-874-40030 Meet these requirements when using pole scaffolds.
You must:
• Make sure pole scaffolds over sixty feet high are:
  – Designed by a registered professional engineer;
  – Constructed and loaded as specified in the design.
  – Made of materials that will not support the load.
  – Leave existing platforms undisturbed until new bearers have been set in place and braced before moving the platform to the new level.
  – Install diagonal bracing on single pole scaffolds as follows:
    – Crossbracing between the inner and outer sets of poles;
    – Diagonal bracing in both directions across the entire inside face of the scaffold;
    – Diagonal bracing in both directions across the entire outside face of the scaffold;
    – Designed to support loads equivalent to a uniformly distributed load of fifty pounds (222 kg) or more per square foot (929 square cm).
  – Install diagonal bracing on single pole scaffolds in both directions across the entire outside face of the scaffold.
  – Make sure runners meet all of the following:
    – Are installed on edge;
    – Extend over a minimum of two poles.

Reference:
• There are specific fall protection requirements for employees using ladder jack scaffolds. Go to WAC 296-874-20056.
• Requirements for wood and metal ladders for general industry activities are found in other chapters:
  – Portable ladders: Metal and wooden, WAC 296-800-290, are found in the safety and health core rules, chapter 296-800 WAC.
  – Portable wood ladders, WAC 296-24-780, and portable metal ladders, WAC 296-24-795, are found in Working surfaces, guarding floors and wall openings, ladders, Part J-1, in the general safety and health standards, chapter 296-24 WAC.
• For construction activities, go to Ladders, WAC 296-155-480, in the safety standards for construction work, chapter 296-155.
– Are supported by bearing blocks securely attached to the poles.
  • Make sure bearers are:
    – Installed on edge;
    AND
    – Extend a minimum of three inches (7.6 cm) over the outside edges of runners.
  • Make sure runners, bearers, and braces are not spliced between poles.
  • Make sure wood poles that are spliced together meet both of the following:
    – The ends of the poles at the splice:
      ■ Are square;
      AND
      ■ The upper section rests squarely on the lower section.
    – Wood splice plates are provided that meet all of the following:
      ■ Are installed on at least two adjacent sides;
      ■ Extend at least two feet (0.6 m) on either side of the splice;
      ■ Overlap the abutted ends equally;
      ■ Have the same cross-sectional areas as the pole.

  Note: Splice plates of material other than wood may be used if they are of equivalent strength.

  [Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-40032, filed 12/7/04, effective 3/1/05.]

WAC 296-874-40032  Meet these requirements when using pump jack scaffolds.

You must:
  • Make sure pump jack brackets, braces, and accessories are made from metal plates and angles.
  • Make sure pump jack brackets have two positive gripping mechanisms to prevent any failure or slippage.
  • Secure poles to the structure using rigid triangular bracing or the equivalent located at all of the following:
    – Top;
    – Bottom;
    – Other points on the pole as necessary.
  • Do both of the following when the pump jack has to pass bracing that's already installed:
    – Install an additional brace approximately four feet (1.2 m) above the brace to be passed;
    – Leave it in place until:
      ■ The pump jack has been moved;
      AND
      ■ The original brace is reinstalled.
  • Make sure work benches are not used as scaffold platforms.

  Note: A work bench may be used as a toprail only if it meets the toprail requirements in Make sure guardrail systems meet these requirements, WAC 296-874-20064.

You must:
  • Make sure wood poles that are constructed of two continuous lengths are joined together with the seam parallel to the bracket.
  • Install a mending plate at all splices to develop the full strength of the member when splicing two by fours together to make a pole.

  [Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-40032, filed 12/7/04, effective 3/1/05.]

WAC 296-874-40034  Meet these requirements when using repair bracket scaffolds.

You must:
  • Make sure brackets are all of the following:
    – Secured in place by at least one wire rope that's at least one-half inch (1.27 cm) in diameter;
    – Attached to the securing wire rope by a positive locking device, or equivalent, that will prevent the bracket from being unintentionally detached from the rope;
    – Provided with a shoe, heel block, foot, or a combination that:
      ■ Is located at the contact point between the supporting structure and the bottom of the bracket;
      AND
      ■ Will prevent lateral movement of the bracket.
  • Secure the platforms to the brackets in a way that prevents:
    – The platforms from separating from the brackets;
    AND
    – The platforms or brackets from moving on a completed scaffold.
  • Make sure wire rope placed around the structure to provide a safe anchorage for personal fall arrest systems used by employees erecting or dismantling scaffolds:
    – Is at least five-sixteenths inch (0.8 cm) in diameter;
    – Provides an anchorage that meets the requirements of WAC 296-874-20058.
  • For construction activities, go to fall restraint and fall arrest, Part C-1, in the safety standards for construction work, chapter 296-155 WAC.
  • Make sure each wire rope used for securing brackets in place or as an anchorage for personal fall arrest systems is all of the following:
    – Protected from damage due to contact with edges, corners, protrusions, or other parts of the supporting structure or scaffold components;
    – Tensioned by a turnbuckle or equivalent means. Turnbuckles must be:
      ■ At least one inch (2.54 cm) in diameter;
      AND
      ■ Connected to the other end of its rope by an eye splice thimble that's sized appropriate to the turnbuckle.
      – Not used with U-bolt wire rope clips.
    • Make sure materials are not dropped to the outside of the supporting structure.
    • Erect the scaffold by progressing around the structure in only one direction.

  [Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-40034, filed 12/7/04, effective 3/1/05.]

(2005 Ed.)
WAC 296-874-40036 Meet these requirements when using roof bracket scaffolds.

You must:
• Make sure scaffold brackets meet all of the following:
  – Are constructed to fit the pitch of the roof;
  – Provide a level support for the platform;
  – Are anchored in place by nails.

Note: If it’s not practical to use nails to anchor brackets, secure them in place with first grade manila rope of at least seven-quarters inch (1.9 cm) diameter, or equivalent.

Reference: There are specific fall protection requirements for employees using ladder jack scaffolds. Go to WAC 296-874-92056.

WAC 296-874-40038 Meet these requirements when using step, platform and trestle ladder scaffolds.

You must:
• Make sure ladders used to support step, platform, and trestle ladder scaffolds are:
  – Type I (250 pound rated capacity) or Type IA (300 pound rated capacity);
  AND
  – Placed, fastened, or equipped with devices to prevent slipping.

Note: Ladders with a duty rating or weight capacity greater than a Type I ladder (250 pounds) satisfy the requirement to use a Type I or Type IA ladder.

You must:
• Make sure job-made ladders are not used to support step, platform, and trestle ladder scaffolds.

WAC 296-874-40040 Meet these requirements when using tube and coupler scaffolds.

You must:
• Make sure tube and coupler scaffolds over one hundred twenty-five feet high are:
  – Designed by a registered professional engineer;
  AND
  – Constructed and loaded as specified in the design.
• Leave existing platforms undisturbed until new bearers have been set in place and braced before moving the platforms to the new level.
• Install crossbracing across the width of the scaffold that meets all of the following:
  – Bracing is installed at:
    □ Each end of the scaffold;
    AND
    □ At least at every third set of posts horizontally and every fourth runner vertically.
• Bracing extends diagonally from the:
  □ Outer posts or runners upwards to the next inner posts or runners;
  □ Inner posts or runners upwards to the next outer posts or runners.

You must:
• Install building ties:
  – At the bearer levels between the crossbracing;
  AND
  – At locations specified in WAC 296-874-40004.
• Install longitudinal bracing on straight run scaffolds as follows:
  – Diagonally in both directions across the inner and outer rows of posts;
  – From the base of the end posts upward to the top of the scaffold at approximately a forty-five degree angle;
  – As close as possible to the intersection of the bearer and post or runner and post;
  – If the scaffold is longer than it is tall, repeat the bracing beginning at every fifth post;
  – If the scaffold is taller than its length, install the bracing:
    □ From the base of the end posts upward to the opposite end posts;
    AND
    □ In alternating directions until reaching the top of the scaffold.

You must:
• Attach bracing to the runners as close to the post as possible, if bracing can't be attached to the post.
• Make sure bearers meet all of the following:
  – Are installed transversely between posts;
  – If the bearer is coupled to the post, have the inboard coupler bear directly on the runner coupler;
  – If the bearer is coupled to the runners, have the couplers as close to the posts as possible;
  – Extend bearers beyond the posts and runners;
  – Provide full contact with the coupler;
  – The bottom bearers are located as close to the base as possible.
• Make sure runners meet all of the following:
  – Are installed along the length of the scaffold;
  – Are located on both the inside and outside posts at the same height;
  – Are interlocked on straight runs to form continuous lengths and are coupled to each post;
  – The bottom runners are located as close to the base as possible.

Note: Tube and coupler guardrails and midrails installed on outside posts can be used in lieu of outside runners.

You must:
• Make sure couplers are made of a structural metal, such as drop-forged steel, malleable iron, or structural grade aluminum.

• Prohibit using couplers made of gray cast iron.

(2005 Ed.)
Bracing – Tube and Coupler Scaffold

Upper braces within 4 times the least base dimension of the highest scaffold platform

Intermediate braces no further apart than:
- 28 feet if the scaffold least base dimension is greater than 3 feet
- 20 feet if the scaffold least base dimension is 3 feet or less

Lower braces at the closest support point above a height equal to 4 times the least base dimension

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, 49.17.060. 05-01-054, § 296-874-40040, filed 12/7/04, effective 3/1/05.]
WAC 296-874-40042 Meet these requirements when using window jack scaffolds.
You must:
• Make sure window jack scaffolds meet all of the following:
  – Are securely attached to the window opening;
  – Are used for working only at the window opening the jack is placed through;
  – Are not used:
    ■ To support planks placed between one window jack and another;
    OR
    ■ As any other element of scaffolding.

WAC 296-874-500 Definitions.
Adjustable suspension scaffold a suspended scaffold equipped with one or more hoists that can be operated by employees on the scaffold.

Bearer a horizontal scaffold member (which may be supported by ledgers or runners) upon which the scaffold platform rests and which joins scaffold uprights, posts, poles, and similar members.

Boatswain's chair a single-point adjustable suspended scaffold consisting of a seat or sling designed to support one employee in a sitting position.

Brace a rigid connection that holds one scaffold member in a fixed position with respect to another member, or to a building or structure.

Bricklayers' square scaffold a supported scaffold composed of framed squares which support a platform.

Carpenters' bracket scaffold a supported scaffold consisting of a platform supported by brackets attached to building or structural walls.

Catenary scaffold a suspended scaffold consisting of a platform supported by two essentially horizontal and parallel ropes attached to structural members of a building or other structure. Additional support may be provided by vertical pickups.

Cleat a structural block used at the end of a platform to prevent the platform from slipping off its supports. Cleats are also used to provide footing on sloped surfaces such as access ramps.

Competent person someone who:
• Is capable of identifying existing and predictable hazards in the surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees;
  AND
• Has the authority to take prompt corrective measures to eliminate them.

Coupler a device for locking together the tubes of a tube and coupler scaffold.

Crawling board (chicken ladder) a supported scaffold consisting of a plank with cleats spaced and secured to provide footing, for use on sloped surfaces such as roofs.

Double-pole (independent pole) scaffold a supported scaffold consisting of one or more platforms resting on cross beams (bearers) supported by ledgers and a double row of uprights independent of support (except ties, guys, braces) from any structure.

Equivalent alternative design, material or method to protect against a hazard. You have to demonstrate it provides an equal or greater degree of safety for employees than the method, material or design specified in the rule.

Exposed power lines electrical power lines which are accessible to and may be contacted by employees. Such lines do not include extension cords or power tool cords.

Eye or eye splice a loop at the end of a wire rope.

Fabricated frame scaffold (tubular welded frame scaffold) a scaffold consisting of platforms supported on fabricated frames with integral posts, horizontal bearers, and intermediate members.

Failure load refusal, breaking, or separation of component parts. Load refusal is the point where the ultimate strength is exceeded.

Float (ship) scaffold a suspended scaffold consisting of a braced platform resting on two parallel bearers and hung from overhead supports by ropes of fixed length.

Form scaffold a supported scaffold consisting of a platform supported by brackets attached to formwork.

Guardrail system a vertical barrier, consisting of, but not limited to, top rails, midrails, and posts, erected to prevent employees from falling off a scaffold platform or walkway.

Handrails (ladder stands) a rail connected to a ladder stand running parallel to the slope and/or top step.

Hoist a manual or power-operated mechanical device to raise or lower a suspended scaffold.

Horse scaffold a supported scaffold consisting of a platform supported by construction horses (saw horses). Horse scaffolds constructed of metal are sometimes known as trestle scaffolds.

Independent pole scaffold (see double pole scaffold).

Interior hung scaffold a suspended scaffold consisting of a platform suspended from the ceiling or roof structure by fixed length supports.

Ladder jack scaffold a supported scaffold consisting of a platform resting on brackets attached to ladders.

Ladder stand a mobile, fixed-size, self-supporting ladder consisting of a wide flat tread ladder in the form of stairs.

Landing a platform at the end of a flight of stairs.

Large area scaffold a pole scaffold, tube and coupler scaffold, system scaffold, or fabricated frame scaffold erected over substantially the entire work area. For example: A scaffold erected over the entire floor area of a room.

Lean-to scaffold a supported scaffold which is kept erect by tilting it toward and resting it against a building or structure.

Ledger (see runner).

Lifeline a component consisting of a flexible line that connects to an anchorage at one end to hang vertically (vertical lifeline), or that connects to anchorages at both ends to stretch horizontally (horizontal lifeline). It serves as a means for connecting other components of a personal fall arrest system to the anchorage.

Lower levels areas below the level where the employee is located and to which an employee can fall. Such areas include, but are not limited to, ground levels, floors, roofs, ramps, runways, excavations, pits, tanks, materials, water, and equipment.

Masons' adjustable supported scaffold (see self-contained adjustable scaffold).
Masons' multipoint adjustable suspension scaffold a continuous run suspended scaffold designed and used for masonry operations.

Maximum intended load the total load of all persons, equipment, tools, materials, transmitted loads, and other loads reasonably anticipated to be applied to a scaffold or scaffold component at any one time.

Midrail a rail, approximately midway between the toprail of a guardrail system and the platform, and secured to the uprights erected along the exposed sides and ends of a platform.

Mobile scaffold supported scaffold mounted on casters or wheels.

Multilevel suspended scaffold a two-point or multipoint adjustable suspension scaffold with a series of platforms at various levels resting on common sturups.

Multipoint adjustable suspension scaffold a suspended scaffold consisting of a platform(s) which is suspended by more than two ropes from overhead supports and equipped with means to raise and lower the platform to desired work levels.

Needle beam scaffold a suspended scaffold which has a platform supported by two bearers (needle beams) suspended from overhead supports.

Outrigger a structural member of a supported scaffold which increases the base width of a scaffold. This provides support for and increases the stability of the scaffold.

Outrigger beam (suspended and supported) the structural member of a suspended scaffold or outrigger scaffold which provides support for the scaffold by extending the scaffold point of attachment to a point out and away from the structure or building.

Outrigger scaffold a supported scaffold consisting of a platform resting on outrigger beams which projects beyond the wall or face of the building or structure. The inboard ends of the outrigger beams are secured inside the building or structure.

Overhand bricklaying the process of laying bricks and masonry so that the surface of the wall is on the opposite side of the wall from the mason, requiring the mason to lean over the wall to complete the work. It includes mason tending and electrical installation incorporated into the brick wall during the overhand bricklaying process.

Personal fall arrest system a system used to arrest an employee's fall. It consists of an anchorage, connectors, and body harness and may also include a lanyard, deceleration device, lifeline, or combinations of these.

Platform a work surface used in scaffolds, elevated above lower levels. Platforms can be constructed using individual wood planks, fabricated planks, fabricated decks, and fabricated platforms.

Pole scaffold (see single-pole scaffold and double (independent) pole scaffold).

Pump jack scaffold a supported scaffold consisting of a platform supported by vertical poles and movable support brackets.

Qualified person a person who has successfully demonstrated the ability to solve problems relating to the subject matter, work, or project, either by:

- Possession of a recognized degree, certificate, or professional standing;

OR

- Extensive knowledge, training and experience.

Rated load the manufacturer's specified maximum load to be lifted by a hoist or to be applied to a scaffold or scaffold component.

Repair bracket scaffold a supported scaffold consisting of a platform supported by brackets. The brackets are secured in place around the circumference or perimeter of a chimney, stack, tank or other supporting structure by one or more wire ropes placed around the supporting structure.

Roof bracket scaffold a supported scaffold used on a sloped roof. It consists of a platform resting on angular-shaped supports so that the scaffold platform is level.

Runner (ledger) the lengthwise horizontal spacing or bracing member which may support the bearers.

Scaffold a temporary elevated platform, including its supporting structure and anchorage points, used for supporting employees or materials.

Self-contained adjustable scaffold a combination supported and suspended scaffold consisting of an adjustable platform mounted on an independent supporting frame, not a part of the object being worked on, which is equipped with a means to raise and lower the platform. Such systems include rolling roof rigs, rolling outrigger systems, and some masons' adjustable supported scaffolds.

Shore scaffold a supported scaffold which is placed against a building or structure and held in place with props.

Single-point adjustable suspension scaffold a suspended scaffold consisting of a platform suspended by one rope from an overhead support and equipped with means to permit the movement of the platform to desired work levels.

Single-pole scaffold a supported scaffold consisting of platforms resting on bearers, the outside ends of which are supported on runners secured to a single row of posts or uprights, and the inner ends of which are supported on or in a structure or building wall.

Step tower (scaffold stairway/tower) a tower comprised of scaffold components which contains internal stairway units and rest platforms. These towers are used to provide access to scaffold platforms and other elevated points such as floors and roofs.

Stall load the load at which the prime mover of a power-operated hoist stalls or the power to the prime mover is automatically disconnected.

Step, platform, and trestle ladder scaffold a platform resting directly on the rungs of a step, platform, or trestle ladder.

Stilts a pair of poles or similar supports with raised footrests, used to permit walking above the ground or working surface.

Stonesetters' multipoint adjustable suspension scaffold a continuous run suspended scaffold designed and used for stoneworkers' operations.

Supported scaffold one or more platforms supported by rigid means such as outrigger beams, brackets, poles, legs, uprights, posts, or frames.

Suspended scaffold one or more platforms suspended from an overhead structure by ropes or other nonrigid means.

System scaffold a scaffold consisting of posts with fixed connection points that accept runners, bearers, and diagonals that can be interconnected at predetermined levels.

[Title 296 WAC—p. 3102]
To workers and their materials.

**Top plate bracket scaffold** a scaffold supported by brackets that hook over or are attached to the top of a wall. This type of scaffold is similar to carpenters' bracket scaffolds and form scaffolds.

**Tube and coupler scaffold** a scaffold consisting of platforms supported by tubing, erected with coupling devices connecting uprights, braces, bearers, and runners.

**Tubular welded frame scaffold** (see fabricated frame scaffold).

**Tubular welded sectional folding scaffold** a sectional, folding metal scaffold either of ladder frame or inside stairway design. It is substantially built of prefabricated welded sections, which consist of end frames, platform frame, inside inclined stairway frame and braces, or hinged connected diagonal and horizontal braces. It can be folded into a flat package when the scaffold is not in use.

**Two-point suspension scaffold (swing stage)** a suspended scaffold consisting of a platform supported by hang- ers (stirrups), suspended by two ropes from overhead supports, and equipped with a means to permit the raising and lowering of the platform to desired work levels.

**Unstable objects** items whose strength, configuration, or lack of stability may allow them to become dislocated and shift and therefore may not properly support the loads imposed on them. Unstable objects do not constitute a safe base support for scaffolds, platforms, or employees. Examples include, but are not limited to, barrels, boxes, loose brick, and concrete blocks.

**Vertical pickup** a rope used to support the horizontal rope in a catenary scaffold.

**Walkway (scaffold)** part of a scaffold used only for access and not as a working level.

**Window jack scaffold** a platform resting on a bracket or jack that projects through a window opening.

**Work level** the elevated platform, used for supporting workers and their materials.

**Warning signs and barricades.** Provide warning signs and barricades when suspended equipment is used.

**Power line clearances.** Maintain clearance between window cleaners and power lines.

**Window-cleaners' belts and anchors.** Select appropriate window-cleaners' belts and anchors.

**Inspect the anchors you plan to use for window cleaning.** Select appropriate boatswain's chairs.

**Move safely on the outside of buildings.** Safely use boatswain's chairs rigged with a block and tackle.

**Rope descent systems.** Safely use rope descent systems.

**Select appropriate rope descent systems.** Safely use rope descent devices.

**Equipment prohibited.** Equipment prohibited.

**Select and use appropriate equipment.** Prohibit equipment from use.

**Definitions.**

**SAFETY STANDARDS FOR WINDOW CLEANING**

**WAC 296-878-100 Scope.** These rules apply to all window-cleaning activities performed on the inside or outside of a building in which the window cleaner is working from a level that is located more than forty-eight inches above grade.

**WAC 296-878-10005 Summary.**

**Your responsibility:**

Make sure workers clean windows safely, and properly use and maintain their window-cleaning equipment.

**IMPORTANT:**

Window-cleaning equipment includes window-cleaner’s belts, boatswain’s chairs, rope descent systems, ladders, supported scaffolds and the support equipment used to suspend employees cleaning windows.

**You must:**

**Training**

Train workers to use window-cleaning equipment.

**WAC 296-878-11005 Building surfaces and fixtures.**

Make sure building surfaces and fixtures are safe to use.

**WAC 296-878-12005 Inspection procedures.**

Inspect the area to be cleaned.

**WAC 296-878-13005**

Inspect window-cleaning equipment before use.

**WAC 296-878-14005 Develop site-specific service and emergency plans.**

Develop a site-specific service and emergency recovery plan for window-cleaning operations.

**WAC 296-878-15005 Equipment.**

Select and use appropriate equipment.

**WAC 296-878-16005 Other window-cleaning equipment.**

Select appropriate rope for suspended equipment.

**WAC 296-878-17005 Select appropriate carabiners.**

Use fall protection equipment.

**WAC 296-878-18005 Use fall protection equipment.**

Select and use appropriate equipment.

**WAC 296-878-19005 Use fall protection equipment.**

Select appropriate carabiners.

**WAC 296-878-20005 Use fall protection equipment.**

Warning signs and barricades.

(2005 Ed.)

[Title 296 WAC—p. 3103]
Warning signs and barricades
Provide warning signs and barricades when suspended equipment is used
WAC 296-878-16005

Power line clearances
Maintain clearance between window cleaners and power lines
WAC 296-878-17005

Window-cleaners' belts and anchors
Select appropriate window-cleaners' belts and anchors
WAC 296-878-18005
Inspect the anchors you plan to use for window cleaning
WAC 296-878-18010
Use window-cleaners' belts safely
WAC 296-878-18015
Move safely on the outside of buildings
WAC 296-878-18020

Boatswains' chairs
Select appropriate boatswains' chairs
WAC 296-878-19005
Safely use boatswains' chairs rigged with a block and tackle
WAC 296-878-19010

Rope descent systems
Select appropriate rope descent systems
WAC 296-878-20005
Safely use rope descent systems
WAC 296-878-20010
Safely use rope descent devices
WAC 296-878-20015

Equipment prohibited
Prohibit equipment from use
WAC 296-878-21005

Definitions
WAC 296-878-220.

Training.
WAC 296-878-11005
Train workers to use window-cleaning equipment.
You must:
• Provide the following training to workers before they use window-cleaning equipment on the job:
  – Proper care and maintenance of the equipment
  – Review manufacturer's instructions for proper equipment use
  – Methods for inspection, assembly, and dismantling of components
  – Identify anchorages
  – A complete understanding of safe working conditions
  – How employees will be rescued.
• Provide additional training to workers using window-cleaners' belts in all the following areas:
  – How to select the proper-sized belt
  – How to use anchors and terminals
  – How to deal with obstructions and slippery/wet surfaces.

Building surfaces and fixtures.
WAC 296-878-120
Make sure building surfaces and fixtures are safe to use.
You must:
• Make sure building surfaces and fixtures are safe to be used before you begin the window-cleaning operation. This includes:
  – Guardrails, parapets, cornices and other building surfaces used to support suspended loads
  – Permanently installed fixtures used as anchorages and tiebacks
  – Window-cleaning equipment support systems permanently dedicated to the building.

Inspection procedures.
WAC 296-878-130
Inspect the area to be cleaned.
You must:
• Inspect the building before cleaning to make sure there are no areas that can damage worker fall protection equipment and window-cleaning equipment. Inspect:
  – Sharp edges of parapets
  – Window frames
  – Open projected windows
  – Cornices
  – Overhangs
  – Any other areas that may abrade, sever, weaken, or damage the equipment.

[Title 296 WAC—p. 3104]
• Make sure all working surfaces are safe and free from hazards such as:
  – Grease
  – Oil
  – Other slippery substances.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 02-22-027, § 296-878-13005, filed 10/28/02, effective 1/1/03.]

**WAC 296-878-13010 Inspect window-cleaning equipment before use.**

You must:

1. Store your window-cleaning equipment in a way that:
   • Is easy to get to, inspect, and safely take out for use
   • Provides protection from moisture, sunlight, or corrosion.

2. Make sure a competent person inspects these items before each use:
   • Window-cleaners’ belts
   • Boatswains’ chairs
   • All components of rope descent systems
   • Suspension devices
   • Certified roof anchorages
   • Primary support ropes or lines
   • The descent device
   • Carabiners or shackles
   • A seatboard or boatswain’s chair
   • Wear points on rope descent system components exposed to constant friction.

3. Make sure you do not use any piece of window-cleaning equipment with defects.
   • Prohibit makeshift repairs to any piece of window-cleaning equipment
   • Label any piece of window-cleaning equipment that is defective "dangerous, do not use."

4. Secure any padding or softeners so they do not come loose from:
   • The surface of the building
   • The rope if not attached to the building.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 02-22-027, § 296-878-13010, filed 10/28/02, effective 1/1/03.]

**WAC 296-878-14005 Develop site-specific service and emergency plans.**

You must:

1. Make sure that all equipment provided to workers for window-cleaning operations is engineered, designed, and intended for use in commercial applications.

   **Note:** Equipment that is designed or labeled for recreational use or rescue use only is prohibited for use in window-cleaning operations.

2. Make sure that the window-cleaning equipment is not altered unless it is specifically approved in writing by the original manufacturer or a registered professional engineer.

3. Provide manufacturer’s instructions to employees for all window-cleaning equipment they will use.

   **Reference:** Use Table 1 for other window-cleaning equipment requirements.

**Table 1 Other window-cleaning equipment**

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 02-22-027, § 296-878-150, filed 10/28/02, effective 1/1/03.]

**WAC 296-878-15005 Select and use appropriate equipment.**

You must:

1. Make sure that all equipment provided to workers for window-cleaning operations is engineered, designed, and intended for use in commercial applications.

   **Note:** Equipment that is designed or labeled for recreational use or rescue use only is prohibited for use in window-cleaning operations.

2. Provide manufacturer’s instructions to employees for all window-cleaning equipment they will use.

**WAC 296-878-15015 Select appropriate carabiners.**

You must:

1. Use carabiners for connecting hardware or attaching boatswains’ chairs, descent devices, and lifelines to anchors.

   **Note:** You may use an outside service for rescue and recovery (such as a fire department) if:
   • The rescue personnel will be able to reach the victims without undue delay
   • They have the necessary equipment to retrieve the victims
   • They are trained and proficient in high angle rescue techniques.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060. 02-22-027, § 296-878-15015, filed 10/28/02, effective 1/1/03.]

(2005 Ed.)
• Make sure carabiners are either manual or auto-locking.

Note: You may secure a rope to an anchor with a knot if normal daily use of the rope will not decrease its initial breaking strength below five thousand pounds.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 02-22-027, § 296-878-15025, filed 10/28/02, effective 1/1/03.]

WAC 296-878-15025 Use fall protection equipment. You must:

(1) Make sure the fall arrest system meets the requirements of WAC 296-24-88050 mandatory Appendix C, Part I, Personal fall arrest systems.

• Use and inspect fall arrest equipment in accordance with the requirements of WAC 296-24-88050, mandatory Appendix C, Part I, Personal fall arrest systems.

• Make sure all workers suspended from a boatswain's chair or rope descent system use an independent fall arrest system where the fall arrest anchorage is separate from the suspension system anchorage.

• Make sure workers operating powered platforms wear and use a fall arrest system.

• Make sure workers assemble and wear their personal fall arrest equipment before they approach the point of suspension.

• Make sure workers are connected at all times to the fall arrest system while they are suspended.

(2) Make sure the boatswain's chair or rope descent system is connected at all times to the suspension line.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 02-22-027, § 296-878-16005, filed 10/28/02, effective 1/1/03.]

WAC 296-878-160 Warning signs and barricades.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 02-22-027, § 296-878-160, filed 10/28/02, effective 1/1/03.]

WAC 296-878-16005 Provide warning signs and barricades when suspended equipment is used.

You must:

(1) Place warning signs below suspended equipment

(2) Block the ground area with barricades directly under or next to the work zone

(3) Assign a competent person to decide if additional protection is necessary

(4) Make sure all tools used by the worker are attached to the worker, seatboard, or boatswain's chair.

Reference: Rules for protecting workers from overhead hazards are listed in WAC 296-800-16055, Make sure your employees use appropriate head protection.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 02-22-027, § 296-878-16005, filed 10/28/02, effective 1/1/03.]

WAC 296-878-170 Power line clearances.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 02-22-027, § 296-878-170, filed 10/28/02, effective 1/1/03.]

WAC 296-878-17005 Maintain clearance between window cleaners and power lines.

You must:

• Maintain clearances between window cleaners and power lines as indicated in Tables 2 and 3.

(WAC 296-878-17005 — 1996 Ed.)

Table 2

Minimum Clearances from Power Lines - Insulated Lines

<table>

<td>10 feet (3.1 m) plus 0.4 inches (1.0 cm) for each 1 kv over 50 kv</td>
<td>2 times the length of the line insulator, but never less than 10 feet (3.1 m)</td>
</tr>
</tbody>
</table>

You must:

• Follow these procedures when window cleaners need to get closer to power lines than allowed in Tables 2 and 3:

  – Notify the utility company or electrical system operator of the need to work closer than the minimum clearances to power lines before starting the work

  – Begin the work only when the utility company or electrical system operator has deenergized or relocated the lines, or installed protective coverings to prevent accidental contact with the lines.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 02-22-027, § 296-878-17005, filed 10/28/02, effective 1/1/03.]

WAC 296-878-180 Window-cleaners' belts and anchors.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 02-22-027, § 296-878-180, filed 10/28/02, effective 1/1/03.]

WAC 296-878-18005 Select appropriate window-cleaners' belts and anchors.

You must:

• Make sure window-cleaners' belts and anchors conform to the:

  AND

  – Manufacturer's specifications.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and 49.17.060, 02-22-027, § 296-878-18005, filed 10/28/02, effective 1/1/03.]

WAC 296-878-18010 Inspect the anchors you plan to use for window cleaning.

You must:

• Make sure you do not use anchors if they:

  – Appear to be damaged

  – Appear deteriorated

  – Appear to be worn

  – Appear to be loose

  – Appear to be unsecured to the building or window frame

  – Will not allow the belt terminal to easily slip over the anchor head.

(2005 Ed.)
• Use window-cleaner’s belts only if:
  – The area to be cleaned is safe
  – All anchors intended for use are safe.
• Make sure window ledges and frames will not impair the safe use of the window-cleaner’s belt.

  Note: If unsafe anchors are found, report them to the building owner or manager and do not use them.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and
49.17.060. 02-22-027, § 296-878-18010, filed 10/28/02, effective 1/1/03.]

WAC 296-878-18015 Use window-cleaners’ belts safely.
You must:
• Make sure workers do not extend more than one arm beyond the window sash when cleaning windows from inside a building.
  • Attach one belt terminal to an anchor before you put more than one arm outside the window.
  • Pull on the terminal strap and look for signs of damage to the anchor.
  • Attach both belt terminals to anchors before climbing out the window.
  • Keep all belt terminals attached during the entire cleaning operation.
  • Make sure the worker keeps one terminal attached to an anchor when reentering the window and until the worker is inside.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and
49.17.060. 02-22-027, § 296-878-18015, filed 10/28/02, effective 1/1/03.]

WAC 296-878-18020 Move safely on the outside of buildings. You must:
• Make sure you travel on the outside of the building only when
  – You keep at least one window-cleaner’s belt terminal attached at all times
    – The anchors are not more than forty-eight inches apart.

  Note: Anchors can be up to seventy-two inches apart if
  • The sill or ledge is continuous
  • The sill or ledge is at least twelve inches wide
  • The sill or ledge has a slope less than five degrees
  • There is at least six inches of window sill in front of the mullions.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and
49.17.060. 02-22-027, § 296-878-18020, filed 10/28/02, effective 1/1/03.]

WAC 296-878-190 Boatswains’ chairs.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and
49.17.060. 02-22-027, § 296-878-190, filed 10/28/02, effective 1/1/03.]

WAC 296-878-19005 Select appropriate boatswains’ chairs.
You must:
(1) Make sure that when you use a block and tackle, it is the correct size, including:
  • Correctly-sized ball bearings or bushed blocks
  • Safety hooks
  • Eye-spliced rope
(2) Make sure all rope used with a boatswain’s chair has a minimum breaking strength of five thousand pounds, including rope used for:
  • Suspension
  • Block and tackle
  • Seat slings.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and
49.17.060. 02-22-027, § 296-878-19005, filed 10/28/02, effective 1/1/03.]

WAC 296-878-19100 Safely use boatswains’ chairs rigged with a block and tackle.
You must:
(1) Make sure the rated capacity or the maximum intended load, whichever is less, is not exceeded.
(2) Make sure the suspension rope stays vertical between the boatswain’s chair and suspension device unless all of these requirements are met:
  • The rigging has been designed by a qualified person
  • The scaffold can be easily reached by rescuers
  • The suspension rope is protected from damage when a change in direction occurs
  • The scaffold will not swing and contact another surface.

(3) Make sure a suspension height of seventy-five feet above grade or building setback is not exceeded.

  Exemption: Suspension height may be up to one hundred thirty feet above grade or building setback if the boatswain’s chair block and tackle has all of the following:
  • An automatic braking system
  • A design that minimizes the amount of force required to raise or lower the suspended worker
  • An automatic braking system that automatically maintains an elevation when no force is applied to the tackle
  • A system that does not slip.

You must:
(4) Prohibit tying any kind of knot in a block and tackle system to maintain elevation.
(5) Make sure another worker is stationed below any boatswain’s chair rigged with a block and tackle who can assist the suspended employee.
(6) Make sure workers do not attempt to increase the work area by swinging, swaying, or other maneuvers.

[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and
49.17.060. 02-22-027, § 296-878-19100, filed 10/28/02, effective 1/1/03.]

WAC 296-878-200 Rope descent systems.
[Statutory Authority: RCW 49.17.010, 49.17.040, 49.17.050, and
49.17.060. 02-22-027, § 296-878-200, filed 10/28/02, effective 1/1/03.]

WAC 296-878-20005 Select appropriate rope descent systems. You must:
• Make sure the rope descent system is designed, used, and maintained according to:
  – The manufacturer’s instructions.
• Make sure the rope descent system has been manufactured and is intended to be used for window cleaning.

(2005 Ed.)
You must:

1. Make sure workers use extreme care when using rope descent equipment around electrical service, heat sources, and turbulent areas, such as air vents.
2. Connect the seatboard or boatswain’s chair to the descent device with a manual or auto-locking carabiner.
3. Make sure workers are positioned in the seatboard or boatswain’s chair before being suspended.
4. Make sure workers do not reach more than six feet in any direction as measured from a centerline straight down from where the suspension rope bears on the building.
5. Make sure workers do not descend rapidly, swing excessively, or stop suddenly.
6. Make sure that, in addition to the suspended worker, there is one other person at the jobsite who is skilled in using the rope descent system and rescue procedures.
7. Make sure you do not exceed a three hundred-foot height of descent as measured from grade or building setback.
8. Make sure your site-specific service plan addresses the following hazards for descents over one hundred thirty feet as measured from grade or building setback:
   - Sudden weather changes, such as wind gusts, microbursts, or tunneling wind currents
   - Inability of the rope descent system to function without using excessive force
   - Workers suspended for long periods of time
   - Rerigging and movement of main suspension and safety lines.
9. Stabilize workers suspended from a rope descent system whenever the descent is higher than one hundred thirty feet, as measured from grade or building setback.
10. Prohibit workers from working when wind speed makes any stabilization equipment ineffective.

You must:

1. Make sure the rated capacity or the maximum intended load, whichever is less, is not exceeded.
2. Make sure the descent device manufacturer’s specifications for rope diameter and construction are followed.
3. Make sure the rope is rigged through the descent device for a controlled rate of descent.
4. Make sure the attachment point on the descent device is one piece with no gates or openings.
5. Make sure the descent device will remain stationary when positive action is taken.

Prohibit use of the following equipment for window-cleaning operations:

- Portable sills
- Window jacks
- Capstan devices to suspend workers
- Suspension or fall-arrest ropes that are made entirely of polypropylene.

Prohibit the use of the following equipment for window-cleaning operations:

- Belt terminal - That part of the safety belt that is attached to the anchor during the window-cleaning operation.
- Block and tackle - A lifting device consisting of one or more pulley blocks reeved with chains, wire ropes, or fibre ropes used solely for raising and lowering a load or moving a load horizontally.
- Anchor, window-cleaner’s belt - Fall-preventing attachment points for direct attachment of the terminal portion of a window-cleaner’s belt.
- Capstan device - An upright, spool-shaped cylinder used for hoisting or lifting weights that is turned by a motor or by hand.
- Carabiner - An oblong metal ring with an openable spring-hinged side, used to clip a rope to an anchoring device.
- Drop line - A vertical line from a fixed anchorage, independent of the work surface.
- Fixture - Attachments, anchors, anchorages, tie backs or support equipment permanently dedicated to a given site.
- Grade - Means the ground, floor, sidewalk, roof, or any level surface that is considered a safe place to work.
- Lanyard - A flexible line to secure a wearer of a safety belt or harness to a drop line, lifeline or fixed anchorage.

Definitions:

- Anchor - A means of suspending a worker.
- Anchor, window-cleaner’s belt - Fall-preventing attachment points for direct attachment of the terminal portion of a window-cleaner’s belt.
- Belt terminal - That part of the safety belt that is attached to the anchor during the window-cleaning operation.
- Block and tackle - A lifting device consisting of one or more pulley blocks reeved with chains, wire ropes, or fibre ropes used solely for raising and lowering a load or moving a load horizontally.
- Boatswain’s chair - A single-point adjustable suspension scaffold consisting of a seat or sling designed to support one worker in a sitting position.
- Carabiner - An oblong metal ring with an openable spring-hinged side, used to clip a rope to an anchoring device.
- Competent person - One who is capable of identifying existing and predictable hazards in the surroundings, or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.
- Drop (drop zone) - A vertical area or work zone accessed by the worker or piece of equipment during one descent.
- Drop line - A vertical line from a fixed anchorage, independent of the work surface.
- Fixture - Attachments, anchors, anchorages, tie backs or support equipment permanently dedicated to a given site.
- Grade - Means the ground, floor, sidewalk, roof, or any level surface that is considered a safe place to work.
- Lanyard - A flexible line to secure a wearer of a safety belt or harness to a drop line, lifeline or fixed anchorage.
Mullion - A slender, vertical dividing bar between windows, panels, etc.

Primary support/suspension - A working line or approved anchorage used for attachment of a working line.

Qualified person - A person is qualified if they have one of the following:
- Extensive knowledge, training, and experience about the subject matter, work, or project
- A recognized degree, certificate, or professional standing
- Successful demonstration of problem solving skills in connection with the subject, work, or project.

Rated capacity - The combined weight of workers, tools, equipment, and other materials that the device is designed and installed to lift and support.

Rope descent system (RDS) - An assembly of components that allows the operator to control the rate of descent at any time. A rope descent system includes the following components:
- Suspension devices
- Certified roof anchorages
- Primary support ropes or lines
- The descent device
- Carabiners or shackles
- A seatboard or boatswain's chair.

Terminal strap - The strap or rope attached to the waist band on one end, and to the belt terminals on the other end.

Window cleaning - Cleaning, wiping, restoring or other methods of cleaning windows.

Working line - A rope suspended from an anchorage and used to access parts of a building.
